55
Jeremiah.

JEREMIAH was called to the prophetic office in the 13th year of the reign of Joſiah the ſon of Amon, A. M. 3376, A. C. 628, and continued to prophecy upwards of 40 years, during the reigns of the degenerate princes of Judah, to whom he boldly threatened thoſe marks of the divine vengeance which their rebellious conduct drew on themſelves and their country. After the deſtruction of Jeruſalem by the Chaldeans, he was ſuffered by Nebuchadnezzar to remain in the deſolate land of Judea to lament the calamities of his infatuated countrymen. He was afterwards, as he himſelf informs us, carried with his diſciple Baruch into Egypt, by Johanan the ſon of Kareah.

It appears from ſeveral paſſages that Jeremiah committed his prophecies to writing. In the 36th chapter we are informed, that the prophet was commanded to write upon a roll all the prophecies which he had uttered; and when the roll was deſtroyed by Jehoiakim the king, Jeremiah dictated the ſame prophecies to Baruch, who wrote them together with many additional circumſtances. The works of Jeremiah extend to the laſt verſe of the 51ſt chapter; in which we have theſe words, "Thus far the words of Jeremiah." The 52d chapter was therefore added by ſome other writer. It is, however, a very important ſupplement, as it illuſtrates the accompliſhment of Jeremiah's prophecies reſpecting the fate of Zedekiah.

56
Chronological arrangement of his writings.

The prophecies of Jeremiah are not arranged in the chronological order in which they were delivered. What has occaſioned this tranſpoſition cannot now be determined. It is generally maintained, that if we conſult their dates, they ought to be thus placed:

In the reign of Joſiah the firſt 12 chapters.

In the reign of Jehoiakim, chapters xiii. xx. xxi. v. 11, 14.; xxii. xxiii. xxv. xxvi. xxxv. xxxvi. xlv.—xlix. 1—33.

In the reign of Zedekiah, chap. xxi. 1—10. xxiv. xxvii. xxxiv. xxxvii. xxxix. xlix. 34—39. l. and li.

Under the government of Gedaliah, chapters xl. xliv. The prophecies which related to the Gentiles were contained in the 46th and five following chapters, being placed at the end, as in ſome meaſure unconnected with the reſt. But in ſome copies of the Septuagint theſe ſix chapters follow immediately after the 13th verſe of the 25th chapter.

Jeremiah, though deficient neither in elegance nor ſublimity, muſt give place in both to Iſaiah. Jerome ſeems to object againſt him a ſort of ruſticity of language, no veſtige of which Dr Lowth was able to diſcover. His ſentiments, it is true, are not always the moſt elevated, nor are his periods always neat and compact; but theſe are faults common to thoſe writers whoſe principal aim is to excite the gentler affections, and to call forth the tear of ſympathy or ſorrow. This obſervation is very ſtrongly exemplified in the Lamentations, where theſe are the prevailing paſſions; it is, however, frequently inſtanced in the prophecies of this author, and moſt of all in the beginning of the book (L), which is chiefly poetical. The middle of it is almoſt entirely hiſtorical. The latter part, again, conſiſting of the laſt ſix chapters, is altogether poetical (M); it contains ſeveral different predictions, which are diſtinctly marked; and in theſe the prophet approaches very near the ſublimity of Iſaiah. On the whole, however, not above half the book of Jeremiah is poetical.

The book of Lamentations, as we are informed in the title, was compoſed by Jeremiah. We ſhall preſent to our reader an account of this elegiac poem from the elegant pen of Dr Lowth. 57
The book of Lamentations.

The Lamentations of Jeremiah (for the title is properly and ſignificantly plural) conſiſt of a number of plaintive effuſions, compoſed on the plan of the funeral dirges, all on the ſame ſubject, and uttered without connection as they roſe in the mind, in a long courſe of ſeparate ſtanzas. Theſe have afterwards been put together, and formed into a collection or correſpondent whole. If any reader, however, ſhould expect to find in them an artificial and methodical arrangement of the general ſubject, a regular diſpoſition of the parts, a perfect connection and orderly ſucceſſion in the matter, and

(L) See the whole of chap. ix. chap. xiv. 17, &c. xx. 14—18.

(M) Chap. xlvi.—li. to ver. 50. Chap. lii. properly belongs to the Lamentations, to which it ſerves as an exordium.

Scripture. and with all this an uninterrupted ſeries of elegance and correctneſs, he will really expect what was foreign to the prophet's deſign. In the character of a mourner, he celebrates in plaintive ſtrains the obſequies of his ruined country: whatever preſented itſelf to his mind in the midſt of deſolation and miſery, whatever ſtruck him as particularly wretched and calamitous, whatever the inſtant ſentiment of ſorrow dictated, he pours forth in a kind of ſpontaneous effuſion. He frequently pauſes, and, as it were, ruminates upon the ſame object; frequently varies and illuſtrates the ſame thought with different imagery, and a different choice of language; ſo that the whole bears rather the appearance of an accumulation of correſponding ſentiments, than an accurate and connected ſeries of different ideas, arranged in the form of a regular treatiſe. There is, however, no wild incoherency in the poem; the tranſitions are eaſy and elegant.

58 How divided. The work is divided into five parts: in the firſt, ſecond, and fourth chapters, the prophet addreſſes the people in his own perſon, or introduces Jeruſalem as ſpeaking. In the third chapter a chorus of the Jews is repreſented. In the fifth the whole captive Jews pour forth their united complaints to Almighty God. Each of theſe five parts is diſtributed into 22 ſtanzas, according to the number of the letters of the alphabet. In the firſt three chapters theſe ſtanzas conſiſt of three lines. In the firſt four chapters the initial letter of each period follows the order of the alphabet; and in the third chapter each verſe of the ſame ſtanza begins with the ſame letter. In the fourth chapter all the ſtanzas are evidently diſtichs, as alſo in the fifth, which is not acroſtic. The intention of the acroſtic was to aſſiſt the memory to retain ſentences not much connected. It deſerves to be remarked, that the verſes of the firſt four chapters are longer by almoſt one half than Hebrew verſes generally are: The length of them ſeems to be on an average about 12 ſyllables. The prophet appears to have choſen this meaſure as being ſolemn and melancholy.

Lowth. 59 The ſubject and beauty of it. "That the ſubject of the Lamentations is the deſtruction of the holy city and temple, the overthrow of the ſtate, the extermination of the people; and that theſe events are deſcribed as actually accompliſhed, and not in the ſtyle of prediction merely, muſt be evident to every reader; though ſome authors of conſiderable reputation * have imagined this poem to have been compoſed on the death of King Joſiah. The prophet, indeed, has ſo copiouſly, ſo tenderly, and poetically, bewailed the misfortunes of his country, that he ſeems completely to have fulfilled the office and duty of a mourner. In my opinion, there is not extant any poem which diſplays ſuch a happy and ſplendid ſelection of imagery in ſo concentrated a ſtate. What can be more elegant and poetical, than the deſcription of that once flouriſhing city, lately chief among the nations, ſitting in the character of a female, ſolitary, afflicted, in a ſtate of widowhood, deſerted by her friends, betrayed by her deareſt connections, imploring relief, and ſeeking conſolation in vain? What a beautiful perſonification is that of "the ways of Sion mourning becauſe none are come to her ſolemn feaſts?" How tender and pathetic are the following complaints?

* Joſephus, Jerome, Uſſerius, &c

Chap. i. 12, 16.

Is this nothing to all you who paſs along the way? behold and ſee,
If there be any ſorrow, like unto my ſorrow, which is inflicted on me;
Which Jehovah inflicted on me in the day of the violence of his wrath.
For theſe things I weep, my eyes ſtream with water;
Becauſe the comforter is far away, that ſhould tranquilize my ſoul:
My children are deſolate, becauſe the enemy was ſtrong.

But to detail its beauties would be to tranſcribe the entire poem." 60

Ezekiel. Ezekiel was carried to Babylon as a captive, and received the firſt revelations from heaven, in the fifth year of Jehoiakim's captivity, A. C. 595. The book of Ezekiel is ſometimes diſtributed under different heads. In the three firſt chapters the commiſſion of the prophet is deſcribed. From the fourth to the thirty-ſecond chapter incluſive, the calamities that befel the enemies of the Jews are predicted, viz. the Ammonites, the Moabites, and Philiſtines. The ruin of Tyre and of Sidon, and the fall of Egypt, are particularly foretold; prophecies which have been fulfilled in the moſt literal and aſtoniſhing manner, as we have been often aſſured by the relation of hiſtorians and travellers. From the 32d chapter to the 40th he inveighs againſt the hypocriſy and murmuring ſpirit of his countrymen, admoniſhing them to reſignation by promiſes of deliverance. In the 38th and 39th chapters he undoubtedly predicts the final return of the Jews from their diſperſion in the latter days, but in a language ſo obſcure that it cannot be underſtood till the event take place. The nine laſt chapters of this book furniſh the deſcription of a very remarkable viſion of a new temple and city, of a new religion and polity. 61

Character as a writer. "Ezekiel is much inferior to Jeremiah in elegance; in ſublimity he is not even excelled by Iſaiah: but his ſublimity is of a totally different kind. He is deep, vehement, tragical; the only ſenſation he affects to excite is the terrible; his ſentiments are elevated, fervid, full of fire, indignant; his imagery is crouded, magnificent, terrific, ſometimes almoſt to diſguſt: his language is pompous, ſolemn, auſtere, rough, and at times unpoliſhed: he employs frequent repetitions, not for the ſake of grace or elegance, but from the vehemence of paſſion and indignation. Whatever ſubject he treats of, that he ſeduloully purſues, from that he rarely departs, but cleaves as it were to it; whence the connection is in general evident and well preſerved. In many reſpects he is perhaps excelled by the other prophets; but in that ſpecies of compoſition to which he ſeems by nature adapted, the forcible, the impetuous, the great and ſolemn, not one of the ſacred writers is ſuperior to him. His diction is ſufficiently perſpicuous; all his obſcurity conſiſts in the nature of the ſubject. Viſions (as for inſtance, among others, thoſe of Hoſea, Amos, and Jeremiah) are neceſſarily dark and confuſed. The greater part of Ezekiel, towards the middle of the book eſpecially, is poetical, whether we regard the matter or the diction. His periods, however, are frequently ſo rude and incompact, that I am often at a loſs how to pronounce concerning his performance in this reſpect. Lowth.

"Iſaiah, Jeremiah, and Ezekiel, as far as relates to ſtyle, may be ſaid to hold the ſame rank among the Hebrews, as Homer, Simonides, and Æſchylus among the Greeks."

So

Scripture.

62 Daniel.

So full an account of Daniel and his writings has been already given under the article DANIEL, that little remains to be ſaid on that ſubject. Daniel flouriſhed during the ſucceſſive reigns of ſeveral Babyloniſh and Median kings to the conqueſt of Babylon by Cyrus. The events recorded in the 6th chapter were contemporary with Darius the Mede; but in the 7th and 8th chapters Daniel returns to an earlier period, to relate the viſions which he beheld in the three firſt years of Belſhazzar's reign; and thoſe which follow in the four laſt chapters were revealed to him in the reign of Darius. The laſt ſix chapters are compoſed of prophecies delivered at different times; all of which are in ſome degree connected as parts of one great ſcheme. They extend through many ages, and furniſh the moſt ſtriking deſcription of the fall of ſucceſſive kingdoms, which were to be introductory to the eſtabliſhment of the Meſſiah's reign. They characterize in deſcriptive terms the four great monarchies of the world to be ſucceeded by "that kingdom which ſhould not be deſtroyed."

63 Character of his prophecies.

The whole book of Daniel being no more than a plain relation of facts, partly paſt and partly future, muſt be excluded the claſs of poetical prophecy. Much indeed of the parabolic imagery is introduced in that book; but the author introduces it as a prophet only; as viſionary and allegorical ſymbols of objects and events, totally untinctured with the true poetical colouring. The Jews, indeed, would refuſe to Daniel even the character of a prophet: but the arguments under which they ſhelter this opinion are very futile; for thoſe points which they maintain concerning the conditions on which the gift of prophecy is imparted, the different gradations, and the diſcrimination between the true prophecy and mere inſpiration, are all trifling and abſurd, without any foundation in the nature of things, and totally deſtitute of ſcriptural authority. They add, that Daniel was neither originally educated in the prophetic diſcipline and precepts, nor afterwards lived conformably to the manner of the prophets. It is not, however, eaſy to comprehend how this can diminiſh his claim to a divine miſſion and inſpiration; it may poſſibly enable us, indeed, to aſſign a reaſon for the diſſimilarity between the ſtyle of Daniel and that of the other prophets, and for its poſſeſſing ſo little of the diction and character of poetry, which the reſt ſeem to have imbibed in common from the ſchools and diſcipline in which they were educated.

64 Their authenticity.

The prophecies of Daniel appear ſo plain and intelligible after their accompliſhment, that Porphyry, who wrote in the 3d century, affirms, that they were written after the events to which they refer took place. A little reflection will ſhow the abſurdity of this ſuppoſition. Some of the prophecies of Daniel clearly refer to Antiochus Epiphanes, with whoſe oppreſſions the Jews were too well acquainted. Had the book of Daniel not made its appearance till after the death of Epiphanes, every Jew who read it muſt have diſcovered the forgery. And what motive could induce them to receive it among their ſacred books? It is impoſſible to conceive *one*. Their character was quite the reverſe: their reſpect for the Scripture had degenerated into ſuperſtition. But we are not left to determine this important point from the character of the Jews; we have acceſs to more deciſive evidence; we are ſure that the book of Daniel contains prophecies, for ſome of them have been accompliſhed ſince the time of Porphyry; particularly thoſe reſpecting Antichriſt: now, if it contains any prophecies, who will take upon him to affirm that the divine Spirit, which dictated theſe many centuries before they were fulfilled, could not alſo have delivered prophecies concerning Antiochus Epiphanes?

The language in which the book of Daniel is compoſed proves that it was written about the time of the Babyloniſh captivity. Part of it is pure Hebrew: a language in which none of the Jewiſh books were compoſed after the age of Epiphanes. Theſe are arguments to a deiſt. To a Chriſtian the internal marks of the book itſelf will ſhow the time in which it was written, and the teſtimony of Ezekiel will prove Daniel to be at leaſt his contemporary *.

* Ezek. xiv. 14. xxviii. 3.

65 Twelve minor prophets.

The twelve minor prophets were ſo called, not from any ſuppoſed inferiority in their writings, but on account of the ſmall ſize of their works. Perhaps it was for this reaſon that the Jews joined them together, and conſidered them as one volume. Theſe 12 prophets preſented in ſcattered hints a lively ſketch of many particulars relative to the hiſtory of Judah and of Iſrael, as well as of other kingdoms; they propheſy with hiſtorical exactneſs the fate of Babylon, of Nineveh, of Tyre, of Sidon, and of Damaſcus. The three laſt prophets eſpecially illuſtrate many circumſtances at a period when the hiſtorical pages of Scripture are cloſed, and when profane writers are entirely wanting. At firſt the Jewiſh prophets appeared only as ſingle lights, and followed each other in individual ſucceſſion; but they became more numerous about the time of the captivity. The light of inſpiration was collected into one blaze, previous to its ſuſpenſion; and it ſerved to keep alive the expectations of the Jews during the awful interval which prevailed between the expiration of prophecy and its grand completion on the advent of Chriſt.

Gray's Key to the Old Teſtament.

66 Prophecies of Hoſea.

Hoſea has been ſuppoſed the moſt ancient of the 12 minor prophets. He flouriſhed in the reign of Jeroboam II. king of Iſrael, and during the ſucceſſive reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. He was therefore nearly contemporary with Iſaiah, Amos, and Jonah. The prophecies of Hoſea being ſcattered through the book without date or connection, cannot with any certainty be chronologically arranged.

67 Character of their ſtyle.

Hoſea is the firſt in order of the minor prophets, and is perhaps, Jonah excepted, the moſt ancient of them all. His ſtyle exhibits the appearance of very remote antiquity; it is pointed, energetic, and conciſe. It bears a diſtinguiſhed mark of poetical compoſition, in that priſtine brevity and condenſation which is obſervable in the ſentences, and which later writers have in ſome meaſure neglected. This peculiarity has not eſcaped the obſervation of Jerome: "He is altogether (ſays he, ſpeaking of this prophet) laconic and ſententious." But this very circumſtance, which anciently was ſuppoſed no doubt to impart uncommon force and elegance, in the preſent ruinous ſtate of the Hebrew literature is productive of ſo much obſcurity, that although the general ſubject of this writer be ſufficiently obvious, he is the moſt difficult and perplexed of all the prophets. There is, however, another reaſon for the obſcurity of his ſtyle: Hoſea propheſied during the reigns of the four kings of Judah, Uzziah, Jotham, Ahaz, and Hezekiah. The duration of his miniſtry, therefore, in whatever

Scripture ever manner we calculate, muft include a very confiderable fpace of time. We have now only a fmall volume of his remaining, which feems to contain his principal prophecies; and thefe are extant in a continued feries, with no marks of diftinction as to the times in which they were publifhed, or the fubjects of which they treat. There is, therefore, no caufe to wonder if, in perufing the prophecies of Hofea, we fometimes find ourfelves in a fimilar predicament with thofe who confulted the fcattered leaves of the Sibyl.

As a fpecimen of Hofea's ftyle, we felect the following beautiful pathetic paffage:

How fhall I refign thee, O Ephraim!
How fhall I deliver thee up, O Ifrael!
How fhall I refign thee as Admah!
How fhall I make thee as Zeboim!
My heart is changed within me;
I am warmed alfo with repentance towards thee.
I will not do according to the fervour of my wrath;
I will not return to deftroy Ephraim:
For I am God, and not man;
Holy in the midft of thee, though I inhabit not thy cities.

68 Prophecies of Joel.

Concerning the date of the prophecy of Joel there are various conjectures. The book itfelf affords nothing by which we can difcover when the author lived, or upon what occafion it was written. Joel fpeaks of a great famine, and of mifchiefs that happened in confequence of an inundation of locufts; but nothing can be gathered from fuch general obfervations to enable us to fix the period of his prophecy. St Jerome thinks (and it is the general opinion) that Jael was contemporary with Hofea. This is poffibly true; but the foundation on which the opinion refts is very precarious, viz. That when there is no proof of the time in which a prophet lived, we are to be guided in our conjectures refpecting it by that of the preceding prophet whofe epoch is better known. As this rule is not infallible, it therefore ought not to hinder us from adopting any other opinion that comes recommended by good reafons. Father Calmet places him under the reign of Jofiah, at the fame time with Jeremiah, and thinks it probable that the famine to which Joel alludes, is the fame with that which Jeremiah predicted, ch. viii. 13.

69 Character of their ftyle.

The ftyle of Joel is effentially different from that of Hofea; but the general character of his diction, though of a different kind, is not lefs poetical. He is elegant, perfpicuous, copious, and fluent; he is alfo fublime, animated, and energetic. In the firft and fecond chapters he difplays the full force of the prophetic poetry, and fhows how naturally it inclines to the ufe of metaphors allegories, and comparifons. Nor is the connection of the matter lefs clear and evident than the complexion of the ftyle: this is exemplified in the difplay of the impending evils which gave rife to the prophecy, the exhortation to repentance; the promifes of happinefs and fuccefs both terreftrial and eternal to thofe who become truly penitent; the reftoration of the Ifraelites; and the vengeance to be taken of their adverfaries. But while we allow this juft commendation to his perfpicuity both in language and arrangement, we muft not deny that there is fometimes great obfcurity obfervable in his fubject, and particularly in the latter part of the prophecy.

Lowth on Hebrew Poetry, Sect. 21.

The following prophecy of a plague of locufts is defcribed with great fublimity of expreffion:

For a nation hath gone up on my land,
Who are ftrong, and without number:
They have deftroyed my vine, and have made my fig-tree a broken branch.
They have made it quite bare, and caft it away: the branches thereof are made white.
The field is laid wafte; the ground mourneth *.

* Joel i. 6. 7, 10, &c.

70 Prophecies of Amos.

Amos was contemporary with Hofea. They both began to prophecy during the reigns of Uzziah over Judah, and of Jeroboam II. over Ifrael. Amos faw his firft vifion two years before the earthquake, which Zechariah informs us happened in the days of Uzziah. See Amos.

Amos was a herdfman of Tekoa, a fmall town in the territory of Judah, and a gatherer of fycamore fruit. In the fimplicity of former times, and in the happy climates of the Eaft, thefe were not confidered as difhonourable occupations. He was no prophet (as he informed Amaziah †), neither was he a prophet's fon, that is, he had no regular education in the fchools of the prophets.

† Amos vii. 14.

The prophecies of Amos confift of feveral diftinct difcourfes, which chiefly refpect the kingdom of Ifrael; yet fometimes the prophet inveighs againft Judah, and threatens the adjacent nations, the Syrians, Philiftines, Tyrians, Edomites, Ammonites, and Moabites.

71 Their ftyle.

Jerome calls Amos "rude in fpeech, but not in knowledge ‡;" applying to him what St Paul modeftly profeffes of himfelf §. "Many (fays Dr Lowth) have followed the authority of Jerome in fpeaking of this prophet, as if he were indeed quite rude, ineloquent, and deftitute of all the embellifhments of compofition. The matter is, however, far otherwife. Let any perfon who has candour and perfpicacity enough to judge, not from the man but from his writings, open the volume of his predictions, and he will, I think, agree with me, that our fhepherd 'is not a whit behind the very chief of the prophets ||.' He will agree, that as in fublimity and magnificence he is almoft equal to the greateft, fo in fplendour of diction and elegance of expreffion he is fcarcely inferior to any. The fame celeftial Spirit indeed actuated Ifaiah and Daniel in the court and Amos in the fheep-folds; conftantly felecting fuch interpreters of the divine will as were beft adapted to the occafion, and fometimes 'from the mouth of babes and fucklings perfecting praife:' occafionally employing the natural eloquence of fome, and occafionally making others eloquent."

‡ *Proem. Comment. in Amos.*
§ 2 Cor. xi. 6.
|| 2 Cor. xi.

Mr Locke has obferved, that the comparifons of this prophet are chiefly drawn from lions and other animals with which he was moft accuftomed; but the fineft images and allufions are drawn from fcenes of nature. There are many beautiful paffages in the writings of Amos, of which we fhall prefent one fpecimen:

Wo to them that are at eafe in Zion,
And truft in the mountains of Samaria;
Who are named chief of the nations,
To whom the houfe of Ifrael came:
Pafs ye unto Calneh and fee,
And from thence go to Hamath the Great;

Then

Scripture.

Then go down to Gath of the Philiftines;
Are they better than thefe kingdoms?
Or their borders greater than their borders?
Ye that put far away the evil day,
And caufe the feat of violence to come near;
That lie upon beds of ivory,
And ftretch yourfelves upon couches;
That eat the lambs out of the flock,
And the calves out of the midft of the ftall;
That chant to the found of the viol,
And like David devife inftruments of mufic;
That drink wine in bowls,
|| Ch. vi. 1.—6. And anoint yourfelves with chief ointments;
But are not grieved for the affliction of Jofeph ||.

72
Of Obadiah. The writings of Obadiah, which confift of one chapter, are compofed with much beauty, and unfold a very interefting fcene of prophecy. Of this prophet little can be faid, as the fpecimen of his genius is fo fhort, and the greater part of it included in one of the prophecies of Jeremiah. Compare Ob. 1—9. with Jer. xlix. 14, 15, 16. See OBADIAH.

73
Of Jonah. Though Jonah be placed the fixth in the order of the minor prophets both in the Hebrew and Septuagint, he is generally confidered as the moft ancient of all the prophets, not excepting Hofea. He lived in the kingdom of Ifrael, and prophefied to the ten tribes under the reign of Joafh and Jeroboam. The book of Jonah is chiefly hiftorical, and contains nothing of poetry but the prayer of the prophet. The facred writers, and our Lord himfelf, fpeak of Jonah as a prophet of confiderable eminence *. See JONAH.

* 2 Kings xiv. 25. Matth. xii. 39. 41. xvi. 4. Luke xi. 29.

74
Of Micah. Micah began to prophefy foon after Ifaiah, Hofea, Joel, and Amos; and he prophefied between A. M. 3246, when Jotham began to reign, and A. M. 3305, when Hezekiah died. One of his predictions is faid † to have faved the life of Jeremiah, who under the reign of Jehoiakim would have been put to death for prophefying the deftruction of the temple, had it not appeared that Micah had foretold the fame thing under Hezekiah above 100 years before ‡. Micah is mentioned as a prophet in the book of Jeremiah and in the New Teftament ||. He is imitated by fucceeding prophets (N), as he himfelf had borrowed expreffions from his predeceffors (O). Our Saviour himfelf fpoke in the language of this prophet (P).

† Jer. xxv. 15—24.

‡ *Jof. Ant.* lib. x. c. 7.

|| Micah iii. 12. Matt. ii. 5. John vii. 42.

75
His ftyle. The ftyle of Micah is for the moft part clofe, forcible, pointed, and concife; fometimes approaching the obfcurity of Hofea; in many parts animated and fublime; and in general truly poetical. In his prophecies there is an elegant poem, which Dr Lowth thinks is a citation from the anfwer of Balaam to the king of the Moabites:

Wherewith fhall I come before Jehovah?
Wherewith fhall I bow myfelf unto the High God?
Shall I come before him with burnt-offerings,
With calves of a year old?
Will Jehovah be pleafed with thoufands of rams?
With ten thoufands of rivers of oil?
Shall I give my firft-born for my tranfgreffion?
The fruit of my body for the fin of my foul?
He hath fhowed thee, O man, what is good:
And what doth Jehovah require of thee,
But to do juftice, and to love mercy,
And to be humble in walking with thy God?

76
Of Nahum. Jofephus afferts, that Nahum lived in the time of Jotham king of Judah; in which cafe he may be fuppofed to have prophefied againft Nineveh when Tiglath-Pilefer king of Affyria carried captive the natives of Galilee and other parts about A. M. 3264. It is, however, probable, that his prophecies were delivered in the reign of Hezekiah; for he appears to fpeak of the taking of No-Ammon a city of Egypt, and of the infolent meffengers of Sennacherib, as of things paft; and he likewife defcribes the people of Judah as ftill in their own country, and defirous of celebrating their feftivals.

While Jerufalem was threatened by Sennacherib, Nahum promifed deliverance to Hezekiah, and predicted that Judah would foon celebrate her folemn feafts fecure from invafion, as her enemy would no more difturb her peace. In the fecond and third chapters Nahum foretels the downfal of the Affyrian empire and the final deftruction of Nineveh, which was probably accomplifhed by the Medes and Babylonians, whofe combined forces overpowered the Affyrians by furprife "while they were folden together as thorns, and while they were drunken as drunkards," when the gates of the river were opened, the palace demolifhed, and an "overrunning flood" affifted the conquerors in their devaftation; who took an endlefs ftore of fpoil of gold and filver, making an utter end of the place of Nineveh, of that vaft and populous city, whofe walls were 100 feet high, and fo broad that three chariots could pafs abreaft. Yet fo completely was this celebrated city deftroyed, that even in the 2d century the fpot on which it ftood could not be afcertained, every veftige of it being gone.

It is impoffible to read of the exact accomplifhment of the prophetic denunciations againft the enemies of the Jews, without reflecting on the aftonifhing proofs which that nation enjoyed of the divine origin of their religion. From the Babylonifh captivity to the time of Chrift they had numberlefs inftances of the fulfilment of their prophecies.

The character of Nahum as a writer is thus defcribed by Dr Lowth: "None of the minor prophets feem to equal Nahum in boldnefs, ardour, and fublimity. His prophecy, too, forms a regular and perfect poem; the exordium is not merely magnificent, it is truly majeftic; the preparation for the deftruction of Nineveh, and the defcription of its downfal and defolation, are expreffed in the moft vivid colours, and are bold and luminous in the higheft degree."

77
Of Habakkuk. As the prophet Habakkuk makes no mention of the Affyrians, and fpeaks of the Chaldean invafions as near at hand, he probably lived after the deftruction of the Affyrian

(N) Compare Zephan. iii. 19. with Micah. iv. 7. and Ezek. xxii. 27. with Micah iii. 11.
(O) Compare Micah. iv. 1—3. and Ifaiah ii. 2—4. Micah iv. 13. with Ifaiah xli. 15.
(P) Compare Micah viii. 6. with Matt. x. 35, 36.

Scripture.

Aſſyrian empire in the fall of Nineveh A. M. 3392, and not long before the devaſtation of Judea by Nebuchadnezzar. Habakkuk was then nearly contemporary with Jeremiah, and predicted the ſame events. A general account of Habakkuk's prophecies has already been given under the word HABAKKUK, which may be conſulted. We ſhould, however, farther obſerve, that the prayer in the third chapter is a moſt beautiful and perfect ode, poſſeſſing all the fire of poetry and the profound reverence of religion.

God came from Teman,
And the Holy One from Mount Paran:
His glory covered the heavens,
And the earth was full of his praiſe.
His brightneſs was as the light;
Beams of glory iſſued from his ſide;
And there was the hiding of his power.
Before him went the peſtilence;
And burning coals went forth at his feet.
He ſtood and meaſured the earth;
He beheld and drove aſunder the nations;
The everlaſting mountains were ſcattered;
The perpetual hills did bow.

The prophet illuſtrates this ſubject throughout with equal ſublimity; ſelecting from ſuch an aſſemblage of miraculous incidents the moſt noble and important, diſplaying them in the moſt ſplendid colours, and embelliſhing them with the ſublimeſt imagery, figures, and diction; the dignity of which is ſo heightened and recommended by the ſuperior elegance of the concluſion, that were it not for a few ſhades which the hand of time has apparently caſt over it in two or three paſſages, no compoſition of the kind would appear more elegant or more perfect than this poem.

|| Heb. x. 37, 38. Rom. i. 17. Gal. iii. 2. Acts xiii. 41. compare with Hab. i. 5.

Habakkuk is imitated by ſucceeding prophets, and his words are borrowed by the evangelical writers ||.

78 Prophecies of Zephaniah.

Zephaniah, who was contemporary with Jeremiah, propheſied in the reign of Joſiah king of Judah; and from the idolatry which he deſcribes as prevailing at that time, it is probable that his prophecies were delivered before the laſt reformation made by that pious prince A. M. 3381.

The account which Zephaniah and Jeremiah give of the idolatries of their age is ſo ſimilar, that St Iſiodore aſſerts, that Zephaniah abridged the deſcriptions of Jeremiah. But it is more probable that the prophecies of Zephaniah were written ſome years before thoſe of his contemporary; for Jeremiah ſeems to repreſent the abuſes as partly removed which Zephaniah deſcribes as flagrant and exceſſive (q).

In the firſt chapter Zephaniah denounces the wrath of God againſt the idolaters who worſhipped Baal and the hoſt of heaven, and againſt the violent and deceitful. In the ſecond chapter the prophet threatens deſtruction to the Philiſtines, the Moabites, the Ammonites, and Ethiopians; and deſcribes the fate of Nineveh in emphatic terms: "Flocks ſhall lie down in the midſt of her; all the beaſts of the nations, both the cormorant and bittern, ſhall lodge in her: their voice ſhall ſing in the windows; deſolation ſhall be in the threſholds." In the third chapter the prophet inveighs againſt the pollutions and oppreſſions of the Jews; and concludes with the promiſe, "That a remnant would be ſaved, and that multiplied bleſſings would be beſtowed upon the penitent." The ſtyle of Zephaniah is poetical, but is not diſtinguiſhed by any peculiar elegance or beauty, though generally animated and impreſſive.

79 Of Haggai.

Haggai, the tenth of the minor prophets, was the firſt who flouriſhed among the Jews after the Babyloniſh captivity. He began to propheſy in the ſecond year of Darius Hyſtaſpes, about 520 years before Chriſt.

The intention of the prophecy of Haggai was to encourage the diſpirited Jews to proceed with the building of the temple. The only prediction mentioned refers to the Meſſiah, whom the prophet aſſures his countrymen would fill the new temple with glory. So well was this prediction underſtood by the Jews, that they looked with earneſt expectation for the Meſſiah's appearing in this temple till it was deſtroyed by the Romans. But as the victorious Meſſiah, whom they expected, did not then appear, they have ſince applied the prophecy to a third temple, which they hope to ſee reared in ſome future period.

The ſtyle of Haggai, in the opinion of Dr Lowth, is proſaic. Dr Newcome, on the contrary, thinks that a great part of it is poetical.

80 Of Zechariah.

Zechariah was undoubtedly a contemporary of Haggai, and began to propheſy two months after him, in the eighth month of the ſecond year of Darius Hyſtaſpes, A. M. 3484, being commiſſioned as well as Haggai to exhort the Jews to proceed in the building of the temple after the interruption which the work had ſuffered. We are informed by Ezra (vi. 14.), that the Jews proſpered through the propheſying of Zechariah and Haggai.

Zechariah begins with general exhortations to his countrymen, exciting them to repent from the evil ways of their fathers, whom the prophets had admoniſhed in vain. He deſcribes angels of the Lord interceding for mercy on Jeruſalem and the deſolate cities of Judah, which had experienced the indignation of the Moſt High for 70 years, while the neighbouring nations were at peace. He declares, that the houſe of the Lord ſhould be built in Jeruſalem, and that Zion ſhould be comforted. The prophet then repreſents the increaſe and proſperity of the Jews under ſeveral typical figures. He deſcribes the eſtabliſhment of the Jewiſh government and the coming of the Meſſiah. He admoniſhes thoſe who obſerved ſolemn faſts without due contrition, to execute juſtice, mercy, and compaſſion, every man to his brother; not to oppreſs the widow nor the fatherleſs, the ſtranger nor the poor. He promiſes, that God would again ſhow favour to Jeruſalem; that their mournful faſts ſhould be turned into cheerful feaſts; and that the church of the Lord ſhould be enlarged by the acceſſion of many nations.

The 12th verſe of the 11th chapter of this book, which exhibits a prophetic deſcription of ſome circumſtances afterwards fulfilled in our Saviour, appears to be

(q) Compare Zephaniah i. 4, 5, 9. with Jeremiah ii. 5, 20, 32.

Scripture. be cited by St Matthew (xxvii. 9, 10.) as ſpoken by Jeremiah; and as the 11th, 12th, and 13th chapters have been thought to contain ſome particulars more ſuitable to the age of Jeremiah than to that of Zechariah, ſome learned writers are of opinion that they were written by the former prophet, and have been from ſimilarity of ſubject joined by miſtake to thoſe of Zechariah. But others are of opinion, that St Matthew might allude to ſome traditional prophecy of Jeremiah, or, what is more probable, that the name of Jeremiah was ſubſtituted by miſtake in place of Zechariah.

The 12th, 13th, and 14th chapters contain prophecies which refer entirely to the Chriſtian diſpenſation; the circumſtances attending which he deſcribes with a clearneſs which indicated their near approach.

The ſtyle of Zechariah is ſo ſimilar to that of Jeremiah, that the Jews were accuſtomed to remark that the ſpirit of Jeremiah had paſſed into him. He is generally proſaic, till towards the concluſion of his work, when he becomes more elevated and poetical. The whole is beautifully connected by eaſy tranſitions, and preſent and future ſcenes are blended with the greateſt delicacy.

81
Of Malachi. Malachi was the laſt prophet that flouriſhed under the Jewiſh diſpenſation; but neither the time in which he lived, nor any particulars of his hiſtory, can now be aſcertained. It is even uncertain whether the word *Malachi* be a proper name, or denote, as the Septuagint have rendered it, *his angel* (R), that is, "the angel of the Lord." Origen ſuppoſed, that Malachi was an angel incarnate, and not a man. The ancient Hebrews, the Chaldee paraphraſt, and St Jerome, are of opinion he was the ſame perſon with Ezra: but if this was the caſe, they ought to have aſſigned ſome reaſon for giving two different names to the ſame perſon.

As it appears from the concurring teſtimony of all the ancient Jewiſh and Chriſtian writers, that the light of prophecy expired in Malachi, we may ſuppoſe that the termination of his miniſtry coincided with the accompliſhment of the firſt ſeven weeks of Daniel's prophecy, which was the period appointed for ſealing the viſion and prophecy. This, according to Prideaux's account, took place in A. M. 3595; but, according to the calculations of Biſhop Lloyd, to A. M. 3607, twelve years later. Whatever reckoning we prefer, it muſt be allowed that Malachi completed the canon of the Old Teſtament about 400 years before the birth of Chriſt.

It appears certain that Malachi propheſied under Nehemiah, and after Haggai and Zechariah, at a time when great diſorders reigned among the prieſts and people of Judah, which are reproved by Malachi. He inveighs againſt the prieſts (i. 6, &c. ii. 1, 2, &c.); he reproaches the people with having taken ſtrange wives (ii. 11.); he reproves them for their inhumanity towards their brethren (ii. 10. iii. 5.); their too frequently divorcing their wives: their neglect of paying their tithes and firſt-fruits (Mal. iii. 13.). He ſeems to allude to the covenant that Nehemiah renewed with the Lord (iii. 10. and ii. 4. 5, &c.). [illegible] by the prieſts and the chief of the nation. He ſpeaks of the ſacrifice of the new law, and of the abolition of thoſe of the old, in theſe words (i. 10, 11, 12, 13.): "I have no pleaſure in you, ſaith the Lord of hoſts, neither will I accept an offering at your hand. For from the riſing of the ſun, even unto the going down of the ſame, my name ſhall be great among the Gentiles, and in every place incenſe ſhall be offered unto my name, and a pure offering: for my name ſhall be great among the Heathen, ſaith the Lord of hoſts." He declares that the Lord was weary with the impiety of Iſrael; and aſſures them, that the Lord whom they ſought ſhould ſuddenly come to his temple preceded by the meſſenger of the covenant, who was to prepare his way; that the Lord when he appeared ſhould purify the ſons of Levi from their unrighteouſneſs, and refine them as metal from the droſs; and that then the offering of Judah, the ſpiritual ſacrifice of the heart, ſhould be pleaſant to the Lord. The prophet, like one who was delivering a laſt meſſage, denounces deſtruction againſt the impenitent in emphatic and alarming words. He encourages thoſe who feared the name of the Lord with the animating promiſe, that the "Sun of righteouſneſs ſhould ariſe with ſalvation in his rays," and render them triumphant over the wicked. And now that prophecy was to ceaſe, and miracles were no more to be performed till the coming of the Meſſiah; now that the Jews were to be left to the guidance of their own reaſon, and the written inſtructions of their prophets—Malachi exhorts them to remember the law of Moſes, which the Lord had revealed from Horeb for the ſake of all Iſrael. At length he ſeals up the prophecies of the Old Teſtament, by predicting the commencement of the new diſpenſation, which ſhould be uſhered in by John the Baptiſt with the power and ſpirit of Elijah; who ſhould turn the hearts of fathers and children to repentance; but if his admonitions ſhould be rejected, that the Lord would ſmite the land with a curſe.

82
New Teſtament. THE collection of writings compoſed after the aſcenſion of Chriſt, and acknowledged by his followers to be divine, is known in general by the name of καινη διαθηκη.

83
Title. This title, though neither given by divine command, nor applied to theſe writings by the apoſtles, was adopted in a very early age, though the preciſe time of its introduction is uncertain, it being juſtified by ſeveral paſſages in Scripture †, and warranted by the authority of St Paul in particular, who calls the ſacred books before the time of Chriſt παλαια διαθηκη ‡. Even long before that period, either the whole of the Old Teſtament, or the five books of Moſes, were entitled βιβλιον διαθηκης, or book of the covenant §.

† Matth. xxvi. 28. Gal. iii. 17. Heb. viii. 8. ix. 15—20.

‡ 2 Cor. iii.

§ 1 Mac. i. 57.

As the word διαθηκη admits of a two-fold interpretation, we may tranſlate this title either the *New Covenant* or *New Teſtament*. The former tranſlation muſt be adopted, if reſpect be had to the texts of Scripture, from which the name is borrowed, ſince thoſe paſſages evidently convey the idea of a covenant; and, beſides, a being incapable of death can neither have made an old nor make a new teſtament. It is likewiſe probable, that the earlieſt Greek diſciples, who made uſe of this expreſſion, had no other notion in view than that of covenant

(R) מלאכי *Malachi* ſignifies properly *my angel*.

venant. We, on the contrary, are accuſtomed to give this ſacred collection the name of *Teſtament;* and ſince it would be not only improper, but even abſurd, to ſpeak of the Teſtament of God, we commonly underſtand the Teſtament of Chriſt; an explanation which removes but half the difficulty, ſince the new only, and not the old, had Chriſt for its teſtator.

84
Importance of the argument from the authenticity of the books.

In ſtating the evidence for the truth of Chriſtianity, there is nothing more worthy of conſideration than the authenticity of the books of the New Teſtament. This is the foundation on which all other arguments reſt; and if it is ſolid, the Chriſtian religion is fully eſtabliſhed. The proofs for the authenticity of the New Teſtament have this peculiar advantage, that they are plain and ſimple, and involve no metaphyſical ſubtilties.—Every man who can diſtinguiſh truth from falſehood muſt ſee their force; and if there are any ſo blinded by prejudice, or corrupted by licentiouſneſs, as to attempt by ſophiſtry to elude them, their ſophiſtry will be eaſily detected by every man of common underſtanding, who has read the hiſtorical evidence with candour and attention. Inſtead, therefore, of declaiming againſt the infidel, we ſolicit his attention to this ſubject, convinced, that where truth reſides, it will ſhine with ſo conſtant and clear a light, that the combined ingenuity of all the deiſts ſince the beginning of the world will never be able to extinguiſh or to obſcure it. If the books of the New Teſtament are really genuine, oppoſition will incite the Chriſtian to bring forward the evidence; and thus by the united efforts of the deiſt and the Chriſtian, the arguments will be ſtated with all the clearneſs and accuracy of which they are ſuſceptible in ſo remarkable a degree.

It is ſurpriſing that the adverſaries of Chriſtianity have not always made their firſt attacks in this quarter; for if they admit that the writings of the New Teſtament are as ancient as we affirm, and compoſed by the perſons to whom they are aſcribed, they muſt allow, if they reaſon fairly, that the Chriſtian religion is true.

The apoſtles frequently allude in their epiſtles to the gift of miracles, which they had communicated to the Chriſtian converts by the impoſition of hands, in confirmation of the doctrine delivered in their ſpeeches and writings, and ſometimes to miracles which they themſelves had performed. Now if theſe epiſtles are really genuine, it is hardly poſſible to deny thoſe miracles to be true. The caſe is here entirely different from that of an hiſtorian, who relates extraordinary events in the courſe of his narrative, ſince either credulity or an actual intention to deceive may induce him to deſcribe as true a ſeries of falſehoods reſpecting a foreign land or diſtant period. Even to the Evangeliſts might an adverſary of the Chriſtian religion make this objection: but to write to perſons with whom we ſtand in the neareſt connection, "I have not only performed miracles in your preſence, but have likewiſe communicated to you the ſame extraordinary endowments," to write in this manner, if nothing of the kind had ever happened, would require ſuch an incredible degree of effrontery, that he who poſſeſſed it would not only expoſe himſelf to the utmoſt ridicule, but by giving his adverſaries the faireſt opportunity to detect his impoſture, would ruin the cauſe which he attempted to ſupport.

Michaelis's Introduction to the New Teſtament.

St Paul's Firſt Epiſtle to the Theſſalonians is addreſſed to a community to which he had preached the goſpel only three Sabbath days, when he was forced to quit it by the perſecution of the populace. In this epiſtle he appeals to the miracles which he had performed, and to the gifts of the Holy Spirit which he had communicated. Now, is it poſſible, without forfeiting all pretenſions to common ſenſe, that, in writing to a community which he had lately eſtabliſhed, he could ſpeak of miracles performed, and gifts of the Holy Ghoſt communicated, if no member of the ſociety had ſeen the one, or received the other?

To ſuppoſe that an impoſtor could write to the converts or adverſaries of the new religion ſuch epiſtles as theſe, with a degree of triumph over his opponents, and yet maintain his authority, implies ignorance and ſtupidity hardly to be believed. Credulous as the Chriſtians have been in later ages, and even ſo early as the third century, no leſs ſevere were they in their inquiries, and guarded againſt deception, at the introduction of Chriſtianity. This character is given them even by Lucian, a writer of the ſecond century, who vented his ſatire not only againſt certain Chriſtians *, who had ſupplied Peregrinus with the means of ſubſiſtence, but alſo againſt heathen oracles and pretended wonders. He relates of his impoſtor (Pſeudomantis), that he attempted nothing ſupernatural in the preſence of the Chriſtians and Epicureans. This Pſeudomantis exclaims before the whole aſſembly, "Away with the Chriſtians, away with the Epicureans, and let thoſe only remain who believe in the Deity!" (πιστευοντες τῳ Θεῳ) on which the populace took up ſtones to drive away the ſuſpicious; while the other philoſophers, Pythagoreans, Platoniſts, and Stoics, as credulous friends and protectors of the cauſe, were permitted to remain †.

* *De morte Peregrini,* § 12, 13, 16. *Ed. Reitz.* tom. iii. p. 334—338. 341.

† *Alexander ſeu Pſeudomantis,* § 25, 32. tom. ii. p. 232, 233, 244, 245.

It is readily acknowledged, that the arguments drawn from the authenticity of the New Teſtament only eſtabliſh the truth of the miracles performed by the apoſtles, and are not applicable to the miracles of our Saviour; yet, if we admit the firſt three goſpels to be genuine, the truth of the Chriſtian religion will be proved from the prophecies of Jeſus. For if theſe goſpels were compoſed by Matthew, Mark, and Luke, at the time in which all the primitive Chriſtians affirm, that is, previous to the deſtruction of Jeruſalem, they muſt be inſpired; for they contain a circumſtantial prophecy of the deſtruction of Jeruſalem, and determine the period at which it was accompliſhed. Now it was impoſſible that human ſagacity could foreſee that event; for when it was predicted nothing was more improbable. The Jews were reſolved to avoid an open rebellion, well knowing the greatneſs of their danger, and ſubmitted to the oppreſſions of their governors in the hope of obtaining redreſs from the court of Rome.—The circumſtance which gave birth to theſe misfortunes is ſo trifling in itſelf, that independent of its conſequences, it would not deſerve to be recorded. In the narrow entrance to a ſynagogue in Cæſarea, ſome perſon had made an offering of birds merely with a view to irritate the Jews. The inſult excited their indignation, and occaſioned the ſhedding of blood. Without this trifling accident, which no human wiſdom could foreſee even the day before it happened, it is poſſible that the prophecy of Jeſus would never have been

fulfilled;

Scripture. fulfilled. But Florus, who was then procurator of Judea, converted this private quarrel into public hostilities, and compelled the Jewish nation to rebel contrary to its wish and resolution, in order to avoid what the Jews had threatened, an impeachment before the Roman emperor for his excessive cruelties. But even after this rebellion had broken out, the destruction of the temple was a very improbable event. It was not the practice of the Romans to destroy the magnificent edifices of the nations which they subdued; and of all the Roman generals, none was more unlikely to demolish so ancient and august a building as Titus Vespasian.

So important then is the question, Whether the books of the New Testament be genuine? that the arguments which prove their authenticity, prove also the truth of the Christian religion. Let us now consider the evidence which proves the authenticity of the New Testament.

85 Their authenticity proved.

We receive the books of the New Testament as the genuine works of Matthew, Mark, Luke, John, and Paul, for the same reason that we receive the writings of Xenophon, of Polybius, of Plutarch, of Cæsar, and of Livy. We have the uninterrupted testimony of all ages, and we have no reason to suspect imposition. This argument is much stronger when applied to the books of the New Testament than when applied to any other writings; for they were addressed to large societies, were often read in their presence, and acknowledged by them to be the writings of the apostles.— Whereas, the most eminent profane writings which still remain were addressed only to individuals, or to no persons at all: and we have no authority to affirm that they were read in public; on the contrary, we know that a liberal education was uncommon; books were scarce, and the knowledge of them was confined to a few individuals in every nation.

The New Testament was read over three quarters of the world, while profane writers were limited to one nation or to one country. An uninterrupted succession of writers from the apostolic ages to the present time quote the sacred writings, or make allusions to them: and these quotations and allusions are made not only by friends but by enemies. This cannot be asserted of even the best classic authors. And it is highly probable, that the translations of the New Testament were made so early as the second century; and in a century or two after, they became very numerous. After this period, it was impossible to forge new writings, or to corrupt the sacred text, unless we can suppose that men of different nations, of different sentiments and different languages, and often exceedingly hostile to one another, should all agree in one forgery. This argument is so strong, that if we deny the authenticity of the New Testament, we may with a thousand times more propriety reject all the other writings in the world: we may even throw aside human testimony itself. But as this subject is of great importance, we shall consider it at more length; and to enable our readers to judge with the greater accuracy, we shall state, from the valuable work of Michaelis, as translated by the judicious and learned Mr Marsh, the reasons which may induce a critic to suspect a work to be spurious.

86 Negatively.

1. When doubts have been made from its first appearance in the world, whether it proceeded from the author to whom it is ascribed. 2. When the immediate friends of the pretended author, who were able to decide upon the subject, have denied it to be his production. 3. When a long series of years has elapsed after his death, in which the book was unknown, and in which it must unavoidably have been mentioned and quoted, had it really existed. 4. When the style is different from that of his other writings, or, in case no other remain, different from that which might reasonably be expected. 5. When events are recorded which happened later than the time of the pretended author. 6. When opinions are advanced which contradict those he is known to maintain in his other writings. Though this latter argument alone leads to no positive conclusion, since every man is liable to change his opinion, or through forgetfulness to vary in the circumstances of the same relation, of which Josephus, in his Antiquities and War of the Jews, affords a striking example.

87 The reasons that would prove a book to be spurious.

88 Do not apply to the New Testament.

1. But it cannot be shown that any one doubted of its authenticity in the period in which it first appeared. 2. No ancient accounts are on record whence we may conclude it to be spurious. 3. No considerable period elapsed after the death of the apostles, in which the New Testament was unknown; but, on the contrary, it is mentioned by their very contemporaries, and the accounts of it in the second century are still more numerous. 4. No argument can be brought in its disfavour from the nature of the style, it being exactly such as might be expected from the apostles, not Attic but Jewish Greek. 5. No facts are recorded which happened after their death. 6. No doctrines are maintained which contradict the known tenets of the authors, since, beside the New Testament, no writings of the apostles exist. But, to the honour of the New Testament be it spoken, it contains numerous contradictions to the tenets and doctrines of the fathers in the second and third century, whose morality was different from that of the gospel, which recommends fortitude and submission to unavoidable evils, but not that enthusiastic ardour for martyrdom for which those centuries are distinguished; it alludes to ceremonies which in the following ages were either in disuse or totally unknown: all which circumstances infallibly demonstrate that the New Testament is not a production of either of those centuries.

89 Positively.

We shall now consider the positive evidence for the authenticity of the New Testament. These may be arranged under the three following heads:

1. The impossibility of a forgery, arising from the nature of the thing itself. 2. The ancient Christian, Jewish, and Heathen testimony in its favour. 3. Its own internal evidence.

90 Impossibility of a forgery arising from the nature of the thing

1. The impossibility of a forgery arising from the nature of the thing itself is evident. It is impossible to establish forged writings as authentic in any place where there are persons strongly inclined and well qualified to detect the fraud. Now the Jews were the most violent enemies of Christianity. They put the founder of it to death; they persecuted his disciples with implacable fury; and they were anxious to stifle the new religion in its birth. If the writings of the New Testament had been forged, would not the Jews have detected the imposture? Is there a single instance on record where a few individuals have imposed a history upon the world against

Scripture.

against the testimony of a whole nation? Would the inhabitants of Palestine have received the gospels, if they had not had sufficient evidence that Jesus Christ really appeared among them, and performed the miracles ascribed to him? Or would the churches of Rome or of Corinth have acknowledged the epistles addressed to them as the genuine works of Paul, if Paul had never preached among them? We might as well think to prove, that the history of the Reformation is the invention of historians; and that no revolution happened in Great Britain during the last century.

91 From testimony.

2. The second kind of evidence which we produce to prove the authenticity of the New Testament, is the testimony of ancient writers, Christians, Jews, and Heathens.

In reviewing the evidence of testimony, it will not be expected that we should begin at the present age, and trace backwards the authors who have written on this subject to the first ages of Christianity. This indeed, though a laborious task, could be performed in the most complete manner; the whole series of authors, numerous in every age, who have quoted from the books of the New Testament, written commentaries upon them, translated them into different languages, or who have drawn up a list of them, could be exhibited so as to form such a perfect body of evidence, that we imagine even a jury of deists would find it impossible, upon a deliberate and candid examination, to reject or disbelieve it. We do not, however, suppose that scepticism has yet arrived at so great a height as to render such a tedious and circumstantial evidence necessary. Passing over the intermediate space, therefore, we shall ascend at once to the fourth century, when the evidence for the authenticity of the New Testament was fully established, and trace it back from that period to the age of the apostles. We hope that this method of stating the evidence will appear more natural, and will afford more satisfaction, than that which has been usually adopted.

It is surely more natural, when we investigate the truth of any fact which depends on a series of testimony, to begin with those witnesses who lived nearest the present age, and whose characters are best established. In this way we shall learn from themselves the foundation of their belief, and the characters of those from whom they derived it; and thus we ascend till we arrive at its origin. This mode of investigation will give more satisfaction to the deist than the usual way; and we believe no Christian, who is confident of the goodness of his cause, will be unwilling to grant any proper concessions. The deist will thus have an opportunity of examining, separately, what he will consider as the weakest parts of the evidence, those which are exhibited by the earliest Christian writers, consisting of expressions, and not quotations, taken from the New Testament. The Christian, on the other hand, ought to wish, that these apparently weak parts of the evidence were distinctly examined, for they will afford an irrefragable proof that the New Testament was not forged: and should the deist reject the evidence of those early writers, it will be incumbent on him to account for the origin of the Christian religion, which he will find more difficult than to admit the common hypothesis.

In the fourth century we could produce the testimonies of numerous witnesses to prove that the books of the New Testament existed at that time; but it will be sufficient to mention their names, the time in which they wrote, and the substance of their evidence. This we shall present in a concise form in the following table, which is taken from Jones's New and Full Method of establishing the canon of the New Testament.

The Names of the Writers.	*Times in which they lived.*	*The variation or agreement of their catalogues with ours now received.*	*The books in which these catalogues are.*
I. Athanasius bishop of Alexandria.	A. C. 315.	The same perfectly with ours now received.	*Fragment. Epist. Testal.* tom. ii. *in Synops.* tom. i.
II. Cyril bishop of Jerusalem.	340.	The same with ours, only the Revelation is omitted.	*Catech. IV.* § *ult.* p. 101.
III. The bishops assembled in the council of Laodicea.	364.	The Revelation is omitted.	*Canon LIX.* N. B. The Canons of this council were not long afterwards received into the body of the canons of the universal church.
IV. Epiphanius bishop of Salamis in Cyprus.	370.	The same with ours now received.	*Hæres.* 76. *cont. Anom.* p. 399.
V. Gregory Nazianzen bishop of Constantinople.	375.	s the Revelation.	*Carm. de veris et genuin. Scriptur.*

Scripture.

The Names of the Writers.	Times in which they lived.	The variation or agreement of their catalogues with ours now received.	The books in which these catalogues are.
VI. Philastrius bishop of Brixia in Venice.	380.	The same with ours now received; except that he mentions only 13 of St Paul's epistles (omitting very probably the Epistle to the Hebrews), and leaves out the Revelations.	*Lib. de Hæres. Numb.* 87.
VII. Jerome.	382.	The same with ours; except that he speaks dubiously of the Epistle to the Hebrews; though in other parts of his writings he receives it as canonical.	*Ep. ad Paulin. Tract.* 6. p. 2. Also commonly prefixed to the Latin vulgar.
VIII. Ruffin presbyter of Aquilegium.	390.	It perfectly agrees with ours.	*Expos. in Symb. Apostol.* § 36. *int. Ep. Hieron. Par.* 1. *Tract.* 3. p. 110. *et inter Op. Cypr.* p. 575.
IX. Austin bishop of Hippo in Africa.	394.	It perfectly agrees with ours.	*De Doctrin. Christ.* lib. ii. c. 8. *Tom. Op.* 3. p. 25.
X. The XLIV bishops assembled in the third council of Carthage.	St Austin was present at it.	It perfectly agrees with ours.	*Vid. Canon XLVII. et cap. ult.*

92 Testimonies of the ancient Christians.

We now go back to Eusebius, who wrote about the year 315, and whose catalogue of the books of the New Testament we shall mention at more length. "Let us observe (says he) the writings of the apostle John, which are *uncontradicted*; and, first of all, must be mentioned, as acknowledged of all, the gospel, according to him, well known to all the churches under heaven." The author then proceeds to relate the occasions of writing the gospels, and the reasons for placing St John's the last, manifestly speaking of all the four as equal in their authority, and in the certainty of their original. The second passage is taken from a chapter, the title of which is, "Of the Scriptures universally acknowledged, and of those that are not such." Eusebius begins his enumeration in the following manner: "In the first place, are to be ranked the sacred four Gospels, then the book of the Acts of the Apostles; after that are to be reckoned the epistles of Paul: in the next place, that called the first Epistle of John and the Epistle of Peter are to be esteemed authentic: after this is to be placed, if it be thought fit, the Revelation of John; about which we shall observe the different opinions at proper seasons. Of the controverted, but yet well known or approved by the most, are that called the Epistle of James and that of Jude, the second of Peter, and the second and third of John, whether they were written by the evangelist or by another of the same name." He then proceeds to reckon up five others, not in our canon, which he calls in one place *spurious*, in another *controverted*; evidently meaning the same thing by these two words (s).

Paley's Evidences of Christianity.

93 Of Eusebius.

94 Of Victorin.

A. D. 290, Victorin bishop of Pettaw in Germany, in a commentary upon this text of the Revelation, "The first was like a lion, the second was like a calf, the third like a man, and the fourth like a flying eagle," makes out, that by the four creatures are intended the four gospels; and to show the propriety of the symbols, he recites the subject with which each evangelist opens his history. The explication is fanciful, but the testimony positive. He also expressly cites the Acts of the Apostles.

95 Of Cyprian.

A. D. 230, Cyprian bishop of Carthage gives the following testimony: "The church (says this father) is watered like Paradise by four rivers, that is, by four gospels." The Acts of the Apostles are also frequently quoted by Cyprian under that name, and under the name of the *Divine Scriptures*." In his various writings are such frequent and copious citations of Scripture, as to place this part of the testimony beyond controversy. Nor is there, in the works of this eminent African bishop, one quotation of a spurious or apocryphal Christian writing."

96 Of Origen.

A. D. 210, Origen is a most important evidence. Nothing can be more peremptory upon the subject now under

(s) That Eusebius could not intend, by the word rendered *spurious*, what we at present mean by it, is evident from a clause in this very chapter, where, speaking of the Gospels of Peter and Thomas, and Matthias and some others, he says, "They are not so much as to be reckoned among the *spurious*, but are to be rejected as altogether absurd and impious." *Lard. Cred.* vol. viii. p. 98.

Scripture. under consideration, and, from a writer of his learning and information, nothing more satisfactory, than the declaration of Origen, preserved in an extract of his works by Eusebius: "That the four gospels alone are received without dispute by the whole church of God under heaven:" to which declaration is immediately subjoined a brief history of the respective authors, to whom they were then, as they are now, ascribed. The sentiments expressed concerning the gospels in all the works of Origen which remain, entirely correspond with the testimony here cited. His attestation to the Acts of the Apostles is no less positive: "And Luke also once more sounds the trumpet relating the Acts of the Apostles." That the Scriptures were then universally read, is plainly affirmed by this writer in a passage in which he is repelling the objections of Celsus, "That it is not in private books, or such as are read by few only, and those studious persons, but in books read by every body, that it is written, The invisible things of God from the creation of the world are clearly seen, being understood by things that are made." It is to no purpose to single out quotations of Scripture from such a writer as this. We might as well make a selection of the quotations of Scripture in Dr Clarke's sermons. They are so thickly sown in the works of Origen, that Dr Mill says, "If we had all his works remaining, we should have before us almost the whole text of the Bible."

97 Of Tertullian. A. D. 194, Tertullian exhibits the number of the gospels then received, the names of the evangelists, and their proper designations, in one short sentence.— "Among the apostles, John and Matthew teach us the faith; among apostolical men, Luke and Mark refresh it." The next passage to be taken from Tertullian affords as complete an attestation to the authenticity of the gospels as can be well imagined. After enumerating the churches which had been founded by Paul at Corinth, in Galatia, at Philippi, Thessalonica, and Ephesus, the church of Rome established by Peter and Paul, and other churches derived from John, he proceeds thus: "I say then, that with them, but not with them only which are apostolical, but with all who have fellowship with them in the same faith, is that gospel of Luke received from its first publication, which we so zealously maintain;" and presently afterwards adds, "The same authority of the apostolical churches will support the other gospels, which we have from them, and according to them, I mean John's and Matthew's, although that likewise which Mark published may be said to be Peter's, whose interpreter Mark was." In another place Tertullian affirms, that the three other gospels, as well as St Luke's, were in the hands of the churches from the beginning. This noble testimony proves incontestably the antiquity of the gospels, and that they were universally received; that they were in the hands of all, and had been so from the first. And this evidence appears not more than 150 years after the publication of the books. Dr Lardner observes, "that there are more and larger quotations of the small volume of the New Testament in this one Christian author, than there are of all the works of Cicero, in writers of all characters, for several ages."

98 Of Irenæus. A. D. 178, Irenæus was bishop of Lyons, and is mentioned by Tertullian, Eusebius, Jerome, and Photius. In his youth he had been a disciple of Polycarp, who was a disciple of John. He asserts of himself and his contemporaries, that they were able to reckon up in all the principal churches the succession of bishops to their first institution. His testimony to the four gospels and Acts of the Apostles is express and positive. "We have not received," says Irenæus, "the knowledge of the way of our salvation by any others than those by whom the gospel has been brought to us. Which gospel they first preached, and afterwards by the will of God, committed to writing, that it might be for time to come the foundation and pillar of our faith. For after that our Lord rose from the dead, and they (the apostles) were endowed from above with the power of the Holy Ghost coming down upon them, they received a perfect knowledge of all things. They then went forth to all the ends of the earth, declaring to men the blessing of heavenly peace, having all of them, and every one alike, the gospel of God. Matthew then, among the Jews, wrote a gospel in their own language, while Peter and Paul were preaching the gospel at Rome, and founding a church there. And after their exit, Mark also, the disciple and interpreter of Peter, delivered to us in writing the things that had been preached by Peter. And Luke, the companion of Paul, put down in a book the gospel preached by him (Paul). Afterwards John, the disciple of the Lord, who also leaned upon his breast, likewise published a gospel while he dwelt at Ephesus in Asia." Irenæus then relates how Matthew begins his gospel, how Mark begins and ends his, and gives the supposed reasons for doing so. He enumerates at length all the passages of Christ's history in Luke, which are not found in any of the other evangelists. He states the particular design with which St John composed his gospel, and accounts for the doctrinal declarations which precede the narrative. If any modern divine should write a book upon the genuineness of the gospels, he could not assert it more expressly, or state their original more distinctly, than Irenæus hath done within little more than 100 years after they were published.

Respecting the book of the Acts of the Apostles, and its author, the testimony of Irenæus is no less explicit. Referring to the account of St Paul's conversion and vocation, in the ninth chapter of that book, "Nor can they (says he, meaning the parties with whom he argues) show that he is not to be credited, who has related to us the truth with the greatest exactness." In another place, he has actually collected the several texts, in which the writer of the history is represented as accompanying St Paul, which led him to exhibit a summary of almost the whole of the last twelve chapters of the book.

According to Lardner, Irenæus quotes twelve of Paul's epistles, naming their author; also the first epistle of Peter, the two first epistles of John, and the Revelation. The epistles of Paul which he omits are those addressed to Philemon and the Hebrews. Eusebius says, that he quotes the epistle to the Hebrews, though he does not ascribe it to Paul. The work, however, is lost.

A. D. 172, Tatian, who is spoken of by Clemens Alexandrinus, Origen, Eusebius, and Jerome, composed a harmony of the four gospels, which he called *Diatessaron* of the four. This title, as well as the work, is remarkable, 99 Of Tatian.

Scripture. markable, becauſe it ſhows that then as well as now there were four, and only four, goſpels in general uſe among Chriſtians.

A. D. 170, the churches of Lyons and Vienne in France ſent an account of the ſufferings of their martyrs to the churches of Aſia and Phrygia, which has been preſerved entire by Euſebius. And what carries in ſome meaſure the teſtimony of theſe churches to a higher age is, that they had now for their biſhop Pothinus, who was 90 years old, and whoſe early life conſequently muſt have immediately followed the times of the apoſtles. In this epiſtle are exact references to the goſpels of Luke and John, and to the Acts of the Apoſtles. The form of reference is the ſame as in all the preceding articles. That from St John is in theſe words: "Then was fulfilled that which was ſpoken by the Lord, that whoſoever killeth you, will think that he doth God ſervice *."

* John xvi. 2.

Diſtinct references are alſo made to other books, viz. Acts, Romans, Epheſians, Philippians, 1 Timothy, 1 Peter, 1 John, Revelation.

100 Of Juſtin Martyr.

A. D. 140, Juſtin Martyr compoſed ſeveral books, which are mentioned by his diſciple Tatian, by Tertullian, Methodius, Euſebius, Jerome, Epiphanius, and Photius. In his writings between 20 and 30 quotations from the goſpels and Acts of the Apoſtles are reckoned up, which are clear, diſtinct, and copious; if each verſe be counted ſeparately, a much greater number; if each expreſſion, ſtill more. Jones, in his book on the Canon of the New Teſtament, ventures to affirm that he cites the books of which it conſiſts, particularly the four goſpels, above 200 times.

We meet with quotations of three of the goſpels within the compaſs of half a page; "and in other words, he ſays, Depart from me into outer darkneſs, which the Father hath prepared for Satan and his Angels," (which is from Matthew xxv. 41.). "And again he ſaid in other words, I give unto you power to tread upon ſerpents and ſcorpions, and venomous beaſts, and upon all the power of the enemy." (This from Luke x. 19.). "And, before he was crucified, he ſaid, The ſon of man muſt ſuffer many things, and be rejected of the Scribes and Phariſees, and be crucified, and riſe again the third day." (This from Mark viii. 31.).

All the references in Juſtin are made without mentioning the author; which proves that theſe books were perfectly well known, and that there were no other accounts of Chriſt then extant, or, at leaſt, no others ſo received and credited as to make it neceſſary to add any marks of diſtinction. But although Juſtin mentions not the authors names, he calls the books *Memoirs compoſed by the Apoſtles; Memoirs compoſed by the Apoſtles and their Companions;* which deſcriptions, the latter eſpecially, exactly ſuit the titles which the Goſpels and Acts of the Apoſtles now bear.

He informs us, in his firſt apology, that *the Memoirs of the Apoſtles*, or the writings of the prophets, are read according as the time allows; and, when the reader has ended, the preſident makes a diſcourſe, exhorting to the imitation of ſuch excellent things.

A few ſhort obſervations will ſhow the value of this teſtimony. 1. The Memoirs of the Apoſtles, Juſtin in another place expreſsly tells us are what are called *goſpels.* And that they were the goſpels which we now uſe is made certain by Juſtin's numerous quotations of them, and his ſilence about any others. 2. He deſcribes the general uſage of the Chriſtian church. 3. He does not ſpeak of it as recent or newly inſtituted, but in the terms in which men ſpeak of eſtabliſhed cuſtoms.

Juſtin alſo makes ſuch alluſions to the following books as ſhews that he had read them: Romans, 1 Corinthians, Galatians, Epheſians, Philippians, Coloſſians, 2 Theſſalonians, Hebrews, 2 Peter; and he aſcribes the Revelation to John the Apoſtle of Chriſt.

101 Of Papias.

A. D. 116, Papias, a hearer of John, and companion of Polycarp, as Irenæus atteſts, and of the apoſtolical age as all agree, in a paſſage quoted by Euſebius, from a work now loſt, expreſsly aſcribes the two firſt goſpels to Matthew and Mark; and in a manner which proves that theſe goſpels muſt have publicly borne the names of theſe authors at that time, and probably long before; for Papias does not ſay, that one goſpel was written by Matthew, and another by Mark; but, aſſuming this as perfectly well known, he tells us from what materials Mark collected his account, viz. from Peter's preaching, and in what language Matthew wrote, viz. in Hebrew. Whether Papias was well informed in this ſtatement or not, to the point for which this teſtimony is produced, namely, that theſe books bore theſe names at this time, his authority is complete.

Papias himſelf declares that he received his accounts of Chriſtianity from thoſe who were acquainted with the apoſtles, and that thoſe accounts which he thus received from the older Chriſtians, and had committed to memory, he inſerted in his books. He farther adds, that he was very ſolicitous to obtain every poſſible information, eſpecially to learn what the apoſtles ſaid and preached, valuing ſuch information more than what was written in books *.

* *Præfat. in Op. apud. Euſeb. Hiſt. Ecl.* lib. iii. c. 39.

A. D. 108, Polycarp was the biſhop of Smyrna, and diſciple of John the Apoſtle. This teſtimony concerning Polycarp is given by Irenæus, who in his youth had ſeen him. "I can tell the place," ſaith Irenæus, "in which the bleſſed Polycarp ſat and taught, and his going out and coming in, and the manner of his life, and the form of his perſon, and the diſcourſes he made to the people, and how he related his converſation with John and others who had ſeen the Lord, and how he related their ſayings, and what he had heard concerning the Lord, both concerning his miracles and his doctrine, as he had received them from the eye-witneſſes of the word of life; all which Polycarp related agreeable to the ſcriptures."

102 Of Polycarp.

Of Polycarp, whoſe proximity to the age and country and perſons of the apoſtles is thus atteſted, we have one undoubted epiſtle remaining; which, though a ſhort performance, contains nearly 40 clear alluſions to the books of the New Teſtament. This is ſtrong evidence of the reſpect which was paid to them by Chriſtians of that age. Amongſt theſe, although the writings of St Paul are more frequently uſed by Polycarp than other parts of ſcripture, there are copious alluſions to the goſpel of St Matthew, ſome to paſſages found in the goſpels both of Matthew and Luke, and ſome which more nearly reſemble the words in Luke.

He thus fixes the authority of the Lord's Prayer, and the uſe of it among Chriſtians. If, therefore, we pray the

Scripture.

the Lord to *forgive us*, *we ought alſo to forgive*. And again, With ſupplication *beſeeching* the all-ſeeing God *not to lead us into temptation*.

In another place, he quotes the words of our Lord: "But remembering what the Lord ſaid, teaching, Judge not, that ye be not judged. Forgive, and ye ſhall be forgiven; be ye merciful, that ye may obtain mercy; with what meaſure ye mete, it ſhall be meaſured to you again *. Suppoſing Polycarp to have had theſe words from the books in which we now find them, it is manifeſt that theſe books were conſidered by him, and by his readers, as he thought, as authentic accounts of Chriſt's diſcourſes; and that this point was inconteſtable.

* Mat. vii. 1. 2.

He quotes alſo the following books, the firſt of which he aſcribes to St Paul: 1 Corinthians, Epheſians, Philippians, 1 and 2 Theſſalonians; and makes evident references to others, particularly to Acts, Romans, 2 Corinthians, Galatians, 1 Timothy, 2 Timothy, 1 Peter, 1 John.

103
Of Ignatius.

Ignatius, as it is teſtified by ancient Chriſtian writers, became biſhop of Antioch about 37 years after Chriſt's aſcenſion; and therefore, from his time, and place, and ſtation, it is probable that he had known and converſed with many of the apoſtles. Epiſtles of Ignatius are referred to by Polycarp his contemporary. Paſſages, found in the epiſtles now extant under his name, are quoted by Irenæus, A. D. 178, by Origen, A. D. 230; and the occaſion of writing them is fully explained by Euſebius and Jerome. What are called the ſmaller epiſtles of Ignatius are generally reckoned the ſame which were read by Irenæus, Origen, and Euſebius.

They are admitted as genuine by Voſſius, and have been proved to be ſo by Biſhop Pearſon with a force of argument which ſeems to admit of no reply. In theſe epiſtles are undoubted alluſions to Matt. iii. 15. xi. 16. to John iii. 8.; and their venerable author, who often ſpeaks of St Paul in terms of the higheſt reſpect, once quotes his epiſtle to the Epheſians by *name*.

104
Of Hermas.

Near the concluſion of the epiſtle to the Romans, St Paul, amongſt others, ſends the following ſalutation: —"Salute Aſyncritus, Phlegon, *Hermas*, Patrobus, Hermes, and the brethren which are with them." Of Hermas, who appears in this catalogue of Roman Chriſtians as contemporary with St Paul, there is a book ſtill remaining, the authenticity of which cannot be diſputed. It is called the *Shepherd*, or *Paſtor of Hermas*. Its antiquity is inconteſtable, from the quotations of it in Irenæus, A. D. 178, Clement of Alexandria, A. D. 194, Tertullian, A. D. 200, Origen, A. D. 230. The notes of time extant in the epiſtle itſelf agree with its title, and with the teſtimonies concerning it, which intimate that it was written during the lifetime of Clement. In this piece are tacit alluſions to St Matthew's, St Luke's, and St John's goſpels; that is to ſay, there are applications of thoughts and expreſſions found in theſe goſpels, without citing the place or writer from which they were taken. In this form appear in Hermas the confeſſing and denying of Chriſt †; the parable of the ſeed ſown; ‡ the compariſon of Chriſt's diſciples to little children; the ſaying, "he that putteth away his wife, and marrieth another, committeth adultery §;" the ſingular expreſſion, "having received all power from his Father," is probably an alluſion to Matt. xxviii. 18. and Chriſt being the "gate," or only way of coming "to God," is a plain alluſion to John xiv. 6. x. 7. 9. There is alſo a probable alluſion to Acts v. 32.

† Matt. x. 32, 33, or Luke xii. 8, 9.
‡ Matt. xiii. 3, or Luke viii. 5.
§ Luke xvi. 18.

The Shepherd of Hermas has been conſidered as a fanciful performance. This, however, is of no importance in the preſent caſe. We only adduce it as evidence that the books to which it frequently alludes exiſted in the firſt century; and for this purpoſe it is ſatisfactory, as its authenticity has never been queſtioned. However abſurd opinions a man may entertain while he retains his underſtanding, his teſtimony to a matter of fact will ſtill be received in any court of juſtice.

105
Of Clemens Romanus.

A. D. 96, we are in poſſeſſion of an epiſtle written by Clement biſhop of Rome, whom ancient writers, without any ſcruple, aſſert to have been the Clement whom St Paul mentions Philippians iv. 3. "with Clement alſo, and other my fellow labourers, whoſe names are in the book of life." This epiſtle is ſpoken of by the ancients as an epiſtle acknowledged by all; and, as Irenæus well repreſents its value, "written by Clement, who had ſeen the bleſſed apoſtles and converſed with them, who had the preaching of the apoſtles ſtill ſounding in his ears, and their traditions before his eyes." It is addreſſed to the church of Corinth; and what alone may ſeem a deciſive proof of its authenticity, Dionyſius biſhop of Corinth, about the year 170, i. e. about 80 or 90 years after the epiſtle was written, bears witneſs, "that it had been uſually read in that church from ancient times." This epiſtle affords, amongſt others, the following valuable paſſages: "Eſpecially remembering the words of the Lord Jeſus, which he ſpake, teaching gentleneſs and long ſuffering; for thus he ſaid (T), Be ye merciful, that ye may obtain mercy; forgive, that it may be forgiven unto you; as you do, ſo ſhall it be done unto you; as you give, ſo ſhall it be given unto you; as ye judge, ſo ſhall ye be judged; as ye ſhew kindneſs, ſo ſhall kindneſs be ſhewn unto you; with what meaſure ye mete, with the ſame it ſhall be meaſured to you. By this command, and by theſe rules, let us eſtabliſh ourſelves, that we may always walk obediently to his holy words."

Again, "Remember the words of the Lord Jeſus, for he ſaid, Wo to that man by whom offences come; it were better for him that he had not been born, than that he ſhould offend one of my elect; it were better for him that a millſtone ſhould be tied about his neck, and that he ſhould be drowned in the ſea, than that he ſhould offend one of my little ones (U)."

He

(T) "Bleſſed are the merciful, for they ſhall obtain mercy," Matt. v. 7. "Forgive, and ye ſhall be forgiven; give, and it ſhall be given unto you," Luke vi. 37, 38. "Judge not, that ye be not judged; for with what judgement ye judge, ye ſhall be judged, and with what meaſure ye mete, it ſhall be meaſured to you again," Matt. vii. 2.

(U) Matt. xviii. 6. "But whoſo ſhall offend one of theſe little ones which believe in me, it were better for him that a millſtone were hanged about his neck, and that he were caſt into the ſea." The latter part of the paſſage

in

Scripture.

He aſcribes the firſt epiſtle to the Corinthians to Paul, and makes ſuch alluſions to the following books as are ſufficient to ſhew that he had ſeen and read them: Acts, Romans, 2 Corinthians, Galatians, Epheſians, Philippians, Coloſſians, 1 Theſſalonians, 1 Timothy, 2 Timothy, Titus, 1 Peter, 2 Peter.

It may be ſaid, as Clement has not mentioned the books by name from which we aſſert theſe alluſions or references are made, it is uncertain whether he refers to any books, or whether he received theſe expreſſions from the diſcourſes and converſation of the apoſtles. Mr Paley has given a very ſatisfactory anſwer to this objection: 1ſt, That Clement, in the very ſame manner, namely, without any mark of reference, uſes a paſſage now found in the epiſtle to the Romans *; which paſſage, from the peculiarity of the words that compoſe it, and from their order, it is manifeſt that he muſt have taken from the epiſtle. The ſame remark may be applied to ſome very ſingular ſentiments in the epiſtle to the Hebrews. Secondly, That there are many ſentences of St Paul's firſt epiſtle to the Corinthians, to be found in Clement's epiſtle, without any ſign of quotation, which yet certainly are quotations; becauſe it appears that Clement had St Paul's epiſtle before him; for in one place he mentions it in terms too expreſs to leave us in any doubt. "Take into your hands the epiſtle of the bleſſed apoſtle Paul." Thirdly, That this method of adopting words of ſcripture, without reference or acknowledgement, was a method in general uſe amongſt the moſt ancient Chriſtian writers. Theſe analogies not only repel the objection, but caſt the preſumption on the other ſide; and afford a conſiderable degree of poſitive proof, that the words in queſtion have been borrowed from the places of ſcripture in which we now find them. But take it, if you will, the other way, that Clement had heard theſe words from the apoſtles or firſt teachers of Chriſtianity; with reſpect to the preciſe point of our argument, viz. that the ſcriptures contain what the apoſtles taught, this ſuppoſition may ſerve almoſt as well.

* Chap. i. 29.

We have now traced the evidence to the times of the apoſtles; but we have not been anxious to draw it out to a great length, by introducing every thing. On the contrary, we have been careful to render it as conciſe as poſſible, that its force might be diſcerned at a glance. The evidence which has been ſtated is of two kinds. Till the time of Juſtin Martyr and Irenæus it conſiſts chiefly of alluſions, references, and expreſſions, borrowed from the books of the New Teſtament, without mentioning them by name. After the time of Irenæus it became uſual to cite the ſacred books, and mention the authors from whom the citations were taken.

106 The alluſions and references to the New Teſtament by the firſt Chriſtian writers prove that it exiſted in their time.

The firſt ſpecies of evidence will perhaps appear to ſome exceptionable; but it muſt be remembered that it was uſual among the ancient Chriſtians as well as Jews to adopt the expreſſions of Scripture without naming the authors. Why they did ſo it is not neceſſary to inquire. The only point of importance to be determined is, whether thoſe references are a ſufficient proof of the exiſtence of the books to which they allude? This, we preſume, will not be denied; eſpecially in the preſent age, when it is ſo common to charge an author with plagiariſm if he happen to fall upon the ſame train of ideas, or expreſs himſelf in a ſimilar manner with authors who have written before him. We may farther affirm, that theſe tacit references afford a complete proof that thoſe ancient writers had no intention of impoſing a forgery upon the world. They prove the exiſtence of the Chriſtian religion and of the apoſtolical writings, without ſhowing any ſuſpicious earneſtneſs that men ſhould believe them. Had theſe books been forged, thoſe who wiſhed to paſs them upon the world would have been at more pains than the firſt Chriſtians were to prove their authenticity. They acted the part of honeſt men; they believed them themſelves, and they never imagined that others would ſuſpect their truth.

It is a conſideration of great importance, in reviewing the evidence which has been now ſtated, that the witneſſes lived in different countries; Clemens flouriſhed at Rome, Polycarp at Smyrna, Juſtin Martyr in Syria, Irenæus in France, Tertullian at Carthage, Origen at Alexandria, and Euſebius at Cæſarea. This proves that the books of the New Teſtament were equally well known in diſtant countries by men who had no intercourſe with one another.

107 Teſtimonies of Heretics.

The ſame thing is proved by teſtimonies if poſſible leſs exceptionable. The ancient heretics, whoſe opinions were ſometimes groſſer and more impious than thoſe which any modern ſectary has ventured to broach, and whoſe zeal in the propagation of them equalled that of the moſt flaming enthuſiaſt of the laſt century, never called in queſtion the authenticity of the books of the New Teſtament. When they met with any paſſage in the goſpels or epiſtles which they could not reconcile to their own heretical notions, they either eraſed it, or denied that the author was inſpired; but they nowhere contend that the book in which it ſtood was not written by the apoſtle or evangeliſt whoſe name it bore. Euſebius relates, that the Ebionites rejected all the epiſtles of Paul, and called him an apoſtate, becauſe he departed from the Levitical law; and they adopted as their rule of faith the goſpel of St Matthew, though indeed they greatly corrupted it. This proves therefore that the goſpel according to Matthew was then publiſhed, and that St Paul's epiſtles were then known.

Of the heretics who eraſed or altered paſſages to make the Scriptures agree with their doctrines, we may produce Marcion as an inſtance, who lived in the beginning of the ſecond century. He lived in an age when he could have eaſily diſcovered if the writings of the New Teſtament had been forged; and as he was much incenſed againſt the orthodox party, if ſuch a forgery had been committed, unqueſtionably he would not have failed to make the diſcovery, as it would have afforded the moſt ample means of revenge and triumph, and enabled him to eſtabliſh his own opinions with leſs difficulty. But his whole conduct ſhows clearly, that he believed the writings of the New Teſtament to be authentic.

in Clement agrees more exactly with Luke xvii. 2. "It were better for him that a millſtone were hanged about his neck, and he caſt into the ſea, than that he ſhould offend one of theſe little ones."

Scripture. authentic. He ſaid, that the goſpel according to St Matthew, the epiſtle to the Hebrews, with thoſe of St Peter and St James, as well as the Old Teſtament in general, were writings not for Chriſtians but for Jews. He publiſhed a new edition of the goſpel according to Luke, and the firſt ten epiſtles of Paul; in which it has been affirmed by Epiphanius, that he altered every paſſage that contradicted his own opinions: but as many of theſe alterations are what modern critics call *various readings*, though we receive the teſtimony of Epiphanius, we muſt not rely upon his opinion (x). Hence it is evident that the books of the New Teſtament abovementioned did then exiſt, and were acknowledged to be the works of the authors whoſe names they bear.

Dr Lardner, in his General Review, ſums up this head of evidence in the following words: "Noetus, Paul of Samoſata, Sabellius, Marcellus, Photinus, the Novatians, Donatiſts, Manicheans (y), Priſcillianiſts, beſide Artemon, the Audians, the Arians, and divers others, all received moſt or all the ſame books of the New Teſtament which the Catholics received; and agreed in a like reſpect for them as writ by apoſtles or their diſciples and companions."

108
Teſtimonies of Heathens.

Celſus and Porphyry, both enemies of the Chriſtian religion, are powerful witneſſes for the antiquity of the New Teſtament. Celſus, who lived towards the end of the ſecond century, not only mentions by name, but quotes paſſages from the books of the New Teſtament: and that the books to which he refers were no other than our preſent goſpels, is evident from the alluſions to various paſſages ſtill found in them. Celſus takes notice of the genealogies, which fixes two of theſe goſpels; of the precepts, Reſiſt not him that injures you, and, If a man ſtrike thee on the one cheek, offer to him the other alſo; of the woes denounced by Chriſt; of his predictions; of his ſaying, that it is impoſſible to ſerve two maſters; of the purple robe, the crown of thorns, and the reed which was put into the hand of Jeſus; of the blood that flowed from his body upon the croſs, a circumſtance which is recorded only by John; and (what is *inſtar omnium* for the purpoſe for which we produce it) of the difference in the accounts given of the reſurrection by the evangeliſts, ſome mentioning two angels at the ſepulchre, others only one.

109
Of Celſus.

It is extremely material to remark, that Celſus not only perpetually referred to the accounts of Chriſt contained in the four goſpels, but that he referred to no other accounts; that he founded none of his objections to Chriſtianity on any thing delivered in ſpurious goſpels.

110
Of Porphyry.

The teſtimony of Porphyry is ſtill more important than that of Celſus. He was born in the year 213, of Tyrian origin. Unfortunately for the preſent age, ſays Michaelis, the miſtaken zeal of the Chriſtian emperors has baniſhed his writings from the world; and every real friend of our religion would gladly give the works of one of the pious fathers to reſcue thoſe of Porphyry from the flames. But Mr Marſh, the learned and judicious tranſlator of Michaelis, relates, that, according to the accounts of Iſaac Voſſius, a manuſcript of the works of Porphyry is preſerved in the Medicean library at Florence, but kept ſo ſecret that no one is permitted to ſee it. It is univerſally allowed, that Porphyry is the moſt ſenſible, as well as the moſt ſevere, adverſary of the Chriſtian religion that antiquity can produce. He was verſed not only in hiſtory, but alſo in philoſophy and politics. His acquaintance with the Chriſtians was not confined to a ſingle country; for he had converſed with them in Tyre, in Sicily, and in Rome. Enabled by his birth to ſtudy the Syriac as well as the Greek authors, he was of all the adverſaries to the Chriſtian religion the beſt qualified to inquire into the authenticity of the ſacred writings. He poſſeſſed therefore every advantage which natural abilities or a ſcientific education could afford to diſcover whether the New Teſtament was a genuine work of the apoſtles and evangeliſts, or whether it was impoſed upon the world after the deceaſe of its pretended authors. But no trace of this ſuſpicion is anywhere to be found in his writings. In the fragments which ſtill remain, mention is made of the goſpels of St Matthew, St Mark, and St John, the Acts of the Apoſtles, and the epiſtle to the Galatians; and it clearly appears from the very objections of Porphyry, that the books to which he alludes were the ſame which we poſſeſs at preſent. Thus he objects to the repetition of a generation in St Matthew's genealogy; to Matthew's call; to the quotation of a text from Iſaiah, which is found in a pſalm aſcribed to Aſaph; to the calling of the lake of Tiberias a ſea; to the expreſſion in St Matthew, "the abomination of deſolation;" to the variation in Matthew and Mark upon the text "the voice of one crying in the wilderneſs," Matthew citing it from Iſaias, Mark from the prophets; to John's application of the term *Word;* to Chriſt's change of intention about going up to the feaſt of tabernacles (John vii. 8.); to the judgement denounced by St Peter upon Ananias and Sapphira, which he calls an imprecation of death.

The inſtances here alleged ſerve in ſome meaſure to ſhow the nature of Porphyry's objections, and prove that Porphyry had read the goſpels with that ſort of attention which a writer would employ who regarded them as the depoſitaries of the religion which he attacked. Beſide theſe ſpecifications, there exiſts in the writings of ancient Chriſtians general evidence, that the places of Scripture, upon which Porphyry had made remarks, were very numerous.

111
Authenticity of the New Teſtament proved from internal evidence.

The internal evidence to prove the authenticity of the New Teſtament conſiſts of two parts: The nature of the ſtyle, and the coincidence of the New Teſtament with the hiſtory of the times.

112
From the ſtyle.

The ſtyle of the New Teſtament is ſingular, and differs very widely from the ſtyle of claſſical authors. It is full of Hebraiſms and Syriaſms; a circumſtance which pious ignorance has conſidered as a fault, and which, even ſo late as the preſent century, it has attempted to remove; not knowing that theſe very deviations from Grecian purity afford the ſtrongeſt preſumption in its favour: for they prove, *that the New Teſtament was written by men of Hebrew origin, and is therefore a production*

(x) Dr Loeffer has written a learned diſſertation to prove that Marcion did not corrupt the ſacred writings.

(y) This muſt be with an exception, however, of Fauſtus, who lived ſo late as the year 384.

Scripture. *duction of the firſt century.* After the death of the firſt Jewiſh converts, few of the Jews turned preachers of the goſpel; the Chriſtians were generally ignorant of Hebrew, and conſequently could not write in the ſtyle of the New Teſtament. After the deſtruction of Jeruſalem and the diſperſion of the Jews, their language muſt have been blended with that of other nations, and their vernacular phraſeology almoſt entirely loſt. The language of the early fathers, though not always the pureſt claſſic Greek, has no reſemblance to that of the New Teſtament, not even excepting the works of the few who had a knowledge of the Hebrew; as Origen, Epiphanius, and Juſtin Martyr, the laſt of whom being a native of Paleſtine, might have written in a ſtyle ſimilar to that of the New Teſtament, had ſuch a ſtyle then prevailed. He that ſuſpects the New Teſtament to be the forgery of a more recent period, ought to produce ſome perſon who has employed a ſimilar diction; but thoſe who are converſant with eaſtern writings know well that a foreigner, who has not been accuſtomed to eaſtern manners and modes of thinking from his infancy, can never imitate with ſucceſs the oriental ſtyle, much leſs forge a hiſtory or an epiſtle which contains a thouſand incidental alluſions, which nothing but truth could ſuggeſt. To imitate cloſely the ſtyle of the New Teſtament is even more difficult than to imitate that of any other oriental book; for there is not a ſingle author, even among the Jews themſelves, ſince the deſtruction of Jeruſalem, that has compoſed in a ſtyle in the leaſt degree like it (z).

But though the books of the New Teſtament bear ſo cloſe a reſemblance in idiom, there is a diverſity of ſtyle which ſhows them to be the work of different perſons. Whoever reads with attention the epiſtles of Paul, muſt be convinced that they were all written by the ſame author. An equal degree of ſimilarity is to be found between the goſpel and 1ſt epiſtle of John. The writings of St John and St Paul exhibit marks of an original genius which no imitation can ever attain. The character of Paul as a writer is drawn with great judgement by Michaelis: " His mind overflows with ſentiment, yet he never loſes ſight of his principal object, but hurried on by the rapidity of thought, diſcloſes frequently in the middle a concluſion to be made only at the end. To a profound knowledge of the Old Teſtament he joins the acuteneſs of philoſophical wiſdom, which he diſplays in applying and expounding the ſacred writings; and his explanations are therefore ſometimes ſo new and unexpected, that ſuperficial obſervers might be tempted to ſuppoſe them erroneous. The fire of his genius, and his inattention to ſtyle, occaſion frequently a twofold obſcurity, he being often too conciſe to be underſtood except by thoſe to whom he immediately wrote, and not ſeldom on the other hand ſo full of his ſubject, as to produce long and difficult parentheſes, and a repetition of the ſame word even in different ſenſes. With a talent for irony and ſatire, he unites the moſt refined ſenſibility, and tempers the ſeverity of his cenſures by expreſſions of tenderneſs and affection; nor does he ever forget in the vehemence of his zeal the rules of modeſty and decorum. He is a writer, in ſhort, of ſo ſingular and wonderful a compoſition, that it would be difficult to find a rival. That truly ſenſible and ſagacious philoſopher Locke was of the ſame opinion, and contended that St Paul was without an equal."

Poems have been forged and aſcribed to former ages with ſome ſucceſs. Philoſophical treatiſes might be invented which it would be difficult to detect; but there is not a ſingle inſtance on record where an attempt has been made to forge a hiſtory or a long epiſtle, where the fraud has not been either fully proved, or rendered ſo ſuſpicious that few are weak enough to believe it. Whoever attempts to forge a hiſtory or an epiſtle in the name of an ancient author, will be in great danger of contradicting the hiſtory or the manners of that age, eſpecially if he relate events which are not mentioned in general hiſtory, but ſuch as refer to a ſingle city, ſect, religion, or ſchool.

The difficulty of forging ſuch hiſtories as the goſpels, and ſuch epiſtles as thoſe of Paul, cannot be overcome by all the genius, learning, and induſtry, of any individual or ſociety of men that ever lived. They contain a purer ſyſtem of ethics than all the ancient philoſophers could invent: They diſcover a candour and modeſty unexampled: They exhibit an originality in the character of Jeſus, and yet ſuch a conſiſtency as the imagination of our beſt poets has never reached. Now it is a very remarkable circumſtance, that hiſtories written by four different men ſhould preſerve ſuch dignity and conſiſtency, though frequently relating different actions of Jeſus, and deſcending to the moſt minute circumſtances in his life. The ſcene of action is too extenſive, and the agreement of facts with the ſtate of the times as repreſented by other hiſtorians is too cloſe, to admit the poſſibility of forgery.

The ſcene of action is not confined to one country, it is ſucceſſively laid in the greateſt cities of the Roman empire; in Rome, in Antioch, in Corinth, in Athens, as well as in Jeruſalem and the land of Paleſtine. Innumerable alluſions are made to the manners and opinions of the Greeks, the Romans, and the Jews; and reſpecting the Jews, they extend even to the trifles and follies of their ſchools. Yet after the ſtricteſt examination, the New Teſtament will be found to have a wonderful coincidence and harmony with Joſephus, the principal hiſtorian of theſe times, and an enemy of Chriſtianity.

113
And from remarkable inſtances of coincidence between Joſephus and the New Teſtament.

It has been a queſtion who the ſoldiers were who are ſaid in the goſpel of Luke to have addreſſed John the Baptiſt in theſe words, *What ſhall we do?* An anſwer to this queſtion may be found in Joſephus *. Herod the tetrarch of Galilee was engaged in a war with his father-in-law Aretas, a petty king in Arabia Petræa, at the very time that John was preaching in the wilderneſs; and the road from Galilee to Arabia running through that wilderneſs, the ſoldiers on their march had this interview with the Baptiſt. A coincidence like this, which

* *Antiq.* lib. xviii. cap. 5. ſect. 1, 2.

(z) The ſtyle of Clemens Romanus may perhaps be an exception. By many eminent critics it has been thought ſo like to that of the epiſtle to the Hebrews, as to give room for the opinion that Clement either was the author of that epiſtle, or was the perſon who tranſlated it from the Syro-Chaldaic language, in which it was originally compoſed.

Scripture. which has been overlooked by all the commentators, would not probably be attended to in a forgery.

Chap. ii. § 11.

Another inſtance of an agreement no leſs remarkable we ſhall quote from the valuable work of Michaelis. It has been a queſtion of ſome difficulty among the learned, who was the Ananias who commanded St Paul to be ſmitten on the mouth when he was making his defence before the council in Jeruſalem *. Kreis, in his remarks taken from Joſephus, has ſhown him to have been the ſon of Nebedeni. But if ſo, how can it be reconciled with chronology, that Ananias was, at that time, called high prieſt, when it is certain from Joſephus that the time of his holding that office was much earlier? And how comes it to paſs that St Paul ſays, "I wiſt not, brethren, that he was the high prieſt?" The ſacerdotal garb muſt have diſcovered who he was: a jeſt would have ill-ſuited the gravity of a tribunal; and a falſehood is inconſiſtent with the character of St Paul.

* Acts xxiii. 2—5.

All theſe difficulties vaniſh as ſoon as we examine the ſpecial hiſtory of that period: "Ananias the ſon of Nebedeni was high prieſt at the time that Helena queen of Adiabene ſupplied the Jews with corn from Egypt during the famine which took place in the fourth year of Claudius, mentioned in the eleventh chapter of the Acts. St Paul therefore, who took a journey to Jeruſalem at that period, could not have been ignorant of the elevation of Ananias to that dignity. Soon after the holding of the firſt council, as it is called, at Jeruſalem, Ananias was diſpoſſeſſed of his office, in conſequence of certain acts of violence between the Samaritans and the Jews, and ſent priſoner to Rome; but being afterwards releaſed, he returned to Jeruſalem. Now from that period he could not be called *high-prieſt* in the proper ſenſe of the word, though Joſephus has ſometimes given him the title of ἀρχιερευς, taken in the more extenſive meaning of a prieſt who had a ſeat and voice in the Sanhedrim; and Jonathan, though we are not acquainted with the circumſtances of his elevation, had been raiſed in the mean time to the ſupreme dignity in the Jewiſh church. Between the death of Jonathan, who was murdered by order of Felix, and the high-prieſthood of Iſmael, who was inveſted with that dignity by Agrippa, elapſed an interval during which the ſacerdotal office was vacant. Now it happened preciſely in this interval that St Paul was apprehended in Jeruſalem: and, the Sanhedrim being deſtitute of a preſident, he undertook of his own authority the diſcharge of that office, which he executed with the greateſt tyranny. It is poſſible therefore that St Paul, who had been only a few days in Jeruſalem, might be ignorant that Ananias, who had been diſpoſſeſſed of the prieſthood, had taken upon himſelf a truſt to which he was not entitled; he might therefore very naturally exclaim, 'I wiſt not, brethren, that he was the high-prieſt!' Admitting him on the other hand to have been acquainted with the fact, the expreſſion muſt be conſidered as an indirect reproof, and a tacit refuſal to recognize uſurped authority."

Could ſuch a correſpondence as this ſubſiſt between truth and falſehood, between a forgery and an authentic hiſtory? or is it credible that theſe events could be related by any perſon but a contemporary?

Impreſſed with the love of truth, and feeling contempt as well as deteſtation at pious frauds, we heſitate not to acknowledge, that in ſome particular facts there is a difference either real or apparent between Joſephus and the writers of the New Teſtament. The objections ariſing from theſe differences are of two kinds: 1. Such as would prove a book not to have been written by the author to whom it is aſcribed. 2. Such as would prove that the author was miſtaken, and therefore not divinely inſpired. To the firſt claſs belongs the following objection: St Paul ſays (2 Cor. xi. 32.) that the governor of Damaſcus was under Aretas the king: but if we are to judge from the 18th book of the Jewiſh Antiquities, which correſponds with the period of St Paul's journey to Damaſcus, that city muſt have belonged at that time to the Romans; and what authority could Aretas, a petty king in Arabia Petræa, have in ſuch a city? In anſwer to this queſtion, J. G. Hyne, in a diſſertation publiſhed in 1755, has ſhown it to be highly probable that Aretas, againſt whom the Romans, not long before the death of Tiberius, made a declaration of war, which they neglected to put in execution, took the opportunity of ſeizing Damaſcus, which had once belonged to his anceſtors; an event omitted by Joſephus, as forming no part of the Jewiſh hiſtory, and by the Roman hiſtorians as being a matter not flattering in itſelf, and belonging only to a diſtant province. Secondly, That Aretas was by religion a Jew; a circumſtance the more credible, when we reflect that Judaiſm had been widely propagated in that country, and that even kings in Arabia Felix had recognized the law of Moſes. The difficulty then is ſo far removed, that it ceaſes to create ſuſpicion againſt an epiſtle which has ſo many evident marks of authenticity; and it is only to be regretted that, in order to place the ſubject in the cleareſt point of view, we are not ſufficiently acquainted with the particular hiſtory of Damaſcus.

114 There are alſo apparent inconſiſtencies, but theſe probably ariſe from overſight in Joſephus;

Examples of the ſecond kind are ſuch as, if allowed their full force, might indeed prove a writer not divinely inſpired, but could afford no reaſon to conclude that he was not the author of the writings which bear his name, ſince miſtakes may be committed by the moſt accurate hiſtorian. The chief difficulties of this nature are found in the goſpel according to St Luke, and do not apply to the writings of Matthew, John, Paul, and Peter. Laying aſide the idea of inſpiration altogether, let us inquire whether Luke or Joſephus be moſt intitled to credit in thoſe paſſages where they differ; which of them is moſt accurate, and which of them had the beſt opportunities of exploring the truth of the facts which they relate. Now Joſephus relates the ſame ſtory differently in different parts of his works, and is ſometimes equally miſtaken in them all. We do not recollect to have ſeen ſuch inconſiſtencies in the writings of St Luke. Luke knew the characters, and witneſſed many of the facts, of which he ſpeaks; and he could receive the beſt information reſpecting thoſe facts which were tranſacted in his abſence. Joſephus was born A. D. 37, ſome years after our Saviour's aſcenſion. Now it is a very important obſervation of Michaelis, that the period of hiſtory with which mankind are leaſt acquainted is that which includes the time of their childhood and youth, together with the twenty or thirty years immediately preceding their birth. Concerning the affairs tranſacted during that period, we are much more liable to fall into miſtakes than concerning thoſe

115 or to his want of authentic information concerning the events that happened near his birth.

thoſe of a remoter age. The reaſon is, that authentic hiſtory never comes down to the period of our birth; our knowledge of the period immediately preceding depends on hearſay; and the events, which paſs within the firſt eighteen or twenty years of our lives, we are too young and heedleſs to obſerve with attention. This muſt have been more remarkably the caſe in the time of Joſephus than at preſent, when there were neither daily papers nor periodical journals to ſupply the want of regular annals. There was no hiſtorian from whom Joſephus could derive any knowledge of the times that immediately preceded his birth. There is a period then of forty or fifty years, in which, even with the moſt diligent inquiry, he was expoſed to error.

When we find therefore the relations of Luke and Joſephus ſo different as not to be reconciled, it would be very unfair to determine without any further inquiry in favour of Joſephus. Let their character, and works, and ſituation, be ſtrictly examined; let their teſtimony be duly weighed and compared; and then let the preference be given to that author who, according to the ſtricteſt rules of equity and juſtice, ſeems intitled to the higheſt degree of credit. The deciſion of a jury, we ſhall venture to ſay, would in every inſtance turn out in favour of Luke.

116 Inſpiration of the New Teſtament.

Having thus aſcertained the authenticity of the books of the New Teſtament, the next thing to be conſidered is their inſpiration. It is certainly of ſome importance to know how far the apoſtles and evangeliſts were guided in their writings by the immediate influence of the ſpirit of God; though this knowledge, if attainable, is not equally important with that of the authenticity of theſe writings. Michaelis indeed aſſerts, that the divinity of the New Teſtament may be proved whether we can evince it to be written by immediate inſpiration or not *. "The queſtion (ſays he), whether the books of the New Teſtament are inſpired? is not ſo important as the queſtion, whether they are genuine? The truth of our religion depends upon the latter, not abſolutely on the former. Had the Deity inſpired not a ſingle book of the New Teſtament, but left the apoſtles and evangeliſts without any other aid than that of natural abilities to commit what they knew to writing, admitting their works to be authentic, and poſſeſſed of a ſufficient degree of credibility, the Chriſtian religion would ſtill be well founded. The miracles by which it is confirmed would equally demonſtrate its truth, even if the perſons who atteſted them were not inſpired, but ſimply human witneſſes; and their divine authority is never preſuppoſed, when we diſcuſs the queſtion of miracles, but merely their credibility as human evidence. If the miracles are true which the evangeliſts relate, the doctrines of Chriſt recorded in the goſpels are proved to be the infallible oracles of God; and, even if we admit the apoſtles to be miſtaken in certain not eſſential circumſtances, yet as the main points of the religion which Chriſt commiſſioned them to preach are ſo frequently repeated, their epiſtles would inſtruct us as well in the tenets of the Chriſtian ſyſtem, as the works of Maclaurin in the philoſophy of Newton. It is poſſible therefore to doubt, and even deny, the inſpiration of the New Teſtament, and yet be fully perſuaded of the truth of the Chriſtian religion: and many really entertain theſe ſentiments either publicly or in private, to whom we

* Chap. iii. § 1.

117 [not neceſſary to the truth of Chriſtianity according to the opinion of Michaelis.]

ſhould render great injuſtice, if we ranked them in the claſs of unbelievers.

"Yet the Chriſtian religion would be attended with difficulty, if our *principium cognoſcendi* reſted not on firmer ground; and it might be objected, that ſufficient care had not been taken for thoſe whoſe conſciences were tender, and who were anxiouſly fearful of miſtaking the ſmalleſt of the divine commands. The chief articles indeed of Chriſtianity are ſo frequently repeated, both by Chriſt and his apoſtles, that even were the New Teſtament not inſpired, we could entertain no doubt of the following doctrines: 'Jeſus was the Meſſias of the Jews, and an infallible meſſenger of God: he died for our iniquity; and by the ſatisfaction made by his death we obtain remiſſion of ſins, if on our part be faith and amendment of life: the Levitical law is aboliſhed, and moral precepts, with the ceremonies of Baptiſm and the Supper of the Lord, are appointed in its ſtead; after the preſent follows an everlaſting life, in which the virtuous ſhall be rewarded and the wicked puniſhed, and where Chriſt himſelf ſhall be the Judge.'

"To the epiſtles indeed (ſays Michaelis), inſpiration is of real conſequence; but with reſpect to the hiſtorical books, viz. the Goſpels and the Acts of the Apoſtles, we ſhould really be no loſers if we abandoned the ſyſtem of inſpiration, and in ſome reſpects have a real advantage. We ſhould be no loſers, if we conſidered the apoſtles in hiſtorical facts as merely human witneſſes, as Chriſt himſelf has done in ſaying, 'Ye alſo ſhall bear witneſs, becauſe ye have been with me from the beginning *.' And no one that attempts to convince an unbeliever of the truth of Chriſtianity, would begin his demonſtration by preſuppoſing a doctrine which his adverſary denies, but would ground his arguments on the credibility of the evangeliſts as human hiſtorians, for the truth of the miracles, the death, and the reſurrection of Chriſt. Even thoſe who examine the grounds of their faith for their own private conviction, muſt treat the evangeliſts as human evidence; ſince it would be arguing in a circle to conclude that the facts recorded in the goſpels are true, becauſe they are inſpired, when we conclude the Scriptures to be inſpired in conſequence of their contents. In theſe caſes, then, we are obliged to conſider the evangeliſts as human evidence; and it would be no detriment to the Chriſtian cauſe to conſider them at all times as ſuch in matters of hiſtorical fact. We find it nowhere expreſsly recorded that the public tranſactions which the apoſtles knew by their own experience, and of which St Luke informed himſelf by diligent inquiry, ſhould be particular objects of divine inſpiration. We ſhould even be conſiderable gainers, in adjuſting the harmony of the goſpels, if we were permitted to ſuppoſe that ſome one of the evangeliſts had committed an immaterial error, and that St John has rectified ſome trifling miſtakes in the preceding goſpels. The moſt dangerous objections which can be made to the truth of our religion, and ſuch as are moſt difficult to anſwer, are thoſe drawn from the different relations of the four evangeliſts."

* John xv. 27.

118 Different meanings of the word inſpiration.

Before any inquiry is made reſpecting the inſpiration of the books of the New Teſtament, it is neceſſary to determine the meaning of the term; for theologians have given to it a variety of ſignifications. Moſt of the German divines make it to conſiſt in an infuſion of words as well as ideas. Luther, Beza, and Salmaſius, reſtrict it to ideas alone. Doddridge underſtands by it an intervention of the Deity, by which the natural faculties of the mind were directed to the diſcovery of truth. Warburton and Law think it was a negative intervention to preſerve the ſacred writers from eſſential errors. Some believe every circumſtance was dictated by the Holy Ghoſt; others ſuppoſe that no ſupernatural aſſiſtance was granted except in the epiſtolary writings. See INSPIRATION.

As there is an evident diſtinction between inſpiration and revelation, and as the origin of the Chriſtian religion may be ſtill proved divine, even though it were denied that thoſe who record its facts and doctrines were inſpired in the act of writing, it will be moſt judicious and ſafe to employ the word *inſpiration* in that ſenſe which can be moſt eaſily defended and ſupported. By doing this, much may be gained and nothing loſt. It is difficult to prove to a deiſt that the words of Scripture are divine, becauſe he ſees that every writer has words and phraſes peculiar to himſelf. It is difficult alſo to prove that the ideas were infuſed into the mind of the authors while they were engaged in the act of writing; becauſe concerning facts they appeal not to divine inſpiration, but declare *what they have ſeen and heard*. In reaſoning they add their own ſentiments to what they had received from the Lord, and ſubjoin, eſpecially in their epiſtles, things not connected with religion. The definition which Doddridge gives, ſeems applicable to ordinary gifts or the uſual endowments of rational creatures, rather than to the extraordinary gifts of the Holy Spirit, which were beſtowed on the apoſtles. Thoſe who maintain that every fact or circumſtance was ſuggeſted by divine inſpiration, will find it no eaſy matter to prove their poſition. The opinion of Warburton and Law, with proper explanations, ſeems moſt probable. The opinion of Grotius, that only the epiſtles were inſpired, may be eaſily refuted.

The proof of the authenticity of the New Teſtament depends on human teſtimony: The proof of its inſpiration is derived from the declaration of inſpired perſons.

119
The proof of it depends on the declarations of Chriſt and his apoſtles.

In proving that the New Teſtament is inſpired, we preſuppoſe its authenticity, that the ſacred books were written by the apoſtles whoſe names they bear, and that they have been conveyed to us pure and uncorrupted. This we have already attempted to prove, and we hope with ſucceſs. The evidence of inſpiration is the teſtimony of Chriſt and his apoſtles, which we receive as credible, becauſe they confirmed their doctrines by miracles. From the important miſſion of Chriſt and his apoſtles, we infer that every power was beſtowed which divine wiſdom thought expedient; and from their conduct we conclude, that it is morally impoſſible that they could lay claim to any powers which they did not poſſeſs. It is proper therefore to inquire into the declarations of Chriſt and his apoſtles concerning the nature, degree, and extent, of the inſpiration beſtowed on the writers of the ſacred books.

120
The declarations of Chriſt.

If we conſider Chriſt's more immediate promiſes of inſpiration to the apoſtles, we ſhall find that he has given them, in the moſt proper ſenſe of the word, at three ſeveral periods, 1ſt, When he ſent the apoſtles to preach the goſpel *; 2dly, In holding a public diſcourſe relating to the goſpel, at which were preſent a conſiderable multitude; 3dly, In his prophecy of the deſtruction of Jeruſalem †. When he ſent the apoſtles to preach the goſpel, he thus addreſſed them: "When they deliver you up, take no thought how or what ye ſhall ſpeak, for it ſhall be given you in that ſame hour what ye ſhall ſpeak; for it is not you that ſpeak, but the ſpirit of your father that ſpeaketh in you." The ſame promiſe was made almoſt in the ſame words in the preſence of an immenſe multitude (Luke xii. 11, 12.). From theſe paſſages it has been urged, that if the apoſtles were to be inſpired in the preſence of magiſtrates in delivering ſpeeches, which were ſoon to be forgotten, it is ſurely reaſonable to conclude that they would be inſpired when they were to compoſe a ſtandard of faith for the uſe of all future generations of Chriſtians. If this concluſion be fairly deduced, it would follow that the writings of the New Teſtament are the dictates of inſpiration, not only in the doctrines and precepts, but in the very words. But it is a concluſion to which ſincere Chriſtians have made objections; for, ſay they, though Chriſt promiſes to aſſiſt his apoſtles in caſes of great emergency, where their own prudence and fortitude could not be ſufficient, it does not follow that he would dictate to them thoſe facts which they knew already, or thoſe reaſonings which their own calm reflection might ſupply. Beſides, ſay they, if the New Teſtament was dictated by the Holy Spirit, and only penned by the apoſtles, what reaſon can be given for the care with which Chriſt inſtructed them both during his miniſtry and after his crucifixion in thoſe things pertaining to the kingdom of God?

* Matt. x. 19, 20.

† Mark xiii. 11.; Luke xxi. 14, 15.

121
Proper idea of inſpiration.

In anſwer to this, we may obſerve, that though it be difficult to prove that the identical words of the New Teſtament were dictated by the Holy Spirit, or the train of ideas infuſed into the minds of the ſacred writers, there is one ſpecies of inſpiration to which the New Teſtament has an undoubted claim. It is this, that the memories of the apoſtles were ſtrengthened and their underſtandings preſerved from falling into eſſential errors. This we prove from theſe words of our Saviour, "and I will pray the Father, and he will give you another comforter, that he may abide with you for ever. He ſhall teach you all things, and bring all things to your remembrance whatſoever I have ſaid unto you *." This promiſe was ſurely not reſtrained to the day of Pentecoſt: it muſt have been a permanent gift, enabling the apoſtles at all times to remember with accuracy the diſcourſes of our Saviour. When the apoſtles therefore (Matthew and John) relate thoſe precepts of Chriſt which they themſelves had heard, they write indeed from memory, but under the protection of the ſpirit who ſecures them from the danger of miſtake: and we muſt of courſe conclude that their goſpels are inſpired.

* John xiv. 16, 26.

Were we called upon more particularly to declare what parts of the New Teſtament we believe to be inſpired, we would anſwer, The doctrines, the precepts, and the prophecies, every thing eſſential to the Chriſtian religion. From theſe the idea of inſpiration is inſeparable. As to the events, the memory of the apoſtles was ſufficient to retain them. If this opinion be juſt, it would enable us to account for the diſcrepancies between the ſacred writers, which are chiefly confined to the relation of facts and events.

All the books of the New Teſtament were originally written in Greek, except the Goſpel according to Matthew

thew and the epiſtle to the Hebrews, which there is reaſon to believe were compoſed in the Syro-Chaldaic language, which in the New Teſtament is called Hebrew.

122 Language in which the New Teſtament was compoſed.

123 Why the greateſt part of it is written in Greek.

Various reaſons have been aſſigned why the greateſt part of the New Teſtament was written in Greek; but the true reaſon is this, It was the language beſt underſtood both by writers and readers. Had St Paul written to a community in the Roman province of Africa, he might have written perhaps in Latin; but epiſtles to the inhabitants of Corinth, Galatia, Epheſus, Philippi, and Theſſalonica, to Timothy, Titus, and Philemon, from a native of Tarſus, could hardly be expected in any other language than Greek. The ſame may be ſaid of the epiſtles of St Peter, which are addreſſed to the Chriſtians of different countries, who had no other language in common than the Greek; and likewiſe of the epiſtles of St James, who wrote to Jews, that lived at a diſtance from Paleſtine, and were ignorant of Hebrew. The native language of St Luke, as well as of Theophilus, to whom he addreſſed his goſpel, and Acts of the apoſtles, appears to have been Greek; and that St John wrote his goſpel in that language, and not in Hebrew, is by no means a matter of ſurpriſe, ſince he wrote at Epheſus.

Michaelis, vol. i. chap. iv. ſect. 1. p. 101.

With reſpect to the epiſtle to the Romans, it may be aſked indeed why St Paul did not write in Latin? Now, whoever propoſes this queſtion, muſt preſuppoſe that St Paul was maſter of the Latin language in ſuch a degree as to find no difficulty in writing it; a matter which remains to be proved. It is very probable that St Paul was acquainted with the Latin; but between underſtanding a language, and being able to write it, there is a very material difference. As St Paul was a native of Tarſus, his native language was Greek; he had travelled during ſeveral years through countries in which no other language was ſpoken, and when he addreſſed the Roman centurion at Jeruſalem, he ſpoke not Latin, but Greek. Is it extraordinary, then, that in writing to the inhabitants of Rome he ſhould have uſed a language which was there ſo generally underſtood? It has been long remarked, that Greek was at that time as well known in Rome as French in any court of modern Europe; that according to Juvenal even the female ſex made uſe of Greek as the language of familiarity and paſſion; and that in letters of friendſhip Greek words and phraſes were introduced with greater freedom than French expreſſions in German letters, as appears from Cicero's epiſtles to Atticus, and from thoſe of Auguſtus preſerved in the works of Suetonius. To this muſt be added a material circumſtance, that a great part of the Roman Chriſtians conſiſted of native Jews, who were better acquainted with Greek than with Latin, as either they themſelves or their anceſtors had come from Greece, Aſia Minor, or Egypt, in which Greek was the language of the country. At leaſt they read the Bible in that language, as no Latin tranſlation of the Old Teſtament at that time exiſted; and the Chriſtian church at that period conſiſting chiefly of Jews, the heathen converts in Rome were of courſe under the neceſſity of accuſtoming themſelves to the Greek language. In ſhort, St Paul in his epiſtle to the Romans made uſe of a language in which alone thoſe who were ignorant of Hebrew could read the Bible. What has been here advanced reſpecting the epiſtle to the Romans is equally applicable to the Greek of St Mark, on the ſuppoſition that it was written at Rome.

To the above arguments may be added the example of Joſephus, who, as well as the apoſtles, was by birth a Jew. He even lived in Rome, which is more than can be ſaid of St Paul and St Mark, who reſided there only a certain time: he was likewiſe younger than either; he came to Italy at an age which is highly ſuitable to the learning of a language, and previous to that period had ſpent ſeveral years in the Roman camp. The Jewiſh antiquities, the hiſtory of the Jewiſh war, and the account of his own life, he wrote undoubtedly with a view of their being read by the Romans; and yet he compoſed all theſe writings in Greek. He expreſſes his motive for writing his Greek account of the Jewiſh war in the following terms: "That having written in his native language (i. e. the Hebrew dialect at that time ſpoken) a hiſtory of the war, in order that Parthians, Babylonians, Arabians, Adiabenes, and the Jews beyond the Euphrates, might be informed of thoſe events, he was now reſolved to write for the Greeks and Romans, who had not been engaged in the campaigns, a more certain account than had hitherto been given." The motives which induced Joſephus to write in Greek are fully as applicable to St Paul and St Mark.

Michaelis, vol. i. chap. iv. ſect. 3. p. 1. 1.

124 Is full of Hebraiſms.

Michaelis has thus characterized the ſtyle of the New Teſtament. "The New Teſtament (ſays he) was written in a language at that time common among the Jews, which may be named Hebraic Greek; the firſt traces of which we find in the tranſlation of the LXX.

"Every man acquainted with the Greek language, who had never heard of the New Teſtament, muſt immediately perceive, on reading only a few lines, that the ſtyle is widely different from that of the claſſic authors. We find this character in all the books of the New Teſtament in a greater or leſs degree, but we muſt not therefore conclude that they poſſeſs an uniformity of ſtyle. The harſheſt Hebraiſms, which extended even to grammatical errors in the government of caſes, are the diſtinguiſhing marks of the book of Revelation; but they are accompanied with tokens of genius and poetical enthuſiaſm of which every reader muſt be ſenſible who has taſte and feeling. There is no tranſlation of it which is not read with pleaſure even in the days of childhood; and the very faults of grammar are ſo happily placed as to produce an agreeable effect. The goſpels of St Matthew and St Mark have ſtrong marks of this Hebraic ſtyle; the former has harſher Hebraiſms than the latter, the fault of which may be aſcribed to the Greek tranſlator, who has made too literal a verſion, and yet the goſpel of St Mark is written in worſe language, and in a manner that is leſs agreeable. The epiſtles of St James and St Jude are ſomewhat better; but even theſe are full of Hebraiſms, and betray in other reſpects a certain Hebrew tone. St Luke has in ſeveral paſſages written pure and claſſic Greek, of which the firſt four verſes of his goſpel may be given as an inſtance: in the ſequel, where he deſcribes the actions of Chriſt, he has very harſh Hebraiſms, yet the ſtyle is more agreeable than that of St Matthew or St Mark. In the Acts of the apoſtles he is not free from Hebraiſms, which he ſeems to have never ſtudiouſly avoided; but his periods are more claſſically turned, and ſometimes poſſeſs beauty

Scripture. beauty devoid of art. St John has numerous, though not uncouth, Hebraiſms both in his goſpel and epiſtles; but he has written in a ſmooth and flowing language, and ſurpaſſes all the Jewiſh writers in the excellence of narrative. St Paul again is entirely different from them all; his ſtyle is indeed neglected and full of Hebraiſms, but he has avoided the conciſe and verſe-like conſtruction of the Hebrew language, and has upon the whole a conſiderable ſhare of the roundneſs of Grecian compoſition. It is evident that he was as perfectly acquainted with the Greek manner of expreſſion as with the Hebrew, and he has introduced them alternately, as either the one or the other ſuggeſted itſelf the firſt, or was the beſt approved."

125 and foreign idioms.

Michaelis has ſhown that the New Teſtament not only contains Hebraiſms but Rabbiniſms, Syriaſms, Chaldaiſms, Arabiſms, Latiniſms, and Perſian words, of which he has exhibited many ſpecimens. To theologians, whoſe duty it certainly is to ſtudy the language of the New Teſtament with attention, we would ſtrenuouſly recommend the peruſal of this work, which in the Engliſh tranſlation is one of the moſt valuable acceſſions to ſcriptural criticiſm that has yet appeared. We ſpeak of the Engliſh tranſlation, which the large and judicious notes of Mr Marſh has rendered infinitely ſuperior to the original.

126 Peculiarities in the compoſition. *Dr Campbell's Preliminary Diſſertations to his Tranſlations of the Goſpels.*

To the obſervations which have been made reſpecting the language of the New Teſtament, a few remarks may be added concerning the peculiarities of the ſtyle and manner of the ſacred writers, particularly the hiſtorians. Theſe remarks extend to the Old Teſtament as well as to the New.—The *firſt* quality for which the ſacred hiſtory is remarkable is ſimplicity in the ſtructure of the ſentences. The firſt five verſes of Geneſis furniſh an example, which conſiſt of eleven ſentences. The ſubſtantives are not attended by adjectives, nor the verbs by adverbs, no ſynonymas, no ſuperlatives, no effort at expreſſing things in a bold, emphatical, or uncommon manner.

2. The ſecond quality is ſimplicity of ſentiment, particularly in the Pentateuch, ariſing from the very nature of the early and uncultivated ſtate of ſociety about which that book is converſant.

3. Simplicity of deſign. The ſubject of the narrative ſo engroſſes the attention of the writer, that he himſelf is as nobody. He introduces nothing as from himſelf, no remarks, doubts, conjectures, or reaſonings. Our Lord's biographers particularly excel in this quality. This quality of ſtyle we meet with in Xenophon and Cæſar.

The Evangeliſts may be ranked next to Geneſis for ſimplicity of compoſition in the ſentences. John and Matthew are diſtinguiſhed for it more than Mark and Luke. But the ſentiment is not ſo remarkable for ſimplicity in the Evangeliſt as the Pentateuch. The reaſons of this difference are, the ſtate of the Jews was totally changed; their manners, cuſtoms, &c. ſplit into factions both in religion and politics. 2. The object of our Lord's miniſtry, which is the great ſubject of the goſpels, was *to inculcate a doctrine and morality* with which none of their ſyſtems perfectly coincided: beſides, being conſtantly oppoſed by all the great men, the greater part of his hiſtory conſiſts of inſtructions and diſputes. 3. As it is occupied with what our Saviour ſaid and what he did, this makes two diſtinctions of ſtyle and manner; that of our Saviour, and the ſacred penman's. In their own character, they neither explain nor command, promiſe nor threaten, praiſe nor blame. They generally omit the names of our Lord's enemies; thus directing our hatred at the vices they committed, not at the perſons. They never mention ſuch perſons without neceſſity; which is the caſe with the high-prieſt, Pilate, Herod, and Judas: the three firſt for the chronology, the fourth to do juſtice to the eleven.

Herodias is indeed mentioned with diſhonour; but her crime was a public one. On the other hand, all perſons diſtinguiſhed for any thing virtuous are carefully mentioned, Joſeph of Arimathea, Nicodemus, Zaccheus, Bartimeus, Jairus, Lazarus, Mary, and Martha. They record their own faults (Peter's, Thomas's), nor do they make any merit of their confeſſion. In one uniform ſtrain they relate the moſt ſignal miracles and moſt ordinary facts.

From the narrative is excluded that quality of ſtyle which is called *animation*. Nothing that diſcovers paſſion in the writer or is calculated to excite the paſſions of the reader. Every thing is directed to mend the heart.

But in the diſcourſes and dialogues of our Saviour the expreſſion, without loſing any thing of its ſimplicity, is often remarkable for ſpirit and energy. Reſpecting harmony and ſmoothneſs, qualities which only add an external poliſh to language, they had not the leaſt ſolicitude.

As to elegance, there is an elegance which reſults from the uſe of ſuch words as are moſt in uſe with thoſe who are accounted fine writers, and from ſuch arrangements in the words and clauſes as have generally obtained their approbation. This is diſclaimed by the ſacred authors.

But there is an elegance of a ſuperior order more nearly connected with the ſentiment; and in this ſort of elegance they are not deficient. In all the oriental languages great uſe is made of tropes, eſpecially metaphors. When the metaphors employed bear a ſtrong reſemblance, they confer vivacity: if they be borrowed from objects which are naturally agreeable, beautiful, or attractive, they add alſo elegance. The Evangeliſts furniſh us with many examples of this kind of vivacity and elegance. Our Lord borrows tropes from cornfields, vineyards, gardens, &c.

127 Proper method of ſtudying the New Teſtament by analyſis and induction.

As a valuable appendage to this part of our ſubject, we ſhall ſubjoin Dr Campbell's method of ſtudying the books of the New Teſtament. This we offer to our readers as a beautiful inſtance of the judicious application of philoſophy to ſacred ſtudies. It is the ſame method of diſcovering truth by analyſis and induction, which was purſued by Sir Iſaac Newton with ſuch aſtoniſhing ſucceſs, which ſince his time has been uniformly practiſed in natural philoſophy, and has been alſo applied to chemiſtry, to medicine, to natural hiſtory, and to the philoſophy of mind, by the ingenious Dr Reid. This is the path of ſound philoſophy, which can alone lead to the diſcovery of truth. In following it, our progreſs may be ſlow, but it will be ſure. If all theologians would ſteadily adhere to it, we might then entertain the pleaſing hope of diſcarding for ever thoſe abſurd ſyſtems of religion which are founded on ſingle paſſages and detached fragments of ſcripture, and of eſtabliſhing opinions and doctrines on a ſolid foundation.

"1. To

128 Dr Campbell's method. *Prel. Diſ. to the Goſpels.*

" 1. To get acquainted with each writer's ſtyle; to obſerve his manner of compoſition, both in ſentences and paragraphs; to remark the words and phraſes peculiar to him, and the peculiar application that he may ſometimes make of ordinary words; for there are few of thoſe writers who have not their peculiarities in all the reſpects now mentioned. This acquaintance with each can be attained only by the frequent and attentive reading of his works in his own language.

" 2. To inquire into the character, the ſituation, and the office of the writer, the time, the place, and the occaſion of his writing, and the people for whoſe immediate uſe he originally intended his work. Every one of theſe particulars will ſometimes ſerve to elucidate expreſſions otherwiſe obſcure or doubtful. This knowledge may in part be learned from a diligent and reiterated peruſal of the book itſelf, and in part be gathered from what authentic, or at leaſt probable, accounts have been tranſmitted to us concerning the compilement of the canon.

" 3. The laſt general direction is, to conſider the principal ſcope of the book, and the particulars chiefly obſervable in the method by which the writer has purpoſed to execute his deſign. This direction is particularly applicable to the epiſtolary writings, eſpecially thoſe of Paul.

" 4. If a particular word or phraſe occur, which appears obſcure, perhaps unintelligible, the firſt thing we ought to do, if ſatisfied that the reading is genuine, is to conſult the context, to attend to the manner wherein the term is introduced, whether in a chain of reaſoning or in a hiſtorical narration, in a deſcription, or included in an exhortation or command. As the concluſion is inferred from the premiſſes, or as from two or more known truths a third unknown or unobſerved before may fairly be deduced; ſo from ſuch attention to the ſentence in connection, the import of an expreſſion, in itſelf obſcure or ambiguous, will ſometimes with moral certainty be diſcovered. This, however, will not always anſwer.

" 5. If it do not, let the ſecond conſideration be, whether the term or phraſe be one of the writer's peculiarities. If ſo, it comes naturally to be inquired, what is the acceptation in which he employs it in other places? If the ſenſe cannot be preciſely the ſame in the paſſage under review, perhaps, by an eaſy and natural metaphor or other trope, the common acceptation may give riſe to one which perfectly ſuits the paſſage in queſtion.—Recourſe to the other places wherein the word or phraſe occurs in the ſame author is of conſiderable uſe, though the term ſhould not be peculiar to him.

" 6. But thirdly, if there ſhould be nothing in the ſame writer that can enlighten the place, let recourſe be had to the parallel paſſages, if there be any ſuch, in the other ſacred writers. By parallel paſſages, I mean thoſe places, if the difficulty occur in hiſtory, wherein the ſame or a ſimilar ſtory, miracle, or event, is related; if in teaching or reaſoning, thoſe parts wherein the ſame argument or doctrine is treated, or the ſame parable propounded; and in moral leſſons, thoſe wherein the ſame claſs of duties is recommended; or, if the difficulty be found in a quotation from the Old Teſtament, let the parallel paſſage in the book referred to, both in the original Hebrew, and in the Greek verſion, be conſulted.

" 7. But if in theſe there be found nothing that can throw light on the expreſſion of which we are in doubt, the fourth recourſe is to all the places wherein the word or phraſe occurs in the New Teſtament, and in the Septuagint verſion of the Old, adding to theſe the conſideration of the import of the Hebrew or Chaldaic word, whoſe place it occupies, and the extent of ſignification, of which in different occurrences ſuch Hebrew or Chaldaic term is ſuſceptible.

" 8. Perhaps the term in queſtion is one of thoſe which very rarely occur in the New Teſtament, or thoſe called ἁπαξ λεγομενα, only once read in Scripture, and not found at all in the tranſlation of the Seventy. Several ſuch words there are. There is then a neceſſity, in the fifth place, for recurring to the ordinary acceptation of the term in claſſical authors. This is one of thoſe caſes wherein the interpretation given by the earlieſt Greek fathers deſerves particular notice. In this, however, I limit myſelf to thoſe comments wherein they give a literal expoſition of the ſacred text, and do not run into viſion and allegory.

129 Manuſcripts of the New Teſtament.

The manuſcripts of the New Teſtament are the natural ſource from which the genuine readings of the Greek Teſtament are to be drawn. The printed editions are either copies of more ancient editions, or of manuſcripts; and they have no further authority than as they correſpond to the manuſcripts from which they were originally taken. By manuſcripts of the New Teſtament, we mean thoſe only which were written before the invention of printing. The moſt ancient of theſe are loſt, and there is no manuſcript now extant older than the ſixth century. Few contain the whole New Teſtament; ſome contain the four goſpels; ſome the Acts of the Apoſtles and Epiſtles; and others the book of Revelation. The greateſt number are thoſe which contain the firſt part; thoſe which have the ſecond, or the firſt and ſecond together, are likewiſe numerous; but thoſe of the third are extremely few. It muſt be added alſo, that in many manuſcripts thoſe epiſtles are omitted whoſe divine authority was formerly doubted.

There are many manuſcripts which have been examined only for a ſingle text, ſuch as 1 John v. 7. or at leaſt for a very ſmall number. Others have been examined from the beginning to the end, but not completely and in reſpect of all the readings. A third claſs conſiſts of ſuch as either have been, or are ſaid to have been, completely and accurately collated. But this requires ſuch phlegmatic patience, that we can hardly expect to find in critical catalogues all the various readings which have been only once collated. Wetſtein, in collating many manuſcripts anew, made diſcoveries which had entirely eſcaped the notice of his predeceſſors. The fourth claſs conſiſts of ſuch as have been completely and accurately collated more than once; but here alſo we are in danger of being led into error.—When various readings are transferred from one critical edition to another, as from that of Gregory to Mill's edition, and from the latter to thoſe of Bengel and Wetſtein, the manuſcripts muſt ſometimes be falſely named, and various readings muſt frequently be omitted. And as Wetſtein has marked by ciphers manuſcripts that in former editions had been denoted by their initial letters, he could ſcarcely avoid ſubſtituting, in ſome caſes, one figure inſtead of another. The fifth claſs, which is by far the moſt valuable, conſiſts of ſuch as have

Scripture. have been printed word for word, and therefore form an original edition of the Greek Testament. We can boast but of a very few manuscripts of this kind. Hearne printed at Oxford, in 1715, the acts of the Apostles in Greek and Latin from the Codex Laudianus 3.; Knittel has annexed to his edition of Ulphilas, p. 53—118, a copy of two very ancient fragments preserved in the library of Wolfenbuttle; the one of the four Gospels in general, the other of St Luke and St John. Woide printed in 1786 the Codex Alexandrinus, a manuscript of great antiquity, which shall afterwards be more fully described; and the University of Cambridge has resolved to publish, in a similar manner, the Cod. Cant. I. or, as it is sometimes called, the Codex Bezæ, the care of which is intrusted to Dr Kipling, a publication which will be thankfully received by every friend to sacred criticism. It was the intention of the Abbé Spoletti, a few years ago, to publish the whole of the celebrated Codex Vaticanus; which would likewise have been a most valuable accession, since a more important manuscript is hardly to be found in all Europe. He delivered for this purpose a memorial to the pope; but the design was not put into execution, either because the pope refused his assent or the abbé abandoned it himself. See the Oriental Bible, vol. xxii. n° 333. and vol. xxiii. n° 348.

130 Michaelis's proposal of taking an impression of ancient manuscripts, vol. ii. p. 182.

"A very valuable library," says Michaelis, "might be composed of the impressions of ancient manuscripts, which, though too expensive for a private person, should be admitted into every university collection, especially the Alexandrian and Cambridge manuscripts, to which I would add, if it were now possible to procure it, Hearne's edition of the Codex Laudianus 3. A plan of this sort could be executed only in England, by a private subscription, where a zeal is frequently displayed in literary undertakings that is unknown in other countries; and it were to be wished that the project were begun before length of time has rendered the manuscripts illegible, and the attempt therefore fruitless. Ten thousand pounds would go a great way towards the fulfilling of this request, if the learned themselves did not augment the difficulty of the undertaking, by adding their own critical remarks, and endeavouring thereby to recommend their publications, rather than by presenting to the public a faithful copy of the original. Should posterity be put in possession of faithful impressions of important manuscripts, an acquisition which would render the highest service to sacred criticism, all these editions of the New Testament should be regulated on the same plan as Hearne's edition of the Acts of the Apostles." It must be highly flattering to the patriotic spirit of an Englishman to hear the encomiums which learned foreigners have so profusely bestowed on our liberality in supporting works of genius and learning and public utility. The plan which Michaelis proposes to us, in preference to all the other nations in Europe, is noble and magnificent, and would certainly confer immortality on those men who would give it their patronage and assistance. Scripture.

There are many ancient manuscripts, especially in Italy, which have never been collated, but lie still unexplored. Here is a field where much remains to be done. See Marsh's Notes to Michaelis, vol. ii. p. 643.

Michaelis has given a catalogue of ancient manuscripts, amounting in number to 292, to which he has added a short account of each. In this place we shall confine our observations to the most celebrated, the Alexandrian and Vatican manuscripts, which we have chiefly extracted from Michaelis.

131 Account of the Alexandrian manuscript.

The *Alexandrian manuscript* consists of four volumes; the first three of which contain the Old Testament, the fourth the New Testament, together with the first Epistle of Clement to the Corinthians, and a fragment of the second. In the New Testament, which alone is the object of our present inquiry, is wanting the beginning as far as Matthew xxv. 6. ὁ νυμφιος ερχεται; likewise from John vi. 50. to viii. 52. and from 2 Cor. iv. 13. to xii. 7. It must likewise be observed, that the Psalms are preceded by the epistle of Athanasius to Marcellinus, and followed by a catalogue, containing those which are to be used in prayer for each hour, both of the day and of the night; also by 14 hymns, partly apocryphal, partly biblical, the 11th of which is an hymn in praise of the Virgin Mary, entitled προσευχη μαριας της θεοτοκου: further, the *Hypotheses Eusebii* are annexed to the Psalms, and his *Canones* to the Gospels. It is true, that this has no immediate reference to the New Testament, but may have influence in determining the antiquity of the manuscript itself.

It has neither accents nor marks of aspiration; it is written with capital, or, as they are called, *uncial letters*, and has very few abbreviations. There are no intervals between the words; but the sense of a passage is sometimes terminated by a point, and sometimes by a vacant space. Here arises a suspicion that the copyist did not understand Greek, because these marks are sometimes found even in the middle of a word, for instance Levit. v. 4. ανομος η for αν ομοση, and Numb. xiii. 29. μω Υσης.

This manuscript was presented to Charles I. in 1628, by Cyrillus Lucaris patriarch of Constantinople. Cyrillus himself has given the following account; "We know so much of this manuscript of the holy writings of the Old and New Testament, that Thecla an Egyptian lady of distinction (*nobilis fœmina Ægyptia*) wrote it with her own hand 1300 years ago (A). She lived soon after the council of Nice. Her name was formerly at the end of the book; but when Christianity was subverted in Egypt by the errors of Mahomet, the books of the Christians suffered the same fate, and the name of Thecla

(A) He wrote this in the year 1628. According to this account, then, the manuscript must have been written in 328; a date to which so many weighty objections may be made, that its most strenuous advocates will hardly undertake to defend it. But this error has furnished Oudin with an opportunity of producing many arguments against the antiquity of the *Codex Alexandrinus*, which seem to imply, that Grabe and others, who have referred it to the fourth century, suppose it to have been written in the above-mentioned year. Now it is probable, that the inference which has been deduced from the account of Cyrillus is more than he himself intended to express, as he relates that Thecla lived after the council of Nice.

Scripture. Thecla was expunged. But oral tradition of no very ancient date (*memoria et traditio recens*) has preserved the remembrance of it.

But the reader will see that this account is merely traditional. Dr Semler very properly observes, that there is no more reason to rely on a tradition respecting the transcriber of an ancient manuscript, than on a tradition which relates to an ancient relic. The arguments which have been urged by Wetstein, Semler, Oudin, and Woide, to fix the date of this manuscript, are so many, that it would be tedious to repeat them. But, after all, its antiquity cannot be determined with certainty, though it appears from the formation of the letters, which resemble those of the fourth and fifth centuries, and the want of accents, that it was not written so late as the tenth century. In this century it was placed by Oudin, while Grabe and Schulze have referred it to the fourth, which is the very utmost period that can be allowed, because it contains the epistles of Athanasius. Wetstein, with more probability, has chosen a mean between these two extremes, and referred it to the fifth century: but we are not justified in drawing this inference from the formation of the letters alone, for it is well known that the same mode of forming the letters was retained longer in some countries and in some monasteries than in others.

We are now in possession of a perfect impression of this manuscript, which is accompanied with so complete and so critical a collection of various readings, as is hardly to be expected from the edition of any other manuscript. Dr Woide published it in 1786, with types cast for that purpose, line for line, without intervals between the words, as in the manuscript itself: the copy is so perfect a resemblance of the original, that it may supply its place. Its title is *Novum Testamentum Græcum e codice MS. Alexandrino qui Londini in Bibliotheca Musei Britannici asservatur descriptum.* It is a very splendid folio; and the preface of the learned editor contains an accurate description of the manuscript, with an exact list of all its various readings, that takes up no less than 89 pages; and each reading is accompanied with a remark, in which is given an account of what his predecessors Juninus, Walton, Fell, Mill, Grabe, and Wetstein, had performed or neglected.

132 Account of the Vatican manuscript.

The *Vatican manuscript* contained originally the whole Greek Bible, including both the Old and New Testament; and in this respect, as well as in regard to its antiquity, it resembles none so much as the *Codex Alexandrinus*, but no two manuscripts are more dissimilar in their readings, in the New Testament as well as in the Old. After the Gospels, which are placed in the usual order, come the Acts of the Apostles, which are immediately followed by the seven catholic epistles. This must be particularly noted, because some have contended that the second Epistle of St Peter, with the second and third of St John, were wanting. Professor Hwiid, in a letter dated Rome, April 12. 1781, assured Michaelis that he had seen them with his own eyes, that the second Epistle of St Peter is placed folio 1434, the second of St John fol. 1442, the third fol. 1443: then follow the Epistles of St Paul, but not in the usual order; for the Epistle to the Hebrews is placed immediately after those to the Thessalonians: and it is not improbable, that in the more ancient manuscript, from which the *Codex Vaticanus* was copied, this Epistle was even placed before that to the Ephesians, and immediately after the Epistle to the Galatians (B); for the Epistles of St Paul are divided into 93 sections by figures written in the margin with red ink; but the Epistle to the Galatians ends with 59, and that to the Ephesians begins with 70; the Epistle to the Hebrews, on the contrary, begins with 60, and ends with 69. With the words ἀμωμον τῷ Θεῷ, Heb. ix. 14. the manuscript ceases, the remaining leaves being lost. There is wanting, therefore, not only the latter part of this Epistle, but the Epistles to Timothy, Titus, and Philemon, with the Revelation of St John: but this last book, as well as the latter part of the Epistle to the Hebrews, has been supplied by a modern hand in the 15th century. In many places the faded letters have been also retouched by a modern, but careful hand; and when the person who made these amendments, who appears to have been a man of learning, found a reading in his own manuscript which differed from that of the *Codex Vaticanus*, he has noted it in the margin, and has generally left the text itself untouched, though in some few examples he has ventured to erase it.

It is certain, that this manuscript is of very high antiquity, though it has been disputed which of the two in this respect is entitled to the preference, the *Vaticanus* or *Alexandrinus*. The editors of the Roman edition of the Septuagint, in 1587, referred the date of the Vatican manuscript to the fourth century, the period to which the advocates for its great rival refer the *Codex Alexandrinus*. More moderate, and perhaps more accurate, are the sentiments of that great judge of antiquity Montfaucon, who, in his *Bibliotheca Bibliothecarum*, p. 3. refers it to the fifth or sixth century; and adds, that though he had seen other manuscripts of equal antiquity, he had found none at the same time so complete.

The *Codex Vaticanus* has a great resemblance to the manuscripts noted by Wetstein, C. D. L. 1. 13. 33. 69. 102. and to the Latin, Coptic, and Ethiopic versions; but it is preferable to most of them, in being almost entirely free from those undeniable interpolations and arbitrary corrections which are very frequently found in the above-mentioned manuscripts, especially in D. 1. and 69. It may be applied, therefore, as a mean not only of confirming their genuine readings, but of detecting and correcting those that are spurious. It is written with great accuracy, and is evidently a faithful copy of the more ancient manuscript from which it was transcribed. Peculiar readings, or such as are found neither in other manuscripts nor ancient versions, are seldom discovered in the *Codex Vaticanus*; and of the few which have been actually found, the greatest part are of little importance. But in proportion as the number of such readings is small, the number of those s great; in support of which few only, though ancient authorities,

(B) Probably because the Epistle to the Hebrews, as well as the Epistle to the Galatians, relates to the abolition of the Mosaic law.

Scripture. authorities, have been hitherto produced: But this manuscript has not throughout the whole New Testament the same uniform text.

As we have now a beautiful printed edition of the Alexandrian manuscript by Dr Woide, it is much to be wished that we had also an exact impression of the Vatican manuscript. From the superstitious fears and intolerant spirit of the inquisition at Rome, all access to this manuscript was refused to the Abbé Spoletti, who presented a memorial for that purpose. Unless the pope interpose his authority, we must therefore despair of having our wishes gratified; but from the liberality of sentiment which the head of the Catholic church has shown on several occasions, we hope that the period is not far distant when the Vatican library will be open to the learned, and when the pope will think it his greatest honour to encourage their researches.

133 The best editions of the Greek New Testament are those of Mill.

The most valuable editions of the Greek New Testament are those of Mill, Bengel, and Wetstein.

The edition of Mill, which was only finished 14 days before his death, occupied the attention of the author for 30 years.

The collections of various readings which had been made before the time of Mill, the Velesian, the Barberini, those of Stephens, the London Polyglot, and Fell's edition, with those which the Bishop had left in manuscript, and whatever he was able to procure elsewhere, he brought together into one large collection. He made likewise very considerable additions to it. He collated several original editions more accurately than had been done before: he procured extracts from Greek manuscripts which had never been collated; and of such as had been before collated, but not with sufficient attention, he obtained more complete extracts. It is said that he has collected from manuscripts, fathers, and versions, not fewer than 30,000 various readings. This collection, notwithstanding its many imperfections, and the superiority of that of Wetstein, is still absolutely necessary to every critic: for Wetstein has omitted a great number of readings which are to be found in Mill, especially those which are either taken from the Vulgate, or confirm its readings. Mill was indeed too much attached to this version; yet he cannot be accused of partiality in producing its evidence, because it is the duty of a critic to examine the witnesses on both sides of the question: and Wetstein, by too frequently neglecting the evidence in favour of the Vulgate, has rendered his collection less perfect than it would otherwise have been. He likewise added, as far as he was able, readings from the ancient versions; and is much to be commended for the great attention which he paid to the quotations of the fathers; the importance of which he had sagacity enough to discern.

It cannot, however, be denied, that Mill's Greek Testament has many imperfections, and some of real importance. His extracts from manuscripts often are not only incomplete, but erroneous; and it is frequently necessary to correct his mistakes from the edition of Wetstein. His extracts from the oriental versions are also imperfect, because he was unacquainted with these languages; and in selecting readings from the Syriac, the Arabic, and Ethiopic, he was obliged to have recourse to the Latin translations, which are annexed to those versions in the London Polyglot.

The great diligence which Mill had shown in collecting so many various readings, alarmed the clergy as if the Christian religion had been in danger of subversion. It gave occasion for a time to the triumphs of the deist, and exposed the author to many attacks. But it is now universally known, that not a single article of the Christian religion would be altered though a deist were allowed to select out of Mill's 30,000 readings whatever he should think most inimical to the Christian cause.

134 Bengel.

In 1734, Bengel abbot of Alpirspach, in the duchy of Wurtemburg, published a new edition of the Greek Testament. The fears which Mill had excited began to subside on this new publication; for Bengel was universally esteemed a man of piety. Bengel was not only diligent in the examination of various readings, but in the strictest sense of the word conscientious; for he considered it as an offence against the Deity, if, through his own fault, that is, through levity or carelessness, he introduced a false reading into the sacred text. His object was not merely to make a collection of readings, and leave the choice of them to the judgement of the reader, but to examine the evidence on both sides, and draw the inference; yet he has not given his own opinion so frequently as Mill, whom he resembled in his reverence for the Latin version, and in the preference which he gave to harsh and difficult readings, before those which were smooth and flowing. It may be observed in general, that he was a man of profound learning, and had a cool and sound judgement, though it did not prevent him from thinking too highly of the Latin readings, and of the *Codex Alexandrinus*, with other Latinizing manuscripts.

The imperfections of Bengel's edition arise chiefly from his diffidence and caution. He did not venture to insert into the text any reading which had not already appeared in some printed edition, even though he believed it to be the genuine reading. In the book of Revelation indeed he took the liberty to insert readings which had never been printed; because few manuscripts had been used in the printing of that book.

135 and of Wetstein.

The celebrated edition of John James Wetstein, which is the most important of all, and the most necessary to those engaged in sacred criticism, was published at Amsterdam in 1751 and 1752, in two volumes folio. No man will deny that Wetstein's *Prolegomena* discover profound erudition, critical penetration, and an intimate acquaintance with the Greek manuscripts. It is a work which in many respects has given a new turn to sacred criticism, and no man engaged in that study can dispense with it. Wherever Wetstein has delivered his sentiments respecting a Greek manuscript, which he has done less frequently than Mill, and indeed less frequently than we could have wished, he shows himself an experienced and sagacious critic. He is likewise more concise than Mill in delivering his opinion, and does not support it by producing so great a number of readings from the manuscript in question. This conciseness is the consequence of that warmth and haste which were peculiar to Wetstein's character, and which have sometimes given birth to mistakes. The fire of his disposition was likewise the cause of his advancing conjectures, in regard to the history of his manuscripts, which exceed the bounds of probability. But the critical

Scripture. tical rules which he has delivered are perfectly juſt; and in this reſpect there is a remarkable agreement between him and his eminent predeceſſors Mill and Bengel. In regard to the Latin verſion alone they appear to differ: in Mill and Bengel it has powerful, and perhaps partial, advocates; but in Wetſtein a ſevere and ſagacious judge, who ſometimes condemns it without a cauſe. The Greek manuſcripts which confirm the readings of the Vulgate, and which he ſuppoſed had been corrupted from it, he of courſe condemned with equal ſeverity: and ſome collections of various readings which had been made by Catholics, he made no ſcruple to pronounce a forgery, ſaying, "*Timeo Danaos et dona ferentes.*" But in conſequence of his antipathy to the Vulgate, his collection of various readings is leſs perfect than it might have been.

It has been aſked, 1. Whether he has quoted his manuſcripts either falſely or imperfectly, in order to eſtabliſh his own religious opinions? or, 2. Whether his diligence and accuracy have been ſuch that we may at all times depend upon them? To the firſt of theſe queſtions there can be no other anſwer, than that Wetſtein, in his character of a critic, is perfectly honeſt. With reſpect to the ſecond, his diligence and accuracy, Michaelis thinks there is leſs reaſon to pronounce him faultleſs. But Mr Marſh has examined the examples on which Michaelis founds his aſſertion, and declares that Michaelis is miſtaken in every one of them.

The diligence of Wetſtein can ſcarcely be queſtioned by any who are acquainted with his hiſtory. He travelled into different countries, and examined with his own eyes a much greater number of manuſcripts than any of his predeceſſors. His collection of various readings amounts to *above a million;* and he has not only produced a much greater quantity of matter than his predeceſſors, but has likewiſe corrected their miſtakes. The extracts from manuſcripts, verſions, and printed editions of the Greek Teſtament, which had been quoted by Mill, are generally quoted by Wetſtein. Whenever Wetſtein had no new extracts from the manuſcripts quoted by Mill, or had no opportunity of examining them himſelf, he copied literally from Mill; but wherever Mill has quoted from printed editions, as from the margin of Robert Stephens's for inſtance, or from the London Polyglot, Wetſtein did not copy from Mill, but went to the original ſource, as appears from his having corrected many miſtakes in Mill's quotations.

In the opinion of Michaelis, there are many defects in the edition of Wetſtein, which require to be ſupplied, and many errors to be corrected. Yet ſtill it muſt be allowed to be a work of immenſe labour, and moſt valuable to thoſe engaged in ſacred criticiſm; and it is ſurpriſing, when we conſider the difficulties and labour which Wetſtein had to encounter, that his errors and imperfections are ſo few.

The propoſal of Michaelis, however, of a new collation of manuſcripts, in order to form a complete collection of various readings, is worthy the attention of the learned. In mentioning this propoſal, Michaelis turns a wiſhful eye towards Britain, the only country, he ſays, which poſſeſſes the will and the means to execute the taſk. Should a reſolution, he adds, be formed in this iſland, ſo happily ſituated for promoting the purpoſes of general knowledge, to make the undertaking a public concern, to enter into a ſubſcription, and to employ men of abilities in collating manuſcripts both at home and abroad, they would be able to do more in ten years than could otherwiſe be done in a century. And could this nation direct its attention to any object more glorious or more uſeful than in aſcertaining the text of the ſacred Scriptures, and giving to poſterity an accurate edition?

Punctuation of the New Teſtament. As the ſenſe of Scripture, as well as all other books, is affected by the punctuation, it is of importance to determine whether the ſtops or points which we find in the ſacred books were uſed by the ſacred writers, or have been inſerted by modern tranſcribers.

We are told by Montfaucon, in his *Palæographia Græca*, p. 31. that the perſon who firſt diſtinguiſhed the ſeveral parts of a period in Greek writing, by the introduction of a point, was Ariſtophanes of Byzantium, who lived under Ptolemæus Epiphanes, in the 145th Olympiad. But though points were not uſed in books before this period, they were employed in inſcriptions above 400 years before the birth of Chriſt. See *Mont. Pal. Græc.* p. 135.

Under the article PUNCTUATION we mentioned, on authority which we reckoned unqueſtionable, that the ancient manuſcripts were written without any points. We have now, however, diſcovered, from Woide's edition of the *Codex Alexandrinus*, that points are uſed in that manuſcript, though omitted in the *fac ſimile* given by Montfaucon. That they are found too in the *Codex Vaticanus*, though not frequently, is related by Birch in his *Prolegomena*, p. 14.

As the fact has not been generally known, that the ancients pointed their manuſcripts, and as it is an important and intereſting fact, we ſhall preſent our readers with the firſt ſix lines of St John's Goſpel, as they are pointed in the Alexandrian manuſcript:

ΕΝΑΡΧΗΗΝΟΛΟΓΟΣΚΑΙΟΛΟΓΟΣΗΝ
ΠΡΟΣΤΟΝΘΝ ΚΑΙΘΣΗΝΟΛΟΓΟΣ·
ΟΥΤΟΣΗΝΕΝΑΡΧΗΠΡΟΣΤΟΝΘΝ
ΠΑΝΤΑΔΙΑΥΤΟΥΕΓΕΝΕΤΟ·ΚΑΙΧΩ
ΡΕΙΣΑΥΤΟΥΕΓΕΝΕΤΟΟΥΔΕΕΝ·
ΟΓΕΓΟΝΕΝΕΝΑΥΤΩΖΩΗΗΝ·

Whether any points for marking the ſenſe were uſed by the apoſtles, cannot be determined; but the points now in uſe have been invented ſince.

In the fourth century, Jerome began to add the comma and colon to the Latin verſion; and they were then inſerted in many more ancient manuſcripts. In the fifth century, Euthalius a deacon of Alexandria divided the New Teſtament into lines. This diviſion was regulated by the ſenſe, ſo that each line ended where ſome pauſe was to be made in ſpeaking. And when a copyiſt was diſpoſed to contract his ſpace, and therefore crowded the lines into each other, he then placed a point where Euthalius had terminated the line. In the eighth century, the ſtroke was invented which we call a comma. In the Latin manuſcripts, Jerome's points were introduced by Paul Warnfried and Alcuin, at the command of Charlemagne. In the ninth century, the Greek note of interrogation (;) was firſt uſed. At the invention of printing the editors placed the points

Scripture. points arbitrarily, probably without bestowing the necessary attention; and Stephens, in particular, varied his points in every edition (D).

The meaning of many passages in the Scripture has been altered by false pointing. We shall produce one instance of this: Mat. v. 34. is commonly pointed in this manner, *εγω δε λεγω υμιν, μη ομοσαι ολως· μητε εν τῳ ουρανῳ*, and consequently translated, "But I say unto you, swear not at all." But if, instead of the colon placed after *ολως*, we substitute a comma, the translation will be, "But I say to you that you ought by no means to swear, either by heaven, for it is his throne, or by earth, for it is his footstool." The command of Christ therefore applies particularly to the abuse of oaths among the Pharisees, who on every trivial occasion swore by the heaven, the earth, the temple, the head, &c. but it implies no prohibition to take an oath in the name of the Deity on solemn and important occasions.

137 Division into chapters.

The ancients divided the New Testament into two kinds of chapters, some longer and some shorter. This method appears to be more ancient than St Jerome, for he expunged a passage from the New Testament which makes an entire chapter. The longer kind of chapters were called *breves*, the shorter *capitula*. St Matthew contained, according to Jerome, 68 breves; Mark contained 48; Luke 83; and John 18. All the evangelists together consisted of 217 breves and 1126 capitula. The inventor of our modern division into chapters was Hugo de S. Caro, a French Dominican friar, who lived in the 13th century.

The ancients had two kinds of verses, one of which they called *στιχοι*, and the other *ρηματα*. The *remata* were lines which contained a certain number of letters, like our printed books, and therefore often broke off in the middle of a word. Josephus's 20 books of Antiquities contained 60,000 of them, though in Ittiquis's edition there are only 40,000 broken lines.

Stichi were lines measured by the sense: according to an ancient written list mentioned by Father Simin, there were in the New Testament 18,612 of these.

138 Division into verses.

The verses into which the New Testament is now divided are more modern, and an imitation of the division of the Old Testament. Robert Stephens, the first inventor, introduced them in his edition in the year 1551. He made this division on a journey from Lyons to Paris; and, as his son Henry tells us in the preface to the Concordance of the New Testament, he made it *inter equitandum*. This phrase probably means, that when he was weary of riding, he amused himself with this work at his inn.

139 Its disadvantages.

This invention of the learned printer was soon introduced into all the editions of the New Testament; and it must be confessed, that in consulting and quoting the Scriptures, and in framing concordances for them, a subdivision into minute parts is of the greatest utility. But all the purposes of utility could surely have been gained, without adopting the hasty and indigested division of Stephens, which often breaks the sense in pieces, renders plain passages obscure, and difficult passages unintelligible. To the injudicious division of Stephens we may ascribe a great part of the difficulties which attend the interpretation of the New Testament, and a great many of those absurd opinions which have disgraced the ages of the Reformation. For as separate verses appear to the eyes of the learned, and to the minds of the unlearned, as so many detached sentences, they have been supposed to contain complete sense, and they have accordingly been explained without any regard to the context, and often in direct opposition to it. Were any modern history or continued discourse divided into fragments with as little regard to the sense, we should soon find, that as many opposite meanings could be forced upon them as have been forced upon the books of the New Testament. The division into verses has been still more injurious to the Epistles than to the Gospels, for there is a close connection between the different parts of the Epistles, which the verses entirely dissolve. It is therefore to be wished that this division into verses were laid aside. The Scriptures ought to be divided into paragraphs, according to the sense; and the figures ought to be thrown into the margin. In this way, the figures will retain their utility without their disadvantages. Dr Campbell, in his beautiful translation of the Gospels, has adopted this method with great judgement and success; and he who will read that translation, will perceive that this single alteration renders the Gospels much more intelligible, and, we may add, more entertaining (E).

140 Meaning of the word *Gospel*.

The word ΕΥΑΓΓΕΛΙΟΝ signifies any joyful tidings, and

(D) The reader will perceive that the account of the origin of points is different from that given under PUNCTUATION. But the best authors differ upon this subject. We shall perhaps reconcile the difference, by supposing that points were invented at the time here mentioned, but were not in general use till the time mentioned under the article PUNCTUATION.

(E) We shall here subjoin, as a curiosity, what the anonymous author terms *the Old and New Testament dissected*. It contains an enumeration of all the books, chapters, verses, words, and letters, which occur in the English Bible and Apocrypha. It is said to have occupied three years of the author's life, and is a singular instance of the trifling employments to which superstition has led mankind.

The OLD and NEW TESTAMENT dissected.

The

Scripture. and exactly correſponds to our Engliſh word GOSPEL. In the New Teſtament this term is confined to "The glad tidings of the coming of the Meſſiah." Thus, in Mat. xi. 5. our Lord ſays, "The poor have the Goſpel preached;" that is, The coming of the Meſſiah is preached to the poor. Hence the name of *Goſpel* was given to the hiſtories of Chriſt, in which the good news of the coming of the Meſſiah, with all its joyful circumſtances, are recorded.

141 Goſpel according to St Matthew.

That the Goſpel according to Matthew was compoſed, ſays Dr Campbell, by one born a Jew, familiarly acquainted with the opinions, ceremonies, and cuſtoms of his countrymen; that it was compoſed by one converſant in the ſacred writings, and habituated to their idiom; a man of plain ſenſe, but of little or no learning, except what he derived from the Scriptures of the Old Teſtament; and finally, that it was the production of a man who wrote from conviction, and had attended cloſely to the facts and ſpeeches which he related, but who in writing entertained not the moſt diſtant view of ſetting off himſelf—we have as ſtrong internal evidence as the nature of the thing will admit, and much ſtronger than that wherein the mind ninety-nine caſes out of a hundred acquieſces.

142 Its authenticity.

That the author of this hiſtory of our bleſſed Saviour was Matthew, appears from the teſtimony of the early Chriſtians. It is atteſted by Jerome, Auguſtin, Epiphanius, and Chryſoſtom, and in ſuch a manner as ſhews that they knew the fact to be uncontroverted, and judged it to be incontrovertible. Origen, who flouriſhed in the former part of the 3d century, is alſo reſpectable authority. He is quoted by Euſebius in a chapter * wherein he ſpecially treats of Origen's account of the ſacred canon. "As I have learned (ſays Origen) *by tradition* concerning the four goſpels, which alone are received without diſpute by the whole church of God under heaven; the firſt was written by Matthew, once a publican, afterwards an apoſtle of Jeſus Chriſt, *who delivered it to the Jewiſh believers, compoſed in the Hebrew language*." In another place he ſays, "Matthew writing for the Hebrews who expected him who was to deſcend from Abraham and David, ſays the lineage of Jeſus Chriſt, ſon of David, ſon of Abraham." It muſt be obſerved, that the Greek word παραδοσις does not exactly correſpond to the Engliſh word *tradition*, which ſignifies any thing delivered orally from age to age. Παραδοσις properly implies any thing tranſmitted from former ages, whether by oral or written teſtimony. In this acceptation we find it uſed in Scripture †: "Hold the traditions (τας παραδοσεις) which ye have been taught, *whether by word* or *our epiſtle*." The next authority to which we ſhall have recourſe is that of Irenæus biſhop of Lyons, who had been a diſciple of Polycarp. He ſays in the only book of his extant, that "Matthew, among the Hebrews, wrote a goſpel in their own language, whilſt Peter and Paul were preaching the goſpel at Rome and founding the church there."

* *Hiſt.* lib. vi. cap. 25.

† Theſſ. ii. 15.

Euſeb. Hiſt. Eccl. lib. v. cap. 8.

To the teſtimony of theſe writers it may be objected, that, except Irenæus, they all lived in the third and fourth centuries, and conſequently their evidence is of little importance. But there is ſuch unanimity in the teſtimony, that it muſt have been derived from ſome authentic ſource. And is it fair to queſtion the veracity of reſpectable men merely becauſe we knew not from what writings they received their information? Many books which were then extant are now loſt; and how do we know but theſe might have contained ſufficient evidence? Irenæus at leaſt had the beſt opportunities of information, having been well acquainted in his youth with Polycarp, the diſciple of John; no objection can therefore be made to his evidence. But we can quote an authority ſtill nearer the times of the apoſtles. Papias biſhop of Hierapolis, in Cæſarea, who flouriſhed about A. D. 116, affirms that Matthew wrote his goſpel in the Hebrew tongue, which every one interpreted as he was able §. Papias was the companion of Polycarp, and beſides muſt have been acquainted with many perſons who lived in the time of the apoſtles. The fact therefore is fully eſtabliſhed, that Matthew, the apoſtle of our Saviour, was the author of that goſpel which is placed firſt in our editions of the New Teſtament.

§ *Euſeb. Hiſt. Eccl.* lib. iii. cap. 39.

The next ſubject of inquiry reſpects the language in which

The middle Chapter and the leaſt in the Bible is Pſalm 117.
The middle Verſe is the 8th of the 118th Pſalm.
The middle time is the 2d of Chronicles, 4th Chap. 16th Verſe.
The word *And* occurs in the Old Teſtament 35,543 times.
The ſame in the New Teſtament occurs 10,684 times.
The word *Jehovah* occurs 6855 times.

OLD TESTAMENT.

The middle Book is Proverbs.
The middle Chapter is Job 29th.
The middle Verſe is 2d Chron. 20th Chap. between 17th and 18th Verſes.
The leaſt Verſe is 1 Chron. 1ſt Chap. and 1ſt Verſe.

NEW TESTAMENT.

The middle Book is Theſſalonians 2d.
The middle Chapter is between the 13th and 14th Romans.
The middle Verſe is 17th Chap. Acts, 17th Verſe.
The leaſt Verſe is 11th Chap. John, Verſe 35.
The 21ſt Verſe of the 7th Chapter of Ezra has all the letters of the alphabet.
The 19th Chapter of 2d Kings and 37th of Iſaiah are alike.

Scripture.

which it was written. This we are aſſured by Papias, by Irenæus, and Origen, was the Hebrew; but the truth of this fact has been diſputed by Eraſmus, Whitby, and others. Whitby urges the improbability that Providence would have ſuffered the original of this goſpel to be loſt, and nothing to remain but a tranſlation. This is an argument of no force againſt written teſtimony; indeed we are always in danger of drawing falſe concluſions when we argue from our own opinions of the conduct of Providence: *For His ways are not as our ways, nor His thoughts as our thoughts.* But though we are forced to acknowledge that the goſpel according to Matthew which we poſſeſs is a tranſlation, it is evidently a cloſe one; and the very circumſtance that it has ſuperſeded the original, is a clear proof that it was thought equally valuable by the ancient Chriſtians. It is neceſſary to remark, that the language in which the goſpel according to Matthew was originally compoſed, and which is called Hebrew by Papias, Irenæus, and Origen, is not the ſame with the Hebrew of the Old Teſtament: it was what Jerome very properly terms Syro-Chaldaic, having an affinity to both languages, but much more to the Chaldean than to the Syrian.

143 Language in which it was written.

144 Date,

The time when this goſpel was compoſed has not been preciſely aſcertained by the learned. Irenæus ſays that "Matthew publiſhed his goſpel when Peter and Paul were preaching at Rome." Now Paul arrived at Rome A. D. 60 or 61, and it is very probable ſuffered martyrdom in A. D. 65. This may be juſtly concluded from comparing the relation of Tacitus with that of Oroſius, a writer of the fifth century. Oroſius having given an account of Nero's perſecution of the Chriſtians, and of the death of the two apoſtles in it, adds, that it was followed by a peſtilence in the city, and other diſaſters. And Tacitus relates that a peſtilence prevailed in the city, and violent ſtorms took place in Italy, in the year of Chriſt 65. Matthew's goſpel was therefore written between the year 60 and 65.

Lardner's Hiſt of the Apoſtles.

145 and deſign of it.

That this hiſtory was primarily intended for the uſe of the Jews, we have, beſides hiſtorical evidence, very ſtrong preſumptions from the book itſelf. Every circumſtance is carefully pointed out which might conciliate the faith of that nation; every unneceſſary expreſſion is avoided, which might in any way ſerve to obſtruct it. To come to particulars, there was no ſentiment relating to the Meſſiah with which the Jews were more ſtrongly poſſeſſed, than that he muſt be of the race of Abraham, and of the family of David. Matthew, therefore, with great propriety, begins his narrative with the genealogy of Jeſus. That he ſhould be born at Bethlehem in Judea, is another circumſtance in which the learned among the Jews were univerſally agreed. His birth in that city, with ſome very memorable circumſtances that attended it, this hiſtorian has alſo taken the firſt opportunity to mention. Thoſe paſſages in the prophets, or other ſacred books, which either foretel any thing that ſhould happen to him, or admit an alluſive appellation, or were in that age generally underſtood to be applicable to events which reſpect the Meſſiah, are never paſſed over in ſilence by this Evangeliſt. The fulfilment of prophecy was always to the Jews, who were convinced of the inſpiration of their ſacred writings, ſtrong evidence. Accordingly none of the Evangeliſts has been more careful than Matthew, that nothing of this kind ſhould be overlooked.

Dr Campbell's Preface to Matthew's Goſpel.

146 Diſtinguiſhing character.

That which chiefly diſtinguiſhes Matthew's writings from thoſe of the other Evangeliſts, is the minute and diſtinct manner in which he has related many of our Lord's diſcourſes and moral inſtructions. Of theſe his ſermon on the mount, his charge to the apoſtles, his illuſtrations of the nature of his kingdom, and his prophecy on Mount Olivet, are examples. He has alſo wonderfully united ſimplicity and energy in relating the replies of his maſter to the cavils of his adverſaries. Being early called to the apoſtleſhip, he was an eye and ear witneſs of moſt of the things which he relates. And there are circumſtances which incline Dr Campbell to think that Matthew has approached as near the preciſe order of time in which the events happened as any of the Evangeliſts.

Concerning the life of the apoſtle Matthew we have nothing to add, as the principal circumſtances in his life have already been mentioned. See MATTHEW.

The Goſpel according to Matthew is cited ſeven times in the epiſtle of Barnabas, twice in the firſt epiſtle of Clemens Romanus to the Corinthians, eight times in the Shepherd of Hermas, ſix times in Polycarp's ſmall epiſtle to the Philippians, and ſeven times in the ſmaller epiſtles of Ignatius. Theſe citations may be ſeen at full length in *Jones's New and Full Method of ſettling the Canon*, with the parallel paſſages in the goſpel according to Matthew.

147 Goſpel according to St Mark.

148 Its authenticity,

That Mark was the author of the goſpel which bears his name, and that it was the ſecond in the order of time, is proved by the unanimous teſtimony of the ancient Chriſtians. Many authorities are therefore unneceſſary; we ſhall only mention thoſe of Papias and Irenæus. Euſebius has preſerved the following paſſage of Papias: "This is what was related by the elder (that is, John, not the apoſtle, but a diſciple of Jeſus); Mark being Peter's interpreter wrote exactly whatever he remembered, not indeed in the order wherein things were ſpoken and done by the Lord; for he was not himſelf a hearer or follower of our Lord; but he afterwards, as I ſaid, followed Peter who gave inſtructions as ſuited the occaſions, but not as a regular hiſtory of our Lord's teaching. Mark, however, committed no miſtake in writing ſuch things as occurred to his memory: for of this one thing he was careful, to omit nothing which he had heard, and to inſert no falſehood into his narrative." Such is the teſtimony of Papias, which is the more to be regarded as he aſſigns his authority. He ſpake not from hearſay, but from the information which he had received from a moſt credible witneſs, John the elder, or preſbyter, a diſciple of Jeſus, and a companion of the apoſtles.

Hiſt. Eccl. lib. iii. cap. 39.

149 and date.

Irenæus, after telling us that Matthew publiſhed his goſpel whilſt Peter and Paul were preaching at Rome, adds: "After their departure (ἔξοδον), Mark alſo, the diſciple and interpreter of Peter, delivered to us in writing the things which had been preached by Peter." The Greek ἔξοδος, like the Engliſh word *departure*, may either denote death, which is a departure out of the world, or mean a departure out of the city. It is probably in the former of theſe ſenſes it is here uſed. Yet by the accounts given by ſome others, Mark's goſpel was publiſhed in Peter's lifetime, and had his approbation.

Adv. Haer. lib. iii. cap. 1.

Scripture. approbation. The goſpel of Mark is ſuppoſed to be but two years poſterior in date to that of Matthew. The preciſe year, however, cannot be determined with certainty; and it is a matter of no importance, ſince we have aſcertained the author and the time in which he lived.

Mark has generally been ſuppoſed to be the ſame perſon who is mentioned in the acts and ſome of Paul's epiſtles, who is called John, and was the nephew of Barnabas. But as this perſon was the attendant of Paul and Barnabas, and is nowhere in ſcripture ſaid to have accompanied Peter in his apoſtolical miſſion, which ancient writers inform us the author of the goſpel did, *Preface to Mark.* Dr Campbell has juſtly concluded that theſe were different perſons. The author of the goſpel is certainly meant by Peter when he ſays *Marcus my ſon ſaluteth you* *.

* 1 Pet v. 13.

150 Language in which it was written. That Mark wrote his goſpel in Greek, is as evidently conformable to the teſtimony of antiquity, as that Matthew wrote his in Hebrew or Syro Chaldaic. The cardinals Baronius and Bellarmine, anxious to exalt the language in which the vulgate was written, have maintained that this Evangeliſt publiſhed his work in Latin. The only appearance of teſtimony which has been produced in ſupport of this opinion is the inſcription ſubjoined to this goſpel in Syriac, and in ſome other oriental verſions. But theſe poſtſcripts are not the teſtimonies of the tranſlators: they proceed from the conjecture of ſome tranſcriber; but when written, or by whom, is equally unknown. Againſt poſitive teſtimony therefore they are entitled to no credit.

151 Deſign of it. From the Hebraiſms in the ſtyle, we ſhould readily conclude that the author was by birth and education a Jew. There are alſo expreſſions which ſhow that he had lived for ſome time among the Latins, as κεντυριων "centurion," and σπεκουλατωρ, "ſentinel;" words which do not occur in the other goſpels. There are other internal evidences that this goſpel was written beyond the confines of Judea. *Dr Campbell's Preface to Mark's Goſpel.* The firſt time the Jordan is metioned, ποταμος, "river," is added to the name for explanation; for though no perſon in Judea needed to be informed that Jordan was a river, the caſe was different in diſtant countries. The word *Gehenna*, which is tranſlated *Hell* in the New Teſtament, originally ſignified the *Valley of Hinnom*, where infants had been ſacrificed by fire to Moloch, and where a continual fire was afterwards kept up to conſume the filth of Jeruſalem. As this word could not have been underſtood by a foreigner, the Evangeliſt adds, by way of explanation, πυρ το ασβεστον, "the unquenchable fire." Inſtead of the word *Mammon*, he uſes the common term χρηματα "riches." When he employs the oriental word *Corban*, he ſubjoins the interpretation ὁ εστι δωρον, "that is, a gift." Theſe peculiarities will corroborate the hiſtorical evidence that has been already mentioned, that Mark intended his goſpel for the uſe of the Gentiles.

152 Mark not the abridger of Matthew. It has been affirmed that this evangeliſt is the abridger of Matthew. It is true that Mark ſometimes copies the expreſſions uſed by Matthew; but he is not to be conſidered as a mere abridger, for he omits altogether ſeveral things related by Matthew, viz. our Lord's pedigree, his birth, the viſit of the Magians, Joſeph's flight into Egypt, and the cruelty of Herod. Dr Lardner has given a liſt of thirty-three paſſages, wherein circumſtances are related which are omitted by the other evangeliſts. There is one parable, and an account of two miracles peculiar to Mark. The parable or ſimilitude is mentioned in chap. iv. 26. One of theſe miracles was the curing of a deaf and dumb man, chap. vii. 31, 37. The other was the giving ſight to a blind man at Bethſaida, chap. viii. 22, 26. The ſtyle of Mark, inſtead of being more conciſe than that of Matthew, is more diffuſe. That he had read Matthew's goſpel cannot be doubted, but that he abridged it, is a miſtake.

According to the teſtimony which has been already produced, Mark derived his information from the apoſtle Peter. It would be improper, therefore, not to remark, that this evangeliſt has omitted many things tending to Peter's honour, which are related in the other goſpels, and has given the moſt particular account of Peter's fall. This goſpel is ſeven times cited by Irenæus, and nine times by Tertullian. 153 but derived his information from Peter.

That the author of the goſpel which is the third in order was Luke, the companion of the apoſtle Paul, is evident from the teſtimonies of Irenæus, Clemens of Alexandria, Origen, Tertullian, and many ſucceeding writers. But it has been diſputed whether he was a Jew or a Gentile. That Luke was a Jew by birth, or at leaſt by religion, may be argued from his being a conſtant companion of Paul. If he had been an uncircumciſed Gentile, exceptions would have been made to him, eſpecially at Jeruſalem; but nothing of that kind appears. It is alſo rendered highly probable, from his mode of computing time by the Jewiſh feſtivals, and from his frequent uſe of the Hebrew idiom. It has been ſuppoſed that Luke was one of the 70 diſciples; but he does not pretend to have been a witneſs of our Lord's miracles and teaching; on the contrary, he tells us in his introduction, that he received his information from others. 154 Goſpel according to St Luke.

The deſign of Luke in writing his goſpel was to ſuperſede ſome imperfect and inaccurate hiſtories of our Saviour, which had then been publiſhed. What theſe were, it is impoſſible now to determine, as they are not mentioned by any contemporary writer, and probably did not ſurvive the age in which they were compoſed. 155 Deſign of it.

It has been ſuppoſed that Luke chiefly derived his information from the apoſtle Paul, whom he faithfully attended in his travels; but, from Luke's own words, we are led to conclude, that the principal ſource of his intelligence, as to the facts related in the goſpel, was from thoſe who had been eye and ear witneſſes of what our Lord both did and taught. Now Paul evidently was not of this number. It was from converſing with ſome of the twelve apoſtles or diſciples of our Lord, who heard his diſcourſes and ſaw his miracles, that he obtained his information. 156 From what ſource of information it was derived.

As to the time when this goſpel was written, we have hardly any thing but conjecture to guide us. But as Origen, Euſebius, and Jerome, have ranged it after thoſe of Matthew and Mark we have no reaſon to doubt but they were written in the ſame order.

The goſpel by Luke has ſupplied us with many intereſting particulars which had been omitted both by Matthew and Mark. It has given a diſtinct narration of the circumſtances attending the birth of John the Baptiſt and the nativity of our Saviour. It has given 157 Has ſupplied many omiſſions of the two former goſpels.

Scripture. an account of feveral memorable incidents and cures which had been overlooked by the reft; the converfion of Zaccheus the publican; the cure of the woman who had been bowed down for 18 years; the cure of the dropfical man; the cleanfing of the ten lepers; the inhofpitable treatment of our Saviour by the Samaritans, and the inftructive rebuke which he gave on that occafion to two of his difciples for their intemperate zeal; alfo the affecting interview which he had after his refurrection with two of his difciples. Luke has alfo added many edifying parables to thofe which the other evangelifts had recorded. Moft of thefe are fpecified by Irenæus as particularly belonging to this gofpel, and has thereby fhown to us, without intending it, that the gofpel of Luke was the fame in his time that it is at prefent.

Dr Campbell: Preface to Luke's Gofpel.

158 Style and compofition of it.

The ftyle of this evangelift abounds as much with Hebraifms as any of the facred writings, but it contains more of the Grecian idiom than any of them. It is alfo diftinguifhed by greater variety and copioufnefs; qualities which may be juftly afcribed to the fuperior learning of the author. His occupation as a phyfician would naturally induce him to employ fome time in reading, and give him eafier accefs to the company of the great than any of the other evangelifts. As an inftance of Luke's copioufnefs, Dr Campbell has remarked that each of the evangelifts has a number of words which are ufed by none of the reft; but in Luke's gofpel the number of fuch peculiarities or words, ufed in none of the other gofpels, is greater than that of the peculiar words found in all the three other gofpels put together; and that the terms peculiar to Luke are for the moft part long and compound words. The fame judicious writer has alfo obferved, that there is more of compofition in Luke's fentences than is found in the other three, and confequently lefs fimplicity. Of this the very firft fentence is an example, which occupies no lefs than four verfes. Luke, too, has a greater refemblance to other hiftorians, in giving what may be called his own verdict in the narrative part of this work; a freedom which the other evangelifts have feldom or never ventured to ufe. He calls the Pharifees *lovers of money*; in diftinguifhing Judas Ifcariot from the other Judas, he ufes the phrafe, *he who proved a traitor*, (ος και εγενετο προδοτης). Matthew and Mark exprefs the fame fentiment in milder language, "he who delivered him up." In recording the moral inftructions of our Lord, efpecially his parables, this evangelift has united an affecting fweetnefs of manner with genuine fimplicity.

Chap xvi. 14.

159 Cited by ancient Chriftian authors.

This gofpel is frequently cited by Clemens Romanus, the contemporary of the Apoftles, by Ignatius, and Juftin Martyr. Irenæus has made above a hundred citations from it. In his lib. iii. *adv. Haref.* c. 14. he vindicates the authority and perfection of Luke's gofpel, and has produced a collection of thofe facts which are only recorded by this evangelift.

160 Gofpel according to John.

That the gofpel which is placed laft in our editions of the New Teftament was written by John, one of our Saviour's apoftles, is confirmed by the unanimous teftimony of the ancient Chriftians. He was the fon of Zebedee, a fifherman of Bethfaida in Galilee, by his wife Salome, and the brother of James, furnamed the elder or greater. He was the beloved difciple of our Saviour, and was honoured, along with Peter and James, with many marks of diftinction which were not conferred on the other difciples. He poffeffed a high degree of intrepidity and zeal, a warm and affectionate heart, and was ftrongly attached to his mafter. His brother James and he were honoured with the title of Boanerges, or *Sons of Thunder*. He was anxious to reftrain whatever he confidered as a mark of difrefpect againft his mafter, and to punifh his enemies with feverity. He was incenfed againft fome perfons for attempting to caft out demons in the name of Jefus; and required them to defift becaufe they were not his difciples. James and he propofed to our Saviour to call down fire from heaven to punifh the inhofpitable Samaritans. Nor was the courage of John lefs ardent than his zeal. When Peter had difowned his Lord, and all the other difciples had fled, John continued to attend his mafter. He was prefent at his trial, and followed him to the crofs, where he was a fpectator of his fufferings and death. The interview between Jefus and this difciple at Calvary, though concifely related, is an event which will ftrongly affect every man of feeling, while it convinces him of the unalterable affection of Jefus to his beloved difciple, as well as difcovers his refpectful tendernefs for his mother. See JOHN. 161

Motives for writing it.

The ancients inform us, that there were two motives which induced John to write his gofpel: the one, that he might refute the herefies of Cerinthus and the Nicolaitans, who had attempted to corrupt the Chriftian doctrine; the other motive was, that he might fupply thofe important events in the life of our Saviour which the other evangelifts had omitted. Of the former of thefe motives Irenæus gives us the following account: "John, defirous to extirpate the errors fown in the minds of men by Cerinthus, and fome time before by thofe called Nicolaitans, publifhed his gofpel; wherein he acquaints us that there is one God, who made all things by his word, and not, as they fay, one who is the Creator of the world, and another who is the father of the Lord; one the fon of the Creator, and another the Chrift, from the fupercaeleftial abodes who defcended upon Jefus, the fon of the Creator, but remained impaffible, and afterwards fled back into his own pleroma or fulnefs." As Irenæus is the moft ancient author who has written upon this fubject, many appeals 162 have been made to his authority. The authority of Irenæus is certainly refpectable, and we have often referred to his teftimony with confidence; but we think it neceffary to make a diftinction between receiving his teftimony to a matter of fact, and implicitly adopting his opinion. He does not tell us, that he derived his information from any preceding writer, or indeed from any perfon at all. Nay, he feems to have believed that John wrote againft thefe herefies by a prophetic fpirit; for he fays in another place, chap. xx. 30. "As John the difciple of our Lord affures us, faying, But thefe are written, that ye might believe that Jefus is the Chrift, the Son of God, and that believing ye might have life through his name; *FORESEEING thefe blafphemous notions that divide the Lord, fo far as it is in their power.*"

Not to confute herefics.

Indeed it feems very improbable that an apoftle fhould write a hiftory of our Lord on purpofe to confute the wild opinions of Cerinthus or any other heretic. Had John confidered fuch a confutation neceffary, it is more likely that he would have introduced it into

Scripture. into an epiftle than blended it with the actions of his venerable Mafter. But were the opinion of Irenæus well-founded, we fhould furely difcover fome traces of it in the gofpel of John; yet except in the introduction, there is nothing that can with the leaft fhadow of probability be applied to the opinions of Cerinthus; and few, we prefume, will affirm, that the gofpel of John was compofed merely for the fake of the firft eighteen verfes.

163 But to prove that Jesus was the Meffiah the Son of God.

The intention of John in writing his gofpel was far more extenfive and important than to refute the opinions of a few men who were to fink into oblivion in the courfe of a few centuries. It was evidently (according to the opinion of Clemens of Alexandria) to fupply the omiffions of the other evangelifts: It was to exhibit the evidences of the Chriftian religion in a diftinct and perfpicuous manner: It was, as he himfelf in the conclufion of his gofpel affures us, to convince his readers, *that Jefus is the Meffiah, the Son of God, and that believing they might have life through his name* *. Now it will appear to any perfon who reads this gofpel with attention, that he has executed his plan with aftonifhing ability, and has given the moft circumftantial and fatisfactory evidence that Jefus was the Meffiah the Son of God. After declaring the pre-exiftence of Jefus, he proceeds to deliver the teftimony of John the Baptift, and felects fome of the greateft miracles of Jefus to prove his divine miffion. In the fifth chapter he prefents us with a difcourfe which our Saviour delivered in the temple in the prefence of the Jews, wherein he ftates in a very diftinct manner the proofs of his miffion from, 1. The teftimony of John; 2. His own miracles; 3. The declaration of the Father at his baptifm; 4. The Jewifh Scriptures. Indeed the conclufion that Jefus was the Meffiah the Son of God, naturally arifes from almoft every miracle which our Saviour is faid to have performed, and from every difcourfe that he delivered. This declaration is very often made by our Saviour himfelf; particularly to the woman of Samaria, to Nicodemus, and to the blind man whom he had cured.

* John xv. 31.

164 Is a fupplement to the other three gofpels.

It muft be evident to every reader, that John ftudioufly paffes over thofe paffages in our Lord's hiftory and teaching which had been treated at large by the other evangelifts, or, if he mentions them at all, he mentions them flightly. This confirms the teftimony of ancient writers, that the firft three gofpels were written and publifhed before John compofed his gofpel. Except the relation of our Saviour's trial, death, and refurrection, almoft every thing which occurs in this book is new. The account of our Saviour's nativity, of his baptifm, and of his temptation in the wildernefs, is omitted; nor is any notice taken of the calling of the twelve apoftles, or of their miffion during our Saviour's life. It is remarkable, too, that not one parable is mentioned, nor any of the predictions relating to the deftruction of Jerufalem. All the miracles recorded by the other evangelifts are paffed over, except the miraculous fupply of provifion, by which five thoufand were fed: and it is probable that this miracle was related for the fake of the difcourfe to which it gave birth. The other miracles which are mentioned are few in number, but in general they are minutely detailed. They confift of thefe: the turning of water into wine at Cana; the cure of the difeafed man at the pool of Bethefda; the cure of the man that had been blind from his birth; the reftoring of Lazarus to life; and the healing of the fervant's ear which Peter had cut off. But valuable would this gofpel be, though it had only recorded the confolation of Jefus to his difciples previous to his departure; which exhibits a moft admirable view of our Saviour's character, of his care and tender regard for his difciples. Having opened every fource of comfort to their defponding minds; exhorted them to mutual love, and to the obedience of his Father's precepts; having warned them of the impending dangers and forrows—our Saviour concludes with a prayer, in the true fpirit of piety and benevolence; ardent without enthufiafm, fober and rational without lukewarmnefs. 165

Dr Campbell's Preface to John's Gofpel.

Time at which it was written.

The time in which this gofpel was written has not been fixed with any precifion. Irenæus informs us, that it was written at Ephefus, but leaves us to conjecture whether it was written before or after John's return from Patmos. He was banifhed to Patmos by Domitian, who reigned 15 years, and according to the beft computation died A. D. 96. The perfecution which occafioned the exile of John commenced in the 14th year of Domitian's reign. If John wrote his gofpel after his return to Ephefus, which is affirmed by Epiphanius to have been the cafe, we may fix the date of it about the year 97 (F). 166

Style of it;

This gofpel is evidently the production of an illiterate Jew, and its ftyle is remarkable for fimplicity. It abounds more with Hebraifms than any of the other gofpels; and contains fome ftrong oriental figures which are not readily underftood by an European. 167

Often quoted by ancient Chriftians.

This gofpel is cited once by Clemens Romanus, by Barnabas three times, by Ignatius five times, by Juftin Martyr fix times, by Irenæus, and above forty times by Clemens Alexandrinus. 168

Acts of the apoftles.

The book which we intitle the Acts of the Apoftles connects the gofpels and the epiftles. It is evidently a continuation of Luke's gofpel, which appears both from the introduction and from the atteftations of ancient Chriftians. Both are dedicated to Theophilus; and in the beginning of the Acts a reference is made to his gofpel, which he calls *a former treatife*, recording the actions and difcourfes of Jefus till his afcenfion to heaven. Luke is mentioned as the author of the Acts of the Apoftles by Irenæus, by Tertullian, by Origen, and Eufebius.

From the frequent ufe of the firft perfon plural, it is manifeft that Luke the author was prefent at many of the

(F) It has been argued from a paffage in this gofpel, that it muft have been written before the deftruction of Jerufalem. In fpeaking of the pool of Bethefda, John ufes the prefent tenfe: His words are, "There *is* at Jerufalem." Now if thefe words had been written after the deftruction of Jerufalem, it is urged the paft tenfe would have been ufed, and not the prefent. This argument is more fpecious than forcible. Though Jerufalem was demolifhed, does it follow that the pool of Bethefda was dried up?

Scripture. the tranfactions which he relates. He appears to have accompanied Paul from Troas to Philippi. He attended him alfo to Jerufalem, and afterwards to Rome, where he remained for two years. He is mentioned by Paul in feveral of thofe epiftles which were written from Rome, particularly in the 2d epiftle to Timothy, and in the epiftle to Philemon.

This book contains the hiftory of the Chriftian church for the fpace of about 28 or 30 years, from the time of our Saviour's afcenfion to Paul's arrival at Rome in the year 60 or 61. As it informs us that Paul refided two years in Rome, it muft have been written after the year 63; and as the death of Paul is not mentioned, it is probable it was compofed before that event, which happened A. D. 65.

169 Contents of that book. The Acts of the Apoftles may be divided into feven parts. 1. The account of our Saviour's afcenfion, and of the occurrences which happened on the firft Pentecoft after that event, contained in chap. i. ii. 2. The tranfactions of the Chriftians of the circumcifion at Jerufalem, in Judea, and Samaria, chap. iii.—ix. xi. 1—21. xii. 3. Tranfactions in Cæfarea, and the admiffion of the Gentiles, chap. x. 4. The firft circuit of Barnabas and Paul among the Gentiles, chap. xi. 22. xiii. xiv. 5. Embaffy to Jerufalem, and the firft council held in that city, chap. xv. 6. Paul's fecond journey, chap. xvi.—xxi. 7. His arreftment, trial, appeal to Cæfar, and journey to Rome, chap. xxi. to the end of the book.

170 Often cited by the early Chriftians. The Acts of Apoftles are cited by Clemens Romanus, by Polycarp, by Juftin Martyr, thirty times by Irenæus, and feven times by Clemens Alexandrinus.

171 The epiftles. All the effential doctrines and precepts of the Chriftian religion were certainly taught by our Saviour himfelf, and are contained in the gofpels. The epiftles may be confidered as commentaries on the doctrines of the gofpel, addreffed to particular focieties, accommodated to their refpective fituations; intended to refute the errors and falfe notions which prevailed among them, and to inculcate thofe virtues in which they were moft deficient.

172 General plan of them. The plan on which thefe LETTERS are written is, firft, to decide the controverfy, or refute the erroneous notions which had arifen in the fociety to which the epiftle was addreffed: And, fecondly, to recommend thofe duties which their falfe doctrines might induce them to neglect; at the fame time inculcating in general exhortations the moft important precepts of Chriftian morality.

173 Arranged in chronological order. Of the epiftles fourteen were written by St Paul. Thefe are not placed according to the order of time in which they were compofed, but according to the fuppofed precedence of the focieties or perfons to whom they were addreffed. It will be proper therefore to exhibit here their chronological order according to Dr Lardner.

A TABLE of St PAUL'S EPISTLES, with the Places where, and times when, written, according to Dr Lardner.

Epiftles.	Places.		A. D.
1 Theffalonians	Corinth		52
2 Theffalonians	Corinth		52
Galatians	Corinth or Ephefus	near the end of / or beginning of	52 / 53
1 Corinthians	Ephefus	the beginning of	53
1 Timothy	Macedonia		56
Titus	Macedonia or near it	bef. the end of	56
2 Corinthians	Macedonia	about October	57
Romans	Corinth	about February	58
Ephefians	Rome	about April	61
2 Timothy	Rome	about May	61
Philippians	Rome	bef. the end of	62
Coloffians	Rome	bef. the end of	62
Philemon	Rome	bef. the end of	62
Hebrews	Rome or Italy	in Spring of	63

A TABLE of the CATHOLIC EPISTLES, and the REVELATION, according to Dr Lardner.

Epiftle.	Place.		A. D.
James	Judea	or beg. of	61 / 62
The two Epiftles of Peter	Rome		64
1 John	Ephefus	about	80
2d and 3d of John	Ephefus	between and	80 / 90
Jude	Unknown		64 or 65
Revelation	Patmos or Ephefus		95 or 96

It is more difficult to underftand the epiftolary writings than the gofpels; the caufe of which is evident. Many things are omitted in a letter, or flightly mentioned, becaufe fuppofed to be known by the perfon to whom it is addreffed. To a ftranger this will create much difficulty. The bufinefs about which St Paul wrote was certainly well known to his correfpondents; but at this diftance of time we can obtain no information concerning the occafion of his writing, of the character and circumftances of thofe perfons for whom his letters were intended, except what can be gleaned from the writings themfelves. It is no wonder, therefore, though many allufions fhould be obfcure. Befides, it is evident from many paffages that he anfwers letters and queftions which his correfpondents had fent him. If thefe had been preferved, they would have thrown more light upon many things than all the notes and conjectures of the commentators. 174 Caufes of their obfcurity.

The caufes of obfcurity which have been now mentioned are common to all the writers of the epiftles; but there are fome peculiar to St Paul. 1. As he had an acute and fertile mind, he feems to have written with great rapidity, and without attending much to the common rules of method and arrangement. To this caufe we may afcribe his numerous and long parenthefes. In the heat of argument he fometimes breaks off abruptly to follow out fome new thought; and when he has exhaufted it, he returns from his digreffion without informing his readers; fo that it requires great attention to retain the connection. 2. His frequent change of perfon, too, creates ambiguity: by the pronoun *I* he fometimes means himfelf; fometimes any Chriftian; fometimes a Jew, and fometimes any man. In ufing the pronoun WE he fometimes intends himfelf; fometimes comprehends his companions; fometimes the apoftles; 175 Caufes of obfcurity peculiar to St Paul's epiftles.

Scripture.

tles; at one time he alludes to the converted Jews, at another time to the converted Gentiles. 3. There is a third cause of obscurity; he frequently proposes objections, and answers them without giving any formal intimation. There are other difficulties which arise from our uncertainty who are the persons he is addressing, and what are the particular opinions and practices to which he refers. To these we may add two external causes, which have increased the difficulty of understanding the epistles. 1. The dividing them into chapters and verses, which dissolves the connection of the parts, and breaks them into fragments. If Cicero's epistles had been so disjointed, the reading of them would be attended with less pleasure and advantage, and with a great deal more labour. 2. We are accustomed to the phraseology of the epistles from our infancy; but we have either no idea at all when we use it, or our idea of it is derived from the articles or system which we have espoused. But as different sects have arbitrary definitions for St Paul's phrases, we shall never by following them discover the meaning of St Paul, who certainly did not adjust his phraseology to any man's system.

The best plan of studying the epistles is that which was proposed and executed by Mr Locke. This we shall present to our readers in the words of that acute and judicious author.

175 Mr Locke's plan of studying the epistles.

"After I had found by long experience, that the reading of the text and comments in the ordinary way proved not so successful as I wished to the end proposed, I began to suspect that in reading a chapter as was usual, and thereupon sometimes consulting expositors upon some hard places of it, which at that time most affected me, as relating to points then under consideration in my own mind, or in debate against others, was not a right method to get into the true sense of these epistles. I saw plainly, after I began once to reflect on it, that if any one should write me a letter as long as St Paul's to the Romans, concerning such a matter as that is, in a style as foreign, and expressions as dubious as his seem to be, if I should divide it into fifteen or sixteen chapters, and read one of them to-day, and another to-morrow, &c. it is ten to one I should never come to a full and clear comprehension of it. The way to understand the mind of him that writ it, every one would agree, was to read the whole letter through from one end to the other all at once, to see what was the main subject and tendency of it: or if it had several views and purposes in it, not dependent one of another, nor in a subordination to one chief aim and end, to discover what those different matters were, and where the author concluded one, and began another; and if there were any necessity of dividing the epistle into parts, to make the boundaries of them.

"In the prosecution of this thought, I concluded it necessary, for the understanding of any one of St Paul's epistles, to read it all through at one sitting, and to observe as well as I could the drift and design of his writing it. If the first reading gave me some light, the second gave me more; and so I persisted on reading constantly the whole epistle over at once till I came to have a good general view of the apostle's main purpose in writing the epistle, the chief branches of his discourse wherein he prosecuted it, the arguments he used, and the disposition of the whole.

"This, I confess, is not to be obtained by one or two hasty readings; it must be repeated again and again with a close attention to the tenor of the discourse, and a perfect neglect of the divisions into chapters and verses. On the contrary, the safest way is to suppose that the epistle has but one business and one aim, till by a frequent perusal of it you are forced to see there are distinct independent matters in it, which will forwardly enough show themselves.

"It requires so much more pains, judgement, and application, to find the coherence of obscure and abstruse writings, and makes them so much the more unfit to serve prejudice and preoccupation when found; that it is not to be wondered that St Paul's epistles have with many passed rather for disjointed, loose, pious discourses, full of warmth and zeal, and overflows of light, rather than for calm, strong, coherent reasonings, that carried a thread of argument and consistency all through them."

Mr Locke tells us he continued to read the same epistle over and over again till he discovered the scope of the whole, and the different steps and arguments by which the writer accomplishes his purpose. For he was convinced before reading his epistles, that Paul was a man of learning, of sound sense, and knew all the doctrines of the gospel by revelation. The speeches recorded in the Acts of the Apostles convinced this judicious critic that Paul was a close and accurate reasoner: and therefore he concluded that his epistles would not be written in a loose, confused, incoherent style. Mr Locke accordingly followed the chain of the apostle's discourse, observed his inferences, and carefully examined from what premises they were drawn, till he obtained a general outline of any particular epistle. If every divine would follow this method, he would soon acquire such a knowledge of Paul's style and manner, that he would peruse his other Epistles with much greater ease.

177 Epistle to the Romans.

That the Epistle to the Romans was written at Corinth by St Paul, is ascertained by the testimony of the ancient Christians. It was composed in the year 58, in the 24th year after Paul's conversion, and is the seventh epistle which he wrote. From the Acts of the Apostles we learn that it must have been written within the space of three months; for that was the whole period of Paul's residence in Greece, (Acts xx. 1, 2, 3.)

178 Its date.

The following analysis of this epistle we have taken from a valuable little treatise, intitled A Key to the New Testament, which was written by Dr Percy bishop of Dromore. It exhibits the intention of the apostle, and the arguments which he uses to prove his different propositions, in the most concise, distinct, and connected manner, and affords the best view of this Epistle that we have ever seen.

179 General design.

"The Christian church at Rome appears not to have been planted by any apostle; wherefore St Paul, lest it should be corrupted by the Jews, who then swarmed in Rome, and of whom many were converted to Christianity, sends them an abstract of the principal truths of the gospel, and endeavours to guard them against those erroneous notions which the Jews had of justification, and of the election of their own nation.

"Now the Jews assigned three grounds for justification. First, 'The extraordinary piety and merits of their ancestors, and the covenant made by God with these holy men.' They thought God could not hate the chil-

Scripture. dren of ſuch meritorious parents; and as he had made a covenant with the patriarchs to bleſs their poſterity, he was obliged thereby to pardon their ſins.' Secondly, 'A perfect knowledge and diligent ſtudy of the law of Moſes.' They made this a plea for the remiſſion of all their ſins and vices. Thirdly, 'The works of the Levitical law,' which were to expiate ſin, eſpecially circumciſion and ſacrifices. Hence they inferred that the Gentiles muſt receive the whole law of Moſes, in order to be juſtified and ſaved.

"The doctrine of the Jews concerning election was, 'That as God had promiſed to Abraham to bleſs his ſeed, to give him not only ſpiritual bleſſings, but alſo the land of Canaan, to ſuffer him to dwell there in proſperity, and to conſider him as his church upon earth:' That therefore this bleſſing extended to their whole nation, and that God was bound to fulfil theſe promiſes to them, whether they were righteous or wicked, faithful or unbelieving. They even believed that a prophet ought not to pronounce againſt their nation the prophecies with which he was inſpired; but was rather to beg of God to expunge his name out of the book of the living.

"Theſe previous remarks will ſerve as a key to unlock this difficult Epiſtle, of which we ſhall now give a ſhort analyſis. See *Michaelis's Lectures on the New Teſtament*.

180 and analyſis of it. "I. The Epiſtle begins with the uſual ſalutation with which the Greeks began their letters, (chap. i. 1—7.)

"II. St Paul profeſſes his joy at the flouriſhing ſtate of the church at Rome, and his deſire to come and preach the goſpel (ver. 8—19.): then he inſenſibly introduces the capital point he intended to prove, viz.

"III. The ſubject of the goſpel (ver. 16, 17.), that it reveals a righteouſneſs unknown before, which is derived ſolely from faith, and to which Jews and Gentiles have an equal claim.

"IV. In order to prove this, he ſhows (chap. i. 18.—iii. 20.) that both Jews and Gentiles are 'under ſin,' i. e. that God will impute their ſins to Jews as well as to Gentiles.

"His arguments may be reduced to theſe ſyllogiſms (chap. ii. 17—24.) 1. 'The wrath of God is revealed againſt thoſe who hold the truth in unrighteouſneſs; i. e. who acknowledge the truth, and yet ſin againſt it. 2. The Gentiles acknowledged truths; but, partly by their idolatry, and partly by their other deteſtable vices, they ſinned againſt the truth they acknowledged. 3. Therefore the wrath of God is revealed againſt the Gentiles, and puniſheth them. 4. The Jews have acknowledged more truths than the Gentiles, and yet they ſin. 5. Conſequently the Jewiſh ſinners are yet more expoſed to the wrath of God (ch. ii. 1—12. Having thus proved his point, he anſwers certain objections to it. *Obj.* 1. 'The Jews were well grounded in their knowledge, and ſtudied the law.' He anſwers, If the knowledge of the law, without obſerving it, could juſtify them, then God could not have condemned the Gentiles, who knew the law by nature, (ch. ii. 13—16.) *Obj.* 2. 'The Jews were circumciſed.' *Anſ.* That is, ye are admitted by an outward ſign into the covenant with God. This ſign will not avail you when ye violate that covenant (ch. ii. 25. to the end). *Obj.* 3. 'According to this doctrine of St Paul, the Jews have no advantage before others.' *Anſ.* Yes, they ſtill have advantages; for unto them are committed the oracles of God. But their privileges do not extend to this, that God ſhould overlook their ſins, which, on the contrary, Scripture condemns even in the Jews (ch. iii. 1—19.). *Obj.* 4. 'They had the Levitical law and ſacrifices.' *Anſ.* From hence is no remiſſion, but only the knowledge of ſin. (ch. iii. 20.). Scripture.

"V. From all this St Paul concludes, that Jews and Gentiles may be juſtified by the ſame means, namely, without the Levitical law, through faith in Chriſt: And in oppoſition to the imaginary advantages of the Jews, he ſtates the declaration of Zechariah, that God is the God of the Gentiles as well as of the Jews, (ch. iii. 21. to the end.

"VI. As the whole bleſſing was promiſed to the faithful deſcendents of Abraham, which both Scripture and the Jews call his children, he proves his former aſſertion from the example of Abraham; who was an idolater before his call, but was declared juſt by God, on account of his faith, long before his circumciſion. Hence he takes occaſion to explain the nature and fruits of faith, (ch. iv. 1. v. 11.).

"VII. He goes on to prove from God's juſtice, that the Jews had no advantages over the Gentiles with reſpect to juſtification. Both Jews and Gentiles had forfeited life and immortality, by the means of one common father of their race, whom they themſelves had not choſen. Now as God was willing to reſtore immortality by a new ſpiritual head of a covenant, viz. Chriſt, it was juſt that both Jews and Gentiles ſhould ſhare in this new repreſentative of the whole race (ch. v. 12. to the end).—Chap. v. ver. 15, 16. amounts to this negative queſtion, 'Is it not fitted that the free gift ſhould extend as far as the offence?'

"VIII. He ſhows that the doctrine of juſtification, as ſtated by him, lays us under the ſtrongeſt obligations of holineſs, (ch. vi. 1. to the end).

"IX. He ſhows that the law of Moſes no longer concerns us at all; for our juſtification ariſes from our appearing in God's ſight, as if actually dead with Chriſt on account of our ſins; but the law of Moſes was not given to the dead. On this occaſion he proves at large, that the eternal power of God over us is not affected by this; and that whilſt we are under the law of Moſes we perpetually become ſubject to death, even by ſins of inadvertency, (ch. vii. 1. to the end).

"X. Hence he concludes, that all thoſe, and thoſe only, who are united with Chriſt, and for the ſake of his union, do not live according to the fleſh, are free from all condemnation of the law, and have an undoubted ſhare in eternal life, (ch. viii. 1.—17.).

"XI. Having deſcribed their bleſſedneſs, he is aware that the Jews, who expected a temporal happineſs, ſhould object to him, that Chriſtians notwithſtanding endure much ſuffering in this world. He anſwers this objection at large, (ch. viii. 18 to the end).

"XII. He ſhows that God is not the leſs true and faithful, becauſe he doth not juſtify, but rather rejects and puniſhes, thoſe Jews who would not believe the Meſſiah, (ch. ix. x. xi.). In diſcuſſing this point, we may obſerve the cautious manner in which, on account of the Jewiſh prejudices, he introduces it (ch. ix. 1.—5.), as well as in the diſcuſſion itſelf.

"He ſhows that the promiſes of God were never made to all the poſterity of Abraham, and that God al-

ways

Scripture. ways reserved to himself the power of choosing those sons of Abraham whom, for Abraham's sake, he intended to bless, and of punishing the wicked sons of Abraham; and that with respect to temporal happiness or misery, he was not even determined in his choice by their works. Thus he rejected Ishmael, Esau, the Israelites in the desert in the time of Moses, and the greater part of that people in the time of Isaiah, making them a sacrifice to his justice, (ch. ix. 6.—29.).

"He then proceeds to show, that God had reason to reject most of the Jews then living, because they would not believe in the Messiah, though the gospel had been preached to them plainly enough, (ch. ix. 30. x. to the end). However, that God had not rejected all the people, but was still fulfilling his promise upon many thousand natural descendants of Abraham, who believed in the Messiah, and would in a future period fulfil them upon more; for that all Israel would be converted, (ch. xi. 1—32.). And he concluded with admiring the wise counsels of God, (ver. 33. to the end).

"XIII. From the doctrine hitherto laid down, and particularly from this, that God has in mercy accepted the Gentiles; he argues, that the Romans should consecrate and offer themselves up wholly to God. This leads him to mention in particular some Christian duties, (ch. xii.), viz.

"XIV. He exhorts them to be subject to magistrates (ch. xiii. 1—7.); the Jews at that time being given to sedition.

"XV. To love one another heartily (ver. 2—10.). And,

"XVI. To abstain from those vices which were considered as things indifferent among the Gentiles, (ver. 11. to the end).

"XVII. He exhorts the Jews and Gentiles in the Christian church to brotherly unity, (ch. xiv. 2. xv. 13.).

"XVIII. He concludes his Epistle with an excuse for having ventured to admonish the Romans, whom he had not converted; with an account of the journey to Jerusalem; and with some salutations to those persons whom he meant to recommend to the church at Rome." See *Michaelis's Lectures on the New Testament*.

181 First Epistle to the Corinthians. Corinth was a wealthy and luxurious city, built upon the isthmus which joins the Morea to the northern parts of Greece. In this city Paul had spent two years founding a Christian church, which consisted of a mixture of Jews and Gentiles, but the greater part Gentiles.

182 Its date. About three years after the apostles had left Corinth, he wrote this Epistle from Ephesus in the year 56 or 57, and in the beginning of Nero's reign. That it was written from Ephesus, appears from the salutation with which the Epistle closes, (chap. xvi. 19.). "The churches of Asia salute you. Aquila and Priscilla salute you much in the Lord." From these words it is evident, in the 1st place, that the Epistle was written in Asia. 2dly, It appears from Acts xviii. 18, 19. that Aquila and Priscilla accompanied Paul from Corinth to Ephesus, where they seem to have continued till Paul's departure.

St Paul had certainly kept up a constant intercourse with the churches which he had founded; for he was evidently acquainted with all their revolutions. They seem to have applied to him for advice in those difficult cases which their own understanding could not solve; and he was ready on all occasions to correct their mistakes.

This Epistle consists of two parts. 1. A reproof for those vices to which they were most propense; 2. An answer to some queries which they had proposed to him. 183 General design of it.

The Corinthians, like the other Greeks, had been accustomed to see their philosophers divide themselves into different sects; and as they brought along with them into the Christian church their former opinions and customs, they wished, as before, to arrange themselves under different leaders. In this Epistle Paul condemns these divisions as inconsistent with the spirit of Christianity, which inculcates benevolence and unanimity, and as opposite to the conduct of Christian teachers, who did not, like the philosophers, aspire after the praise of eloquence and wisdom. They laid no claim to these nor to any honour that cometh from men. The apostle declares, that the Christian truths were revealed from heaven; that they were taught with great plainness and simplicity, and proved by the evidence of miracles, (chap. i. 1.). He dissuades them from their divisions and animosities, by reminding them of the great trial which every man's work must undergo; of the guilt they incurred by polluting the temple or church of God; of the vanity of human wisdom; and of glorying in men. He admonishes them to esteem the teachers of the gospel only as the servants of Christ; and to remember that every superior advantage which they enjoyed was to be ascribed to the goodness of God, (chap. iii. 4.). 184 The apostle reproves the Corinthians for their vices;

2. In the fifth chapter the apostle considers the case of a notorious offender, who had married his stepmother; and tells them, that he ought to be excommunicated. He also exhorts the Christians not to associate with any person who led such an openly profane life.

3. He censures the Corinthians for their litigious disposition, which caused them to prosecute their Christian brethren before the Heathen courts. He expresses much warmth and surprise that they did not refer their differences to their brethren; and concludes his exhortations on this subject, by assuring them that they ought rather to allow themselves to be defrauded than to seek redress from Heathens (chap. v. 1—9.).

4. He inveighs against those vices to which the Corinthians had been addicted before their conversion, and especially against fornication, the criminality of which they did not fully perceive, as this vice was generally overlooked in the systems of the philosophers, (chap. vi. 10. to the end).

Having thus pointed out the public irregularities with which they were chargeable, he next replies to certain questions which the Corinthians had proposed to him by letter. He, 1. Determines some questions relating to the marriage state; as, 1st, Whether it was good to marry under the existing circumstances of the church? And, 2d, Whether they should withdraw from their partners if they continued unbelievers? (chap. vii.). 185 And answers certain questions which they had proposed to him.

2. He instructs them how to act with respect to idol offerings. It could not be unlawful in itself to eat the food which had been offered to idols; for the consecration of flesh or wine to an idol did not make it the property of the idol, an idol being nothing, and therefore incapable

Scripture.

incapable of property. But ſome Corinthians thought it lawful to go to a feaſt in the idol temples, which at the ſame time were places of reſort for lewdneſs, and to eat the ſacrifices while praiſes were ſung to the idol. This was publicly joining in the idolatry. He even adviſes to abſtain from ſuch participation as was lawful, rather than give offence to a weak brother; which he enforces by his own example, who had abſtained from many lawful things, rather than prove a ſcandal to the goſpel, (chap. viii. ix. x.).

3. He anſwers a third query concerning the manner in which women ſhould deliver any thing in public, when called to it by a divine impulſe. And here he cenſures the unuſual dreſs of both ſexes in propheſying, which expoſed them to the contempt of the Greeks, among whom the men uſually went uncovered and the women veiled.

Being thus led to the conſideration of the abuſes that prevailed in their public worſhip, he goes on to cenſure the irregularities which were committed at their love-feaſts, or, as we term them, the *Lord's Supper*. It was a common practice with the Greeks at their ſocial ſuppers for every man to bring his own proviſions along with him, not, however, to ſhare them with the company, but to feaſt on them in a ſolitary manner. Thus the rich ate and drank to exceſs, whilſt the poor were totally neglected. The Corinthians introduced the ſame practice in the celebration of the Lord's Supper, thus confounding it with their ordinary meals, and without ever examining into the end of the inſtitution. It was this groſs abuſe that Paul reproves in the 11th chapter. He alſo cenſures their conduct in the exerciſe of the extraordinary gifts of the Holy Ghoſt; he ſhows them they all proceeded from the ſame ſpirit, and were intended for the inſtruction of Chriſtian ſocieties; that all Chriſtians ought to be united in mutual love; and that tenderneſs ought to be ſhown to the moſt inconſiderable member, as every one is ſubſervient to the good of the whole (chap. xii.). In the 13th chapter he gives a beautiful deſcription of benevolence, which has been much and juſtly admired. He repreſents it as ſuperior to the ſupernatural gifts of the ſpirit, to the moſt exalted genius, to univerſal knowledge, and even to faith. In the 14th chapter he cautions the Corinthians againſt oſtentation in the exerciſe of the gift of languages, and gives them proper advices.

4. He aſſerts the reſurrection of the dead, in oppoſition to ſome of the Corinthians who denied it, founding it on the reſurrection of Jeſus Chriſt, which he conſiders as one of the moſt eſſential doctrines of Chriſtianity. He then anſwers ſome objections to the reſurrection, drawn from our not being capable of underſtanding how it will be accompliſhed, (chap. xv.). He then concludes with ſome directions to the Corinthian church concerning the manner of collecting alms; promiſes them a viſit, and ſalutes ſome of the members.

186 The ſecond Epiſtle to the Corinthians.

The ſecond Epiſtle to the Corinthians was written from Macedonia in the year 57, about a year after the former. See 2 Cor. ix. 1—5. viii. and xiii. 1.

187 State of the Corinthian church.

St Paul's firſt Epiſtle had wrought different effects among the Corinthians: many of them examined their conduct; they excommunicated the inceſtuous man; requeſted St Paul's return with tears; and vindicated him and his office againſt the falſe teacher and his adherents. Others of them ſtill adhered to that adverſary of St Paul, expreſsly denied his apoſtolic office, and even furniſhed themſelves with pretended arguments from that Epiſtle. He had formerly promiſed to take a journey from Epheſus to Corinth, thence to viſit the Macedonians, and return from them to Corinth (2 Cor. i. 15, 16.). But the unhappy ſtate of the Corinthian church made him alter his intention (verſe 23.), ſince he found he muſt have treated them with ſeverity. Hence his adverſaries partly argued, 1. That St Paul was irreſolute and unſteady, and therefore could not be a prophet: 2. The improbability of his ever coming to Corinth again, ſince he was afraid of them. Such was the ſtate of the Corinthian church when St Paul, after his departure from Epheſus, having viſited Macedonia, (Acts xx. 1.), received an account of the above particulars from Titus (2 Cor. vii. 5, 6.), and therefore wrote them his ſecond Epiſtle about the end of the ſame year, or the beginning of 58.

188 View of the contents of this Epiſtle.

But to give a more diſtinct view of the contents of this Epiſtle:

1. The apoſtle, after a general ſalutation, expreſſes his grateful ſenſe of the divine goodneſs; profeſſing his confidence in God, ſupported by a ſenſe of his own integrity; makes an apology for not having viſited the Corinthians as he had intended, and vindicates himſelf from the charge of fickleneſs, (chap. i.).

2. He forgives the inceſtuous man, whoſe conduct had made ſo deep an impreſſion on the apoſtle's mind, that one reaſon why he had deferred his journey to Corinth was, that he might not meet them in grief, nor till he had received advice of the effect of his apoſtolical admonitions. He mentions his anxiety to meet Titus at Troas, in order to hear of their welfare; expreſſes his thankfulneſs to God for the ſucceſs attending his miniſtry, and ſpeaks of the Corinthians as his credentials, written by the finger of God, (chap. ii. iii. 1.—6.).

3. He treats of the office committed to him of preaching the redemption; and highly prefers it to preaching the law: to which probably his adverſaries had made great pretences. They had ridiculed his ſufferings; which he ſhows to be no diſgrace to the goſpel or its miniſters; and here he gives a ſhort abſtract of the doctrine he preaches, (chap. iii. 6. v. to the end).

He expatiates with great copiouſneſs on the temper with which, in the midſt of afflictions and perſecutions, he and his brethren executed their important embaſſy; and with great affection and tenderneſs he exhorts them to avoid the pollution of idolatry, (chap. vi.). He endeavours to win their confidence, by telling them how much he rejoiced in their amendment and welfare, and how ſorry he had been for the diſtreſs which his neceſſary reproofs had occaſioned, (chap. vii.). He then exhorts them to make liberal contributions for the Chriſtians in Judæa. He recommends to them the example of the Macedonians, and reminds them of the benevolence of the Lord Jeſus. He expreſſes his joy for the readineſs of Titus to aſſiſt in making the collection; and makes alſo honourable mention of other Chriſtian brethren, whom he had joined with Titus in the ſame commiſſion, chap. viii.). He then, with admirable addreſs, urges a liberal contribution, and recommends them to the divine bleſſing, (chap. ix.).

4. Next he obviates ſome reflections which had been thrown

thrown on him for the mildneſs of his conduct, as if it had proceeded from fear. He aſſerts his apoſtolical power and authority, cautioning his opponents againſt urging him to give too ſenſible demonſtrations of it, (chap. x.). He vindicates himſelf againſt the inſinuations of ſome of the Corinthians, particularly for having declined pecuniary ſupport from the church; an action which had been ungenerouſly turned to his diſadvantage. To ſhow his ſuperiority over thoſe deſigning men who had oppoſed his preaching, he enumerates his ſufferings; gives a detail of ſome extraordinary revelations which he had received; and vindicates himſelf from the charge of boaſting, by declaring that he had been forced to it by the deſire of ſupporting his apoſtolical character, (chap. xi. xii.). He cloſes the Epiſtle, by aſſuring them with great tenderneſs how much it would grieve him to demonſtrate his divine commiſſion by ſeverer methods.

189
Epiſtle to the Galatians.

The Galatians were deſcended from thoſe Gauls who had formerly invaded Greece, and afterwards ſettled in Lower Aſia. St Paul had preached the goſpel among them in the year 51, ſoon after the council held at Jeruſalem, (Acts xvi. 6.). Aſia ſwarmed at that time with zealots for the law of Moſes, who wanted to impoſe it on the Gentiles, (Acts xv. 1.). Soon after St Paul had left the Galatians, theſe falſe teachers had got among them, and wanted them to be circumciſed, &c. This occaſioned the following Epiſtle, which Michaelis thinks was written in the ſame year, before St Paul left Theſſalonica. Dr Lardner dates it about the end of the year 52, or in the very beginning of 53, before St Paul ſet out to go to Jeruſalem by way of Epheſus.

190
The date

191
and contents of it.

The ſubject of this Epiſtle is much the ſame with that of the Epiſtle to the Romans; only this queſtion is more fully conſidered here, "Whether circumciſion, and an obſervance of the Levitical law, be neceſſary to the ſalvation of a Chriſtian convert?" It appears, theſe Judaizing Chriſtians, whoſe indirect views St Paul expoſes (Acts xv. 1. Gal. v. 3, 9.), at firſt only repreſented circumciſion as neceſſary to ſalvation; but afterwards they inſiſted upon the Chriſtians receiving the Jewiſh feſtivals, (Gal. iv. 10.).

As St Paul had founded the churches of Galatia, and inſtructed them in the Chriſtian religion, he does not ſet before them its principal doctrines, as he had done in the Epiſtle to the Romans; but referring them to what he had already taught (chap. i. 8, 9.), he proceeds at once to the ſubject of the Epiſtle.

As it appears from ſeveral paſſages of this Epiſtle, particularly chap. i. 7, 8, 10. and chap. v. 11. that the Judaizing Chriſtians had endeavoured to perſuade the Galatians that Paul himſelf had changed his opinion, and now preached up the Levitical law; he denies that charge, and affirms that the doctrines which he had taught were true, for he had received them from God by immediate revelation. He relates his miraculous converſion; aſſerts his apoſtolical authority, which had been acknowledged by the diſciples of Jeſus; and, as a proof that he had never inculcated a compliance with the Moſaic law, he declares that he had oppoſed Peter at Antioch for yielding to the prejudices of the Jews.

Having now vindicated his character from the ſuſpicion of fickleneſs, and ſhown that his commiſſion was divine, he argues that the Galatians ought not to ſubmit to the law of Moſes: 1. Becauſe they had received the Holy Ghoſt and the gift of miracles, not by the law, but by the goſpel, (chap. iii. 1—5.). 2. Becauſe the promiſes which God made to Abraham were not reſtricted to his circumciſed deſcendants, but extended to all who are his children by faith, (chap. iii. 6—18.). In anſwer to the objection, *To what then ſerveth the law?* he replies, That it was given becauſe of tranſgreſſion; that is, to preſerve them from idolatry till the Meſſiah himſelf ſhould come. 3. Becauſe all men, whether Jews or Gentiles, are made the children of God by faith, or by receiving the Chriſtian religion, and therefore do not ſtand in need of circumciſion, (chap. iii. 26—29.). From the 1ſt verſe of chap. iv. to the 11th, he argues that the law was temporary, being only fitted for a ſtate of infancy; but that the world, having attained a ſtate of manhood under the Meſſiah, the law was of no farther uſe. In the remaining part of chapter iv. he reminds them of their former affection to him, and aſſures them that he was ſtill their ſincere friend. He exhorts them to ſtand faſt in the liberty with which Chriſt had made them free; for the ſons of Agar, that is, thoſe under the law given at Mount Sinai, are in bondage, and to be caſt out; the inheritance being deſigned for thoſe only who are the free-born ſons of God under the ſpiritual covenant of the goſpel.

192
Arguments by which the apoſtle proves that the law of Moſes was not obligatory on the Galatians.
Locke on the Epiſtles.

193
How he vindicates his own character from falſe aſperſions.

The apoſtle next confutes the falſe report which had been ſpread abroad among the Galatians, that Paul himſelf preached up circumciſion. He had already indirectly refuted this calumny by the particular account which he gave of his life; but he now directly and openly contradicts it in the following manner:

1. By aſſuring them, that all who thought circumciſion neceſſary to ſalvation could receive no benefit from the Chriſtian religion, (chap. v. 2—4.).

2. By declaring, that he expected juſtification only by faith, (verſe 5, 6.).

3. By teſtifying, that they had once received the truth, and had never been taught ſuch falſe doctrines by him, (verſe 7, 8.).

4. By inſinuating that they ſhould paſs ſome cenſure on thoſe who miſled them (ver. 9, 10.), by declaring that he was perſecuted for oppoſing the circumciſion of the Chriſtians, (ver. 11.).

5. By expreſſing a wiſh that thoſe perſons ſhould be cut off who troubled them with his doctrine.

This Epiſtle affords a fine inſtance of Paul's ſkill in managing an argument. The chief objection which the advocates for the Moſaic law had urged againſt him was, that he himſelf preached circumciſion. In the beginning of the Epiſtle he overturns this ſlander by a ſtatement of facts, without taking any expreſs notice of it; but at the end fully refutes it, that it might leave a ſtrong and laſting impreſſion on their minds.

He next cautions them againſt an idea which his arguments for Chriſtian liberty might excite, that it conſiſted in licentiouſneſs. He ſhows them it does not conſiſt in gratifying vicious deſires; for none are under ſtronger obligations to moral duties than the Chriſtian. He recommends gentleneſs and meekneſs to the weak (chap. vi. 1—5.), and exhorts them to be liberal to their teachers, and to all men (ver. 6—10.). He

concludes

concludes with exposing the false pretences of the Judaizing teachers, and asserting the integrity of his own conduct.

194
Epistle to the Ephesians.

Ephesus was the chief city of all Asia on this side Mount Taurus. St Paul had passed through it in the year 54, but without making any stay, (Acts xviii. 19—21.). The following year he returned to Ephesus again, and staid there three years, (chap. xix.). During his abode there he completed a very flourishing church of Christians, the first foundations of which had been laid by some inferior teachers. As Ephesus was frequented by persons of distinction from all parts of Asia Minor, St Paul took the opportunity of preaching in the ancient countries (ver. 10.); and the other churches of Asia were considered as the daughters of the church of Ephesus; so that an Epistle to the Ephesians was, in effect, an epistle to the other churches of Asia at the same time.

195
The date

Dr Lardner shows it to be highly probable that this epistle was written in the year 61, soon after Paul's arrival at Rome.

196
and design of it.

As Paul was in a peculiar manner the apostle of the Gentiles, and was now a prisoner at Rome in consequence of having provoked the Jews, by asserting that an observance of the Mosaic law was not necessary to obtain the favour of God, he was afraid least an advantage should be taken of his confinement to unsettle the minds of those whom he had converted. Hearing that the Ephesians stood firm in the faith of Christ, without submitting to the law of Moses, he writes this Epistle to give them more exalted views of the love of God, and of the excellence and dignity of Christ. This epistle is not composed in an argumentative or didactic style: The first three chapters consist almost entirely of thanksgivings and prayers, or glowing descriptions of the blessings of the Christian religion. This circumstance renders them a little obscure; but by the assistance of the two following epistles, which were written on the same occasion, and with the same design, the meaning of the apostle may be easily discovered. The last three chapters contain practical exhortations. He first inculcates unity, love, and concord, from the consideration that all Christians are members of the same body, of which Christ is the head. He then advises them to forsake the vices to which they had been addicted while they remained heathens. He recommends justice and charity; strenuously condemns lewdness, obscenity, and intemperance, vices which seem to have been too common among the Ephesians. In the 6th chapter he points out the duties which arise from the relations of husbands and wives, parents and children, masters and servants; and concludes with strong exhortations to fortitude, which he describes in an allegorical manner.

197
Epistle to the Philippians

The church at Philippi had been founded by Paul, Silas, and Timothy (Acts xvi.), in the year 51, and had continued to show a strong and manly attachment to the Christian religion, and a tender affection for the apostle. Hearing of his imprisonment at Rome, they sent Epaphroditus, one of their pastors, to supply him with money. It appears from this epistle that he was in great want of necessaries before this contribution arrived; for as he had not converted the Romans, he did not consider himself as intitled to receive supplies from them. Being a prisoner, he could not work as formerly, and it was a maxim of his never to accept any pecuniary assistance from those churches where a faction had been raised against him. From the Philippians he was not averse to receive a present in the time of want, because he considered it as a mark of their affection, and because he was assured that they had conducted themselves as sincere Christians.

198
The date

It appears from the apostle's own words, that this letter was written while he was a prisoner at Rome, (chap. i. 7, 13. iv. 22.); and from the expectation which he discovers (chap. ii. 24.) of being soon released and restored to them, compared with Philemon v. 22. and Heb. xiii. 13. where he expresses a like expectation in stronger terms, it is probable that this epistle was written towards the end of his first imprisonment in the year 62.

199
and design of it.

The apostle's design in this epistle, which is quite of the practical kind, seems to be, "to comfort the Philippians under the concern they had expressed at the news of his imprisonment; to check a party-spirit that appears to have broken out among them, and to promote, on the contrary, an entire union and harmony of affection; to guard them against being seduced from the purity of the Christian faith by Judaizing teachers; to support them under the trials with which they struggled; and, above all, to inspire them with a concern to adorn their profession by the most eminent attainments in the divine life." After some particular admonitions in the beginning of the 4th chapter, he proceeds in the 8th verse to recommend virtue in the most extensive sense, mentioning all the different foundations in which it had been placed by the Grecian philosophers. Towards the close of the epistle, he makes his acknowledgements to the Philippians for the seasonable and liberal supply which they had sent him, as it was so convincing a proof of their affection for him, and their concern for the support of the gospel, which he preferred far above any private secular interest of his own; expresly disclaiming all selfish, mercenary views, and assuring them with a noble simplicity, that he was able upon all occasions to accommodate his temper to his circumstances; and had learned, under the teachings of Divine grace, in whatever station Providence might see fit to place him, therewith to be content. After which, the apostle, having encouraged them to expect a rich supply of all their wants from their God and Father, to whom he devoutly ascribes the honour of all, concludes with salutations from himself and his friends at Rome to the whole church, and a solemn benediction, (verse 10. to the end); and declares, that he rejoiced in their liberality chiefly on their own account.

200
Epistle to the Colossians.—Date and design of it.

The epistle to the Colossians was written while Paul was in prison (chap. iv. 3.), and was therefore probably composed in the year 62. The intention of the apostle, as far as can be gathered from the epistle itself, was to secure the Colossians from the influence of some doctrines that were subversive of Christianity, and to excite them to a temper and behaviour worthy of their sacred character. A new sect had arisen, which had blended the oriental philosophy with the superstitious opinions of the Jews.

201
To guard the Colossians against the dangerous doctrines of the Jews.

They held, 1. That God was surrounded by demons or angels, who were mediators with God, and therefore to be worshipped. 2. That the soul is defiled by the body; that all bodily enjoyments hurt the soul, which they believed to be immortal, though they seem to have denied

Scripture. denied the resurrection of the body, as it would only render the soul sinful by being reunited to it. 3. That there was a great mystery in numbers, particularly in the number seven; they therefore attributed a natural holiness to the seventh or Sabbath day, which they observed more strictly than the other Jews. They spent their time mostly in contemplation; abstained from marriage, and every gratification of the senses; used washings, and thought it sinful to touch certain things; regarded wine as poison, &c.

Percy's Key to the New Testament.

202 The arguments which the apostle employs.

The arguments against these doctrines are managed with great skill and address. He begins with expressing great joy for the favourable character which he had heard of them, and assures them that he daily prayed for their farther improvement. Then he makes a short digression, in order to describe the dignity of Jesus Christ; declares that he had created all things, whether thrones or dominions, principalities and powers; that he alone was the head of the church, and had reconciled men to the Father. The inference from this description is evident, that Jesus was superior to angels; that they were created beings, and ought not to be worshipped. Thus he indirectly confutes one doctrine before he formally opposes it. Paul now returns from his digression in the 21st verse to the sentiments with which he had introduced it in the 13th and 14th verses, and again expresses his joy that the Philippians remained attached to the gospel, which was to be preached to the Gentiles, without the restraints of the ceremonial law. Here again he states a general doctrine, which was inconsistent with the opinions of those who were zealous for the law of Moses; but he leaves the Colossians to draw the inference, (chap. i.).

Having again assured them of his tender concern for their welfare, for their advancement in virtue, and that they might acknowledge the mystery of God, that is, that the gospel was to supersede the law of Moses, he proceeds directly to caution them against the philosophy of the new teachers, and their superstitious adherence to the law; shows the superiority of Christ to the angels, and warns Christians against worshipping them. He censures the observation of Sabbaths, and rebukes those who required abstinence from certain kinds of food, and cautions them against persons who assume a great appearance of wisdom and virtue, (chap. ii.).

203 Exhortations.

In the 3d chapter he exhorts them, that, instead of being occupied about external ceremonies, they ought to cultivate pure morality. He particularly guards them against impurity, to which they had before their conversion been much addicted. He admonishes them against indulging the irascible passions, and against committing falsehood. He exhorts them to cultivate the benevolent affections, and humility, and patience. He recommends also the relative duties between husbands and wives, parents and children, masters and servants. He enjoins the duties of prayer and thanksgiving (chap. iv. 2.), and requests them to remember him in their petitions. He enjoins affability and mild behaviour to the unconverted heathens (verse 6th); and concludes the epistle with matters which are all of a private nature, except the directions for reading this epistle in the church of Laodicea, as well as in the church of Colosse.

204 First Epistle to the Thessalonians.

This epistle is addressed to the inhabitants of Thessalonica, the capital of Macedonia, a large and populous city. It appears from the Acts, chapter xvii. 1. that the Christian religion was introduced into this city by Paul and Silas, soon after they had left Philippi. At first they made many converts; but at length the Jews, ever jealous of the admission of the Gentiles to the same privileges with themselves, stirred up the rabble, which assaulted the house where the apostle and his friends lodged; so that Paul and Silas were obliged to flee to Berea, where their success was soon interrupted by the same restless and implacable enemies. The apostle then withdrew to Athens; and Timothy, at his desire, returned to Thessalonica (1 Thess. iii. 2.), to see what were the sentiments and behaviour of the inhabitants after the persecution of the Jews. From Athens Paul went to Corinth, where he stayed a year and six months; during which, Timothy returned with the joyful tidings, that the Thessalonians remained stedfast to the faith, and firmly attached to the apostle, notwithstanding his flight. Upon this he sent them this epistle, A. D. 52, in the 12th year of Claudius.

205 The date

This is generally reckoned the first epistle which Paul wrote; and we find he was anxious that it should be read to all the Christians. In chap. v. 27. he uses these words; "I adjure you by the Lord, that this epistle be read unto all the holy brethren." This direction is very properly inserted in his first epistle.

206 and design of it.

The intention of Paul in writing this epistle was evidently to encourage the Thessalonians to adhere to the Christian religion. This church being still in its infancy, and oppressed by the powerful Jews, required to be established in the faith. St Paul, therefore, in the three first chapters, endeavours to convince the Thessalonians of the truth and divinity of his gospel, both by the miraculous gifts of the Holy Ghost which had been imparted, and by his own conduct when among them.

While he appeals, in the first chapter, to the miraculous gifts of the Holy Spirit, he is very liberal in his commendations. He vindicates himself from the charge of timidity, probably to prevent the Thessalonians from forming an unfavourable opinion of his fortitude, which his flight might have excited. He asserts, that he was not influenced by selfish or dishonourable motives, but that he was anxious to please God and not man. He expresses a strong affection for them, and how anxious he was to impart the blessings of the gospel. He congratulates himself upon his success; mentions it to their honour that they received the gospel as the word of God and not of man, and therefore did not renounce it when persecution was raised by the Jews. He expresses a strong desire to visit the Thessalonians; and assures them he had been hitherto retained against his will.

As a farther proof of his regard, the apostle informs them, that when he came to Athens, he was so much concerned, least, being discouraged by his sufferings, they should be tempted to cast off their profession, that he could not forbear sending Timothy to comfort and strengthen them; and expresses, in very strong terms, the sensible pleasure he felt, in the midst of all his afflictions, from the favourable account he received of their faith and love; to which he adds, that he was continually praying for their farther establishment in religion, and for an opportunity of making them another visit, in order

 order to promote their edification, which lay fo near his heart, (chap. iii. throughout).

Having now fhown his paternal affection for them, with great addrefs he improves all that influence which his zeal and fidelity in their fervice muft naturally have given him to inculcate upon them the precepts of the gofpel. He recommends chaftity, in oppofition to the prevailing practice of the heathens; juftice, in oppofition to fraud. He praifes their benevolence, and encourages them to cultivate higher degrees of it. He recommends induftry and prudent behaviour to their heathen neighbours. In order to comfort them under the lofs of their friends, he affures them that thofe who were fallen afleep in Jefus fhould be raifed again at the laft day, and fhould, together with thofe who remained alive, be caught up to meet their Lord, and fhare his triumph, (chap. iv.). He admonifhes them to prepare for this folemn event, that it might not come upon them unawares; and then concludes the epiftle with various exhortations.

207 Second Epiftle to the Theffalonians.

The fecond epiftle to the Theffalonians appears to have been written foon after the firft, and from the fame place; for Silvanus or Silas, and Timothy, are joined together with the apoftle in the infcriptions of this epiftle, as well as of the former.

208 Contents of it.

The apoftle begins with commending the faith and charity of the Theffalonians, of which he had heard a favourable report. He expreffes great joy on account of the patience with which they fupported perfecution; and obferves that their perfecution was a proof of a righteous judgement to come, where their perfecutors would meet with their proper recompenfe, and the righteous be delivered out of all their afflictions. He affures them of his conftant prayers for their farther improvement, in order to attain the felicity that was promifed, (chap. i.).

From mifunderftanding a paffage in his former letter, it appears that the Theffalonians believed the day of judgement was at hand. To rectify this miftake, he informs them that the day of the Lord will not come till a great apoftacy has overfpread the Chriftian world, the nature of which he defcribes (G). Symptoms of this myftery of iniquity had then appeared; but the apoftle expreffes his thankfulnefs to God that the Theffalonians had efcaped this corruption. He exhorts them to ftedfaftnefs, and prays that God would comfort and ftrengthen them, (chap. ii.).

He requefts the prayers of the Theffalonians for him and his two affiftants, at the fame time expreffing his confidence that they would pay due regard to the inftructions which he had given them. He then proceeds to correct fome irregularities. Many of the Theffalonians feem to have led an idle diforderly life; thefe he feverely reproves, and commands the faithful to fhun their company if they ftill remained incorrigible.

209 Firft Epiftle to Timothy, when written.

When the firft Epiftle to Timothy was written, it is difficult to afcertain. Lardner dates it in 56; Mill, Whitby, and Macknight, place it in 64: but the arguments on which each party founds their opinion are too long to infert here.

210 Intention and contents of it.

Timothy was the intimate friend and companion of Paul, and is always mentioned by that apoftle with much affection and efteem. Having appointed him to fuperintend the church of Ephefus during a journey which he made to Macedonia, he wrote this letter, in order to direct him how to difcharge the important truft which was committed to him. This was the more neceffary, as Timothy was young and inexperienced, (1 Tim. iv. 12.). In the beginning of the epiftle he reminds him of the charge with which he had intrufted him, to wit, to preferve the purity of the gofpel againft the pernicious doctrines of the Judaizing teachers, whofe opinions led to frivolous controverfies, and not to a good life. He fhows the ufe of the law of Mofes, of which thefe teachers were ignorant. This account of the law, he affures Timothy, was agreeable to the reprefentation of it in the gofpel, with the preaching of which he was intrufted. He then makes a digreffion, in the fulnefs of his heart, to exprefs the fenfe which he felt of the goodnefs of God towards him.

In the fecond chapter, the apoftle prefcribes the manner in which the worfhip of God was to be performed in the church of Ephefus; and in the third explains the qualifications of the perfons whom he was to ordain as bifhops and deacons. In the fourth chapter he foretels the great corruptions of the church which were to prevail in future times, and inftructs him how to fupport the facred character. In the fifth chapter he teaches Timothy how to admonifh the old and young of both fexes; mentions the age and character of fuch widows as were to be employed by the fociety in fome peculiar office; and fubjoins fome things concerning the refpect due to elders. In the fixth chapter he defcribes the duties which Timothy was to inculcate on flaves; condemns trifling controverfies and pernicious difputes; cenfures the exceffive love of money, and charges the rich to be rich in good works. 211

Second Epiftle to Timothy.

That the fecond Epiftle to Timothy was written from Rome is univerfally agreed; but whether it was during his firft or fecond imprifonment has been much difputed. That Timothy was at Ephefus or in Afia Minor when this Epiftle was fent to him, appears from the frequent mention in it of perfons refiding at Ephefus. 212

Defign and contents of it.

The apoftle feems to have intended to prepare Timothy for thofe fufferings which he forefaw he would be expofed to. He exorts him to conftancy and perfeverance and to perform with a good confcience the duties of the facred function.

The falfe teachers, who had before thrown this church into confufion, grew every day worfe: infomuch that not only Hymenæus, but Philetus, another Ephefian heretic, now denied the refurrection of the dead. They were led into this error by a difpute about words. At firft they only annexed various improper fignifications to the word *refurrection*, but at laft they denied it altogether (H); pretending that the refurrection of the dead was only a refurrection from the death of fin, and fo

(G) For an explanation of this prophecy, Dr Hurd's Sermons may be confulted. He applies it to the papal power, to which it correfponds with aftonifhing exactnefs.

(H) This is by no means uncommon among men; to begin to difpute about the fignification of words, and to

Scripture. so was already past. This error was probably derived from the eastern philosophy, which placed the origin of sin in the body (chapter ii.). He then forewarns him of the fatal apostacy and declension that was beginning to appear in the church; and at the same time animates him, from his own example and the great motives of Christianity, to the most vigorous and resolute discharge of every part of the ministerial office.

213
Epistle to Titus.

This Epistle is addressed to Titus, whom Paul had appointed to preside over the church of Crete. It is difficult to determine either its date or the place from which it was sent. The apostle begins with reminding Titus of the reasons for which he had left him at Crete; and directs him on what principles he was to act in ordaining Christian pastors: the qualifications of whom he particularly describes. To show him how cautious he ought to be in selecting men for the sacred office, he reminds him of the arts of the Judaizing teachers, and the bad character of the Cretans (chapter i.).

214
Design and contents of it.

He advises him to accommodate his exhortations to the respective ages, sexes, and circumstances, of those whom it was his duty to instruct; and to give the greater weight to his instructions, he admonishes him to be an example of what he taught (chap. ii.). He exhorts him also to teach obedience to the civil magistrate, because the Judaizing Christians affirmed that no obedience was due from the worshippers of the true God to magistrates who were idolaters. He cautions against censoriousness and contention, and recommends meekness; for even the best Christians had formerly been wicked, and all the blessings which they enjoyed they derived from the goodness of God. He then enjoins Titus strenuously to inculcate good works, and to avoid useless controversies; and concludes with directing him how to proceed with those heretics who attempted to sow dissension in the church.

215
Epistle to Philemon.—Date and design of it.

The epistle to Philemon was written from Rome at the same time with the Epistles to the Colossians and Philippians, about A. D. 62 or 63. The occasion of the letter was this: Onesimus, Philemon's slave, had robbed his master and fled to Rome; where, happily for him, he met with the apostle, who was at that time a prisoner at large, and by his instructions and admonitions was converted to Christianity; and reclaimed to a sense of his duty. St Paul seems to have kept him for some considerable time under his eye, that he might be satisfied of the reality of the change; and, when he had made a sufficient trial of him, and found that his behaviour was entirely agreeable to his profession, he would not detain him any longer for his own private convenience, though in a situation that rendered such an assistant peculiarly desirable (compare ver. 13, 14.), but sent him back to his master; and, as a mark of his esteem, entrusted him, together with Tychicus, with the charge of delivering his Epistle to the church at Colosse, and giving them a particular account of the state of things at Rome, recommending him to them, at the same time, as a faithful and beloved brother (Col. iv. 9.).

Doddridge's Family Expositor.

And as Philemon might well be supposed to be strongly prejudiced against one who had left his service in so infamous a manner, he sends him this letter, in which he employs all his influence to remove his suspicions, and reconcile him to the thoughts of taking Onesimus into his family again. And whereas St Paul might have exerted that authority which his character as an apostle, and the relation in which he stood to Philemon as a spiritual father, would naturally give him, he chooses to entreat him as a friend; and with the softest and most insinuating address urges his suit, conjuring him by all the ties of Christian friendship that he would not deny him his request: and the more effectually to prevail upon him, he represents his own peace and happiness as deeply interested in the event; and speaks of Onesimus in such terms as were best adapted to soften his prejudices, and dispose him to receive one who was so dear to himself, not merely as a servant, but as a fellow Christian and a friend. Scripture.

216
The skill and address which the apostle discovers in this Epistle.

It is impossible to read over this admirable Epistle, without being touched with the delicacy of sentiment, and the masterly address that appear in every part of it. We see here, in a most striking light, how perfectly consistent true politeness is, not only with all the warmth and sincerity of the friend, but even with the dignity of the Christian and the apostle. And if this letter were to be considered in no other view than as a mere human composition, it must be allowed a master-piece in its kind. As an illustration of this remark, it may not be improper to compare it with an epistle of Pliny, that seems to have been written upon a similar occasion, (lib. ix. lit. 21); which, though penned by one that was reckoned to excel in the epistolary style, and though it has undoubtedly many beauties, yet must be acknowledged, by every impartial reader, vastly inferior to this animated composition of the apostle.

217
Epistle to the Hebrews was composed by Paul.

The epistle to the Hebrews has been generally ascribed to Paul; but the truth of this opinion has been suspected by others, for three reasons: 1. The name of the writer is nowhere mentioned, neither in the beginning nor in any other part of the Epistle. 2. The style is said to be more elegant than Paul's. 3. There are expressions in the Epistle which have been thought unsuitable to an apostle's character. 1. In answer to the first objection, Clemens Alexandrinus has assigned a very good reason: "Writing to the Hebrews (says he), who had conceived a prejudice against him, and were suspicious of him, he wisely declined setting his name at the beginning, lest he should offend them." 2. Origen and Jerome admired the elegance of the style, and reckoned it superior to that which Paul has exhibited in his Epistles: but as ancient testimony had assigned it to Paul, they endeavoured to answer the objection, by supposing that the sentiments were the apostle's, but the language and composition the work of some other person. If the Epistle, however, be a translation, which we believe it to be, the elegance of the language may belong to the translator. As to the composition and arrangement, it cannot be denied that there are many specimens in the writings of this apostle not inferior

Macknight on the Epistles.

---

to be led gradually to deny the thing signified. This appears to have been the cause of most disputes, and the general beginning of scepticism and infidelity.

ferior in theſe qualities to the Epiſtle to the Hebrews. 3. It is objected, that in Heb. ii. 3. the writer of this Epiſtle joins himſelf with thoſe who had received the goſpel from Chriſt's apoſtles. Now Paul had it from Chriſt himſelf. But Paul often appeals to the teſtimony of the apoſtles in ſupport of thoſe truths which he had received from Revelation. We may inſtance 1 Cor. xv.
218 5, 6, 7, 8.; 2. Tim. ii. 2.

Quoted as his by ancient writers.

This Epiſtle is not quoted till the end of the ſecond century, and even then does not ſeem to have been univerſally received. This ſilence might be owing to the Hebrews themſelves, who ſuppoſing this letter had no relation to the Gentiles, might be at pains to diffuſe copies of it. The authors, however, on whoſe teſtimony we receive it as authentic, are entitled to credit; for they lived ſo near the age of the apoſtles, that they were in no danger of being impoſed on; and from the numerous liſt of books which they rejected as ſpurious, we are aſſured that they were very careful to guard againſt impoſition. It is often quoted as Paul's by Clemens Alexandrinus, about the year 194. It is received and quoted as Paul's by Origen, about 230; by Dionyſius biſhop of Alexandria in 247; and by a numerous liſt of ſucceeding writers.

219

Written in the Syro-Chaldaic language.

The Epiſtle to the Hebrews was originally written in Hebrew, or rather Syro-Chaldaic; a fact which we believe on the teſtimony of Clemens Alexandrinus, Jerome, and Euſebius. To this it has been objected, that as theſe writers have not referred to any authority, we ought to conſider what they ſay on this ſubject merely as an opinion. But as they ſtate no reaſons for adopting this opinion, but only mention as a fact that Paul wrote to the Hebrews in their native language, we muſt allow that it is their teſtimony which they produce, and not their opinion. Euſebius informs us, that ſome ſuppoſed Luke the Evangeliſt, and others Clemens Romanus, to have been the tranſlator.

According to the opinion of ancient writers, particularly Clemens Alexandrinus, Jerome, and Euthalius, this Epiſtle was addreſſed to the Jews in Paleſtine.—The
220 ſcope of the Epiſtle confirms this opinion.

Date of it.

Having now given ſufficient evidence that this Epiſtle was written by Paul, the time when it was written may be eaſily determined: For the ſalutation from the ſaints of Italy (chap. iv. 24.), together with the apoſtle's promiſe to ſee the Hebrews (ver. 23.), plainly intimate, that his confinement was then either ended or on the eve of being ended. It muſt therefore have been written ſoon after the Epiſtles to the Coloſſians, Epheſians, and Philemon, and not long before Paul left Italy, that is, in the year 61 or 62.

Percy's Key to the New Teſtament.

As the zealous defenders of the Moſaic law would naturally inſiſt on the divine authority of Moſes, on the majeſty and glory attending its promulgation by the miniſtry of angels, and the great privileges it afforded thoſe who adhered to it; the apoſtle ſhows,

221

Deſign of it to prove to the Jews the truth of the Chriſtian religion and its ſuperiority to the law of Moſes;

I. That in all theſe ſeveral articles Chriſtianity had an infinite ſuperiority to the law.

This topic he purſues from chap. i. to xi. wherein he reminds the believing Hebrews of the extraordinary favour ſhown them by God, in ſending them a revelation by his own ſon, whoſe glory was far ſuperior to that of angels (chap. i. throughout); very naturally inferring from hence the danger of deſpiſing Chriſt on account of his humilitation, which, in perfect conſiſtence with his dominion over the world to come, was voluntarily ſubmitted to by him for wiſe and important reaſons; particularly to deliver us from the fear of death, and to encourage the freedom of our acceſs to God (chap. ii. throughout). With the ſame view he magnifies Chriſt as ſuperior to Moſes, their great legiſlator; and from the puniſhment inflicted on thoſe who rebelled againſt the authority of Moſes, infers the danger of contemning the promiſes of the goſpel (chap. iii. 2—13.). And as it was an eaſy tranſition to call to mind on this occaſion that reſt in Canaan to which the authority inveſted in Moſes was intended to lead them; the apoſtle hence cautions them againſt unbelief, as what would prevent their entering into a ſuperior ſtate of reſt to what the Jews ever enjoyed (chap. iii. 14. iv. 11.). This caution is ſtill farther enforced by awful views of God's omniſcience, and a lively repreſentation of the high-prieſthood of Chriſt (chap. iv. to the end; and chap. v. throughout). In the next place, he intimates the very hopeleſs ſituation of thoſe who apoſtatiſe from Chriſtianity (chap. vi. 1—9.); and then, for the comfort and confirmation of ſincere believers, diſplays to them the goodneſs of God, and his faithful adherence to his holy engagements; the performance of which is ſealed by the entrance of Chriſt into heaven as our forerunner (chap. vi. 9. to the end). Still farther to illuſtrate the character of our Lord, he enters into a parallel between him and Melchizedec as to their title and deſcent; and, from inſtances wherein the prieſthood of Melchizedec excelled the Levitical, infers, that the glory of the prieſthood of Chriſt ſurpaſſed that under the law (chap. vii. 1—17). From theſe premiſes the apoſtle argues, that the Aaronical prieſthood was not only excelled, but conſummated by that of Chriſt, to which it was only introductory and ſubſervient; and of courſe, that the obligation of the law was henceforth diſſolved (chap. vii. 18. to the end). Then recapitulating what he had already demonſtrated concerning the ſuperior dignity of Chriſt's prieſthood, he thence illuſtrates the diſtinguiſhed excellence of the new covenant, as not only foretold by Jeremiah, but evidently enriched with much better promiſes than the old (ch. viii. throughout): Explaining farther the doctrine of the prieſthood and interceſſion of Chriſt, by comparing it with what the Jewiſh high-prieſts did on the great day of atonement (chap. ix. 1—14). Afterwards he enlarges on the neceſſity of ſhedding Chriſt's blood, and the ſufficiency of the atonement made by it (chap. ix. 15. to the end); and proves that the legal ceremonies could not by any means purify the conſcience: whence he infers the inſufficiency of the Moſaic law, and the neceſſity of looking beyond it (chap. x. 1—15.). He then urges the Hebrews to improve the privileges which ſuch an high-prieſt and covenant conferred on them, to the purpoſes of approaching God with confidence, to a conſtant attendance on his worſhip, and moſt benevolent regards to each other (chap. x. 15—25.).

The apoſtle having thus obviated the inſinuations and objections of the Jews, for the ſatisfaction and eſtabliſhment of the believing Hebrews, proceeds, 222

and to animate them to bear perſecution with fortitude.

II. To prepare and fortify their minds againſt the ſtorm of perſecution which in part had already befallen them, which was likely to continue and be often renewed, he reminds them of thoſe extremities they had endured, and of the fatal effects which would attend their apoſtacy

apoſtacy (chap. x. 26. to the end); calling to their remembrance the eminent examples of faith and fortitude exhibited by holy men, and recorded in the Old Teſtament (chap. xi. 1—29.). He concludes his diſcourſe with glancing at many other illuſtrious worthies; and, beſides thoſe recorded in Scripture, refers to the caſe of ſeveral who ſuffered under the perſecution of Antiochus Epiphanes (2 Maccab. chap. viii. &c. chap. xi. 30. xii. 2.).

Having thus finiſhed the argumentative part of the Epiſtle, the apoſtle proceeds to a general application; in which he exhorts the Hebrew Chriſtians to patience, peace, and holineſs (chap. xii. 3—14.); cautions them againſt ſecular views and ſenſual gratifications, by laying before them the incomparable excellence of the bleſſings introduced by the goſpel, which even the Jewiſh economy, glorious and magnificent as it was, did by no means equal; exhorts them to brotherly affection, purity, compaſſion, dependence on the divine care, ſtedfaſtneſs in the profeſſion of truth, a life of thankfulneſs to God, and benevolence to man: and concludes the whole with recommending their pious miniſters to their particular regard, intreating their prayers, ſaluting and granting them his uſual benediction.

223
The ſeven Catholic epiſtles.

The ſeven following Epiſtles, one of James, two of Peter, three of John, and one of Jude, have been diſtinguiſhed by the appellation of *catholic* or *general* epiſtles, becauſe moſt of them are inſcribed, not to particular churches or perſons, but to the body of Jewiſh or Gentile converts over the world. The authenticity of ſome of theſe has been frequently queſtioned, viz. the Epiſtle of James, the ſecond of Peter, the Epiſtle of Jude, and the ſecond and third of John. The ancient Chriſtians were very cautious in admitting any books into their canon whoſe authenticity they had any reaſon to ſuſpect. They rejected all the writings forged by heretics in the name of the apoſtles, and certainly, therefore, would not receive any without firſt ſubjecting them to a ſevere ſcrutiny. Now, though theſe five epiſtles were not immediately acknowledged as the writings of the apoſtles, this only ſhows that the perſons who doubted had not received complete and inconteſtable evidence of their authenticity. But as they were afterwards univerſally received, we have every reaſon to conclude, that upon a ſtrict examination they were found to be the genuine productions of the apoſtles. The truth is, ſo good an opportunity had the ancient Chriſtians of examining this matter, ſo careful were they to guard againſt impoſition, and ſo well founded was their judgement concerning the books of the New Teſtament, that, as Dr Lardner obſerves, no writing which they pronounced genuine has yet been proved ſpurious, nor have we at this day the leaſt reaſon to believe any book genuine which they rejected.

Macknight on the Epiſtles.

224
Epiſtle of James the Leſs.

That the Epiſtle of James was written in the apoſtolical age is proved by the quotations of ancient authors. Clemens Romanus and Ignatius ſeem to have made references to it. Origen quotes it once or twice.—There are ſeveral reaſons why it was not more generally quoted by the firſt Chriſtian writers. Being written to correct the errors and vices which prevailed among the Jews, the Gentiles might think it of leſs importance to them, and therefore take no pains to procure copies of it. As the author was ſometimes denominated James the Juſt, and often called biſhop of Jeruſalem, it might be doubted whether he was one of the apoſtles. But its authenticity does not ſeem to have been ſuſpected on account of the doctrines which it contains. In modern times, indeed, Luther called it a ſtrawy epiſtle (*epiſtola ſtraminea*), and excluded it from the ſacred writings, on account of its apparent oppoſition to the apoſtle Paul concerning juſtification by faith.

This Epiſtle could not be written by James the Elder, the ſon of Zebedee, and brother of John, who was beheaded by Herod in the year 44, for it contains paſſages which refer to a later period. It muſt, therefore, have been the compoſition of James the Leſs, the ſon of Alpheus, who was called *the Lord's brother*, becauſe he was the ſon of Mary, the ſiſter of our Lord's mother. 225
As to the date of this Epiſtle, Lardner fixes it in the year 61 or 62.

The date

James the Leſs ſtatedly reſided at Jeruſalem, whence he hath been ſtyled by ſome ancient fathers biſhop of that city, though without ſufficient foundation. Now James being one of the apoſtles of the circumciſion, while he confined his perſonal labours to the inhabitants of Judea, it was very natural for him to endeavour by his writings to extend his ſervices to the Jewiſh Chriſtians who were diſperſed abroad in more diſtant regions. For this purpoſe, there are two points which the apoſtle ſeems to have principally aimed at, though he hath not purſued them in an orderly and logical method, but in the free epiſtolary manner, handling them jointly or diſtinctly as occaſions naturally offered. And theſe were, "to correct thoſe errors both in doctrine and practice into which the Jewiſh Chriſtians had fallen, which might otherwiſe have produced fatal conſequences; and then to eſtabliſh the faith and animate the hope of ſincere believers, both under their preſent and their approaching ſufferings."

Doddridge's Family Expoſitor.

226
and deſign of it.

The opinions which he is moſt anxious to refute are theſe, that God is the author of ſin, (ch. i. 13.); that the belief of the doctrines of the goſpel was ſufficient to procure the favour of God for them, however deficient they were in good works, (ch. ii.). He diſſuades the Jews from aſpiring to the office of teachers in the third chapter, becauſe their prejudices in favour of the law of Moſes might induce them to pervert the doctrines of the goſpel. He therefore guards them againſt the ſins of the tongue, by repreſenting their pernicious effects; and as they thought themſelves wiſe and intelligent, and were ambitious of becoming teachers, he adviſes them to make good their pretenſions, by ſhowing themſelves poſſeſſed of that wiſdom which is from above, (ch. iii.).

The deſtruction of Jeruſalem was now approaching; the Jews were ſplit into factions, and often ſlaughtered one another; the apoſtle, therefore, in the fourth chapter, admoniſhes them to purify themſelves from thoſe vices which produced tumults and bloodſhed. To rouſe them to repentance, he foretels the miſeries that were coming upon them. Laſtly, He checks an irreligious ſpirit that ſeems to have prevailed, and concludes the Epiſtle with ſeveral exhortations.

227
Firſt Epiſtle of Peter.

The authenticity of the firſt Epiſtle of Peter has never been denied. It is referred to by Clemens Romanus, by Polycarp, and is quoted by Papias, Irenæus, Clemens Alexandrinus, and Tertullian. It is addreſſed to the ſtrangers ſcattered through Pontus, &c. who are evidently Chriſtians in general, as appears from chap.

Scripture. chap. ii. 10. "In time past they were not a people, but are now the people of God." From Peter's sending the salutation of the church at Babylon to the Christians in Pontus, &c. it is generally believed that he wrote it in Babylon. There was a Babylon in Egypt and another in Assyria. It could not be the former, for it was an obscure place, which seems to have had no church for the first four centuries. We have no authority to affirm that Peter ever was in Assyria. The most probable opinion is that of Grotius, Whitby, Lardner, as well as of Eusebius, Jerome, and others, that by Babylon Peter figuratively means Rome.

228 The date Lardner dates it in 63 or 64, or at the latest 65.

229 and design of it. St Peter's chief design is to confirm the doctrine of St Paul, which the false teachers pretended he was opposing; and to assure the proselytes that they stood in the true grace of God, (ch. v. 12.). With this view he calls them elect; and mentions, that they had been declared such by the effusion of the Holy Ghost upon them, (ch. i. 1, 2.). He assures them that they were regenerate without circumcision, merely through the gospel and resurrection of Christ, (ver. 3, 4, 21—25.); and that their sufferings were no argument of their being under the displeasure of God, as the Jews imagined, (ver. 6—12.). He recommends it to them to hope for grace to the end, (ver. 13.). He testifies, that they were not redeemed by the Paschal lamb, but through Christ, whom God had preordained for this purpose before the foundation of the world, (ver. 18—20.).

230 Second Epistle of Peter. The authenticity of it proved The second Epistle of Peter is not mentioned by any ancient writer extant till the fourth century, from which time it has been received by all Christians except the Syrians. Jerome acquaints us, that its authenticity was disputed, on account of a remarkable difference between the style of it and the former Epistle. But this remarkable difference in style is confined to the 2d chapter of the 2d Epistle. No objection, however, can be drawn from this circumstance; for the subject of that chapter is different from the rest of Peter's writings, and nothing is so well known than that different subjects suggest different styles. Peter, in describing the character of some flagitious impostors, feels an indignation which he cannot suppress: it breaks out, therefore, in the bold and animated figures of an oriental writer. Such a diversity of style is not uncommon in the best writers, especially when warmed with their subject.

231 from internal evidence. This objection being removed, we contend that this Epistle was written by Peter, from the inscription, *Simon Peter, a servant and an apostle of Jesus Christ.* It appears from chap. i. 16, 17, 18, that the writer was one of the disciples who saw the transfiguration of our Saviour. Since it has never been ascribed to James or John, it must therefore have been Peter. It is evident, from chap. iii. 1. that the author had written an Epistle before to the same persons, which is another circumstance that proves Peter to be the author.

It is acknowledged, however, that all this evidence is merely internal; for we have not been able to find any external evidence upon the subject. If, therefore, the credit which we give to any fact is to be in proportion to the degree of evidence with which it is accompanied, we shall allow more authority due to the gospels than to the epistles; more to those epistles which have been generally acknowledged than to those which have been controverted; and therefore no doctrine of Christianity ought to be founded solely upon them. It may also be added, that perhaps the best way of determining what are the essential doctrines of Christianity would be to examine what are the doctrines which occur oftenest in the gospels; for the gospels are the plainest parts of the New Testament; and their authenticity is most completely proved. They are therefore best fitted for common readers. Nor will it be denied, we presume, that our Saviour taught all the doctrines of the Christian religion himself; that he repeated them on different occasions, and inculcated them with an earnestness proportionable to their importance. The Epistles are to be considered as a commentary on the essential doctrines of the gospel, adapted to the situation and circumstances of particular churches, and perhaps sometimes explaining doctrines of inferior importance. 1. The essential doctrines are therefore first to be sought for in the gospels, and to be determined by the number of times they occur. 2. They are to be sought for, in the next place, in the uncontroverted Epistles, in the same manner. 3. No essential doctrine ought to be founded on a single passage, nor on the authority of a controverted Epistle.

That Peter was old, and near his end, when he wrote this Epistle, may be inferred from chap. i. 14. "Knowing that shortly I must put off this tabernacle, even as our Lord Jesus has shewn me." Lardner thinks it was written soon after the former. Others, perhaps with more accuracy, date it in 67.

The general design of this Epistle is, to confirm the doctrines and instructions delivered in the former; "to excite the Christian converts to adorn, and stedfastly adhere to their holy religion, as a religion proceeding from God, notwithstanding the artifices of false teachers, whose character is at large described; or the persecution of their bitter and inveterate enemies." 232 Design of it.

The first Epistle of John is ascribed by the unanimous suffrage of the ancients to the beloved disciple of our Lord. It is referred to by Polycarp, is quoted by Papias, by Irenæus, and was received as genuine by Clemens Alexandrinus, by Dionysius of Alexandria, by Cyprian, by Origen, and Eusebius. There is such a resemblance between the style and sentiments of this Epistle and those of the gospel according to John, as to afford the highest degree of internal evidence that they are the composition of the same author. In the style of this apostle there is a remarkable peculiarity, and especially in this Epistle. His sentences, considered separately, are exceeding clear and intelligible; but when we search for their connection, we frequently meet with greater difficulties than we do even in the Epistles of St Paul. The principal signature and characteristic of his manner is an artless and amiable simplicity, and a singular modesty and candour, in conjunction with a wonderful sublimity of sentiment. His conceptions are apparently delivered to us in the order in which they arose to his own mind, and are not the product of artificial reasoning or laboured investigation. 233 First Epistle of John. Its authenticity and style.

It is impossible to fix with any precision the *date* of this Epistle, nor can we determine to what persons it was addressed.

The leading design of the apostle is to show the insufficiency of faith, and the external profession of religion, separate from morality; to guard the Christians to whom he writes against the delusive arts of the corrupters 234 Design of it.

Scripture. rupters of Chriſtianity, whom he calls Antichriſt; and to inculcate univerſal benevolence. His admonitions concerning the neceſſity of good morals, and the inefficacy of external profeſſions, are ſcattered over the Epiſtle, but are moſt frequent in the 1ſt, 2d, and 3d chapters. The enemies or corrupters of Chriſtianity, againſt whom he contends, ſeem to have denied that Jeſus was the Meſſiah, the Son of God (chap. ii. 22. v. 1.), and had actually come into the world in a human form, (chap. iv. 2, 3.). The earneſtneſs and frequency with which this apoſtle recommends the duty of benevolence is remarkable. He makes it the diſtinguiſhing characteriſtic of the diſciples of Jeſus, the only ſure pledge of our love to God, and the only aſſurance of eternal life, (chap. iii. 34, 15.). Benevolence was his favourite theme, which he affectionately preſſed upon others, and conſtantly practiſed himſelf. It was conſpicuous in his conduct to his great Maſter, and in the reciprocal affection which it inſpired in his ſacred breaſt. He continued to recommend it in his laſt words. When his extreme age and infirmities had ſo waſted his ſtrength that he was incapable to exerciſe the duties of his office, the venerable old man, anxious to exert in the ſervice of his Maſter the little ſtrength which ſtill remained, cauſed himſelf to be carried to church, and, in the midſt of the congregation, he repeated theſe words, "Little children, love one another."

235

econd and third Epiſtles of John. It has been obſerved by Dr Mill that the ſecond and third Epiſtles of John are ſo ſhort, and reſemble the firſt ſo much in ſentiment and ſtyle, that it is not worth while to contend about them. The ſecond Epiſtle conſiſts only of 13 verſes; and of theſe eight may be found in the 1ſt Epiſtle, in which the ſenſe or language is preciſely the ſame.

The ſecond Epiſtle is quoted by Irenæus, and was received by Clemens Alexandrinus. Both were admitted by Athanaſius, by Cyril of Jeruſalem, and by Jerome. The ſecond is addreſſed to a woman of diſtinction whoſe name is by ſome ſuppoſed to be *Cyria* (taking κυρια for a proper name), by others *Electa*. The third is inſcribed to Gaius, or Caius according to the Latin orthography, who, in the opinion of Lardner, was an eminent Chriſtian, that lived in ſome city of Aſia not far from Epheſus, where St John chiefly reſided after his leaving Judea. The time of writing theſe two Epiſtles cannot be determined with any certainty. They are ſo ſhort that an analyſis of them is not neceſſary.

236

piſtle of ide. Its uthenticity. The Epiſtle of Jude is cited by no ancient Chriſtian writer extant before Clemens Alexandrinus about the year 194; but this author has tranſcribed eight or ten verſes in his Stromata and Pedagogue. It is quoted once by Tertullian about the year 200; by Origen frequently about 230. It was not however received by many of the ancient Chriſtians, on account of a ſuppoſed quotation from a book of Enoch. But it is not certain that Jude quotes any book. He only ſays that *Enoch propheſied, ſaying, The Lord cometh with ten thouſand of his ſaints.* Theſe might be words of a prophecy preſerved by tradition, and inſerted occaſionally in different writings. Nor is there any evidence that there was ſuch a book as Enoch's prophecies in the time of Jude, though a book of that name was extant in the ſecond and third centuries. As to the date of this Epiſtle nothing beyond conjecture can be produced. Scripture.

237

The deſign of it is, by deſcribing the character of the falſe teachers, and the puniſhments to which they were liable, to caution Chriſtians againſt liſtening to their ſuggeſtions, and being thereby perverted from the faith and purity of the goſpel. and deſign.

238

The Apocalypſe or Revelation has not always been unanimouſly received as the genuine production of the apoſtle John. Its authenticity is proved, however, by the teſtimony of many reſpectable authors of the firſt centuries. It is referred to by the martyrs of Lyons: it was admitted by Juſtin Martyr as the work of the apoſtle John. It is often quoted by Irenæus, by Theophilus biſhop of Antioch, by Clement of Alexandria, by Tertullian, by Origen, and by Cyprian of Carthage. It was alſo received by heretics, by Novatus and his followers, by the Donatiſts, and by the Arians. For the firſt two centuries no part of the New Teſtament was more univerſally acknowledged, or mentioned with higher reſpect. But a diſpute having ariſen about the millennium, Caius with ſome others, about the year 212, to end the controverſy as ſpeedily and effectually as poſſible, ventured to deny the authority of the book which had given occaſion to it. The Apocalypſe. Its authenticity proved.

239

The book of Revelation, as we learn from Rev. i. 9. was written in the iſle of Patmos. According to the general teſtimony of ancient authors, John was baniſhed into Patmos in the reign of Domitian, and reſtored by his ſucceſſor Nerva. But the book could not be publiſhed till after John's releaſe, when he returned to Epheſus. As Domitian died in 96, and his perſecution did not commence till near the end of his reign, the Revelation might therefore be publiſhed in 96 or 97. The date of it.

Here we ſhould conclude; but as the curious reader may deſire to be informed how the predictions revealed in this book of St John have uſually been interpreted and applied, we ſhall conſiſtently with our ſubject ſubjoin *a key to the prophecies contained in the Revelation.* This is extracted from the learned diſſertations of Dr Newton, biſhop of Briſtol (1): to which the reader is referred for a more full illuſtration of the ſeveral parts, as the conciſeneſs of our plan only admits a ſhort analyſis or abridgment of them. *Percy's Key to the New Teſtament.*

240

Nothing of a prophetical nature occurs in the firſt three chapters, except, 1. What is ſaid concerning the church of Epheſus, that her "candleſtick ſhall be removed out of its place," which is now verified, not only in this, but in all the other Aſiatic churches which exiſted at that time; the light of the goſpel having been taken from them, not only by their hereſies and diviſions from within, but by the arms of the Saracens from without: And, 2. Concerning the church of Smyrna, that ſhe ſhall "have tribulation ten days;" that is, in prophetic language, Dr Newton's explication of the prophecies which have been already accompliſhed.

(1) Diſſertations on the prophecies which have remarkably been fulfilled, and at this time are fulfilling, in the world, vol. iii. 8vo.

guage, "ten years;" referring to the perſecution of Diocleſian, which alone of all the general perſecutions laſted ſo long.

The next five chapters relate to the opening of the *Seven Seals;* and by theſe ſeals are intimated ſo many different periods of the prophecy. Six of theſe ſeals are opened in the ſixth and ſeventh chapters.

The *firſt ſeal* or period is memorable for conqueſts. It commences with Veſpaſian, and terminates in Nerva; and during this time Judea was ſubjugated. The *ſecond ſeal* is noted for war and ſlaughter. It commences with Trajan, and continues through his reign, and that of his ſucceſſors. In this period, the Jews were entirely routed and diſperſed; and great was the ſlaughter and devaſtation occaſioned by the contending parties. The *third ſeal* is characteriſed by a rigorous execution of juſtice, and an abundant proviſion of corn, wine, and oil. It commences with Septimius Severus. He and Alexander Severus were juſt and ſevere emperors, and at the ſame time highly celebrated for the regard they paid to the felicity of their people, by procuring them plenty of every thing, and particularly corn, wine, and oil. This period laſted during the reigns of the Septimian family. The *fourth ſeal* is diſtinguiſhed by a concurrence of evils, ſuch as war, famine, peſtilence, and wild beaſts; by all which the Roman empire was remarkably infeſted from the reign of Maximin to that of Diocleſian. The *fifth ſeal* begins at Diocleſian, and is ſignalized by the great perſecution, from whence aroſe that memorable era, the Era of Martyrs. With Conſtantine begins the *ſixth ſeal*, a period of revolutions, pictured forth by great commotions in earth and in heaven, alluding to the ſubverſion of Paganiſm and the eſtabliſhment of Chriſtianity. This period laſted from the reign of Conſtantine the Great to that of Theodoſius the firſt. The *ſeventh ſeal* includes under it the remaining parts of the prophecy, and comprehends ſeven periods diſtinguiſhed by the ſounding of ſeven trumpets.

As the ſeals foretold the ſtate of the Roman empire before and till it became Chriſtian, ſo the trumpets foreſhow the fate of it afterwards; each trumpet being an alarm to one nation or other, rouſing them up to overthrow that empire.

Four of theſe trumpets are ſounded in the eighth chapter.

At the ſounding of the firſt, Alaric and his Goths invade the Roman empire, beſiege Rome twice, and ſet it on fire in ſeveral places. At the ſounding of the ſecond, Attila and his Huns waſte the Roman provinces, and compel the eaſtern emperor Theodoſius the ſecond, and the weſtern emperor Valentinian the third, to ſubmit to ſhameful terms. At the ſounding of the third, Genſeric and his Vandals arrive from Africa; ſpoil and plunder Rome, and ſet ſail again with immenſe wealth and innumerable captives. At the ſounding of the fourth, Odoacer and the Heruli put an end to the very name of the weſtern empire; Theodoric founds the kingdom of the Oſtrogoths in Italy; and at laſt Italy becomes a province of the eaſtern empire, Rome being governed by a duke under the exarch of Ravenna. As the foregoing trumpets relate chiefly to the downfal of the weſtern empire, ſo do the following to that of the eaſtern. They are ſounded in the ninth, tenth, and part of the eleventh chapters. At the ſounding of the fifth trumpet, Mahomet, that blazing ſtar, appears, opens the bottomleſs pit, and with his locuſts the Arabians darkens the ſun and air. And at the ſounding of the ſixth, a period not yet finiſhed, the four angels, that is, the four ſultans, or leaders of the Turks and Othmans, are looſed from the river Euphrates. The Greek or Eaſtern empire was cruelly "hurt and tormented" under the fifth trumpet; but under the ſixth, was "ſlain," and utterly deſtroyed.

The Latin or Weſtern Church not being reclaimed by the ruin of the Greek or Eaſtern, but ſtill perſiſting in their idolatry and wickedneſs; at the beginning of the tenth chapter, and under the ſound of this ſixth trumpet, is introduced a viſion preparative to the prophecies reſpecting the Weſtern Church, wherein an angel is repreſented, having in his hand a little book, or codicil, deſcribing the calamities that ſhould overtake that church. The meaſuring of the temple ſhows, that during all this period there will be ſome true Chriſtians, who will conform themſelves to the rule of God's word, even whilſt the outer court, that is, the external and more extenſive part of this temple or church, is trodden under foot by Gentiles, *i. e.* ſuch Chriſtians as, in their idolatrous worſhip and perſecuting practice, reſemble and outdo the Gentiles themſelves. Yet againſt theſe corrupters of religion there will always be ſome true witneſſes to proteſt, who, however they may be overborne at times, and in appearance reduced to death, yet will ariſe again from time to time, till at laſt they triumph and glorioſly aſcend. The eleventh chapter concludes with the ſounding of the ſeventh trumpet.

In the twelfth chapter, by the woman bearing a man-child is to be underſtood the Chriſtian church; by the great red dragon, the heathen Roman empire; by the man-child whom the woman bore, Conſtantine the Great; and by the war in heaven, the conteſts between the Chriſtian and Heathen religions.

In the thirteenth chapter, by the beaſt with ſeven heads and ten horns, unto whom the dragon gave his power, ſeat, and great authority, is to be underſtood, not Pagan but Chriſtian, not imperial but papal Rome; in ſubmitting to whoſe religion, the world did in effect ſubmit again to the religion of the dragon. The ten-horned beaſt therefore repreſents the Romiſh church and ſtate in general: but the beaſt with two horns like a lamb is the Roman clergy; and that image of the ten-horned beaſt, which the two-horned beaſt cauſed to be made, and inſpired with life, is the pope; whoſe number is 666, according to the numerical powers of the letters conſtituting the Roman name Λατεινος, *Latinus*, or its equivalent in *Hebrew*, רומיית *Romith*.

Chapter xiv. By the lamb on Mount Sion is meant Jeſus; by the hundred forty and four thouſand, his church and followers; by the angel preaching the everlaſting lafting gofpel, the firft principal effort made towards a reformation by that public oppofition formed againft the worfhip of faints and images by emperors and bifhops in the eighth and ninth centuries; by the angel crying, "Babylon is fallen," the Waldenfes and Albigenfes, who pronounced the church of Rome to be the Apocalyptic Babylon, and denounced her deftruction; and by the third angel Martin Luther and his fellow reformers, who protefted againft all the corruptions of the church of Rome, as deftructive to falvation. For an account of the doctrines and precepts contained in the Scriptures, fee THEOLOGY. For proofs of their divine origin, fee RELIGION, PROPHECY, and MIRACLES.

SCRIVENER, one who draws contracts, or whofe bufinefs it is to place money at intereft. If a fcrivener be entrufted with a bond, he may receive the intereft; and if he fail, the obligee fhall bear the lofs: and fo it is if he receive the principal and deliver up the bond; for being entrufted with the fecurity itfelf, it muft be prefumed that he is trufted with power to receive intereft or principal; and the giving up the bond on payment of the money fhall be a difcharge thereof. But if a fcrivener fhall be entrufted with a mortgage-deed, he hath only authority to receive the intereft, not the principal; the giving up the deed in this cafe not being fufficient to reftore the eftate, but there muft be a reconveyance, &c. It is held, where a fcrivener puts out his client's money on a bad fecurity, which upon inquiry might have been eafily found fo, yet he cannot in equity be charged to anfwer for the money; for it is here faid, no one would venture to put out money of another upon a fecurity, if he were obliged to warrant and make it good in cafe a lofs fhould happen, without any fraud in him.

SCROBICULUS CORDIS, the fame as ANTICARDIUM.

SCROFANELLO, in *Ichthyology*, a name by which fome have called a fmall fifh of the Mediterranean, more ufually known by the name of the *fcorpæna*.

SCROLL, in *Heraldry*. See that article, chap. iv. fect. 9. When the motto relates to the creft, the fcroll is properly placed above the achievement; otherwife it fhould be annexed to the efcutcheon. Thofe of the order of knighthood are generally placed round fhields.

SCROPHULA, the KING'S EVIL. See MEDICINE, N° 349.

SCROPHULARIA, FIGWORT, a genus of plants belonging to the didynamia clafs, and in the natural method ranking under the 40th order, *Perfonatæ*. See BOTANY *Index*.

SCROTUM. See ANATOMY, N° 220.

SCRUPLE, SCRUPULUS, or *Scrupulum*, the leaft of the weights ufed by the ancients, which amongft the Romans was the 24th part of an ounce, or the 3d part of a dram. The fcruple is ftill a weight among us, containing the 3d part of a dram, or 20 grains. Among goldfmiths it is 24 grains.

SCRUPLE, in *Chaldean Chronology*, is $\frac{1}{1080}$ part of an hour, called by the Hebrews *helakin*. Thefe fcruples are much ufed by the Jews, Arabs, and other eaftern people, in computations of time.

SCRUPLES of half Duration, an arch of the moon's orbit, which the moon's centre defcribes from the beginning of an eclipfe to its middle.

SCRUPLES of Immerfion or *Incidence*, an arch of the moon's orbit, which her centre defcribes from the beginning of the eclipfe to the time when its centre falls into the fhadow.

SCRUPLES of Emerfion, an arch of the moon's orbit, which her centre defcribes in the time from the firft emerfion of the moon's limb to the end of the eclipfe.

SCRUTINY, (*Scrutinium*), in the primitive church, an examination or probation practifed in the laft week of Lent, on the catechumens, who were to receive baptifm on the Eafter-day. The fcrutiny was performed with a great many ceremonies. Exorcifms and prayers were made over the heads of the catechumens; and on Palm Sunday, the Lord's Prayer and Creed were given them, which they were afterwards made to rehearfe. This cuftom was more in ufe in the church of Rome than anywhere elfe; though it appears, by fome miffals, to have been likewife ufed, though much later, in the Gallican church. It is fuppofed to have ceafed about the year 860. Some traces of this practice ftill remain at Vienne, in Dauphiné, and at Liege.

SCRUTINY, is alfo ufed, in the *Canon Law*, for a ticket or little paper billet, wherein at elections the electors write their votes privately, fo as it may not be known for whom they vote. Among us the term *fcrutiny* is chiefly ufed for a ftrict perufal and examination of the feveral votes haftily taken at an election; in order to find out any irregularities committed therein, by unqualified voters, &c.

SCRUTORE, or SCRUTOIR (from the French *efcritoire*), a kind of cabinet, with a door or lid opening downwards, for conveniency of writing on, &c.

SCRY, in falconry, denotes a large flock of fowl.

SCUDDING, the movement by which a fhip is carried precipitately before a tempeft. As a fhip flies with amazing rapidity through the water whenever this expedient is put in practice, it is never attempted in a contrary wind, unlefs when her condition renders her incapable of fuftaining the mutual effort of the wind and waves any longer on her fide, without being expofed to the moft imminent danger of being overfet.

A fhip either fcuds with a fail extended on her foremaft, or, if the ftorm is exceffive, without any fail: which, in the fea-phrafe, is called *fcudding under bare poles*. In floops and fchooners, and other fmall veffels, the fail employed for this purpofe is called the *fquare fail*. In large fhips, it is either the forefail at large, reefed, or with its goofe-wings extended, according to the degree of the tempeft; or it is the fore-top fail, clofe reefed, and lowered on the cap; which laft is particularly ufed when the fea runs fo high as to becalm the forefail occafionally, a circumftance which expofes the fhip to the danger of broaching to. The principal hazards incident to fcudding are generally, a pooping fea; the difficulty of fteering, which expofes the veffel perpetually to the rifk of broaching to; and the want of fufficient fea-room. A fea ftriking the fhip violently on the ftern may dafh it inwards, by which fhe muft inevitably founder. In broaching to (that is, inclining fuddenly to windward), fhe is threatened with being immediately overturned; and, for want of fea-room, fhe is endangered

dangered by ſhipwreck on a lee-ſhore, a circumſtance too dreadful to require explanation.

SCULPONEÆ, among the Romans, a kind of ſhoes worn by ſlaves of both ſexes. Theſe ſhoes were only blocks of wood made hollow, like the French ſabots.

SCULPTURE,

1 Definition of ſculpture. Origin of it.

IS the art of carving wood or hewing ſtone into images. It is an art of the moſt remote antiquity, being practiſed, as there is reaſon to believe, before the general deluge. We are induced to aſſign to it this early origin, by conſidering the expedients by which, in the firſt ſtages of ſociety, men have everywhere ſupplied the place of alphabetic characters. Theſe, it is univerſally known, have been picture-writing, ſuch as that of the Mexicans, which, in the progreſs of refinement and knowledge, was gradually improved into the hieroglyphics of the Egyptians and other ancient nations. See HIEROGLYPHICS.

That mankind ſhould have lived near 1700 years, from the creation of the world to the flood of Noah, without falling upon any method to make their conceptions permanent, or to communicate them to a diſtance, is extremely improbable; eſpecially when we call to mind that ſuch methods of writing have been found, in modern times, among people much leſs enlightened than thoſe muſt have been who were capable of building ſuch a veſſel as the ark. But if the antediluvians were acquainted with any kind of writing, there can be little doubt of its being hieroglyphical writing. Mr Bryant has proved that the Chaldeans were poſſeſſed of that art before the Egyptians; and Beroſus * informs us, that a delineation of all the monſtrous forms which inhabited the chaos, when this earth was in that ſtate, was to be ſeen in the temple of Belus in Babylon. This delineation, as he deſcribes it, muſt have been a hiſtory in hieroglyphical characters; for it conſiſted of human figures with wings, with two heads, and ſome with the horns and legs of goats. This is exactly ſimilar to the hieroglyphical writing of the Egyptians; and it was preſerved, our author ſays, both in drawings and *engravings* in the temple of the god of Babylon. As Chaldee was the firſt peopled region of the earth after the flood, and as it appears from Pliny †, as well as from Beroſus, that the art of engraving on bricks baked in the ſun was there carried to a conſiderable degree of perfection at a very early period, the probability certainly is, that the Chaldeans derived the art of hieroglyphical writing, and conſequently the rudiments of the art of ſculpture, from their antediluvian anceſtors.

* *Apud Syncellum*, p. 37.

† *Hiſt. Nat.* lib. vii. cap. 56.

2 not ſolely from idolatry;

It is generally thought that ſculpture had its origin from idolatry, as it was found neceſſary to place before the people the images of their gods to enliven the fervour of their devotion: but this is probably a miſtake. The worſhip of the heavenly bodies, as the only gods of the heathen nations, prevailed ſo long before the deification of dead men was thought of (ſee POLYTHEISM), that we cannot ſuppoſe mankind to have been, during all that time, ignorant of the art of hieroglyphical writing. But the deification of departed heroes undoubtedly gave riſe to the almoſt univerſal practice of repreſenting the gods by images of a human form; and therefore we muſt conclude, that the elements of ſculpture were known before that art was employed to enliven the devotion of idolatrous worſhippers. The pyramids and obeliſks of Egypt, which were probably temples, or rather altars, dedicated to the ſun (ſee PYRAMID), were covered from top to bottom with hieroglyphical emblems of men, beaſts, birds, fiſhes, and reptiles, at a period prior to that in which there is any unexceptionable evidence that mere ſtatue-worſhip prevailed even in that nurſery of idolatry.

3 though it probably contributed to carry the art to perfection,

But though it appears thus evident that picture-writing was the firſt employment of the ſculptor, we are far from imagining that idolatrous worſhip did not contribute to carry his art to that perfection which it attained in ſome of the nations of antiquity. Even in the dark ages of Europe, when the other fine arts were almoſt extinguiſhed, the mummery of the church of Rome, and the veneration which ſhe taught for her ſaints and martyrs, preſerved among the Italians ſome veſtiges of the ſiſter-arts of ſculpture and painting; and therefore, as human nature is everywhere the ſame, it is reaſonable to believe that a ſimilar veneration for heroes and demigods would, among the ancient nations, have a ſimilar effect. But if this be ſo, the preſumption is, that the Chaldeans were the firſt who invented the art of hewing blocks of wood and ſtone into the figures of men and other animals; for the Chaldeans were unqueſtionably the firſt idolaters, and their early progreſs in ſculpture is confirmed by the united teſtimonies of Beroſus, Alexander Polyhiſtor, Apollodorus, and Pliny; not to mention the eaſtern tradition, that the father of Abraham was a ſtatuary.

4 Mr Bromley's theory, that ſculpture was invented by the Scythians,

Againſt this concluſion Mr Bromley, in his late Hiſtory of the Fine Arts, has urged ſome plauſible arguments. In ſtating theſe he profeſſes not to be original, or to derive his information from the fountain-head of antiquity. He adopts, as he tells us, the theory of a French writer, who maintains, that in the year of the world 1949, about 300 years after the deluge, the Scythians under Brouma, a deſcendant of Magog the ſon of Japhet, extended their conqueſts over the greater part of Aſia. According to this ſyſtem, Brouma was not only the civilizer of India, and the author of the braminical doctrines, but alſo diffuſed the principles of the Scythian mythology over Egypt, Phœnicia, Greece, and the continent of Aſia.

Of theſe principles Mr Bromley has given us no diſtinct enumeration; the account which he gives of them is not to be found in one place, but to be collected from a variety of diſtant paſſages. In attempting therefore to preſent the ſubſtance of his ſcattered hints in one view, we will not be confident that we have omitted none of them. The ox, ſays he, was the Scythian emblem of the generator of animal life, and hence it became the principal divinity of the Arabians. The ſerpent was the ſymbol of the ſource of intelligent nature. Theſe were the common points of union in all the firſt religions

religions of the earth. From Egypt the Iſraelites carried with them a religious veneration for the ox and the ſerpent. Their veneration for the ox appeared ſoon after they marched into the wilderneſs, when in the abſence of Moſes they called upon Aaron to make them gods which ſhould go before them. The idea of having an idol to go before them, ſays our author, was completely Scythian; for ſo the Scythians acted in all their progreſs through Aſia, with this difference, that their idol was a living animal. The Iſraelites having gained their favourite god, which was an ox (not a calf as it is rendered in the book of Exodus), next proceeded to hold a feſtival, which was to be accompanied with dancing; a ſpecies of gaiety common in the feſtivals which were held in adoration of the emblematic *Urotal* or ox in that very part of Arabia near Mount Sinai where this event took place. It is mentioned too as a curious and important fact, that the ox which was revered in Arabia was called *Adonai*. Accordingly Aaron announcing the feaſt to the ox or golden calf, ſpeaks thus, *to-morrow is a feaſt to Adonai*, which is in our tranſlation rendered *to the Lord*. In the time of Jeroboam we read of the golden calves ſet up as objects of worſhip at Bethel and Dan. Nor was the reverence paid to the ox confined to Scythia, to Egypt, and to Aſia; it extended much farther. The ancient Cimbri, as the Scythians did, carried an ox of bronze before them on all their expeditions. Mr Bromley alſo informs us, that as great reſpect was paid to the living ox among the Greeks as was offered to its ſymbol among other nations.

The emblem of the ſerpent, continues Mr Bromley, was marked yet more decidedly by the expreſs direction of the Almighty. That animal had ever been conſidered as emblematic of the ſupreme generating power of intelligent life: And was that idea, ſays he, diſcouraged, ſo far as it went to be a ſign or ſymbol of life, when God ſaid to Moſes, "Make thee a brazen ſerpent, and ſet it on a pole, and it ſhall come to paſs that every one who is bitten, when he looketh on it, ſhall live." In Egypt the ſerpent ſurrounded their Iſis and Oſiris, the diadems of their princes, and the bonnets of their prieſts. The ſerpent made a diſtinguiſhed figure in Grecian ſculpture. The fable of Echidne, the mother of the Scythians, gave her figure terminating as a ſerpent to all the founders of ſtates in Greece; from which their earlieſt ſculptors repreſented in that form the Titan princes, Cecrops, Draco, and even Ericthonius. Beſides the ſpear of the image of Minerva, which Phidias made for the citadel of Athens, he placed a ſerpent, which was ſuppoſed to guard that goddeſs.

The ſerpent was combined with many other figures. It ſometimes was coiled round an egg as an emblem of the creation; ſometimes round a trident, to ſhow its power over the ſea; ſometimes it encircled a flambeau, to repreſent life and death.

In Egypt, as well as in Scythia and India, the divinity was repreſented on the leaves of the tamara or lotus. Pan was worſhipped as a god in that country, as well as over the eaſt. Their ſphinxes, and all their combined figures of animal creation, took their origin from the mother of the Scythians, who brought forth an offspring that was half a woman and half a ſerpent. Their pyramids and obeliſks aroſe from the idea of flame; the firſt emblem of the ſupreme principle, introduced by the Scythians, and which even the influence of Zoroaſter and the Magi could not remove.

We are told that the Bacchus of the Greeks is derived from the Brouma of the Indians; that both are repreſented as ſeated on a ſwan ſwimming over the waves, to indicate that each was the god of humid nature, not the god of wine, but the god of waters. The mitre of Bacchus was ſhaped like half an egg; an emblem taken from this circumſtance, that at the creation the egg from which all things ſprung was divided in the middle. Pan alſo was revered among the Scythians; and from that people were derived all the emblems by which the Greeks repreſented this divinity.

It would be tedious to follow our author through the whole of this ſubject; and were we to ſubmit to the labour of collecting and arranging his ſcattered materials, we ſhould ſtill view his ſyſtem with ſome degree of ſuſpicion. It is drawn, as he informs us, from the work of M. D'Ancarville, intitled, *Recherches ſur l'Origine, l'Eſprit, et les Progres, des Arts de la Grece.*

To form concluſions concerning the origin of nations, ill founded.
the riſe and progreſs of the arts and ſciences, without the aid of hiſtorical evidence, by analogies which are ſometimes accidental, and often fanciful, is a mode of reaſoning which cannot readily be admitted. There may indeed, we acknowledge, be reſemblances in the religion, language, manners, and cuſtoms, of different nations, ſo ſtriking and ſo numerous, that to doubt of their being deſcended from the ſame ſtock would ſavour of ſcepticiſm. But hiſtorical theories muſt not be adopted raſhly. We muſt be certain that the evidence is credible and ſatisfactory before we proceed to deduce any concluſions. We muſt firſt know whether the Scythian hiſtory itſelf be authentic, before we make any compariſon with the hiſtory of other nations. But what is called the Scythian hiſtory, every man of learning knows to be a collection of fables. Herodotus and Juſtin are the two ancient writers from whom we have the fulleſt account of that warlike nation; but theſe two hiſtorians contradict each other, and both write what cannot be believed of the ſame people at the ſame period of their progreſs. Juſtin tells us, that there was a long and violent conteſt between the Scythians and Egyptians about the antiquity of their reſpective nations; and after ſtating the arguments on each ſide of the queſtion, which, as he gives them *, are nothing to the purpoſe, he decides in favour of the claim of the Scythians. Herodotus was too partial to the Egyptians, not to give them the palm of antiquity: and he was probably in the right; for Juſtin deſcribes his moſt ancient of nations, even in the time of Darius Hyſtaſpes, as ignorant of all the arts of civil life. "They occupied their land in common (ſays he), and cultivated none of it. They had no houſes nor ſettled habitations, but wandered with their cattle from deſert to deſert. In theſe rambles they carried their wives and children in tumbrels covered with the ſkins of beaſts, which ſerved as houſes to protect them from the ſtorms of winter. They were without laws, governed by the dictates of natural equity. They coveted not gold or ſilver like the reſt of mankind, and lived upon milk and honey. Though they were expoſed to extreme cold, and had abundance of flocks, they knew not how to make garments of wool, but clothed themſelves in the ſkins of wild

* Lib. ii. cap. 1.

wild beafts †." This is the moft favourable account which any ancient writer gives of the Scythians. By Strabo ‡ and Herodotus § they are reprefented as the moft favage of mortals, delighting in war and bloodfhed, cutting the throats of all ftrangers who came among them, eating their flefh, and making cups and pots of their fkulls. Is it conceivable that fuch favages could be fculptors; or that, even fuppofing their manners to have been fuch as Juftin reprefents them, a people fo fimple and ignorant could have impofed their mythology upon the Chaldeans, Phenicians, and Egyptians, whom we know by the moft incontrovertible evidence to have been great and polifhed nations fo early as in the days of Abraham? No! We could as foon admit other novelties of more importance, with which the French of the prefent age pretend to enlighten the world, as this origin affigned by Mr Bromley to the art of fculpture, unlefs fupported by better authority than that of D'Ancarville.

† Lib. ii. cap. 2.
‡ Lib. vii.
§ Lib. iv. cap. 62.

The inference of our author from the name of the facred ox in Arabia, and from the dancing and gaiety which were common in the religious feftivals of the Arabians, appears to us to be very haftily drawn. At the early period of the departure of the Ifraelites from Egypt, the language of the Hebrews, Egyptians, and Arabians, differed not more from each other than do the different dialects of the Greek tongue which are found in the poems of Homer (fee PHILOLOGY, Sect. III.); and it is certain, that for many years after the formation of the golden-calf, the Hebrews were ftrangers to every fpecies of idolatry but that which they had brought with them from their houfe of bondage. See REMPHAN.

Taking for granted, therefore, that the Scythians did not impofe their mythology on the eaftern nations, and that the art of fculpture, as well as hieroglyphic writing and idolatrous worfhip, prevailed firft among the Chaldeans, we fhall endeavour to trace the progrefs of this art through fome other nations of antiquity, till we bring it to Greece, where it was carried to the higheft perfection to which it has yet attained.

The firft intimation that we have of the art of fculpture is in the book of Genefis, where we are informed, that when Jacob, by the divine command, was returning to Canaan, his wife Rachel carried along with her the teraphim or idols of her father. Thefe we are affured were fmall, fince Rachel found it fo eafy to conceal them from her father, notwithftanding his anxious fearch. We are ignorant, however, how thefe images were made, or of what materials they were compofed. The firft perfon mentioned as an artift of eminence is Bezaleel, who formed the cherubims which covered the mercy-feat.

6
Egyptian fculpture.

The Egyptians alfo cultivated the art of fculpture; but there were two circumftances which obftructed its progrefs, 1. The perfons of the Egyptians were not poffeffed of the graces of form, of elegance, or of fymmetry; and of confequence they had no perfect ftandard to model their tafte. They refembled the Chinefe in the caft of their face, in their great bellies, and in the clumfy rounding of their contours. 2. They were reftrained by their laws to the principles and practices of their anceftors, and were not permitted to introduce any innovations. Their ftatues were always formed in the fame ftiff attitude, with the arms hanging perpendicularly down the fides. What perfection were they capable of who knew no other attitude than that of chairmen? So far were they from attempting any improvements, that in the time of Adrian the art continued in the fame rude ftate as at firft; and when their flavifh adulation for that emperor induced them to place the ftatue of his favourite Antinous among the objects of their worfhip, the fame inanimate ftiffnefs in the attitude of the body and pofition of the arms was obferved. We believe it will fcarcely be neceffary to inform our readers that the Egyptian ftatue juft now mentioned is very different from the celebrated ftatue of Antinous, of which fo many moulds have been taken that imitations of it are now to be met with almoft in every cabinet in Europe.

Nothwithftanding the attachment of the Egyptians to ancient ufages, Winkelman thinks he has difcovered two different ftyles of fculpture which prevailed at different periods. The firft of thefe ends with the conqueft of Egypt by Cambyfes. The fecond begins at that time, and extends beyond the reign of Alexander the Great. In the firft ftyle, the lines which form the contour are ftraight and projecting a little; the pofition is ftiff and unnatural: In fitting figures the legs are parallel, the feet fqueezed together, and the arms fixed to the fides; but in the figures of women the left arm is folded acrofs the breaft; the bones and mufcles are faintly difcernible; the eyes are flat and looking obliquely, and the eyebrows funk—features which deftroy entirely the beauty of the head; the cheek-bones are high, the chin fmall and piked; the ears are generally placed higher than in nature, and the feet are too large and flat. In fhort, if we are to look for any model in the ftatues of Egypt, it is not for the model of beauty but of deformity. The ftatues of men are naked, only they have a fhort apron, and a few folds of drapery furrounding their waift: The veftments of women are only diftinguifhable by the border, which rifes a little above the furface of the ftatue. In this age it is evident the Egyptians knew little of drapery.

7
First ftyle.

Of the fecond ftyle of fculpture practiced among the Egyptians, Winkelman thinks he has found fpecimens in the two figures of bafaltes in the Capitol, and in another figure at Villa Albani, the head of which has been renewed. The firft two of thefe, he remarks, bear vifible traces of the former ftyle, which appear efpecially in the form of the mouth and fhortnefs of the chin. The hands poffefs more elegance; and the feet are placed at a greater diftance from each other, than was cuftomary in more ancient times. In the firft and third figures the arms hang down clofe to the fides. In the fecond they hang more freely. Winkelman fufpects that thefe three ftatues have been made after the conqueft of Egypt by the Greeks. They are clothed with a tunic, a robe, and a mantle. The tunic, which is puckered into many folds, defcends from the neck to the ground. The robe in the firft and third ftatues feems clofe to the body, and is only perceptible by fome little folds. It is tied under the breaft, and covered by the mantle, the two buttons of which are placed under the epaulet.

8
Second ftyle.

The Antinous of the Capitol is compofed of two pieces, which are joined under the haunches. But as all the Egyptian ftatues which now remain have been hewn out of one block, we muft believe that Diodorus, in in ſaying the ſtone was divided, and each half finiſhed by a ſeparate artizan, ſpoke only of a coloſſus. The ſame author informs us, that the Egyptians divided the human body into $24\frac{1}{4}$ parts; but it is to be regretted that he has not given a more minute detail of that diviſion.

The Egyptian ſtatues were not only formed by the chiſel, they were alſo poliſhed with great care. Even thoſe on the ſummit of an obeliſk, which could only be viewed at a diſtance, were finiſhed with as much labour and care as if they had admitted a cloſe inſpection. As they are generally executed in granite or baſaltes, ſtones of a very hard texture, it is impoſſible not to admire the indefatigable patience of the artiſts.

The eye was often of different materials from the reſt of the ſtatue; ſometimes it was compoſed of a precious ſtone or metal. We are aſſured that the valuable diamond of the empreſs of Ruſſia, the largeſt and moſt beautiful hitherto known, formed one of the eyes of the famous ſtatue of Scheringham in the temple of Brama.

Thoſe Egyptian ſtatues which ſtill remain are compoſed of wood or baked earth: and the ſtatues of earth are covered with green enamel.

9 Phenician ſculpture. The Phenicians poſſeſſed both a character and ſituation highly favourable to the cultivation of ſtatuary. They had beautiful models in their own perſons, and their induſtrious character qualified them to attain perfection in every art for which they had a taſte. Their ſituation raiſed a ſpirit of commerce, and commerce induced them to cultivate the arts. Their temples ſhone with ſtatues and columns of gold, and a profuſion of emeralds was everywhere ſcattered. All the great works of the Phenicians have been unfortunately deſtroyed; but many of the Carthaginian medals are ſtill preſerved, ten of which are depoſited in the cabinet of the grand duke of Florence. But though the Carthaginians were a colony of Phenicians, we cannot from their works judge of the merit of their anceſtors.

10 This art not cultivated among the Perſians. The Perſians made no diſtinguiſhed figure in the arts of deſign. They were indeed ſenſible to the charms of beauty, but they did not ſtudy to imitate them. Their dreſs, which conſiſted of long flowing robes concealing the whole perſon, prevented them from attending to the beauties of form. Their religion, too, which taught them to worſhip the divinity in the emblem of fire, and that it was impious to repreſent him under a human form, ſeemed almoſt to prohibit the exerciſe of this art, by taking away thoſe motives which alone could give it dignity and value; and as it was not cuſtomary among them to raiſe ſtatues to great men, it was impoſſible that ſtatuary could flouriſh in Perſia.

11 Etrurian ſculpture. The Etrurians or ancient Tuſcans, in the opinion of Winkelman, carried this art to ſome degree of perfection at an earlier period than the Greeks. It is ſaid to have been introduced before the ſiege of Troy by Dedalus, who, in order to eſcape the reſentment of Minos king of Crete, took refuge in Sicily, from whence he paſſed into Italy, where he left many monuments of his art. Pauſanias and Diodorus Siculus informs us, that ſome works aſcribed to him were to be ſeen when they wrote, and that theſe poſſeſſed that character of majeſty which afterwards diſtinguiſhed the labours of Etruria.

A character ſtrongly marked forms the chief diſtinction in thoſe productions of Etruria which have deſcended to us. Their ſtyle was indeed harſh and overcharged; a fault alſo committed by Michael Angelo the celebrated painter of modern Etruria; for it is not to be ſuppoſed that a people of ſuch rude manners as the Etrurians could communicate to their works that vividneſs and beauty which the elegance of Grecian manners inſpired. On the other hand, there are many of the Tuſcan ſtatues which bear ſo cloſe a reſemblance to thoſe of Greece, that antiquarians have thought it probable that they were conveyed from that country, or Magna Græcia, into Etruria, about the time of the Roman conqueſt, when Italy was adorned with the ſpoils of Greece.

12 First ſtyle. Among the monuments of Etrurian art two different ſtyles have been obſerved. In the firſt the lines are ſtraight, the attitude ſtiff, and no idea of beauty appears in the formation of the head. The contour is not well rounded, and the figure is too ſlender. The head is oval, the chin piked, the eyes flat, and looking aſquint.

Theſe are the defects of an art in a ſtate of infancy, which an accompliſhed maſter could never fall into, and are equally conſpicuous in Gothic ſtatues as in the productions of the ancient natives of Florence. They reſemble the ſtyle of the Egyptians ſo much, that one is almoſt induced to ſuppoſe that there had once been a communication between theſe two nations; but others think that this ſtyle was introduced by Dedalus.

13 Second ſtyle. Winkelman ſuppoſes that the ſecond epoch of this art commenced in Etruria, about the time at which it had reached its greateſt perfection in Greece, in the age of Phidias; but this conjecture is not ſupported by any proofs. To deſcribe the ſecond ſtyle of ſculpture among the Etrurians, is almoſt the ſame as to deſcribe the ſtyle of Michael Angelo and his numerous imitators. The joints are ſtrongly marked, the muſcles raiſed, the bones diſtinguiſhable; but the whole mien harſh. In deſigning the bone of the leg, and the ſeparation of the muſcles of the calf, there is an elevation and ſtrength above life. The ſtatues of the gods are deſigned with more delicacy. In forming them, the artiſts were anxious to ſhow that they could exerciſe their power without that violent diſtenſion of the muſcles which is neceſſary in the exertions of beings merely human; but in general their attitudes are unnatural, and the actions ſtrained. If a ſtatue, for inſtance, hold any thing with its fore fingers, the reſt are ſtretched out in a ſtiff poſition.

According to ancient hiſtory, the Greeks did not emerge from the ſavage ſtate till a long time after the Egyptians, Chaldeans, and Indians, had arrived at a conſiderable degree of civilization. The original rude inhabitants of Greece were civilized by colonies which arrived among them, at different times, from Egypt and Phenicia. Theſe brought along with them the religion, the letters, and the arts of their parent countries: and if ſculpture had its origin from the worſhip of idols, there is reaſon to believe that it was one of the arts which were thus imported; for that the gods of Greece were of Egyptian and Phenician extraction is a fact incontrovertible; (ſee MYSTERIES, MYTHOLOGY, PHILOLOGY, Sect. VII. PHILOSOPHY, N° 19, and TITAN). The original ſtatues of the gods, however, were very rude. The earlieſt objects of idolatrous worſhip

worship have everywhere been the heavenly bodies; and the symbols consecrated to them were generally pillars of a conical or pyramidal figure. It was not till hero-worship was engrafted on the planetary, that the sculptor thought of giving to the sacred statue any part of the human form (see POLYTHEISM, N° 19, 23.); and it appears to have been about the era of their revolution in idolatry that the art of sculpture was introduced among the Greeks. The first representations of their gods were round stones placed upon cubes or pillars; and these stones they afterwards formed roughly, so as to give them something of the appearance of a head. Agreeable to this description was a Jupiter, which Pausanias saw in Tegeum, in Arcadia. These representations were called *Hermes;* not that they represented Mercury, but from the word *Herma*, which signified a rough stone. It is the name which Homer gives to the stones which were used to fix vessels to the shore. Pausanias saw at Pheres 30 deities made of unformed blocks or cubical stones. The Lacedemonians represented Castor and Pollux by two parallel posts; and a transverse beam was added, to express their mutual affection.

If the Greeks derived from foreign nations the rudiments of the arts, it must redound much to their honour, that in a few centuries they carried them to such wonderful perfection as entirely to eclipse the fame of their masters. It is by tracing the progress of sculpture among them that we are to study the history of this art; and we shall see its origin and successive improvements correspond with nature, which always operates slowly and gradually.

View of Grecian Sculpture.

14 Causes which promoted the art of sculpture in Greece.

The great superiority of the Greeks in the art of sculpture may be ascribed to a variety of causes. The influence of climate over the human body is so striking, that it must have fixed the attention of every thinking man who has reflected on the subject. The violent heats of the torrid zone, and the excessive cold of the polar regions, are unfavourable to beauty. It is only in the mild climates of the temperate regions that it appears in its most attractive charms. Perhaps no country in the world enjoys a more serene air, less tainted with mists and vapours, or possesses in a higher degree that mild and genial warmth which can unfold and expand the human body into all the symmetry of muscular strength, and all the delicacies of female beauty in greater perfection, than the happy climate of Greece; and never was there any people that had a greater taste for beauty, or were more anxious to improve it. Of the four wishes of Simonides, the second was to have a handsome figure. The love of beauty was so great among the Lacedemonian women, that they kept in their chambers the statues of Nereus, of Narcissus, of Hyacinthus, and of Castor and Pollux; hoping that by often contemplating them they might have beautiful children.

There was a variety of circumstances in the noble and virtuous freedom of the Grecian manners that rendered these models of beauty peculiarly subservient to the cultivation of the fine arts. There were no tyrannical laws, as among the Egyptians, to check their progress. They had the best opportunities to study them in the public places, where the youth, who needed no other veil than chastity and purity of manners, performed their various exercises quite naked. They had the strongest motives to cultivate sculpture, for a statue was the highest honour which public merit could attain. It was an honour ambitiously sought, and granted only to those who had distinguished themselves in the eyes of their fellow citizens. As the Greeks preferred natural qualities to acquired accomplishments, they decreed the first rewards to those who excelled in agility and strength of body. Statues were often raised to wrestlers. Even the most eminent men of Greece, in their youth, sought renown in gymnastic exercises. Chrysippus and Cleanthes distinguished themselves in the public games before they were known as philosophers. Plato appeared as a wrestler both at the Isthmian and Pythian games; and Pythagoras carried off the prize at Elis, (see PYTHAGORAS). The passion by which they were inspired was the ambition of having their statues erected in the most sacred place of Greece, to be seen and admired by the whole people. The number of statues erected on different occasions was immense; of course the number of artists must have been great, their emulation ardent, and their progress rapid.

As most of their statues were decreed for those who vanquished in the public games, the artists had the opportunity of seeing excellent models; for those who surpassed in running, boxing, and wrestling, must in general have been well formed, yet would exhibit different kinds of beauty.

The high estimation in which sculptors were held was very favourable to their art. Socrates declared the artists the only wise men. An artist could be a legislator, a commander of armies, and might hope to have his statue placed beside those of Miltiades and Themistocles, or those of the gods themselves. Besides, the honour and success of an artist did not depend on the caprice of pride or of ignorance. The productions of art were estimated and rewarded by the greatest sages in the general assembly of Greece, and the sculptor who had executed his work with ability and taste was confident of obtaining immortality.

It was the opinion of Winkelman, that liberty was highly favourable to this art; but, though liberty is absolutely necessary to the advancement of science, it may be doubted whether the fine arts owe their improvement to it. Sculpture flourished most in Greece, when Pericles exercised the power of a king; and in the reign of Alexander, when Greece was conquered. It attained no perfection in Rome till Augustus had enslaved the Romans. It revived in Italy under the patronage of the family of Medici, and in France under the despotic rule of Louis XIV. It is the love of beauty, luxury, wealth, or the patronage of a powerful individual, that promotes the progress of this art.

15 Grecian ideas of beauty.

It will now be proper to give a particular account of the ideas which the Greeks entertained concerning the standard of beauty in the different parts of the human body. And with respect to the head, the profile which they chiefly admired is peculiar to dignified beauty.

16 The profile.

It consists in a line almost straight, or marked by such slight and gentle inflections as are scarcely distinguishable from a straight line. In the figures of women and young persons, the forehead and nose form a line approaching to a perpendicular.

Ancient

17 The forehead. Ancient writers, as well as artists, assure us that the Greeks reckoned a small forehead a mark of beauty, and a high forehead a deformity. From the same idea, the Circassians wore their hair hanging down over their foreheads almost to their eyebrows. To give an oval form to the countenance, it is necessary that the hair should cover the forehead, and thus make a curve about the temples; otherwise the face, which terminates in an oval form in the inferior part, will be angular in the higher part, and the proportion will be destroyed. This rounding of the forehead may be seen in all handsome persons, in all the heads of ideal beauty in ancient statues, and especially in those of youth. It has been overlooked, however, by modern statuaries. Bernini, who modelled a statue of Louis XIV. in his youth, turned back the hair from the forehead.

18 The eyes. It is generally agreed that large eyes are beautiful; but their size is of less importance in sculpture than their form, and the manner in which they are enchased. In ideal beauty, the eyes are always sunk deeper than they are in nature, and consequently the eyebrows have a greater projection. But in large statues, placed at a certain distance, the eyes, which are of the same colour with the rest of the head, would have little effect if they were not sunk. By deepening the cavity of the eye, the statuary increases the light and shade, and thus gives the head more life and expression. The same practice is used in small statues. The eye is a characteristic feature in the heads of the different deities. In the statues of Apollo, Jupiter, and Juno, the eye is large and round. In those of Pallas they are also large; but by lowering the eyelids, the virgin air and expression of modesty are delicately marked. Venus has small eyes, and the lower eyelid being raised a little, gives them a languishing look and enchanting sweetness. It is only necessary to see the Venus de Medicis to be convinced that large eyes are not essential to beauty, especially if we compare her small eyes with those which resemble them in nature. The beauty of the eyebrows consists in the fineness of the hair, and in the sharpness of the bone which covers them; and masters of the art considered the joining of the eyebrows as a deformity, though it is sometimes to be met with in ancient statues.

19 The mouth. The beauty of the mouth is peculiarly necessary to constitute a fine face. The lower lip must be fuller than the upper, in order to give an elegant rounding to the chin. The teeth seldom appear, except in laughing satyrs. In human figures the lips are generally close, and a little opened in the figures of the gods, The lips of Venus are half open.

In figures of ideal beauty, the Grecian artists never interrupted the rounding of the chin by introducing a dimple: for this they considered not as a mark of beauty, and only to be admitted to distinguish individuals. The dimple indeed appears in some ancient statues, but antiquaries suspect it to be the work of a modern hand. It is suspected also, that the dimple which is sometimes found on the cheeks of ancient statues is a modern innovation.

20 The ears. No part of the head was executed by the ancients with more care than the ears, though little attention has been given to them by modern artists. This character is so decisive, that if we observe in any statue that the ears are not highly finished, but only roughly marked, we may conclude with certainty that we are examining a modern production. The ancients were very attentive to copy the precise form of the ear in taking likenesses. Thus, where we meet with a head the ears of which have a very large interior opening, we know it to be the head of Marcus Aurelius.

21 The hair. The manner in which the ancient artists formed the hair also enables us to distinguish their works from those of the moderns. On hard and coarse stones the hair was short, and appeared as if it had been combed with a wide comb; for that kind of stone was difficult to work, and could not without immense labour be formed into curled and flowing hair. But the figures executed in marble in the most flourishing period of the art have the hair curled and flowing; at least where the head was not intended to be an exact resemblance, for then the artist conformed to his model. In the heads of women, the hair was thrown back, and tied behind in a waving manner, leaving considerable intervals; which gives the agreeable variety of light and shade, and produces the effects of the claro-obscuro. The hair of the Amazons is disposed in this manner. Apollo and Bacchus have their hair falling down their shoulders; and young persons, till they arrived at manhood, wore their hair long. The colour of the hair which was reckoned most beautiful, was fair; and this they gave without distinction to the most beautiful of their gods, Apollo and Bacchus, and likewise to their most illustrious heroes.

22 The hand. Although the ravages of time have preserved but few of the hands or feet of ancient statues, it is evident from what remains how anxious the Grecian artists were to give every perfection to these parts. The hands of young persons were moderately plump, with little cavities or dimples at the joints of the fingers. The fingers tapered very gently from the root to the point, like well-proportioned columns, and the joints were scarcely perceptible. The terminating joint was not bent, as it commonly appears in modern statues.

23 The legs and feet. In the figures of young men the joints of the knee are faintly marked. The knee unites the leg to the thigh without making any remarkable projections or cavities. The most beautiful legs and best-turned knees, according to Winkelman, are preserved in the Apollo Sauroctones, in the Villa Burghese; in the Apollo which has a swan at its feet; and in the Bacchus of Villa Medicis. The same able connoisseur remarks, it is rare to meet with beautiful knees in young persons, or in the elegant representations of art. As the ancients did not cover the feet as we do, they gave to them the most beautiful turning, and studied the form of them with the most scrupulous attention.

The breasts of men were large and elevated. The breasts of women did not possess much amplitude. The figures of the deities have always the breasts of a virgin, the beauty of which the ancients made to consist in a gentle elevation. So anxious were the women to resemble this standard, that they used several arts to restrain the growth of their breasts. The breasts of the nymphs and goddesses were never represented swelling, because that is peculiar to those women who suckle. The paps of Venus contract and end in a point, this being considered as an essential characteristic of perfect beauty. Some of the moderns have transgressed these rules, and have fallen into great improprieties.

The

The lower part of the body in the ftatues of men was formed like that of the living body after a profound fleep and good digeftion. The navel was confiderably funk, efpecially in female ftatues.

25
Ideal beauty.

As beauty never appears in equal perfection in every part of the fame individual, perfect or ideal beauty can only be produced by felecting the moft beautiful parts from different models; but this muft be done with fuch judgement and care, that thefe detached beauties when united may form the moft exact fymmetry. Yet the ancients fometimes confined themfelves to one individual, even in the moft flourifhing age. Theodorus, whom Socrates and his difciples vifited, ferved as a model to the artifts of his time. Phryne alfo appears to have been a model to the painters and fculptors. But Socrates, in his converfation with Parrhafius, fays, that when a perfect beauty was to be produced, the artifts joined together the moft ftriking beauties which could be collected from the fineft figures. We know that Zeuxis, when he was going to paint Helen, united in one picture all the beauties of the moft handfome women of Crotona.

26
The drapery of ftatues.

THE Grecian fculptors, who reprefented with fuch fuccefs the moft perfect beauty of the human form, were not regardlefs of the drapery of their ftatues. They clothed their figures in the moft proper ftuff, which they wrought into that fhape which was beft calculated to give effect to their defign.

The veftments of women in Greece generally confifted of linen cloth, or fome other light ftuff, and in latter times of filk and fometimes of woollen cloth. They had alfo garments embroidered with gold. In the works of fculpture, as well as in thofe of painting, one may diftinguifh the linen by its tranfparency and fmall united folds. The other light ftuffs which were worn by the women (A) were generally of cotton produced in the ifle of Cos; and thefe the art of ftatuary was able to diftinguifh from the linen veftments. The cotton cloth was fometimes ftriped, and fometimes embellifhed with a profufion of flowers. Silk was alfo employed; but whether it was known in Greece before the time of the Roman emperors cannot eafily be determined. In paintings, it is diftinguifhable by changing its colour in different lights to red, violet, and fky-blue. There were two forts of purple; that which the Greeks called the *colour of the fea*, and Tyrian purple, which refembled lac. Woollen garments are eafily known by the amplitude of their folds. Befides thefe, cloth of gold fometimes compofed their drapery: but it was not like the modern fabric, confifting of a thread of gold or of filver fpun with a thread of filk; it was compofed of gold or filver alone, without any mixture.

The veftments of the Greeks, which deferve particular attention, are the tunic, the robe, and the mantle.

27
The tunic.

The tunic was that part of the drefs which was next to the body. It may be feen in fleeping figures, or in thofe in difhabille; as in the Flora Farnefe, and in the ftatues of the Amazons in the Capitol. The youngeft of the daughters of Niobe, who throws herfelf at her mother's fide, is clothed only with a tunic. It was of linen, or fome other light ftuff, without fleeves, fixed to the fhoulders by a button, fo as to cover the whole breaft. None but the tunics of the goddefs Ceres and comedians have long ftraight fleeves.

28
The robe.

The robes of women commonly confifted of two long pieces of woollen cloth, without any particular form, attached to the fhoulders by a great many buttons, and fometimes by a clafp. They had ftraight fleeves which came down to the wrifts. The young girls, as well as the women, faftened their robe to their fide by a cincture, in the fame way as the high-prieft of the Jews faftened his, as it is ftill done in many parts of Greece. The cincture formed on the fide a knot of ribbons fometimes refembling a rofe in fhape, which has been particularly remarked in the two beautiful daughters of Niobe. In the younger of thefe the cincture is feen paffing over the fhoulders and the back. Venus has two cinctures, the one paffing over the fhoulder, and the other furrounding the waift. The latter is called *ceftus* by the poets.

29
The mantle.

The mantle was called *peplon* by the Greeks, which fignifies properly the mantle of Pallas. The name was afterwards applied to the mantles of the other gods, as well as to thofe of men. This part of the drefs was not fquare, as fome have imagined, but of a roundifh form. The ancients indeed fpeak in general of fquare mantles, but they received this fhape from four taffels which were affixed to them; two of thefe were vifible, and two were concealed under the mantle. The mantle was brought under the right arm, and over the left fhoulder; fometimes it was attached to the fhoulder by two buttons, as may be feen in the beautiful ftatue of Leucothoe at Villa Albani.

30
The colour of the veftments.

The colour of veftments peculiar to certain ftatues is too curious to be omitted. To begin with the figures of the gods.—The drapery of Jupiter was red, that of Neptune is fuppofed by Winkelman to have been fea-green. The fame colour alfo belonged to the Nereids and Nymphs. The mantle of Apollo was blue or violet. Bacchus was dreffed in white. Martianus Capella affigns green to Cybele. Juno's veftments were fky-blue, but fhe fometimes had a white veil. Pallas was robed in a flame-coloured mantle. In a painting of Herculaneum, Venus is in flowing drapery of a golden yellow. Kings were arrayed in purple; priefts in white; and conquerors fometimes in fea-green.

With refpect to the head, women generally wore no covering but their hair; when they wifhed to cover their head, they ufed the corner of their mantle.—Sometimes we meet with veils of a fine tranfparent texture. Old women wore a kind of bonnet upon their head, an example of which may be feen in a ftatue in the Capitol, called the *Præfica;* but Winkelman thinks it is a ftatue of Hecuba.

The covering of the feet confifted of fhoes or fandals. The fandals were generally an inch thick, and compofed of more than one fole of cork. Thofe of Pallas in Villa Albani has two foles, and other ftatues had no lefs than five.

WINKELMAN

(A) Men fometimes wore cotton, but all who did fo were reckoned effeminate.

31 Four ſtyles of this art among the Greeks.

WINKELMAN has aſſigned four different ſtyles to this art. The *ancient* ſtyle, which continued until the time of Phidias; the *grand* ſtyle, formed by that celebrated ſtatuary; the *beautiful*, introduced by Praxiteles, Apelles, and Lyſippus; and the *imitative* ſtyle, practiſed by thoſe artiſts who copied the works of the ancient maſters.

32 The ancient ſtyle.

The moſt authentic monuments of the ancient ſtyle are medals, containing an inſcription, which leads us back to very diſtant times. The writing is from right to left in the Hebrew manner; a uſage which was abandoned before the time of Herodotus. The ſtatue of Agamemnon at Elis, which was made by Onatas, has an inſcription from right to left. This artiſan flouriſhed 50 years before Phidias; it is in the intervening period therefore between theſe two artiſts, that we are to look for the ceſſation of this practice. The ſtatues formed in the ancient ſtyle were neither diſtinguiſhed by beauty of ſhape nor by proportion, but bore a cloſe reſemblance to thoſe of the Egyptians and Etrurians (B); the eyes were long and flat; the ſection of the mouth not horizontal; the chin was pointed; the curls of the hair were ranged in little rings, and reſembled grains incloſed in a heap of raiſins. What was ſtill worſe, it was impoſſible by inſpecting the head to diſtinguiſh the ſex.

The characters of this ancient ſtyle were theſe: The deſigning was energetic, but harſh; it was animated, but without gracefulneſs; and the violence of the expreſſion deprived the whole figure of beauty.

33 The grand ſtyle.

The grand ſtyle was brought to perfection by Phidias, Polycletus, Scopas, Alcamenes, Myron, and other illuſtrious artiſts. It is probable, from ſome paſſages of ancient writers, that in this ſtyle were preſerved ſome characters of the ancient manner, ſuch as the ſtraight lines, the ſquares and angles. The ancient maſters, ſuch as Polycletus, being the legiſlators of proportions, ſays Winkelman, and of conſequence thinking they had a right to diſtribute the meaſures and dimenſions of the parts of the human body, have undoubtedly ſacrificed ſome degree of the form of beauty to a grandeur which is harſh, in compariſon of the flowing contours and graceful forms of their ſucceſſors.—The moſt conſiderable monuments of the grand ſtyle are the ſtatues of Niobe and her daughters, and a figure of Pallas, to be ſeen in Villa Albani; which, however, muſt not be confounded with the ſtatue which is modelled according to the firſt ſtyle, and is alſo found in the ſame place. The head poſſeſſes all the characters of dignified beauty, at the ſame time exhibiting the rigidneſs of the ancient ſtyle. The face is defective in gracefulneſs; yet it is evident how eaſy it would have been to give the features more roundneſs and grace. The figures of Niobe and her daughters have not, in the opinion of Winkelman, that auſterity of appearance which marks the age of the ſtatue of Pallas. They are characteriſed by grandeur and ſimplicity: ſo ſimple are the forms, that they do not appear to be the tedious productions of art, but to have been created by an inſtantaneous effort of nature.

34 The graceful ſtyle.

The third ſtyle was the graceful or beautiful. Lyſippus was perhaps the artiſt who introduced this ſtyle. Being more converſant than his predeceſſors with the ſweet, the pure, the flowing, and the beautiful lines of nature, he avoided the ſquare forms which the maſters of the ſecond ſtyle had too much employed. He was of opinion that the uſe of the art was rather to pleaſe than to aſtoniſh, and that the aim of the artiſt ſhould be to raiſe admiration by giving delight. The artiſts who cultivated this ſtyle did not, however, neglect to ſtudy the ſublime works of their predeceſſors. They knew that grace is conſiſtent with the moſt dignified beauty, and that it poſſeſſes charms which muſt ever pleaſe: they knew alſo that theſe charms are enhanced by dignity. Grace is infuſed into all the movements and attitudes of their ſtatues, and it appears in the delicate turns of the hair, and even in the adjuſting of the drapery. Every ſort of grace was well known to the ancients; and great as the ravages of time have been amongſt the works of art, ſpecimens are ſtill preſerved, in which can be diſtinguiſhed *dignified* beauty, *attractive* beauty, and a beauty *peculiar to infants*. A ſpecimen of dignified beauty may be ſeen in the ſtatue of one of the muſes in the palace of Barberini at Rome; and in the garden of the pope, on the Quirinal, is a ſtatue of another muſe, which affords a fine inſtance of attractive beauty. Winkelman ſays that the moſt excellent model of infant beauty which antiquity has tranſmitted to us is a ſatyr of a year old, which is preſerved, though a little mutilated, in Villa Albani.

35 The imitative ſtyle.

The great reputation of Praxiteles and Apelles raiſed an ardent emulation in their ſucceſſors, who deſpairing to ſurpaſs ſuch illuſtrious maſters, were ſatisfied with imitating their works. But it is well known that a mere imitator is always inferior to the maſter whom he attempts to copy. When no original genius appears, the art muſt therefore decline.

36 Materials of Grecian ſtatues.

CLAY was the firſt material which was employed in ſtatuary. An inſtance of this may be ſeen in a figure of Alcamenes in bas-relief in Villa Albani. The ancients uſed their fingers, and eſpecially their nails, to render certain parts more delicate and lively: hence aroſe the phraſe *ad unguem factus homo*, "an accompliſhed man." 37 Clay and plaſter. It was the opinion of Count Caylus that the ancients did not uſe models in forming their ſtatues. But to diſprove this, it is only neceſſary to mention an engraving on a ſtone in the cabinet of Stoſch, which repreſents Prometheus engraving the figure of a man, with a plummet in his hand to meaſure the proportions of his model. The ancients as well as the moderns made works in plaſter; but no ſpecimens remain except ſome figures in bas-relief, of which the moſt beautiful were found at Baia.

38 Ivory, ſilver, and gold.

The works made of ivory and ſilver were generally of a ſmall ſize. Sometimes, however, ſtatues of a prodigious ſize were formed of gold and ivory. The coloſſal Minerva of Phidias, which was compoſed of theſe materials, was 26 cubits high. It is indeed ſcarcely poſſible

(B) This is a proof additional to thoſe that will be found in the articles to which we have referred, that the Greeks received the rudiments of the art of ſculpture from the nations to which they were confeſſedly indebted for the elements of ſcience.

poſſible to believe that ſtatues of ſuch a ſize could entirely conſiſt of gold and ivory. The quantity of ivory neceſſary to a coloſſal ſtatue is beyond conception. M. de Paw calculates that the ſtatue of Jupiter Olympus, which was 54 feet high, would conſume the teeth of 300 elephants.

39 Marble.

The Greeks generally hewed their marble ſtatues out of one block, though they after worked the heads ſeparately, and ſometimes the arms. The heads of the famous group of Niobe and her daughters have been adapted to their bodies after being ſeparately finiſhed. It is proved by a large figure repreſenting a river, which is preſerved in Villa Albani, that the ancients firſt hewed their ſtatues roughly before they attempted to finiſh any part. When the ſtatue had received its perfect figure, they next proceeded to poliſh it with pumice-ſtone, and again carefully retouched every part with the chiſel.

40 Porphyry.

The ancients, when they employed porphyry, uſually made the head and extremities of marble. It is true, that at Venice there are four figures entirely compoſed of porphyry; but theſe are the productions of the Greeks of the middle age. They alſo made ſtatues of baſaltes and alabaſter.

41 Expreſſion and attitude.

WITHOUT expreſſion, geſture, and attitude, no figure can be beautiful, becauſe in theſe the graces always reſide. It was for this reaſon that the graces are always repreſented as the companions of Venus.

The expreſſion of tranquillity was frequent in Grecian ſtatues, becauſe, according to Plato, that was conſidered as the middle ſtate of the ſoul between pleaſure and pain. Experience, too, ſhows that in general the moſt beautiful perſons are endowed with the ſweeteſt and moſt engaging manner. Without a ſedate tranquillity dignified beauty could not exiſt. It is in this tranquillity, therefore, that we muſt look for the complete diſplay of genius.

42 In the ſtatues of the gods.

The moſt elevated ſpecies of tranquillity and repoſe was ſtudied in the figures of the gods. The father of the gods, and even inferior divinities, are repreſented without emotion or reſentment. It is thus that Homer paints Jupiter ſhaking Olympus by the motion of his hair and his eyebrows.

> Shakes his ambroſial curls, and gives the nod,
> The ſtamp of fate and ſanction of the god.

Jupiter is not always exhibited in this tranquil ſtate. In a bas-relief belonging to the marquis Rondini he appears ſeated on an arm-chair with a melancholy aſpect. The Apollo of the Vatican repreſents the god in a fit of rage againſt the ſerpent Python, which he kills at a blow. The artiſt, adopting the opinion of the poets, has made the noſe the ſeat of anger, and the lips the ſeat of diſdain.

43 In the ſtatues of heroes.

To expreſs the action of a hero, the Grecian ſculptors delineated the countenance of a noble virtuous character repreſſing his groans, and allowing no expreſſion of pain to appear. In deſcribing the actions of a hero the poet has much more liberty than the artiſt. The poet can paint them ſuch as they were before men were taught to ſubdue their paſſions by the reſtraints of law, or the refined cuſtoms of ſocial life. But the artiſt, obliged to ſelect the moſt beautiful forms, is reduced to the neceſſity of giving ſuch an expreſſion of the paſſions as may not ſhock our feelings and diſguſt us with his production. The truth of theſe remarks will be acknowledged by thoſe who have ſeen two of the moſt beautiful monuments of antiquity; one of which repreſents the fear of death, the other the moſt violent pains and ſufferings. The daughters of Niobe, againſt whom Diana has diſcharged her fatal arrows, are exhibited in that ſtate of ſtupefaction which we imagine muſt take place when the certain proſpect of death deprives the ſoul of all ſenſibility. The fable preſents us an image of that ſtupor which Eſchylus deſcribes as ſeizing the daughters of Niobe when they were transformed into a rock. The other monument referred to is the image of Laocoon, which exhibits the moſt agonizing pain that can affect the muſcles, the nerves, and the veins. The ſufferings of the body and the elevation of the ſoul are expreſſed in every member with equal energy, and form the moſt ſublime contraſt imaginable. Laocoon appears to ſuffer with ſuch fortitude, that, whilſt his lamentable ſituation pierces the heart, the whole figure fills us with an ambitious deſire of imitating his conſtancy and magnanimity in the pains and ſufferings that may fall to our lot.

Philoctetes is introduced by the poets ſhedding tears, uttering complaints, and rending the air with his groans and cries; but the artiſt exhibits him ſilent and bearing his pains with dignity. The Ajax of the celebrated painter Timomachus is not drawn in the act of deſtroying the ſheep which he took for the Grecian chiefs, but in the moments of reflection which ſucceeded that frenzy. So far did the Greeks carry their love of calmneſs and ſlow movements, that they thought a quick ſtep always announced ruſticity of manners. Demoſthenes reproaches Nicobulus for this very thing; and from the words he makes uſe of, it appears, that to ſpeak with inſolence and to walk haſtily were reckoned ſynonymous.

44 In the ſtatues of women.

In the figures of women, the artiſts have conformed to the principle obſerved in all the ancient tragedies, and recommended by Ariſtotle, never to make women ſhow too much intrepidity or exceſſive cruelty. Conformable to this maxim, Clytemneſtra is repreſented at a little diſtance from the fatal ſpot, watching the murderer, but without taking any part with him. In a painting of Timomachus repreſenting Medea and her children, when Medea lifts up the dagger they ſmile in her face, and her fury is immediately melted into compaſſion for the innocent victims. In another repreſentation of the ſame ſubject, Medea appears heſitating and indeciſive. Guided by the ſame maxims, the artiſts of moſt refined taſte were careful to avoid all deformity, chooſing rather to recede from truth than from their accuſtomed reſpect for beauty, as may be ſeen in ſeveral figures of Hecuba. Sometimes, however, ſhe appears in the decrepitude of age, her face furrowed with wrinkles, and her breaſts hanging down.

45 In the ſtatues of the Roman emperors.

Illuſtrious men, and thoſe inveſted with the offices of dignity, are repreſented with a noble aſſurance and firm aſpect. The ſtatues of the Roman emperors reſemble thoſe of heroes, and are far removed from every ſpecies of flattery, in the geſture, in the attitude, and action. They never appear with haughty looks, or with the ſplendor of royalty; no figure is ever ſeen preſenting any thing to them with bended knee, except captives; and none addreſſes them with an inclination of the head.

In

In modern works too little attention has been paid to the ancient *coſtume*. Winkelman mentions a bas-relief, which was lately executed at Rome for the fountain of Trevi, repreſenting an architect in the act of preſenting the plan of an aqueduct to Marcus Agrippa. The modern ſculptor, not content with giving a long beard to that illuſtrious Roman, contrary to all the ancient marble ſtatues as well as medals which remain, exhibits the architect on his knees.

In general, it was an eſtabliſhed principle to baniſh all violent paſſions from public monuments. This will ſerve as a deciſive mark to diſtinguiſh the true antique from ſuppoſititious works. A medal has been found exhibiting two Aſſyrians, a man and woman tearing their hair, with this inſcription, ASSYRIA. ET. PALAESTINA. IN POTEST. P. R. REDAC. S. C. The forgery of this medal is manifeſt from the word *Palaeſtina*, which is not to be found in any ancient Roman medal with a Latin inſcription. Beſides, the violent action of tearing the hair does not ſuit any ſymbolical figure. This extravagant ſtyle, which was called by the ancients *parenthyrſis*, has been imitated by moſt of the modern artiſts. Their figures reſemble comedians on the ancient theatres, who, in order to ſuit the diſtant ſpectators, put on painted maſks, employed exaggerated geſtures, and far overleaped the bounds of nature. This ſtyle has been reduced into a theory in a treatiſe on the paſſions compoſed by Le Brun. The deſigns which accompany that work exhibit the paſſions in the very higheſt degree, approaching even to frenzy: but theſe are calculated to vitiate the taſte, eſpecially of the young; for the ardour of youth prompts them rather to ſeize the extremity than the middle; and it will be difficult for that artiſt who has formed his taſte from ſuch empaſſioned models ever to acquire that noble ſimplicity and ſedate grandeur which diſtinguiſhed the works of ancient taſte.

46 Of proportions.

PROPORTION is the baſis of beauty, and there can be no beauty without it; on the contrary, proportion may exiſt where there is little beauty. Experience every day teaches us that knowledge is diſtinct from taſte; and proportion, therefore, which is founded on knowledge, may be ſtrictly obſerved in any figure, and yet the figure have no pretenſions to beauty. The ancients conſidering ideal beauty as the moſt perfect, have frequently employed it in preference to the beauty of nature.

The body conſiſts of three parts as well as the members. The three parts of the body are the trunk, the thighs, and the legs. The inferior parts of the body are the thighs, the legs, and the feet. The arms alſo conſiſt of three parts. Theſe three parts muſt bear a certain proportion to the whole as well as to one another. In a well formed man the head and body muſt be proportioned to the thighs, the legs, and the feet, in the ſame manner as the thighs are proportioned to the legs and the feet, or the arms to the hands. The face alſo conſiſts of three parts, that is, three times the length of the noſe; but the head is not four times the length of the noſe, as ſome writers have aſſerted. From the place where the hair begins to the crown of the head are only three-fourths of the length of the noſe, or that part is to the noſe as 9 to 12.

It is probable that the Grecian, as well as Egyptian artiſts, have determined the great and ſmall proportions by fixed rules; that they have eſtabliſhed a poſitive meaſure for the dimenſions of length, breadth, and circumference. This ſuppoſition alone can enable us to account for the great conformity which we meet with in ancient ſtatues. Winkelman thinks that the foot was the meaſure which the ancients uſed in all their great dimenſions, and that it was by the length of it that they regulated the meaſure of their figures, by giving to them ſix times that length. This in fact is the length which Vitruvius aſſigns, *Pes vero altitudinis corporis ſextæ*, lib. iii. cap. 1. That celebrated antiquary thinks the foot is a more determinate meaſure than the head or the face, the parts from which modern painters and ſculptors too often take their proportions. This proportion of the foot to the body, which has appeared ſtrange and incomprehenſible to the learned Huetius, and has been entirely rejected by Perrault, is however founded upon experience. After meaſuring with great care a vaſt number of figures, Winkelman found this proportion obſerved not only in Egyptian ſtatues, but alſo in thoſe of Greece. This fact may be determined by an inſpection of thoſe ſtatues the feet of which are perfect. One may be fully convinced of it by examining ſome divine figures, in which the artiſts have made ſome parts beyond their natural dimenſions. In the Apollo Belvidere, which is a little more than ſeven heads high, the foot is three Roman inches longer than the head. The head of the Venus de Medicis is very ſmall, and the height of the ſtatue is ſeven heads and a half: the foot is three inches and a half longer than the head, or preciſely the ſixth part of the length of the whole ſtatue.

PRACTICE OF SCULPTURE.

WE have been thus minute in our account of the Grecian ſculpture, becauſe it is the opinion of the ableſt critics that modern artiſts have been more or leſs eminent as they have ſtudied with the greater or leſs attention the models left us by that ingenious people: Winkelman goes ſo far as to contend that the moſt finiſhed works of the Grecian maſters ought to be ſtudied in preference even to the works of nature. This appears to be paradoxical; but the reaſon aſſigned by the Abbé for his opinion is, that the faireſt lines of beauty are more eaſily diſcovered, and make a more ſtriking and powerful impreſſion, by their reunion in theſe ſublime copies, than when they are ſcattered far and wide in the original. Allowing, therefore, the ſtudy of nature the high degree of merit it ſo juſtly claims, it muſt neverthe'eſs be granted, that it leads to true beauty by a much more tedious, laborious, and difficult path, than the ſtudy of the *antique*, which preſents immediately to the artiſt's view the object of his reſearches, and combines in a clear and ſtrong point of light the various rays of beauty that are diſperſed through the wide domain of nature. 47 Grecian ſculpture to be ſtudied by the modern artiſts.

As ſoon as the artiſt has laid this excellent foundation, acquired an intimate degree of familiarity with the beauties of the Grecian ſtatues, and formed his taſte after the admirable models they exhibit, he may then proceed with advantage and aſſurance to the imitation of nature. The ideas he has already formed of the perfection of nature, by obſerving her diſperſed beauties combined and collected in the compoſitions of the ancient artists, will enable him to acquire with facility, and to employ with advantage, the detached and partial ideas of beauty which will be exhibited to his view in a survey of nature in her actual state. When he discovers these partial beauties, he will be capable of combining them with those perfect forms of beauty with which he is already acquainted. In a word, by having always present to his mind the noble models already mentioned, he will be in some measure his own oracle, and will draw rules from his own mind.

48 Two ways of imitating nature.

There are, however, two ways of imitating nature. In the one a single object occupies the artist, who endeavours to represent it with precision and truth; in the other, certain lines and features are taken from a variety of objects, and combined and blended into one regular whole. All kinds of copies belong to the first kind of imitation; and productions of this kind must be executed necessarily in the Dutch manner, that is to say, with high finishing, and little or no invention. But the second kind of imitation leads directly to the investigation and discovery of true beauty, of that beauty whose idea is connate with the human mind, and is only to be found there in its highest perfection. This is the kind of imitation in which the Greeks excelled, and in which men of genius excite the young artists to excell after their example, *viz.* by studying nature as they did.

After having studied in the productions of the Grecian masters their choice and expression of select nature, their sublime and graceful contours, their noble draperies, together with that sedate grandeur and admirable simplicity that constitute their chief merit, the curious artists will do well to study the manual and mechanical part of their operations, as this is absolutely necessary to the successful imitation of their excellent manner.

49 Models of statues.

It is certain that the ancients almost always formed their first models in wax: to this modern artists have substituted clay, or some such composition: they prefer clay before wax in the carnations, on account of the yielding nature of the latter, and its sticking in some measure to every thing it touches. We must not, however, imagine from hence that the method of forming models of wet clay was either unknown or neglected among the Greeks; on the contrary, it was in Greece that models of this kind were invented. Their author was Dibutades of Sicyon; and it is well known that Arcesilas, the friend of Lucullus, obtained a higher degree of reputation by his clay models than by all his other productions. Indeed, if clay could be made to preserve its original moisture, it would undoubtedly be the fittest substance for the models of the sculptor; but when it is placed either in the fire or left to dry imperceptibly in the air, its solid parts grow more compact, and the figure losing thus a part of its dimensions, is necessarily reduced to a smaller volume. This diminution would be of no consequence did it equally affect the whole figure, so as to preserve its proportions entire. But this is not the case: for the smaller parts of the figure dry sooner than the larger; and thus losing more of their dimensions in the same space of time than the latter do, the symmetry and proportions of the figure inevitably suffer. This inconveniency does not take place in those models that are made in wax. It is indeed extremely difficult, in the ordinary method of working the wax, to give it that degree of smoothness that is necessary to represent the softness of the carnations or fleshy parts of the body. This inconvenience may, however, be remedied, by forming the model first in clay, then moulding it in plaster, and lastly casting it in wax. And, indeed, clay is seldom used but as a mould in which to cast a figure of plaster, stucco, or wax, to serve henceforth for a model by which the measures and proportions of the statue are to be adjusted. In making waxen models, it is common to put half a pound of colophony to a pound of wax; and some add turpentine, melting the whole with oil of olives.

50 Method of working the marble, and

So much for the first or preparatory steps in this procedure. It remains to consider the manner of working the marble after the model so prepared; and the method here followed by the Greeks seems to have been extremely different from that which is generally observed by modern artists. In the ancient statues we find the most striking proofs of the freedom and boldness that accompanied each stroke of the chisel, and which resulted from the artist's being perfectly sure of the accuracy of his idea, and the precision and steadiness of his hand: the most minute parts of the figure carry these marks of assurance and freedom; no indication of timorousness or diffidence appears; nothing that can induce us to fancy that the artist had occasion to correct any of his strokes. It is difficult to find, even in the second-rate productions of the Grecian artists, any mark of a false stroke or a random touch. This firmness and precision of the Grecian chisel were certainly derived from a more determined and perfect set of rules than those which are observed in modern times.

The method generally observed by the modern sculptor is as follows: First, out of a great block of marble he saws another of the size required, which is performed with a smooth steel saw, without teeth, casting water and sand thereon from time to time; then he fashions it, by taking off what is superfluous with a steel point and a heavy hammer of soft iron; after this, bringing it near the measure required, he reduces it still nearer with another finer point; he then uses a flat cutting instrument, having notches in its edge; and then a chisel to take off the scratches which the former has left; till, at length, taking rasps of different degrees of fineness, by degrees he brings his work into a condition for polishing.

After this, having studied his model with all possible attention, he draws upon this model horizontal and perpendicular lines which intersect each other at right angles. He afterwards copies these lines upon his marble, as the painter makes use of such transversal lines to copy a picture, or to reduce it to a smaller size. These transversal lines or squares, drawn in an equal number upon the marble and upon the model, in a manner proportioned to their respective dimensions, exhibit accurate measures of the surfaces upon which the artist is to work; but cannot determine, with equal precision, the depths that are proportioned to these surfaces.—The sculptor, indeed, may determine these depths by observing the relation they bear to his model; but as his eye is the only guide he has to follow in this estimate, he is always more or less exposed to error, or at least to doubt. He is never sure that the cavities made by by his chisel are exact; a degree of uncertainty accompanies each stroke; nor can he be assured that it has carried away neither too much nor too little of his marble. It is equally difficult to determine, by such lines as have already been mentioned, the external and internal contours of the figure, or to transfer them from the model to the marble. By the internal contour is understood that which is described by the parts which approach towards the centre, and which are not marked in a striking manner.

It is farther to be noticed, that in a complicated and laborious work, which an artist cannot execute without assistance, he is often obliged to make use of foreign hands, that have not the talents or dexterity that are necessary to finish his plan. A single stroke of the chisel that goes too deep is a defect not to be repaired; and such a stroke may easily happen, where the depths are so imperfectly determined. Defects of this kind are inevitable, if the sculptor, in chipping his marble, begins by forming the depths that are requisite in the figure he designs to represent. Nothing is more liable to error than this manner of proceeding. The cautious artist ought, on the contrary, to form these depths gradually, by little and little, with the utmost circumspection and care; and the determining of them with precision ought to be considered as the last part of his work, and as the finishing touches of his chisel.

51 Of copying ancient statues.

The various inconveniences attending this method determined several eminent artists to look out for one that would be liable to less uncertainty, and productive of fewer errors. The French academy of painting at Rome hit on a method of copying the ancient statues, which some sculptors have employed with success, even in the figures which they finished after models in clay or wax. This method is as follows. The statue that is to be copied is inclosed in a frame that fits it exactly. The upper part of this frame is divided into a certain number of equal parts, and to each of these parts a thread is fixed with a piece of lead at the end of it. These threads, which hang freely, show what parts of the statue are most removed from the centre with much more perspicuity and precision than the lines which are drawn on its surface, and which pass equally over the higher and hollow parts of the block: they also give the artist a tolerable rule to measure the more striking variations of height and depth, and thus render him more bold and determined in the execution of his plan.

But even this method is not without its defects: for as it is impossible, by the means of a straight line, to determine with precision the procedure of a curve, the artist has, in this method, no certain rule to guide him in his contours; and as often as the line which he is to describe deviates from the direction of the plumb line, which is his main guide, he must necessarily feel himself at a loss, and be obliged to have recourse to conjecture.

It is also evident, that this method affords no certain rule to determine exactly the proportion which the various parts of the figure ought to bear to each other, considered in their mutual relation and connections. The artist, indeed, endeavours to supply this defect by intersecting the plumb-lines by horizontal ones. This recourse has, nevertheless, its inconveniences, since the squares formed by transversal lines, that are at a distance from the figure (though they be exactly equal), yet represent the parts of the figure as greater or smaller, according as they are more or less removed from our position or point of view. But, notwithstanding these inconveniences, the method now under consideration is certainly the best that has hitherto been employed: it is more practicable and sure than any other we know, though it appears, from the remarks we have now been making, that it does not exhibit a sure and universal criterion to a sculptor who executes after a model.

52 Of polishing the statue.

To polish the statue, or make the parts of it smooth and sleek, pumice-stone and smelt are used; then tripoli; and when a still greater lustre is required, burnt straw is employed. For the *Casting of Statues*, see FOUNDERY, and *PLASTER of Paris*.

SCUM, properly denotes the impurities which a liquor, by boiling, casts up to the surface. The term *scum* is also used for what is more properly called the scoria of metals.

SCUPPERS, in a ship, are certain channels cut through the water-ways and sides of a ship, at proper distances, and lined with plated lead, in order to carry the water off from the deck into the sea. The scuppers of the lower deck of a ship of war are usually furnished with a leathern pipe, called the *scupper-hose*, which hangs downward from the mouth or opening of the scupper. The intent of this is to prevent the water from entering when the ship inclines under a weight of sail.

SCURVY, in *Medicine*, see that article, N° 351, where we have given an account of the symptoms, causes, and modes of prevention and cure, according to some of the most eminent writers in medicine. We have here only to add, that, in the opinion of Dr Beddoes, the mineral acids, especially the nitric and vitriolic, may be employed in the prevention or cure of this dreadful disease with as much success as the vegetable acids.—But of all the substances that can at once be cheaply procured and long preserved, he thinks the concrete acid of tartar by far the most promising. It is very grateful, and comes near to the citric acid. In tropical countries the scurvy is seldom known.

SCURVY-Grass. See COCHLEAREA, BOTANY *Index*.

SCUTAGE (*scutagium*, Sax. *scildpening*), was a tax or contribution raised by those that held lands by knights service, towards furnishing the king's army, at one, two, or three merks for every knight's fee. Henry III. for his voyage to the Holy Land, had a tenth granted by the clergy, and *scutage*, three merks of every knight's fee by the *laity*. This was also levied by Henry II. Richard I. and King John. See *KNIGHT-Service*.

SCUTE (*scutum*), a French gold coin of 3s. 4d. in the reign of King Henry V. Catharine queen of England had an assurance made her of sundry castles, manors, lands, &c. valued at the sum of 40,000 *scutes*, every

every two whereof were worth a noble. *Rot. Parl.* 1. *Hen.* VI.

SCUTELLARIA, Skull-cap, a genus of plants, belonging to the didynamia class; and in the natural method ranking under the 40th order, *Personatæ*. See Botany *Index*.

SCUTTLES, in a ship, square holes cut in the deck, big enough to let down the body of a man, and which serve upon some occasions to let the people down into any room below, or from one deck to another.

SCYLAX, a celebrated mathematician and geographer of Caria, flourished under the reign of Darius Hystaspes, about 558 B. C. Some have attributed to him the invention of geographical tables. We have under his name a geographical work published by Hoeschelius; but it is written by a much later author, and is perhaps only an abridgement of Scylax's Ancient Geography.

SCYLLA, in *Ancient Geography*, a rock in the Fretum Siculum, near the coast of Italy, dangerous to shipping, opposite to Charybdis, a whirlpool on the coast of Sicily; both of them famous in mythology.

Sutherland's Tour up the Straits, Letter xii. Scylla and Charybdis have been almost subdued by the repeated convulsions of this part of the earth, and by the violence of the current, which is continually increasing the breadth of the straits. If proper allowance be made for these circumstances, we shall acquit the ancients of any exaggeration, notwithstanding the very dreadful colours in which they have painted this passage. It is formed by a low peninsula, called *Cape Pelorus*, stretching to the eastward on the Sicilian side, immediately within which lies the famous whirlpool of Charybdis, and by the rocks of Scylla, which a few miles below on the Calabrian shore project towards the west. The current runs with surprising force from one to the other alternately in the direction of the tide, and the tides themselves are very irregular. Thus vessels, by shunning the one, were in the utmost danger of being swallowed up by the other.

At present, in moderate weather, when the tide is either at ebb or flood, boats pass all over the whirlpool: but, in general, it is like the meeting of two contending currents, with a number of eddies all around; and, even now, there is scarcely a winter in which there are not some wrecks.

"At the time when we passed the straits (says Captain Sutherland, from whom we have obtained this accurate information) the weather was as favourable as we could wish; and yet, in spite of a strong breeze and the current, which hurried us on with surprising velocity, the ship's head was suddenly whirled round near three points; but the wind blowing fresh, in a few seconds she dashed through the eddy that had caught her; for, to avoid Scylla, and secure Messina, we had kept pretty close to Charybdis." For a later account of these rocks, see Sicily.

SCYROS, an island in the Ægean sea, at the distance of about 28 miles north-east from Eubœa. It is 60 miles in circumference. It was originally in the possession of the Pelasgians and Carians. Achilles retired there to avoid going to the Trojan war, and became father of Neoptolemus by Deidamia the daughter of King Lycomedes. Scyros was conquered by the Athenians under Cimon. It was very rocky and barren. Now *Sciro*. E. Long. 25. 0. N. Lat. 38. 15.

SCYTALA Laconica, in antiquity, a stratagem or device of the Lacedemonians, for the secret writing of letters to their correspondents, so that if they should chance to be intercepted, nobody might be able to read them.—To this end they had two wooden rollers or cylinders, perfectly alike and equal; one whereof was kept in the city, the other by the person to whom the letter was directed. For the letter, a skin of very thin parchment was wrapped round the roller, and thereon was the matter written; which done, it was taken off, and sent away to the party, who, upon putting it in the same manner upon his roller, found the lines and words in the very same disposition as when they were first written. This expedient they set a very high value on; though, in truth, artless and gross enough: the moderns have improved vastly on this method of writing. See Cipher.

SCYTALIA, a genus of plants belonging to the octandria class; and in the natural method ranking with those that are doubtful. See Botany *Index*.

SCYTHE, in *Husbandry*, a well known instrument which has been long employed for cutting grass for hay. The same instrument with certain modifications in its construction has been used in reaping grain, in place of the sickle the use of which is far more common, and in Scotland at least prevails almost universally, although it must be admitted that the method of reaping by the scythe, where it is practicable, is attended with less labour, is more expeditious, and therefore more economical. But against the use of the scythe, as a reaping instrument, many objections have been raised. Some of these are probably founded in prejudice, while others, considering the slow progress which has been made in introducing this instrument as a substitute for the sickle, rest on a more solid foundation.

It is said that this instrument shakes the ear, so that many of the grains are lost; that it lets the corn fall after it is cut, in a scattered confused manner, in consequence of which either a great deal of it is lost, or much time is wasted in gathering it together. It is also affirmed that it can only be made use of in very even land, and which is free from stones; that it does not leave length enough of stubble on the ground, on which to lay the corn when it is cut; that it mixes noxious weeds with the corn, the seeds of which are sown the ensuing year; and finally, that the use of the scythe is prejudicial to the health of the reaper.

It appears, however, that these objections have either no weight, or they are made by those who are unacquainted with the scythes peculiarly adapted to this purpose, and with the manner in which they ought to be used. With a good scythe properly managed, the corn when cut, remains at first upright, afterwards falling gently on the rake fixed to the scythe, without any shaking or jolting, or at least with less than what is occasioned by the sickle. The loss of grain chiefly arises from the corn being too dry, and therefore it ought to be reaped on proper days, and suitable times of the day, which is more easily accomplished by the scythe than the sickle, because the one requires less time than the other. The stalks, held together by the rake, may be laid on the ground, or against the corn not yet cut down, in a state so regular and connected, that those by whom the sheaves are collected and bound have themselves alone to blame, should any thing be left behind. It is sufficiently even when lands are ploughed and harrowed

 rowed in a proper manner; and the only neceſſary precaution in ſtony ground, is to keep the ſcythe a little higher, that it may not ſtrike againſt the ſtones. If the ſtubble be ſhort, the ſtraw cut off will of courſe be the longer, and of conſequence more valuable; and long ſtubble only incommodes the cattle afterwards ſent to feed upon it.

Theſe and ſimilar conſiderations, prevailed with the patriotic ſociety of Milan, to ſend to theſe places where ſcythes are uſed for reaping; and having procured a model from Sileſia, they ordered one of a proper ſize to be made. It was firſt tried on corn, and afterwards on millet; and notwithſtanding the firſt was far from being made with accuracy, and although ſuch an inſtrument had never before been made uſe of by the reaper, nearly half the uſual time was found to be ſaved, and the wonted fatigue and labour were much diminiſhed. The corn was cut without receiving any injurious ſhock, falling in an even and regular ſtate, by which means it was afterwards bound up with eaſe in compact ſheaves.

Plate cccclxxviii. Fig. 1. These inſtruments are ſo ſimple in their conſtruction, that a figure of one of them renders a deſcription almoſt unneceſſary. Fig. 1. repreſents the Sileſian ſcythe tried by the ſociety, the difference between which and the Auſtrian one we ſhall mention in our deſcription. The Sileſian ſcythe differs little from that commonly employed in mowing graſs, except that the blade is rather ſmaller; to it four teeth of wood are added, parallel to the blade, fixed and ſecured in a proper manner, and deſigned to keep the corn together after it is cut; ſo that inſtead of its falling in a confuſed ſtate, the reaper can lay it down in a regular and compact manner. The Auſtrian ſcythe is ſimilar to the former, but the blade is larger; of courſe the wooden teeth, being five in number, are longer; the handle is alſo flatter, and rather crooked.

In the firſt, the handle *a b* (ſee fig. 1.) is four feet three inches in length; the blade *bc* is about two feet; the piece of wood in which the teeth are fixed, one foot ten inches and a half. In the *ſecond*, the handle is four feet one inch; the blade, two feet eight inches; the piece in which the teeth are fixed, $11\frac{1}{2}$ inches.

The difference in the conſtruction of theſe two ſcythes renders it neceſſary to uſe them in a different manner, which will be better acquired in practice than by precept. Such as are accuſtomed to the uſe of the common ſcythe will ſoon find out the moſt advantageous manner of uſing theſe new kinds of ſcythes, and of laying down the corn properly after it is cut.

It is neceſſary to obſerve, that, in mowing graſs, the feet are held in a poſition nearly parallel to each other, whereas in reaping corn they ſhould be kept on a line, the one behind the other, bringing the right foot forward, and drawing the left towards it. The reaſon is, that when graſs is mowed it is left to fall where it is cut; but when corn is cut down, it is to be laid in a proper manner againſt that which is not yet cut, and which is at the reaper's left hand. Were the feet kept parallel to each other, the reaper would be under the neceſſity of extending and turning his body in a very inconvenient manner.

Theſe obſervations having been publiſhed, the ſociety made farther experiments on the ſubject, by which they diſcovered, that when the ſtalks of corn are bent down by reaſon of extremely wet weather, the wooden teeth of the ſcythes are apt to lay hold of ſome ears, to the ſtalks of which the iron does not extend; and therefore theſe not being cut below, are pulled ſo that the grain is ſcattered. This chiefly happens from the reapers not being accuſtomed to that kind of ſcythe, and therefore not knowing how to adapt it to particular exiſting circumſtances.

It occurred to an ingenious blackſmith, that, in order to remedy this inconvenience, a *collector* made of cloth ſhould be added to the common ſcythe, as may be ſeen at fig. 2. where *abc* is a common ſcythe, *cdmloſne* is the gatherer, which at *c d e* is compoſed of a thin plate of iron, having a hollow at its extremity for receiving the point of the blade. At *e d* are holes for ſewing in the cloth, which is coarſe, light, and of low price; it is alſo fixed to two thick iron wires, of which the upper one is continued to *f*, where it terminates in a hole in the handle; the other is fixed to the back of the blade. The manner of fixing this gatherer to the back of the ſcythe will be better underſtood by referring to fig. 3. which repreſents one of the irons which, by means of the ſcrew, are faſtened to the back of the ſcythe. Theſe proceed from, and make part of the upright irons *m n*, *l o*, which ſerve to keep the gatherer extended. Fig. 2. Fig. 3.

This contrivance is both cheap and ſimple; but an attempt was made to render it more ſo, by ſubſtituting two iron hoops for the gatherer, which are ſhewn in fig. 2. by the dotted lines *h g*, *k i*, with a croſs piece *p*, which connects them. Experience has ſhewn, however, that the gatherer is in general preferable to theſe hoops, as it does not leave an ear of corn behind. Fig. 2.

SCYTHIA, an ancient name for the northern parts of Aſia, now known by the name of *Tartary;* alſo for ſome of the north-eaſtern parts of Europe.

This vaſt territory, which extends itſelf from the Iſter or Danube, the boundary of the Celts, that is, from about the 25th to almoſt the 110th degree of eaſt longitude, was divided into Scythia in Europe and Scythia in Aſia, including, however, the two Sarmatias; or, as they are called by the Greeks, *Sauromatias*, now the Circaſſian Tartary, which lay between and ſevered the two Scythias from each other. Sauromatia was alſo diſtinguiſhed into European and Aſiatic; and was divided from the European Scythia by the river Don or Tanais, which falls into the Palus Meotis; and from the Aſiatic by the Rha, now Volga, which empties itſelf into the Caſpian ſea.

1. The Aſiatic Scythia comprehended, in general, great Tartary, and Ruſſia in Aſia; and, in particular, the Scythia beyond or without Imaus, contained the regions of Bogdoi or Oſtiacoi, and Tanguti. That within, or on this ſide Imaus, had Turkeſtan and Mongal, the Uſbeck or Zagatai, Kalmuc and Nagaian Tartars; beſides Siberia, the land of the Samoiedes, and Nova Zembla. Theſe three laſt not being ſo ſoon inhabited as the former, as may be reaſonably ſuppoſed, were wholly unknown to the ancients; and the former were peopled by the Bactrians, Sogdians, Gandari, Sacks, and Maſſagetes. As for Sarmatia, it contained Albania, Iberia, and Colchis; which makes now the Circaſſian Tartary, and the province of Georgia.

2. Scythia in Europe reached (towards the ſouth-weſt) to the Po and the Alps, by which it was divided from Celto-Gallia. It was bounded on the ſouth by the

the Iſter or Danube and the Euxine ſea. Its northern limits have been ſuppoſed to ſtretch to the ſpring-heads of the Boriſthenes or Nieper, and the Rha or Volga, and ſo to that of the Tanais.—The ancients divided this country into Scythia Arimaſpæa, which lay eaſtward, joining to Scythia in Aſia; and Sarmatia Europeana on the weſt. In Scythia, properly ſo called, were the Arimaſpæi on the north; the Getæ or Dacians along the Danube, on the ſouth; and the Neuri between theſe two. So that it contained the European Ruſſia or Muſcovy, and the Leſſer Crim Tartary eaſtward; and, on the weſt, Lithuania, Poland, part of Hungary, Tranſilvania, Walachia, Bulgaria, and Moldavia. Sarmatia is ſuppoſed to have reached northward to that part of Swedeland called *Feningia*, now *Finland;* in which they placed the Oœnes, Panoti, and Hippopodes. This part they divided from Northern Germany, now the weſt part of Sweden and Norway, by the *Mare Sarmaticum* or *Scythicum*, which they ſuppoſed ran up into the northern ocean, and, dividing Lapland into two parts, formed the weſtern part of Sweden, with Norway, into one iſland, and Finland into another; ſuppoſing this alſo to be cut off from the continent by the gulf of that name.

Although the ancient Scythians were celebrated as a warlike people, yet their hiſtory is too uncertain and obſcure to enable us to give any detail which would not prove equally tireſome and unintereſting to the reader. Mr Pinkerton, in a diſſertation on their origin, endeavours to prove that they were the moſt ancient of nations; and he aſſigns for the place of their firſt habitation the country known by the name of Perſia. From Perſia, he thinks, they proceeded in numerous hordes weſtward, ſurrounded the Euxine, peopled Germany, Italy, Gaul, the countries bordering on the Baltic, with part of Britain and Ireland. That the Scythians were of Aſiatic origin cannot, we think, be queſtioned; and as Perſia was peopled at a very early period, it may not improbably have been their parent country: but when our author contends that their empire had ſubſiſted for more than 1500 years before Ninus the founder of the Aſſyrian monarchy, and that it extended from Egypt to the Ganges, and from the Perſian gulf and Indian ſea to the Caſpian, we cannot help thinking that his prejudices againſt the Celts, and his deſire to do honour to his favourite Goths, have made him advance a paradox inconſiſtent with the moſt authentic records of antiquity. His diſſertation however is ingenious, and replete with a variety of curious learning.

SCYTHIAN Lamb, in *Natural Hiſtory*. See *Scythian LAMB*.

SCYTHROPS, or CHANNEL-BILL, a genus of birds belonging to the order of Picæ. See ORNITHOLOGY, N° 149.

SEA, in a ſtrict ſenſe, ſignifies a large portion of water almoſt ſurrounded by land, as the Baltic and Mediterranean ſeas; but it is frequently uſed for that vaſt body of water which encompaſſes the whole earth.

1 What proportion the ſurface of the ſea bears to that of the land.

What proportion the ſuperficies of the ſea bears to that of the land cannot eaſily be aſcertained. Buffon has ſuppoſed that the ſurface of our globe is equally divided between land and water, and has accordingly calculated the ſuperficies of the ſea to be 85,490,506 ſquare miles. But it is now well known that the ocean covers much more than the half of the earth's ſurface. Buffon believed the exiſtence of a vaſt ſouthern continent, which Captain Cook has ſhown to be viſionary. It was this circumſtance which miſled him. According to the moſt accurate obſervations hitherto made, the ſurface of the ſea is to the land as three to one; the ocean therefore extends over 128,235,759 ſquare miles, ſuppoſing the ſuperficies of the whole globe to be 170,981,012 ſquare miles.

2 Depth of the ſea.

To aſcertain the depth of the ſea is ſtill more difficult than its ſuperficies, both on account of the numerous experiments which it would be neceſſary to make, and the want of proper inſtruments for that purpoſe. Beyond a certain depth the ſea has hitherto been found unfathomable; and though ſeveral methods have been contrived to obviate this difficulty, none of them has completely anſwered the purpoſe. We know in general that the depth of the ſea increaſes gradually as we leave the ſhore; but if this continued beyond a certain diſtance, the depth in the middle of the ocean would be prodigious. Indeed the numerous iſlands everywhere ſcattered in the ſea demonſtrate the contrary, by ſhowing us that the bottom of the water is unequal like the land, and that ſo far from uniformly ſinking, it ſometimes riſes into lofty mountains. If the depth of the ſea be in proportion to the elevation of the land, as has generally been ſuppoſed, its greateſt depth will not exceed five or ſix miles, for there is no mountain ſix miles perpendicular above the level of the ſea. The ſea has never been actually ſounded to a greater depth than a mile and 66 feet; every thing beyond that therefore reſts entirely upon conjecture and analogical reaſoning, which ought never to be admitted to determine a ſingle point that can be aſcertained by experiment, becauſe, when admitted, they have too often led to falſe concluſions. Along the coaſts, where the depth of the ſea is in general well known, it has always been found proportioned to the height of the ſhore: when the coaſt is high and mountainous, the ſea that waſhes it is deep; when, on the contrary, the coaſt is low, the water is ſhallow. Whether this analogy holds at a diſtance from the ſhore, experiments alone can determine.

3 Quantity of water which it contains.

To calculate the quantity of water contained in the ſea, while its depth is unknown, is impoſſible. But if we ſuppoſe with Buffon that its medium depth is the fourth part of a mile, the ocean, if its ſuperficies be 120,235,759 ſquare miles, will contain 32,058,939.75 cubic miles of water.

Buffon's Theory of the Earth, art. 10.

Let us now endeavour to compute the quantity of water which is conſtantly diſcharged into the ſea. For this purpoſe let us take a river whoſe velocity and quantity of water is known, the Po, for inſtance, which according to Riccioli is 1000 feet (or 100 perches of Bologna) broad, 10 feet deep, and runs at the rate of four miles in an hour; conſequently that river diſcharges into the ſea 200,000 cubic perches of water in an hour, or 4,800,000 in a day. A cubic mile contains 125,000,000 cubic perches; the Po therefore will take 26 days to diſcharge a cubic mile of water into the ſea. Let us now ſuppoſe, what is perhaps not very far from the truth, that the quantity of water which the ſea receives from the rivers in any country is proportioned to the extent of that country. The Po from its origin to its mouth traverſes a country 380 miles long, and the rivers which fall into it on every ſide riſe from ſources about ſixty miles diſtant from it.

The

The Po, therefore, and the rivers which it receives, water a country of 45,600 ſquare miles. Now ſince the whole ſuperficies of the dry land is about 42,745,253 ſquare miles, it follows, from our ſuppoſition, that the quantity of water diſcharged by all the rivers in the world, in one day, is 36 cubic miles, and in a year 13,140. If therefore the ſea contains 32,058,939 cubic miles of water, it would take all the rivers in the world 2439 years to diſcharge an equal quantity.

4
Why it does not increaſe.

It may ſeem ſurpriſing that the ſea, ſince it is continually receiving ſuch an immenſe ſupply of water, does not viſibly increaſe, and at laſt cover the whole earth. But our ſurpriſe will ceaſe, if we conſider that the rivers themſelves are ſupplied from the ſea, and that they do nothing more than carry back thoſe waters which the ocean is continually laviſhing on the earth. Dr Halley has demonſtrated that the vapours raiſed from the ſea and tranſported on land are ſufficient to maintain all the rivers in the world. The ſimplicity of this great proceſs is aſtoniſhing: the ſea not only connects diſtant countries, and renders it eaſy to tranſport the commodities of one nation to another, but its waters riſing in the air deſcend in ſhowers to fertilize the earth and nouriſh the vegetable kingdom, and collecting into rivers flow onwards, bringing fertility and wealth and commerce along with them, and again return to the ſea to repeat the ſame round.

5
Theories of philoſophers on this ſubject.

The knowledge of this proceſs of nature might, one would think, have convinced philoſophers that the proportion between ſea and land continued always nearly the ſame. Philoſophers however have formed different theories about this as well as moſt other ſubjects, maintaining on the one hand that the ſea is continually encroaching on the land, and on the other that the land is conſtantly gaining on the ſea. Both ſides have ſupported their theories by arguments, demonſtrations, and incontrovertible facts!

6
Arguments of thoſe who affirm that the ſea is encroaching on the land.

The height of the mountains, ſay the philoſophers who ſupport the encroachments of the ſea, is continually diminiſhing; expoſed to the violence of every ſtorm, the hardeſt rocks muſt at laſt give way and tumble down. The rivers are continually ſweeping along with them particles of earth which they depoſite in the bottom of the ſea. Both the depth of the ocean then and the height of the dry land muſt be always decreaſing; the waters therefore muſt, unleſs a part of them were annihilated, ſpread over a greater extent of ſurface in proportion as theſe cauſes operate. This reaſoning, convincing as it is, might be confirmed by a great number of facts: it will be ſufficient however to mention one or two. In the reign of Auguſtus the iſle of Wight made a part of Britain, ſo that the Engliſh croſſed over to it at low water with cart loads of tin; yet that iſland is at preſent ſeparated from Britain by a channel half a mile wide. The Godwin ſands on the eaſtern ſhore of England were formerly the fertile eſtate of earl Godwin. Nor are the encroachments of the ſea confined to Britain. In the bay of Baiæ near Naples there are remains of houſes and ſtreets ſtill viſible below the preſent level of the ſea. The ſea therefore is making continued encroachments upon the land; and the time will come, ſay they, when the waters will again cover the ſurface of the earth.

Such are the arguments of thoſe philoſophers who maintain the continual encroachments of the ſea. Thoſe who maintain the oppoſite theory, that the land is gradually gaining on the ſea, though they pretend not to deny the facts advanced by their opponents, affirm that they are altogether inſufficient to eſtabliſh the hypotheſis which they were brought forward to ſupport.

7
Arguments of thoſe who affirm that the land is gaining on the ſea.

Though the rivers carry down particles of earth into the ſea, theſe, ſay they, are either accumulated on other ſhores, or, collecting in the bottom of the ocean, harden into ſtone, which being poſſeſſed of a vegetative power riſes by degrees above the ſurface of the ſea and forms rocks, and mountains, and iſlands. The vegetative nature of ſtone indeed is ſufficient, of itſelf, to convince us that the quantity of earth muſt be daily accumulating, and conſequently that the ſurface of the ſea is diminiſhing in extent. Celſius, a Swediſh philoſopher (for this diſpute has been carried on in Sweden with the greateſt keenneſs), has endeavoured to build this theory with more ſolid materials than vegetable ſtone. In a curious memoir, publiſhed in 1743, he aſſerts that the Baltic and the Atlantic, at leaſt that part of it which waſhes Norway, is conſtantly diminiſhing; and he proves this by the teſtimony of a great many aged pilots and fiſhermen, who affirmed that the ſea was become much ſhallower in many places than it had been during their youth: that many rocks formerly covered with water were now ſeveral feet above the ſurface of the ſea: that loaded veſſels uſed formerly to ride in many places where pinnaces and barks could now with difficulty ſwim. He produces inſtances of ancient ſea-port towns now ſeveral leagues from the ſhore, and of anchors and wrecks of veſſels found far within the country. He mentions a particular rock which 168 years before was at the bottom of the ſea, but was then raiſed eight feet above its ſurface. In another place where the water 50 years before had reached to the knee there was then none. Several rocks, too, which during the infancy of ſome old pilots had been two feet under water, were then three feet above it. From all theſe obſervations M. Celſius concludes, that the water of the Baltic decreaſes in height $4\frac{1}{2}$ lines in a year, 4 inches 5 lines in 18 years, 4 feet 5 inches in a hundred years, and in a thouſand years 45 feet. Conſcious, however, that theſe facts, how concluſive ſoever as far as relates to the Baltic, can never determine the general queſtion, M. Celſius advances another argument in ſupport of his theory. All that quantity of moiſture, ſays he, which is imbibed by plants is loſt to the general maſs of water, being converted into earth by the putrefaction of vegetables. This notion had been mentioned by Newton, and was adopted by Van Helmont: if granted, it follows as a conſequence that the earth is continually increaſing and the water diminiſhing in a very rapid degree.

8
Theſe arguments examined.

Such are the arguments advanced in ſupport of both theories; for it is needleſs to mention a notion of Linnæus that the whole earth was formerly covered with water except a ſingle mountain. When fairly weighed, they amount to nothing more than this, that the ſea has encroached upon the land in ſome places, and retired in others; a concluſion which we are very willing to allow. What was advanced by thoſe philoſophers who maintain that the ſea is continually encroaching on the land, about the depth of the ſea conſtantly diminiſhing, muſt remain a mere aſſertion till they prove by experiments, either that this is really the caſe, or that nature has no way of reſtoring thoſe particles of earth

Sea.

earth which are waſhed down by the rivers. Nor have they any good reaſon to affirm that the height of the mountains is decreaſing. Can a ſingle uncontrovertible inſtance be produced of this? Are the Alps or the Apennines, or Taurus, or Caucaſus, leſs lofty now than they were a thouſand years ago? We mean not to deny that the rain actually waſhes down particles of earth from the mountains, nor to affirm that the hardeſt rocks are able to reſiſt continual ſtorms, nor that many mountains have ſuffered, and continue to ſuffer daily, from a thouſand accidents. But the effects produced by all theſe cauſes are ſo trifling as to be altogether imperceptible (A). Nature has aſſiduouſly guarded againſt ſuch accidents; ſhe has formed the mountains of the moſt durable materials; and where they are covered with earth, ſhe has bound it together by a thick and firm matting of graſs, and thus ſecured it from the rains; and ſhould accident deprive it of this covering, ſhe takes care immediately to ſupply the defect. Even ſhould the earth be ſwept away together with its covering, nature has ſtill ſuch reſources left as frequently reſtore things to their former ſtate. Many kinds of moſs, one would be tempted to think, have been created for this very purpoſe: they take root and flouriſh almoſt upon the bare rock, and furniſh as they decay a ſufficient bed for ſeveral of the hardy Alpine plants. Theſe periſh in their turn, and others ſucceed them. The roots of the plants bind faſt the earth as it accumulates, more plants ſpring up and ſpread wider, till by degrees the whole ſurface is covered with a firm coat of graſs.

9 Bottom of the ſea.

As the ſea covers ſo great a portion of the globe, we ſhould, no doubt, by exploring its bottom, diſcover a vaſt number of intereſting particulars. Unfortunately in the greater part of the ocean this has hitherto been impoſſible. Part, however, has been examined; and the diſcoveries which this examination has produced may enable us to form ſome idea at leaſt of the whole. The bottom of the ſea, as might have been conjectured indeed beforehand, bears a great reſemblance to the ſurface of the dry land, being, like it, full of plains, rocks, caverns and mountains; ſome of which are abrupt and almoſt perpendicular, while others riſe with a gentle declivity, and ſometimes tower above the water and form iſlands. Neither do the materials differ which compoſe the bottom of the ſea and the baſis of the dry land. If we dig to a conſiderable depth in any part of the earth, we uniformly meet with rock; the ſame thing holds in the ſea. The ſtrata, too, are of the ſame kind, diſpoſed in the ſame manner, and form indeed but one whole. The ſame kind of mineral and bituminous ſubſtances are alſo found interſperſed with theſe ſtrata; and it is to them probably that the ſea is indebted for its bitter taſte. Over theſe natural and original ſtrata an artificial bed has pretty generally been formed, compoſed of different materials in different places. It conſiſts frequently of muddy tartareous ſubſtances firmly cemented together, ſometimes of ſhells or coral reduced to powder, and near the mouths of rivers it is generally compoſed of fine ſand or gravel. The bottom of the ſea reſembles the land likewiſe in another particular: many freſh ſprings and even rivers riſe out of it, which, diſplacing the ſalt water, render the lower part of the ſea wherever they abound quite freſh. An inſtance of this kind occurs near Goa on the weſtern coaſt of Indoſtan *, and another † in the Mediterranean ſea not far from Marſeilles. Theſe facts occaſioned a notion, which later experiments have exploded, that the ſea beyond a certain depth was always freſh.

* *Boyle de Fundo Maris.*
† *Marſigli Hiſtoire Phyſique de la Mer,* partie 1.

Subſtances of a very beautiful appearance are frequently brought up by the ſounding line from the bottom of the ſea. The plummet is hollowed below, and this cavity filled with tallow, to which ſome of the ſubſtances adhere which form the bed of the ocean. Theſe are generally ſand, gravel, or mud; but they are ſometimes of the brighteſt ſcarlet, vermilion, purple, and yellow; and ſometimes, though leſs frequently, they are blue, green, or white. Theſe colours are owing to a kind of jelly which envelopes the ſubſtances, and vaniſh entirely as ſoon as this jelly dries. At times, however, they aſſume the appearance of tartareous cruſts, and are then ſo permanent, that they can be received into white wax melted and poured round them, and perhaps by proper care might be converted into valuable paints.

10 Colour of the ſea.

Sea-water is really, as any one may convince himſelf by pouring it into a glaſs, as clear and tranſparent as river water. The various appearances therefore which it aſſumes are owing to accidental cauſes, and not to any change in the water itſelf. The depth, or the materials which compoſe the bottom of the ſea, occaſions it to aſſume different colours in different places. The Arabian gulf, for inſtance, is ſaid to be red from the colour of the ſands which form its bed. The appearance of the ſea is affected too by the winds and the ſun, while the clouds that paſs over it communicate all their various and fleeting colours. When the ſun ſhines it is green; when the ſun gleams through a fog it is yellow; near the north pole it appears black; while in the torrid zone its colour is often brown. Sometimes the ſea aſſumes a luminous appearance. See LIGHT, Vol. XII. page 2.

11 Saltneſs of the ſea.

The ſea contains the greateſt quantity of ſalt in the torrid zone, where otherwiſe from the exceſſive heat it would be in danger of putrefaction: as we advance northward this quantity diminiſhes, till at the pole it nearly vaniſhes altogether. Under the line Lucas found that the ſea contained a ſeventh part of ſolid contents, conſiſting chiefly of ſea-ſalt. At Harwich he found it yielded $\frac{1}{25}$th of ſea-ſalt. At Carlſcroon in Sweden it contains $\frac{1}{70}$th part (B), and on the coaſt of Greenland a great deal leſs. This deficiency of ſalt near the poles probably contributes a good deal towards the prodigious

(A) M. Genſanne pretends that the Pyrenean mountains become an inch lower every ten years. But even according to his own calculation, it would require a million of years to level theſe mountains with the plain, though they continued to decreaſe at the ſame rate; and philoſophers tell us that this rate is conſtantly diminiſhing!

(B) This gradual diminution of ſaltneſs from the equator to the pole is not, however, without particular exceptions. The Mediterranean ſea contains $\frac{1}{27}$th of ſea-ſalt, which is leſs than the German ſea contains.

Sea.

ous quantities of ice which are met with in theſe ſeas; for ſalt water requires a much greater degree of cold to freeze it than freſh water. It was this circumſtance, probably, together with its conſtant motion, which induced the ancients to believe that the ſea never froze. Even among the moderns it has been a generally received opinion, that ſea-ice is originally formed in rivers. Buffon has made the great quantities of ice with which the South ſea abounds an argument for the exiſtence of a continent near the Antarctic pole. But it is now well known that great quantities of ice are formed at a diſtance from land. Sea-ice is of two kinds; field ice, which extends along the ſhore, and is only two or three feet thick; and mountain ice, which abounds in the middle of the ocean. The ſize of theſe mountains is ſometimes prodigious. The ſea-ice is always freſh, and has been often of great uſe to navigators. The weight of ſea-water is to that of river-water as 73 to 70; that is, a cubic foot of ſea-water weighs 73lb. while the ſame quantity of river-water weighs only 70lb.; but this proportion varies in different places. It is worthy of our attention, too, that the water at the ſurface of the ſea contains leſs ſalt than near the bottom; the difference indeed is inconſiderable, but ſtill it is ſomething. The Compte de Marſigli found the ſame quantity of water, when taken from the bottom of the Mediterranean, to weigh one ounce three pennyweights 51 grains; whereas from the ſurface it weighed only one ounce three pennyweights 49 grains. He repeated the experiment frequently with nearly the ſame reſult.

12 Temperature of the ſea.

The ſea, with reſpect to temperature, may be divided into two regions: The firſt begins at the ſurface of the water, and deſcends as far as the influence of the ſun's rays; the ſecond reaches from thence to the bottom of the ſea. In ſummer the lower region is conſiderably colder than the upper: but it is probable that during winter the very reverſe takes place; at leaſt the Compte de Marſigli found it ſo repeatedly in the Mediterranean. This naturally reſults from the ſituation of the water near the bottom of the ſea. Uninfluenced by the changes in the atmoſphere, it retains always nearly the ſame degree of temperature: and this is conſiderably above congelation; for the lower region of the ſea, at leaſt in the temperate parts of the world, was never known to freeze. Captain Ellis let down a ſea-gage (ſee GAGE) in latitude 25° 13′ north, and longitude 25° 12′ weſt, to take the degrees of temperature and ſaltneſs of the ſea at different depths. It deſcended 5346 feet, which is a mile and eleven fathoms. He found the ſea ſalter and colder in proportion to its depth till the gage had deſcended 3900 feet, when the mercury in the thermometer came up at 53; but the water never grew colder, though he let down the gage 2446 feet lower. At the ſurface the thermometer ſtood at 84.

Boyle de Temperie Regionum Submarinarum.

Phil. Tranſ. for 1771, p. 213.

13 The ſea has three motions. Motion occaſioned by the wind

The ſea has three kinds of motion: 1. The firſt is that undulation which is occaſioned by the wind. This motion is entirely confined to the ſurface; the bottom even during the moſt violent ſtorms remains perfectly calm. Mr Boyle has remarked, from the teſtimony of ſeveral divers, that the ſea is affected by the winds only to the depth of ſix feet. It would follow from this, that the height of the waves above the ſurface does not exceed ſix feet; and that this holds in the Mediterranean at leaſt, we are informed by the Compte de Marſigli, though he alſo ſometimes obſerved them, during a very violent tempeſt, riſe two feet higher. It is affirmed by Pliny, and ſeveral other ancient writers, that oil calms the waves of the ſea; and that divers were accuſtomed to carry ſome of it for that purpoſe in their mouths. This account was always conſidered by the moderns as a fable, and treated with ſuch contempt, that they did not even deign to put it to the teſt of experiment, till Dr Franklin accidentally diſcovered its truth. Happening in 1757 to be in the middle of a large fleet, he obſerved that the water round one or two veſſels was quite calm and ſmooth, while everywhere elſe it was very much agitated by the winds. He applied to the captain for an explanation of this phenomenon, who replied, that the cooks, he ſuppoſed, had thrown their greaſy water out at the ſcupper-holes, and by that means oiled the ſides of the veſſels in queſtion. This anſwer did not ſatisfy the Doctor at firſt; but recollecting what Pliny had ſaid on the ſubject, he reſolved at leaſt to make the experiment. He did ſo accordingly in 1762, and found that oil actually calmed the waves of the ſea. He repeated the experiment upon a pond at Clapham: the oil ſpread itſelf with great rapidity upon the ſurface, but did not produce the deſired effect, becauſe, having been thrown in upon the ſide oppoſite to the wind, it was immediately driven to the edge of the water. But upon throwing in a like quantity upon the other ſide of the lake, it calmed in an inſtant ſeveral yards of the ſurface; and gradually ſpreading, rendered all that part of the lake, to the extent of at leaſt half an acre, as ſmooth as glaſs. The curious effect produced by this liquid may be accounted for by the repulſion which exiſts between oil and water, and between oil and air, which prevents all immediate contact, all rubbing of the one upon the other.

14 Calmed by oil.

15 Motion towards the weſt—Currents.

2. The ſecond kind of motion is that continual tendency which the whole water in the ſea has towards the weſt. It is greater near the equator than about the poles; and indeed cannot be ſaid to take place at all in the northern hemiſphere beyond the trophic. It begins on the weſt ſide of America, where it is moderate: hence that part of the ocean has been called *Pacific*. As the waters advance weſtward their motion is accelerated; ſo that, after having traverſed the globe, they ſtrike with great violence on the eaſtern ſhore of America. Being ſtopped by that continent, they turn northward, and run with conſiderable impetuoſity in the gulf of Mexico; from thence they proceed along the coaſt of North America, till they come to the ſouth ſide of the great bank at Newfoundland, when they turn off, and run down through the Weſtern Iſles. This current is called the *Gulf Stream*. It was firſt accurately deſcribed by Dr Franklin, who remarked alſo, that the water in it having been originally heated in the torrid zone, cools ſo gradually in its paſſage northward, that even the latitude might be found in any part of the ſtream by means of a thermometer.—This motion of the ſea weſtward has never been explained: it ſeems to have ſome connection with the trade-winds and the diurnal revolution of the earth on its axis.

16 Motion occaſioned by the tide.

3. The third and moſt remarkable motion of the ſea is the tide, which is a regular ſwell of the ocean once every 12 hours, owing, as Newton has demonſtrated, to the attraction of the moon. In the middle of the ſea the tide ſeldom riſes higher than one or two feet,

but on the coaſt it frequently reaches the height of 45 feet, and, in ſome places even more. The tide generally riſes higher in the evening than in the morning: on the coaſt of Britain this holds in winter, but in ſummer the morning tides are higheſt. In ſome ſeas it is ſaid that there are no tides. This cannot be owing to their being ſurrounded by land, becauſe there is a tide in the lakes of North America. For an explanation of theſe and other phenomena we refer to the article TIDE.

SEA-Air, that part of the atmoſphere which is above the ſea.

Sea-air has been found ſalubrious and remarkably beneficial in ſome diſtempers. This may be owing to its containing a greater portion of oxigenous gas or vital air, and being leſs impregnated with noxious vapours than the land. Dr Ingenhouſz made ſeveral experiments to aſcertain the ſalubrity of ſea-air. By mixing equal meaſures of common air and nitrous air, he found, that at Graveſend, they occupied about 104, or one meaſure and $\frac{4}{100}$ of a meaſure: whereas on ſea, about three miles from the mouth of the Thames, two meaſures of air (one of common and one of nitrous air) occupied from 0.91 to 0.94. He attempted a ſimilar experiment on the middle of the channel between the Engliſh coaſt and Oſtend; but the motion of the ſhip rendered it impracticable. He found that in rainy and windy weather the ſea-air contained a ſmaller quantity of vital air than when the weather was calm. On the ſea-ſhore at Oſtend it occupied from $94\frac{1}{2}$ to 97; at Bruges he found it at 105; and at Antwerp $109\frac{1}{2}$. Dr Ingenhouſz thus concludes his paper:

Phil. Tranſ. 1780, p. 354.

It appears, from theſe experiments, that the air at ſea and cloſe to it is in general purer and fitter for animal life than the air on the land, though it ſeems to be ſubject to the ſame inconſtancy in its degree of purity with that of the land; ſo that we may now with more confidence ſend our patients, labouring under conſumptives diſorders, to the ſea, or at leaſt to places ſituated cloſe to the ſea, which have no marſhes in their neighbourhood. It ſeems alſo probable, that the air will be found in general much purer far from the land than near the ſhore, the former being never ſubject to be mixed with land air.

Dr Damman, an eminent phyſician and profeſſor royal of midwifery at Ghent, told Dr Ingenhouſz, that when he was formerly a practitioner at Oſtend, during ſeven years, he found the people there remarkably healthy; that nothing was rarer there than to ſee a patient labouring under a conſumption or aſthma, a malignant, putrid, or ſpotted fever; that the diſeaſe to which they are the moſt ſubject, is a regular intermittent fever in autumn, when ſudden tranſitions from hot to cold weather happen.

People are in general very healthy at Gibraltar, though there are very few trees near that place; which Dr Ingenhouſz thinks is owing to the purity of the air ariſing from the neighbourhood of the ſea.

Moſt ſmall iſlands are very healthy.

At Malta people are little ſubject to diſeaſes, and live to a very advanced age.

SEA-Dragon, a monſter of a very ſingular nature. In the Gentleman's Magazine for the year 1749, we have the account of a ſea-dragon which was ſaid to be taken between Orford and Southwould, on the coaſt of Suffolk, and afterwards carried round the country as a curioſity by the fiſhermen who caught it.

"Its head and tail (ſays the writer) reſemble thoſe of an alligator; it has two large fins, which ſerve it both to ſwim and to fly; and though they were ſo dried that I could not extend them, yet they appear, by the folds, to be ſhaped like thoſe which painters have given to dragons and other winged monſters that ſerve as ſupporters to coats of arms. Its body is covered with impenetrable ſcales; its legs have two joints, and its feet are hoofed like thoſe of an aſs: it has five rows of very white and ſharp teeth in each jaw, and is in length about four feet, though it was longer when alive, it having ſhrunk as it became dry.

"It was caught in a net with mackerel; and being dragged on ſhore, was knocked down with a ſtretcher or boat-hook. The net being opened, it ſuddenly ſprung up, and flew above 50 yards: the man who firſt ſeized it had ſeveral of his fingers bitten off; and the wound mortifying, he died. It afterwards faſtened on the man's arm who ſhows it, and lacerated it ſo much, that the muſcles are ſhrunk, and the hand and fingers diſtorted; the wound is not yet healed, and is thought to be incurable. It is ſaid by ſome to have been deſcribed by naturaliſts under the name of the *Sea-dragon*." We muſt add to the account now given of the monſter called a *ſea-dragon*, that we think it extremely probable that the animal was nothing more than a diſtorted or overgrown individual of ſome of the well known ſpecies of fiſh.

SEA-Plants, are thoſe vegetables that grow in ſalt-water within the ſhores of the ſea. The old botaniſts divided

Sea. divided thefe into three claffes. 1. The firft clafs, according to their arrangement, contained the *algæ*, the *fuci*, the *fea-moffes* or *confervas*, and the different fpecies of fponges. 2. The fecond contained fubftances of a hard texture, like ftone or horn, which feem to have been of the fame nature with what we call *zoophyta*, with this difference, that we refer fponges to this clafs and not to the firft. The third clafs was the fame with our *lithophyta*, comprehending *corals*, *mandrepora*, &c. It is now well known that the genera belonging to the fecond and third of thefe claffes, and even fome referred to the firft, are not vegetables, but animals, or the productions of animals. See CORALLINA, MADREPORA, SPONGIA. Sea-plants, then, properly fpeaking, belong to the clafs of cryptogamia, and the order of algæ; and, according to Bomare, are all comprehended under the genus of fucus. We may alfo add feveral fpecies of the ulva and conferva and the fargazo. The fuci and marine ulvæ are immerfed in the fea, are feffile, and without root. The marine confervæ are either feffile or floating. The fargazo grows beyond foundings.

As fome fpecies of the fucus, when dried and preferved, are extremely beautiful, the curious, and efpecially thofe who profecute the ftudy of botany, muft be anxious to know the beft method of preferving them, without deftroying their colour and beauty. The following method is recommended by M. Mauduyt. Take a fheet of paper, or rather of pafteboard, and cover it with varnifh on both fides; and having rowed in a boat to the rock where the fucus abounds, plunge your varnifhed paper into the water, and, detaching the fucus, receive it upon the paper. Agitate the paper gently in the water, that the plant may be properly fpread over it; and lift them up together foftly out of the water: then fix down with pins the ftrong ftalks, that they may not be difplaced, and leave the plant lying upon the varnifhed paper to dry in the open air. When it is fully dry, the different parts will retain their pofition, and the plant may be preferved within the leaves of a book. To free it from the flime and falt which adhere to it, wafh it gently in frefh water, after being removed from the rock on which it grew.

SEA-Serpent, a monftrous creature, faid to inhabit the northern feas about Greenland and the coafts of Norway. The following marvellous account of this monfter is given by Guthrie. "In 1756, one of them was fhot by a mafter of a fhip: its head refembled that of a horfe; the mouth was large and black, as were the eyes, a white mane hanging from its neck: it floated on the furface of the water, and held its head at leaft two feet out of the fea: between the head and neck were feven or eight folds, which were very thick; and the length of this fnake was more than 100 yards, fome fay fathoms. They have a remarkable averfion to the fmell of caftor; for which reafon, fhip, boat, and bark mafters provide themfelves with quantities of that drug, to prevent being overfet, the ferpent's olfactory nerves being remarkably exquifite. The particularities related of this animal would be incredible, were they not attefted upon oath. Egede, a very reputable author, fays, that on the 6th day of July 1734, a large and frightful fea-monfter raifed itfelf fo high out of the water, that its head reached above the main-top-maft of the fhip; that it had a long fharp fnout, broad paws, and fpouted water like a whale; that the body feemed to be covered with fcales; the fkin was uneven and wrinkled, and the lower part was formed like a fnake. The body of this monfter is faid to be as thick as a hogfhead; his fkin is variegated like a tortoife fhell; and his excrement, which floats upon the furface of the water, is corrofive." Notwithftanding the belief of Guthrie, and the teftimony which he produces, we cannot help doubting of the exiftence of the fea-ferpent. Its bulk is faid to be fo difproportionate to all the known animals of our globe, that it requires more than ordinary evidence to render it credible; but the evidence which is offered is fo very feeble and unfatisfactory, that no man of found judgement would think it fufficient to eftablifh the truth of an extraordinary fact. Sea.

Attempts have lately been made to revive the opinion of the exiftence of fea-mermaids and fea-ferpents. An individual of the latter, it is fuppofed, was fome time ago thrown on fhore in Orkney. Part of the fkeleton is faid to be in the mufeum of the Univerfity of Edinburgh, and another part is in the poffeffion of Mr Home of London, who thinks that it may have belonged to an individual of fome of the whale tribe, perhaps a monfter of that tribe; but according to others it is to be confidered as conftituting a diftinct genus. We cannot avoid obferving, that this point muft remain unfettled till other fpecies of this new genus have been difcovered, or at leaft till an entire individual have been defcribed by an experienced naturalift.

SEA-Sicknefs, a diforder incident to moft perfons on their firft going to fea, occafioned by the agitation of the veffel. This diforder has not been much treated of, although it is very irkfome and diftreffing to the patient during its continuance. It has, however, been found beneficial in afthmatic and pulmonary complaints, and the inftances in which it has proved fatal, are extremely rare. The fea-ficknefs appears to be a fpafmodic affection of the ftomach, occafioned by the alternate preffure and recefs of its contents againft its lower internal furface, according as the rife and fall of the fhip oppofe the action of gravity.

The feas in which the attacks of this diforder are accompanied with the greateft violence, are thofe where the waves have an uninterrupted freedom of action; and of confequence bays, gulfs and channels, may be navigated with lefs inconvenience, as the waves, meeting with more frequent refiftance, the veffel does not experience that gentle uniform vacillation which induces ficknefs, and renders the head giddy. A perfon feels lefs inconvenience from the diforder in a fmall veffel on the wide ocean, on which the flighteft motion of the waves makes a ftrong impreffion. He is alfo lefs expofed to it in a very large veffel deeply laden, as the waves, in this cafe, fcarcely affect the veffel. It is in fhips of an ordinary fize, and which carry but a light cargo, that the paffenger fuffers moft from the fea-ficknefs. The fooner it takes place after embarkation, the continuance of it becomes the more probable. It does not always ceafe immediately on landing, but in fome cafes continues for a confiderable time.

Many methods of preventing, or at leaft of mitigating this diforder, have been recommended, of which the moft efficacious appear to be the following.

1. Not to go on board immediately after eating, and not to eat, when on board, any large quantity at a time.

2. To

2. To take much exercise, with as little intermission as possible; as indolent passengers are always the greatest sufferers from the disorder.

3. To keep much upon deck, even when the weather is stormy, as the sea breeze is not so apt to affect the stomach as the impure air of the cabin, rendered so for want of proper circulation.

4. Not to watch the motion of the waves, particularly when strongly agitated with tempest.

5. Carefully to shun all employments by which the mind may be harassed, as reading, studying, gaming, &c. and to seek all opportunities of mental relaxation.

6. To drink occasionally liquids containing carbonic acid, as the froth of beer strongly fermented, or wine and Seltzer water mixed together, and sweetened with pounded sugar.

7. It will also be beneficial to take sulphuric acid dulcified, dropped on a bit of sugar, or in peppermint water, or ten drops of ether.

The proper diet consists of bread and fresh meat, to be eaten cold with pepper. All sweet savoured food should be carefully avoided, and the passenger ought to refrain from fat, and particularly from such meat as is in the smallest degree tainted. Even the smell of flowers is injurious, for which reason marine productions ought not to be examined; but the fumes of vinegar may be advantageously inhaled. The drink should consist of lemonade or tart wines, but never of common water. An accidental diarrhœa has often relieved the patient from sea-sickness, and therefore a gentle laxative in such a disorder seems to be indicated. It will also be found useful to apply a tonic anodyne plaster to the pit of the stomach, spread upon leather, and covered with linen.

When symptoms of vomiting appear, they may often be remedied by the patient placing himself in a horizontal position on his back or belly, and lying perfectly still. If the fits of vomiting are too violent to be repressed, they should be promoted by a strong dose of salt water; not, however, to be often repeated, as it debilitates the stomach. When the emetic operates, the patient should bend his body, bringing his knees towards his breast, and supporting his head against a firm resting-place. His garters and cravat must be untied, a precaution which will secure him from the danger of a rupture.

The vomiting having subsided, a state of repose will prevent its return, and the eyes may be kept shut for a considerable time. The patient must make choice of a cool, ventilated place, remembering to keep himself warm and well clothed, as perspiration is highly beneficial. A gargle of sugar dissolved in vinegar is to be taken in the morning, accompanied with frequent and spare eating. Water must never be taken in its pure state, but mixed with wine, vinegar, or brandy. A glass of wine may be taken in the morning, with an infusion of orange peel, gentian root, or peruvian bark. A glass of punch occasionally taken will be extremely beneficial, by which perspiration is promoted.

Persons accustomed to smoke tobacco, will find the use of the pipe salutary on such occasions, but the practice of smoking will be injurious to all others. We may add that warm clothing, flannel shirts, caps, trowsers, &c. are powerful remedies against excessive expectoration, with every other symptom of this dreadful malady.

SEA-Star. See ASTERIAS, } HELMINTHOLOGY *Index*.
SEA-Urchin. See ECHINUS, }

SEA-Water, the salt water of the sea. The principal salts contained in sea-water are, 1st, Common marine or culinary salt, compounded of fossil alkali or soda and marine acid; 2dly, A salt formed by the union of the same acid with magnesian earth; and, lastly, A small quantity of selenite. The quantity of saline matter contained in a pint of sea-water, in the British seas, is, according to Neumann, about one ounce in each pint (A).

The saltness of this water is supposed to arise from numerous mines and mountains of salt dispersed here and there in the depths of the sea. Dr Halley supposes that it is probable the greatest part of the sea-salt, and of all salt lakes, as the Caspian sea, the Dead sea, the lake of Mexico, and the Titicaca in Peru, is derived from the water of the rivers which they receive: and since this sort of lakes has no exit or discharge but by the exhalation of vapours, and also since these vapours are entirely fresh or devoid of such particles, it is certain that the saltness of the sea and of such lakes must from time to time increase; and therefore the saltness at this time must be greater than at any time heretofore. He further adds, that if, by experiments made in different ages, we could find the different quantity of salt which the same quantity of water (taken up in the same place, and in all other the same circumstances) would afford, it would be easy from thence, by rules of proportion, to find the age of the world very nearly, or the time wherein it has been acquiring its present saltness.

This opinion of Dr Halley is so improbable, that it is surprising so acute a philosopher could have adopted it. That fresh water rivers should in the course of many thousand years produce saltness in the sea, is quite incredible. If this were the case, every sea or great body of water which receives rivers must be salt, and must possess a degree of saltness in proportion to the quantity of water which the rivers discharge. But so

(A) In Bergman's analysis of sea-water taken up in the beginning of June 1776, about the latitude of the Canaries, from the depth of 60 fathoms, the solid contents of a pint of the water were,

	Grs.				
Of common salt	$253\frac{6}{11}$		ʒ.	℈	Grs.
Salited magnesia	$69\frac{1}{11}$	or	5	1	$10\frac{9}{11}$
Gypsum	$8\frac{2}{11}$				
Total	$330\frac{9}{11}$				

fo far is this from being true, that the Palus Meotis and the great lakes in America do not contain falt but frefh water. It may indeed be objected, that the quantity of falt which the rivers carry along with them and depofit in the fea, muft depend on the nature of the foil through which they flow, which may in fome places contain no falt at all: and this may be the reafon why the great lakes in America and the Palus Meotis are frefh. But to this opinion, which is merely hypothetical, there are unfurmountable objections. It is a curious fact that the faltnefs of the fea is greateft under the line, and diminifhes gradually as we advance to the poles: We muft therefore fuppofe, if Dr Halley's theory be true, that the earth contains more falt in the tropical regions than in the temperate zones, and more in the temperate zones than in the frigid; and confequently that the rivers in thefe different regions contain a quantity of falt proportionable to their diftance from the equator. This, however, muft be firft proved by experiment, and cannot be affumed as an eftablifhed fact. But there is another circumftance that entirely deftroys this theory. If we allow that the fea receives its faltnefs from the rivers, it muft be equally falt or nearly fo in every part of the earth. For, according to a fimple and well known principle in chemiftry, "when any fubftance is diffolved in water with the affiftance of agitation, at whatever part of the water it is introduced, it will be equally diffufed through the whole liquid." Now though it were true that a greater quantity of falt were introduced into the fea under the line than towards the poles, from the conftant agitation occafioned by the wind and tide, the falt muft foon pervade the whole mafs of water. To fay that the fuperior degree of heat in the tropical regions may diffolve a greater quantity of falt, will not deftroy our argument; for it is an eftablifhed principle in chemiftry, that cold water will diffolve nearly as great a quantity of falt as hot water can diffolve.

The faltnefs of the fea has alfo been afcribed to the folution of fubterraneous mines of falt which is fuppofed to abound in the bottom of the fea and along its fhores. But this hypothefis cannot be fupported. If the fea were conftantly diffolving falt, it would foon become faturated; for it cannot be faid that it is deprived of any part of its falt by evaporation, fince rain-water is frefh. If the fea were to become faturated, neither fifhes nor vegetables could live in it. We muft therefore defpair of being able to account for the faltnefs of the fea by fecond caufes; and muft fuppofe that it has been falt from the creation. It is impoffible indeed to fuppofe that the waters of the fea were at any period frefh fince the formation of fifhes and fea-plants: for as thefe will not live in water faturated with falt, neither will they live in water that is frefh; we therefore conclude that the faltnefs of the fea has been nearly the fame in all ages. This is the fimpleft hypothefis of the three that has been mentioned. It explains beft the various phenomena, and is involved in feweft difficulties. We fhall, however, allow that there may be fome exceptions; that the faltnefs of fome feas, or of particular parts of the fame fea, may be increafed by mines of rock-falt difperfed near its fhores.

With regard to the ufe of this falt property of fea-water, it is obferved, that the faltnefs of the fea preferves its waters pure and fweet, which otherwife would corrupt and ftink like a filthy lake, and confequently that none of the myriads of creatures which now live therein could then have a being. From thence alfo the fea water becomes much heavier, and therefore fhips of greater fize and quantity may be ufed thereon. Salt-water alfo doth not freeze fo foon as frefh-water, whence the feas are more free for navigation. We have a differtation, by Dr Ruffel, concerning the medical ufes of fea-water in difeafes of the glands, &c. wherein the author premifes fome obfervations upon the the nature of fea-water, confidered as impregnated with particles of all the bodies it paffes over, fuch as fubmarine plants, fifh, falts, minerals, &c. and faturated with their feveral effluvia, to enrich it and keep it from putrefaction: whence this fluid is fuppofed to contract a foapinefs; and the whole collection, being pervaded by the fulphureous fteams paffing through it, to conftitute what we call *fea-water;* the confeffed diftinguifhing characteriftics of which are faltnefs, bitternefs, nitrofity, and unctuofity: whence the author concludes, that it may be juftly expected to contribute fignally to the improvement of phyfic. The cafes in which our author informs us we are to expect advantages from fea-water are, 1. In all recent obftructions of the glands of the inteftines and mefentery. 2. All recent obftructions of the pulmonary glands, and thofe of the vifcera, which frequently produce confumptions. 3. All recent glandular fwellings of the neck, or other parts. 4. Recent tumors of the joints, if they are not fuppurated, or become fchirrous or cancerous, and have not carious bones for their caufe. 5. Recent defluxions upon the glands of the eyelids. 6. All defœdations of the fkin, from an eryfipelas to a lepra. 7. Difeafes of the glands of the nofe, with their ufual companion a thicknefs of the lip. 8. Obftructions of the kidneys, where there is no inflammation, and the ftone not large. 9. In recent obftructions of the liver, this method will be proper, where it prevents conftipations of the belly, and affifts other medicines directed in icterical cafes. The fame remedy is faid to be of fignal fervice in the bronchocele; and is likewife recommended for the prevention of thofe bilious colics that fo frequently affect our mariners.

Prefervation of SEA-Water from Putrefaction. As it is fometimes neceffary to preferve fea-water in cafks for bathing and other purpofes, it is of importance to know how to keep it from putrefaction. Many experiments were made to determine this point by Mr Henry, and are recorded in the firft volume of the Memoirs of the Literary and Philofophical Society of Manchefter. His firft experiment we fhall here prefent to our readers. "To one quart of fea-water were added two fcruples of frefh quick-lime; to another, half an ounce of common culinary falt; and a third was kept as a ftandard without any addition. The mouths of the bottles being loofely covered with paper, they were expofed to the action of the fun in fome of the hotteft weather in fummer. In about a week the ftandard became very offenfive; and the water, with the additional quantity of falt, did not continue fweet many hours longer; whereas that with lime continued many months without ever exhibiting the leaft marks of putridity." When he added a dram more of quicklime, the whole of the magnefia contained in the water was feparated; and when a further addition was made, a lime-water was

Sea. immediately formed. He therefore concluded, that two fcruples of quicklime are fufficient to preferve a quart of fea-water. The proportions, however, may vary a little, according to the ftrength of the quicklime employed.

1 Different methods of frefhening fea-water.

Frefhening of SEA-Water. The method of making fea-water frefh was long a defideratum in navigation. Many methods have been propofed for this purpofe. Mr Appleby publifhed an account of a procefs which he had inftituted in the year 1734. He diftilled fea-water with a quantity of *lapis infernalis* and calcined bones; but this procefs was foon laid afide, as it was not only difficult in itfelf, but rendered the water unpalatable. Dr Butler propofed foap-leys in place of Mr Appleby's ingredients; but the water was ftill liable to the fame objection. Dr Stephen Hales recommended powdered chalk; but his method was expenfive, and did not improve the tafte of the water. Dr Lind of Portfmouth diftilled fea-water without any ingredients; but as the experiment he made was performed in a veffel containing only two quarts, with a glafs receiver, in his ftudy, nothing conclufive can be drawn from it for the ufe of failors.

2 Dr Irving's

At length Dr Irving brought the procefs to a very high degree of fimplicity and perfection, by which the water is obtained pure, without much expence of fuel or a complicated apparatus. For this valuable difcovery he received a reward of 5000l. The advantages of this method remain to be ftated, which may be reduced to the following: 1. The abolifhing all ftills, ftillheads, worm-pipes, and their tubes, which occupy fo much fpace as to render them totally incompatible with the neceffary bufinefs of the fhip; and ufing in the room of thefe the fhip's kettle or boiler, to the top whereof may occafionally be applied a fimple tube, which can be eafily made on board a veffel at fea, of iron plate, ftove funnel, or tin fheet; fo that no fituation can prevent a fhip from being completely fupplied with the means of diftilling fea-water. 2. In confequence of the principles of diftillation being fully afcertained, the contrivance of the fimpleft means of obtaining the greateft quantity of diftilled water, by making the tube fufficiently large to receive the whole column of vapour, and placing it nearly in a horizontal direction, to prevent any compreffion of the fluid, which takes place fo much with the common worm. 3. The adopting of the fimpleft and moft efficacious means of condenfing vapour; for nothing more is required in the diftillation but keeping the furface of the tube always wet, which is done by having fome fea-water at hand, and a perfon to dip a mop or fwab into this water, and pafs it along the upper furface of the tube. By this operation the vapour contained in the tube will be entirely condenfed with the greateft rapidity imaginable; for by the application of the wet mop thin fheets of water are uniformly fpread, and mechanically preffed upon the furface of the hot tube; which being converted into vapour make way for a fucceffion of frefh fheets; and thus, both by the evaporation and clofe contact of the cold water conftantly repeated, the heat is carried off more effectually than by any other method yet known. 4. The carrying on the diftillation without any addition, a correct chemical analyfis of fea-water having evinced the futility of mixing ingredients with it, either to prevent an acid from rifing with the vapour, or to deftroy any bituminous oil fuppofed to exift in fea-water, and to contaminate the diftilled water, giving it that fiery unpalatable tafte infeparable from the former proceffes. 5. The afcertaining the proper quantity of fea-water that ought to be diftilled, whereby the frefh water is prevented from contracting a noxious impregnation of metallic falts, and the veffel from being corroded and otherwife damaged by the falts caking on the bottom of it. 6. The producing a quantity of fweet and wholefome water, perfectly agreeable to the tafte, and fufficient for all the purpofes of fhipping. 7. The taking advantage of the dreffing the fhip's provifions, fo as to diftil a very confiderable quantity of water from the vapour, which would otherwife be loft, without any addition of fuel. To fum up the merits of this method in a few words: The ufe of a fimple tube, of the moft eafy conftruction, applicable to any fhip's kettle. The rejecting all ingredients; afcertaining the proportion of water to be diftilled, with every advantage of quality, faving of fuel, and prefervation of boilers. The obtaining frefh water, wholefome, palatable, and in fufficient quantities. Taking advantage of the vapour which afcends in the kettle while the fhip's provifions are boiling. All thefe advantages are obtained by the above mentioned fimple addition to the common fhip's kettles. But Dr Irving propofes to introduce two further improvements. The firft is a hearth, or ftove, fo conftructed that the fire which is kept up the whole day for the common bufinefs of the fhip ferves likewife for diftillation; whereby a fufficient quantity of water for all the economical purpofes of the fhip may be obtained, with a very inconfiderable addition to the expence of fuel. The other improvement is that of fubftituting, even in the largeft fhips, caft-iron boilers, of a new conftruction, in the place of coppers.

3 Directions for diftilling fea-water.

As foon as fea-water is put into the boiler, the tube is to be fitted either into the top or lid, round which, if neceffary, a bit of wet linen may be applied, to make it fit clofe to the mouth of the veffel; there will be no occafion for luting, as the tube acts like a funnel in carrying off the vapour. When the water begins to boil, the vapour fhould be allowed to pafs freely for a minute, which will effectually clean the tube and upper part of the boiler. The tube is afterwards to be kept conftantly wet, by paffing a mop or fwab, dipped in fea water, along its upper furface. The wafte water running from the mop may be carried off by means of a board made like a fpout, and placed beneath the tube. The diftillation may be continued till three-fourths of the water be drawn off, and no further. This may be afcertained either by a gauge-rod put into the boiler, or by meafuring the water diftilled. The brine is then to be let out. Water may be diftilled in the fame manner while the provifions are boiling. When the tube is made on fhore, the beft fubftance for the purpofe is thin copper well tinned, this being more durable in long voyages than tin-plates. Inftead of mopping, the tube, if required, may have a cafe made alfo of copper, fo much larger in diameter as to admit a thin fheet of water to circulate between them by means of a fpiral copper thread, with a pipe of an inch diameter at each end of the cafe; the lower for receiving cold water, and the upper for carrying it off when heated.

When only a very fmall portion of room can be conveniently allowed for diftillation, the machine (fig. 2.), which is only 27 inches long, may be fubftituted, as

was

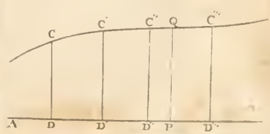
SERIES.



Sea. was done in this voyage. The principal intention of this machine, however, is to distil rum and other liquors; for which purpofe it has been employed with extraordinary fuccefs, in preventing an *empyreuma*, or fiery tafte.

Plate cccclxxviii. Fig. 1. Figure 1. reprefents in perfpective a fection of the two boilers taken out of the frame. In the back part at D, E, are feen openings for the cocks. On the top is a diftilling tube A, B, C, five inches diameter at A, and decreafing in fize to three inches at C; the length from B to C is five feet. Near C is a ring to prevent the water which is applied to the furface from mixing with the diftilled water. In the infide of the tube, below B, is a fmall lip or ledging, to hinder the diftilled water from returning into the boiler by the rolling of the fhip.

Fig. 2. In figure 2. A, B, C, D, reprefent a vertical fection of a copper box, 27 inches long, feven inches wide, and 11 in height, tinned on the infide. In the bottom F is an aperture about fix inches in diameter, having a ring to fit on the ftill or boiler. The dotted lines which run nearly horizontal, are veffels of thin copper, tinned on the outfide, two feet long, feven inches wide, and three quarters of an inch deep. At G is a funnel to receive cold water, which is conveyed into the veffels by communicating pipes, contrived in fuch a manner as to form a complete and quick circulation of the water through their whole extent. When the water is become hot by the action of the fteam, it is difcharged by the horizontal pipe at A. E is a pipe from which the diftilled water or fpirits run, and is bent in fuch a form that the liquor running from it acts as a valve, and hinders any fteam from efcaping that way. On the top of the box, at H, is a fafety-valve, which prevents any danger from a great accumulation of vapour not condenfed for want of a proper fupply of cold water.

4 Lorgna's method of frefhening it by congelation. We fhall now mention a different method, difcovered by the Chevalier Lorgna, by congelation of fea-water. Sea-water requires a very great degree of cold in order to become ice. Our author found that a freezing mixture, made by mixing three parts of pounded ice with two parts of common falt, was quite fufficient to freeze it. The cold produced by this mixture is equal to about 4° below 0 of Fahrenheit's thermometer.

A quantity of fea-water is never entirely congealed, a portion of it always remaining fluid; and, what is very remarkable, this fluid part is incomparably more full of falt and more naufeous than the reft: hence, if this be feparated from the congealed part, the latter on being melted will be found to contain much lefs falt than it did before congelation. This we fhall call *the water of the firft purification.*

If the water of the firft purification be again congealed, a part of it will remain fluid as in the firft operation. This fluid portion will contain a greater proportion of falt than the reft, which is of courfe more pure, and, being melted, forms the water of the fecond purification. Thus, by repeatedly freezing the fame fea water, and feparating the fluid from the congealed part in every operation, it is at laft perfectly purified, fo as to be entirely divefted of falt, and as fit for drink and other purpofes as the pureft water that is ufed.

At firft the fea-water, in order to be congealed, requires a very great degree of cold, as mentioned above, the ice formed in it confifts rather of fcales or filaments than of a compact body, and the quantity of the fluid parts bears a confiderable proportion to the quantity of ice. But as the water, by undergoing the fucceffive congelations, becomes more and more pure, fo it becomes capable of being congealed by a fmaller and fmaller degree of cold; the ice is at the fame time more compact, and in greater quantity; the fluid part at laft becoming very inconfiderable. Sea.

SEA-Weed, or *Alga Marina*, is commonly ufed as a manure on the fea-coaft, where it can be procured in abundance. The beft fort grows on rocks, and is that from which kelp is made. The next to this is called the *peafy fea-weed;* and the worft is that with a long ftalk. In the neighbourhood of Berwick, the farmers mix it with ftable dung and earth, and thus obtain a great quantity of excellent manure. Sea-weed is found alfo to be a very fit manure for gardens, as it not only enriches them, but deftroys the vermin by which they are ufually infefted.

Saltnefs of the SEA. See *SEA-Water.*

South SEA. See *PACIFIC Ocean*, and *SOUTH Sea.*

SEAL, a puncheon, piece of metal, or other matter, ufually either round or oval; whereon are engraven the arms, device, &c. of fome prince, ftate, community, magiftrate, or private perfon, often with a legend or infcription; the impreffion whereof in wax ferves to make acts, inftruments, &c. authentic.

The ufe of feals, as a mark of authenticity to letters and other inftruments in writing, is extremely ancient. We read of it among the Jews and Perfians in the earlieft and moft facred records of hiftory. And in the book of Jeremiah there is a very remarkable inftance, not only of an atteftation by feal, but alfo of the other ufual formalities attending a Jewifh purchafe. In the civil law alfo, feals were the evidence of truth, and were required, on the part of the witneffes at leaft, at the atteftation of every teftament. But in the times of our Saxon anceftors, they were not much in ufe in England. For though Sir Edward Coke relies on an inftance of King Edwyn's making ufe of a feal about 100 years before the Conqueft, yet it does not follow that this was the ufage among the whole nation: and perhaps the charter he mentions may be of doubtful authority, from this very circumftance of its being fealed; fince we are affured by all our ancient hiftorians that fealing was not then in common ufe. The method of the Saxons was, for fuch as could write to fubfcribe their names, and, whether they could write or not, to affix the fign of the crofs; which cuftom our illiterate vulgar do for the moft part to this day keep up, by figning a crofs for their mark when unable to write their names. And indeed this inability to write, and therefore making a crofs in its ftead, is honeftly avowed by Caedwalla, a Saxon king, at the end of one of his charters. In like manner, and for the fame infurmountable reafon, the Normans, a brave but illiterate nation, at their firft fettlement in France ufed the practice of fealing only, without writing their names; which cuftom continued when learning made its way among them, though the reafon for doing it had ceafed; and hence the charter of Edward the Confeffor to Weftminfter-abbey, himfelf being brought up in Normandy, was witneffed only by his feal, and is generally thought to be the oldeft fealed charter of any authenticity in England.

land. At the Conqueſt, the Norman lords brought over into this kingdom their own faſhions; and introduced waxen ſeals only, inſtead of the Engliſh method of writing their names, and ſigning with the ſign of the croſs. The impreſſions of theſe ſeals were ſometimes a knight on horſeback, ſometimes other devices; but coats of arms were not introduced into ſeals, nor indeed uſed at all till about the reign of Richard I. who brought them from the croiſade in the Holy Land, where they were firſt invented and painted on the ſhields of the knights, to diſtinguiſh the variety of perſons of every Chriſtian nation who reſorted thither, and who could not, when clad in complete ſteel, be otherwiſe known or aſcertained.

This neglect of ſigning, and reſting only upon the authenticity of ſeals, remained very long among us; for it was held in all our books, that ſealing alone was ſufficient to authenticate a deed: and ſo the common form of atteſting deeds, "ſealed and delivered," continues to this day; notwithſtanding the ſtatute 29 Car. II. c. 3. revives the Saxon cuſtom, and expreſsly directs the ſigning in all grants of lands and many other ſpecies of deeds: in which, therefore, ſigning ſeems to be now as neceſſary as ſealing, though it hath been ſometimes held that the one includes the other.

The king's *great ſeal* is that whereby all patents, commiſſions, warrants, &c. coming down from the king are ſealed; the keeping whereof is in the hands of the lord chancellor. The king's *privy ſeal* is a ſeal that is uſually firſt ſet to grants that are to paſs the great ſeal.

SEAL. See *KEEPER of the Privy Seal.*

SEAL is alſo uſed for the wax or lead, and the impreſſion thereon affixed to the thing ſealed.

An amalgam of mercury with gold, reduced to the conſiſtence of butter, by ſtraining off part of the mercury through leather, has been recommended as a proper material for taking off the impreſſion of ſeals in wax. In this ſtate, the compound ſcarcely contains one part of mercury to two of gold; yet is of a ſilver whiteneſs, as if there was none of the precious metal in it. In this ſtate it grows ſoft on being warmed or worked between the fingers; and is therefore proper for the purpoſe above-mentioned, but is not ſuperior to ſome amalgams made with the inferior metals, as is well known to ſome impoſtors, who have ſold for this uſe amalgams of the baſe metals as curious preparations of gold.

SEAL. See PHOCA, MAMMALIA *Index*.

SEALER, an officer in chancery appointed by the lord chancellor or keeper of the great ſeal, to ſeal the writs and inſtruments there made in his preſence.

SEALING, in *Architecture*, the fixing a piece of wood or iron in a wall with plaſter, mortar, cement, lead, or other ſolid binding. For ſtaples, hinges, and joints, plaſter is very proper.

SEALING-Wax. See WAX.

SEAM, or SEME, of corn, is a meaſure of eight buſhels.

SEAM of Glaſs, the quantity of 120 pounds, or 24 ſtones, each five pounds weight. The ſeam of wood is an horſe-load working.

SEAM, in mines, the ſame with a ſtratum or bed; as a ſeam of coal.

SEAMANSHIP.

1 Definition.

BY this word we expreſs that noble art, or, more purely, the qualifications which enable a man to exerciſe the noble art of working a ſhip. A SEAMAN, in the language of the profeſſion, is not merely a mariner or labourer on board a ſhip, but a man who underſtands the ſtructure of this wonderful machine, and every ſubordinate part of its mechaniſm, ſo as to enable him to employ it to the beſt advantage for puſhing her forward in a particular direction, and for avoiding the numberleſs dangers to which ſhe is expoſed by the violence of the winds and waves. He alſo knows what courſes can be held by the ſhip, according to the wind that blows, and what cannot, and which of theſe is moſt conducive to her progreſs in her intended voyage; and he muſt be able to perform every part of the neceſſary operation with his own hands. As the ſeamen expreſs it, he muſt be able "to hand, reef, and ſteer."

2 Importance and

We are juſtified in calling it a *noble art*, not only by its importance, which it is quite needleſs to amplify or embelliſh, but by its immenſe extent and difficulty, and the prodigious number and variety of principles on which it is founded—all of which muſt be poſſeſſed in ſuch a manner that they ſhall offer themſelves without reflection in an inſtant, otherwiſe the pretended ſeaman is but a lubber, and cannot be truſted on his watch.

The art is practiſed by perſons without what we call *education*, and in the humbler walks of life, and therefore it ſuffers in the eſtimation of the careleſs ſpectator. It is thought little of, becauſe little attention is paid to it. But if multiplicity, variety, and intricacy of principles, and a ſyſtematic knowledge of theſe principles, intitle any art to the appellation of *ſcientific* and *liberal*, ſeamanſhip claims theſe epithets in an eminent degree. We are amuſed with the pedantry of the ſeaman, which appears in his whole language. Indeed it is the only pedantry that amuſes. A ſcholar, a ſoldier, a lawyer, nay, even the elegant courtier, would diſguſt us, were he to make the thouſandth part of the alluſions to his profeſſion that is well received from the jolly ſeaman; and we do the ſeaman no more than juſtice. His profeſſion *muſt* engroſs his whole mind, otherwiſe he can never learn it. He poſſeſſes a prodigious deal of knowledge; but the honeſt tar cannot tell what he knows, or rather what he feels, for his ſcience is really at his fingers ends. We can ſay with confidence, that if a perſon of education, verſed in mechanics, and acquainted with the ſtructure of a ſhip, were to obſerve with attention the movements which are made on board a firſt or ſecond rate ſhip of war during a ſhifting ſtorm, under the direction of an intelligent officer, he would be rapt in admiration.

3 Difficulty of the art,

What a pity it is that an art ſo important, ſo difficult, and ſo intimately connected with the invariable laws of mechanical nature, ſhould be ſo held by its poſſeſſors, that it cannot improve, but muſt die with each individual. Having no advantages of previous education,

tion, they cannot arrange their thoughts; they can hardly be ſaid to think. They can far leſs expreſs or communicate to others the intuitive knowledge which they poſſeſs; and their art, acquired by habit alone, is little different from an inſtinct. We are as little intitled to expect improvement here as in the architecture of the bee or the beaver. The ſpecies (pardon the alluſion, ye generous hearts of oak) cannot improve. Yet a ſhip is a machine. We know the forces which act on it, and we know the reſults of its conſtruction—all theſe are as fixed as the laws of motion. What hinders this to be reduced to a ſet of practical maxims, as well founded and as logically deduced as the working of a ſteam engine or a cotton mill. The ſtoker or the ſpinner acts only with his hands, and may "whiſtle as he works, for want of thought;" but the mechaniſt, the engineer, thinks for him, improves his machine, and directs him to a better practice. May not the rough ſeaman look for the ſame aſſiſtance; and may not the ingenious ſpeculatiſt in his cloſet unravel the intricate thread of mechaniſm which connects all the manual operations with the unchangeable laws of nature, and both furniſh the ſeaman with a better machine and direct him to a more dexterous uſe of it?

4 which has been zealouſly cultivated by the French philoſophers.

We cannot help thinking that much may be done; nay, we may ſay that much has been done. We think highly of the progreſſive labours of Renaud, Pitot, Bouguer, Du Hamel, Groignard, Bernoulli, Euler, Romme, and others; and are both ſurpriſed and ſorry that Britain has contributed ſo little in theſe attempts. Gordon is the only one of our countrymen who has given a profeſſedly ſcientific treatiſe on a ſmall branch of the ſubject. The government of France has always been ſtrongly impreſſed with the notion of great improvements being attainable by ſyſtematic ſtudy of this art; and we are indebted to the endeavours of that ingenious nation for any thing of practical importance that has been obtained. M. Bouguer was profeſſor of hydrology at one of the marine academies of France, and was enjoined, as part of his duty, to compoſe diſſertations both on the conſtruction and the working of ſhips. His *Traité du Navire*, and his *Manœuvre des Vaiſſeaux*, are undoubtedly very valuable performances: So are thoſe of Euler and Bernoulli, conſidered as mathematical diſſertations, and they are wonderful works of genius, conſidered as the productions of perſons who hardly ever ſaw a ſhip, and were totally unacquainted with the profeſſion of a ſeaman. In this reſpect Bouguer had great ſuperiority, having always lived at a ſea port, and having made many very long voyages. His treatiſes therefore are infinitely better accommodated to the demands of the ſeaman, and more directly inſtructive; but ſtill the author is more a mathematician than an artiſt, and his performance is intelligible only to mathematicians. It is true, the academical education of the young gentlemen of the French navy is ſuch, that a great number of them may acquire the preparatory knowledge that is neceſſary; and we are well informed that, in this reſpect, the officers of the Britiſh navy are greatly inferior to them.

5 Argument againſt the utility of their performances,

But this very circumſtance has furniſhed to many perſons an argument againſt the utility of thoſe performances. It is ſaid that, "notwithſtanding this ſuperior mathematical education, and the poſſeſſion of thoſe boaſted performances of M. Bouguer, the French are greatly inferior, in point of ſeamanſhip, to our countrymen, who have not a page in their language to inſtruct them, and who could not peruſe it if they had it." Nay, ſo little do the French themſelves ſeem ſenſible of the advantage of theſe publications, that no perſon among them has attempted to make a familiar abridgement of them, written in a way fitted to attract attention; and they ſtill remain neglected in their original abſtruſe and unintereſting form.

We wiſh that we could give a ſatisfactory anſwer to this obſervation. It is juſt, and it is important. Theſe very ingenious and learned diſſertations are by no means ſo uſeful as we ſhould expect. They are large books, and appear to contain much; and as their plan is logical, it ſeems to occupy the whole ſubject, and therefore to have done almoſt all that can be done. But, alas! they have only opened the ſubject, and the ſtudy is yet in its infancy. The whole ſcience of the art muſt proceed on the knowledge of the impulſions of the wind and water. Theſe are the forces which act on the machine; and its motions, which are the ultimatum of our reſearch, whether as an end to be obtained or as a thing to be prevented, muſt depend on theſe forces. Now it is with reſpect to this fundamental point that we are as yet almoſt totally in the dark. And, in the performances of M. Bouguer, as alſo in thoſe of the other authors we have named, the theory of theſe forces, by which their quantity and the direction of their action are aſcertained, is altogether erroneous; and its reſults deviate ſo enormouſly from what is obſerved in the motions of a ſhip, that the perſon who ſhould direct the operations on ſhipboard, in conformity to the maxims deducible from M. Bouguer's propoſitions, would be baffled in moſt of his attempts, and be in danger of loſing the ſhip. The whole proceeds on the ſuppoſed truth of that theory which ſtates the impulſe of a fluid to be in the proportion of the ſquare of the ſine of the angle of incidence; and that its action on any ſmall portion, ſuch as a ſquare foot of the ſails or hull, is the ſame as if that portion were detached from the reſt, and were expoſed, ſingle and alone, to the wind or water in the ſame angle. But we have ſhown, in the article *RESISTANCE of Fluids*, both from theory and experience, that both of theſe principles are erroneous, and this to a very great degree, in caſes which occur moſt frequently in practice, that is, in the ſmall angles of inclination. When the wind falls nearly perpendicular on the ſails, theory is not very erroneous: but in theſe caſes, the circumſtances of the ſhip's ſituation are generally ſuch that the practice is eaſy, occurring almoſt without thought; and in this caſe, too, even conſiderable deviations from the very beſt practice are of no great moment. The intereſting caſes, where the intended movement requires or depends upon very oblique actions of the wind on the ſails, and its practicability or impracticability depends on a very ſmall variation of this obliquity; a miſtake of the force, either as to intenſity or direction, produces a mighty effect on the reſulting motion. This is the caſe in ſailing to windward; the moſt important of all the general problems of ſeamanſhip. The trim of the ſails, and the courſe of the ſhip, ſo as to gain moſt on the wind, are very nice things; that is, they are confined within very narrow limits, and a ſmall miſtake produces a very conſiderable effect. The ſame thing obtains in many of the nice problems

6 which are confeſſedly erroneous in their fundamental principles;

blems of tacking, box-hauling, wearing after lying to in a ftorm, &c.

The error in the fecond affertion of the theory is ftill greater, and the action on one part of the fail or hull is fo greatly modified by its action on another adjoining part, that a ftay-fail is often feen hanging like a loofe rag, although there is nothing between it and the wind ; and this merely becaufe a great fail in its neighbourhood fends off a lateral ftream of wind, which completely hinders the wind from getting at it. Till the theory of the action of fluids be eftablifhed, therefore, we cannot tell what are the forces which are acting on every point of the fail and hull : Therefore we cannot tell either the mean intenfity or direction of the whole force which acts on any particular fail, nor the intenfity and mean direction of the refiftance to the hull ; circumftances abfolutely neceffary for enabling us to fay what will be their energy in producing a rotation round any particular axis. In like manner, we cannot, by fuch a computation, find the fpontaneous axis of converfion (fee ROTATION), or the velocity of fuch converfion. In fhort, we cannot pronounce with tolerable confidence *à priori* what will be the motions in any cafe, or what difpofitions of the fails will produce the movement we wifh to perform. The experienced feaman learns by habit the general effects of every difpofition of the fails ; and though his knowledge is far from being accurate, it feldom leads him into any very blundering operation. Perhaps he feldom makes the beft adjuftment poffible, but feldomer ftill does he deviate very far from it ; and in the moft general and important problems, fuch as working to windward, the refult of much experience and many corrections has fettled a trim of the fails, which is certainly not far from the truth, but (it muft be acknowledged) deviates widely and uniformly from the theories of the mathematician's clofet, The honeft tar, therefore, muft be indulged in his joke on the ufelefs labours of the mathematician, who can neither hand, reef, nor fteer.

After this account of the theoretical performances in the art of feamanfhip, and what we have faid in another place on the fmall hopes we entertain of feeing a perfect theory of the impulfe of fluids, it will not be expected that we enter very minutely on the fubject in this place ;

7 Though ufe may be made of them.

nor is it our intention. But let it be obferved, that the theory is defective in one point only ; and although this is a moft important point, and the errors in it deftroy the conclufions of the chief propofitions, the reafonings remain in full force, and the *modus operandi* is precifely fuch as is ftated in the theory. The *principles* of the art are therefore to be found in thefe treatifes ; but falfe inferences have been drawn, by computing from erroneous quantities. The rules and the practice of the computation, however, are ftill beyond controverfy : Nay, fince the procefs of inveftigation is legitimate, we may make ufe of it in order to difcover the very circumftance in which we are at prefent miftaken : for by converting the propofition, inftead of finding the motions by means of the fuppofed forces, combined with the known mechanifm, we may difcover the forces by means of this mechanifm and the obferved motions.

8 Defign of the article.

We fhall therefore in this place give a very general view of the movements of a fhip under fail, fhowing how they are produced and modified by the action of the wind on her fails, the water on her rudder and on her bows. We fhall not attempt a precife determination of any of thefe movements ; but we fhall fay enough to enable the curious landfman to underftand how this mighty machine is managed amidft the fury of the winds and waves : and, what is more to our wifh, we hope to enable the uninftructed but thinking feaman to generalife that knowledge which he poffeffes ; to clafs his ideas, and give them a fort of rational fyftem ; and even to improve his practice, by making him fenfible of the immediate operation of every thing he does, and in what manner it contributes to produce the movement which he has in view.

9 A fhip confidered as in free fpace impelled and refifted by oppofite forces.

A fhip may be confidered at prefent as a mafs of inert matter in free fpace, at liberty to move in every direction, according to the forces which impel or refift her : and when fhe is in actual motion, in the direction of her courfe, we may ftill confider her as at reft in abfolute fpace, but expofed to the impulfe of a current of water moving equally faft in the oppofite direction : for in both cafes the preffure of the water on her bows is the fame ; and we know that it is poffible, and frequently happens in currents, that the impulfe of the wind on her fails, and that of the water on her bows, balance each other fo precifely, that fhe not only does not ftir from the place, but alfo remains fteadily in the fame pofition, with her head directed to the fame point of the compafs. This ftate of things is eafily conceived by any perfon accuftomed to confider mechanical fubjects, and every feaman of experience has obferved it. It is of importance to confider it in this point of view, becaufe it gives us the moft familiar notion of the manner in which thefe forces of the wind and water are fet in oppofition, and made to balance or not to balance each other by the intervention of the fhip, in the fame manner as the goods and the weights balance each other in the fcales by the intervention of a beam or fteelyard.

10 Impulfe of the wind on the fails oppofite to that of the water on the bows.

When a fhip proceeds fteadily in her courfe, without changing her rate of failing, or varying the direction of her head, we muft in the firft place conceive the accumulated impulfes of the wind on all her fails as precifely equal and directly oppofite to the impulfe of the water on her bows. In the next place, becaufe the fhip does not change the direction of her keel, fhe refembles the balanced fteelyard, in which the energies of the two weights, which tend to produce rotations in oppofite directions, and thus to change the pofition of the beam, mutually balance each other round the fulcrum ; fo the energies of the actions of the wind on the different fails balance the energies of the water on the different parts of the hull.

The feaman has two principal tafks to perform. The firft is to keep the fhip fteadily in that courfe which will bring her artheft on in the line of her intended voyage. This is frequently very different from that line, and the choice of the beft courfe is fometimes a

11 Skill of the feaman difplayed in fhaping his courfe.

matter of confiderable difficulty. It is fometimes poffible to fhape the courfe precifely along the line of the voyage ; and yet the intelligent feaman knows that he will arrive fooner, or with greater fafety, at his port, by taking a different courfe ; becaufe he will gain more by increafing his fpeed than he lofes by increafing the diftance. Some principle muft direct him in the felection of this courfe. This we muft attempt to lay before the reader.

Having chofen fuch a courfe as he thinks moft advantageous,

tageous, he muſt ſet ſuch a quantity of ſail as the ſtrength of the wind will allow him to carry with ſafety and effect, and muſt trim the ſails properly, or ſo adjuſt their poſitions to the direction of the wind, that they may have the greateſt poſſible tendency to impel the ſhip in the line of her courſe, and to keep her ſteadily in that direction.

His other taſk is to produce any deviations which he ſees proper from the preſent courſe of the ſhip; and to produce theſe in the moſt certain, the ſafeſt, and the moſt expeditious manner. It is chiefly in this movement that the mechanical nature of a ſhip comes into view, and it is here that the ſuperior addreſs and reſource of an expert ſeaman is to be perceived.

Under the article SAILING ſome notice has been taken of the firſt taſk of the ſeaman, and it was there ſhown how a ſhip, after having taken up her anchor and fitted her ſails, accelerates her motion, by degrees which continually diminiſh, till the increaſing reſiſtance of the water becomes preciſely equal to the diminiſhed impulſe of the wind, and then the motion continues uniformly the ſame ſo long as the wind continues to blow with the ſame force and in the ſame direction.

It is perfectly conſonant to experience that the impulſe of fluids is in the duplicate ratio of the relative velocity. Let it be ſuppoſed that when water moves one foot per ſecond, its perpendicular preſſure or impulſe on a ſquare foot is m pounds. Then, if it be moving with the velocity V eſtimated in feet per ſecond, its perpendicular impulſe on a ſurface S, containing any number of ſquare feet, muſt be $m\,SV^2$.

In like manner, the impulſe of air on the ſame ſurface may be repreſented by $n\,S\,V^2$; and the proportion of the impulſe of theſe two fluids will be that of m to n. We may expreſs this by the ratio of q to 1, making

$$\frac{m}{n} = q.$$

12 Impulſe of the water computed in ounces on the ſquare foot.

M. Bouguer's computations and tables are on the ſuppoſition that the impulſe of ſea-water moving one foot per ſecond is 23 ounces on a ſquare foot, and that the impulſe of the wind is the ſame when it blows at the rate of 24 feet per ſecond. Theſe meaſures are all French. They by no means agree with the experiments of others; and what we have already ſaid, when treating of the *RESISTANCE of Fluids*, is enough to ſhow us that nothing like preciſe meaſures can be expected. It was ſhown as the reſult of a rational inveſtigation, and confirmed by the experiments of Buat and others, that the impulſions and reſiſtances at the ſame ſurface, with the ſame obliquity of incidence and the ſame velocity of motion, are different according to the form and ſituation of the adjoining parts. Thus the total reſiſtance of a thin board is greater than that of a long priſm, having this board for its front or bow, &c.

We are greatly at a loſs what to give as abſolute meaſures of theſe impulſions.

1. With reſpect to water. The experiments of the French academy on a priſm two feet broad and deep and four feet long, indicate a reſiſtance of 0,973 pounds avoirdupois to a ſquare foot, moving with the velocity of one foot per ſecond at the ſurface of ſtill water.

Mr Buat's experiments on a ſquare foot wholly immerſed in a ſtream were as follow:

A ſquare foot as a thin plate -	1,81 pounds.
Ditto as the front of a box one foot long - - - -	1,42
Ditto as the front of a box three feet long - - - -	1,29

The reſiſtance of ſea-water is about $\frac{1}{35}$ greater.

2. With reſpect to air, the varieties are as great.—The reſiſtance of a ſquare foot to air moving with the velocity of one foot per ſecond appears from Mr Robins's experiments on 16 ſquare inches to be on a

ſquare foot - - -	0,001596 pounds,
Chevalier Borda's on 16 inches	0,001757
——————— on 81 inches	0,002042
Mr Rouſe's on large ſurfaces	0,002291

Preciſe meaſures are not to be expected, nor are they neceſſary in this inquiry. Here we are chiefly intereſted in their proportions, as they may be varied by their mode of action in the different circumſtances of obliquity and velocity.

We begin by recurring to the fundamental propoſition concerning the impulſe of fluids, viz. that the abſolute preſſure is always in a direction perpendicular to the impelled ſurface, whatever may be the direction of the ſtream of fluid. We muſt therefore illuſtrate the doctrine, by always ſuppoſing a flat ſurface of ſail ſtretched on a yard, which can be braced about in any direction, and giving this ſail ſuch a poſition and ſuch an extent of ſurface that the impulſe on it may be the ſame both as to direction and intenſity with that on the real ſails. Thus the conſideration is greatly ſimplified. The direction of the impulſe is therefore perpendicular to the yard. Its intenſity depends on the velocity with which the wind meets the ſail, and the obliquity of its ſtroke. We ſhall adopt the conſtructions founded on the common doctrine, that the impulſe is as the ſquare of the ſine of the inclination, becauſe they are ſimple; whereas, if we were to introduce the values of the oblique impulſes, ſuch as they have been obſerved in the excellent experiments of the Academy of Paris, the conſtructions would be complicated in the extreme, and we could hardly draw any conſequences which would be intelligible to any but expert mathematicians. The concluſions will be erroneous, not in kind but in quantity only; and we ſhall point out the neceſſary corrections, ſo that the final reſults will be found not very different from real obſervation.

13 Direction of the impulſe on the ſail perpendicular to the yard.

If a ſhip were a round cylindrical body like a flat tub, floating on its bottom, and fitted with a maſt and ſail in the centre, ſhe would always ſail in a direction perpendicular to the yard. This is evident. But ſhe is an oblong body, and may be compared to a cheſt, whoſe length greatly exceeds its breadth. She is ſo ſhaped, that a moderate force will puſh her through the water with the head or ſtern foremoſt; but it requires a very great force to puſh her ſidewiſe with the ſame velocity. A fine ſailing ſhip of war will require about 12 times as much force to puſh her ſidewiſe as to puſh her head foremoſt. In this reſpect therefore ſhe will very much reſemble a cheſt whoſe length is 12 times its breadth; and whatever be the proportion of theſe reſiſtances in different ſhips, we may always ſubſtitute a box which ſhall have the ſame reſiſtances headwiſe and ſidewiſe.

14 A ſhip compared to an oblong box.

Let LFGH (fig. 1.) be the horizontal ſection of ſuch

Plate CCCCLXXXIX Fig. 1. ſuch a box, and AB its middle line, and C its centre. In whatever direction this box may chance to move, the direction of the whole reſiſtance on its two ſides will paſs through C. For as the whole ſtream has one inclination to the ſide EF, the equivalent of the equal impulſes on every part will be in a line perpendicular to the middle of EF. For the ſame reaſon, it will be in a line perpendicular to the middle of FG. Theſe perpendiculars muſt croſs in C. Suppoſe a maſt erected at C, and YC y to be a yard hoiſted on it carrying a ſail. Let the yard be firſt conceived as braced right athwart at right angles to the keel, as repreſented by $Y' y'$. Then, whatever be the direction of the wind abaft this ſail, it will impel the veſſel in the direction CB. But if the ſail has the oblique poſition Y y, the impulſe will be in the direction CD perpendicular to CY, and will both puſh the veſſel ahead and ſidewiſe: For the impulſe CD is equivalent to the two impulſes CK and CI (the ſides of a rectangle of which CD is the diagonal). The force CI puſhes the veſſel ahead, and CK puſhes her ſidewiſe. She muſt therefore take ſome intermediate direction a b, ſuch that the reſiſtance of the water to the plane FG is to its reſiſtance to the plane EF as CI to CK.

15 Makes leeway when not ſailing directly before the wind.

The angle b CB between the real courſe and the direction of the head is called the LEEWAY; and in the courſe of this diſſertation we ſhall expreſs it by the ſymbol x. It evidently depends on the ſhape of the veſſel and on the poſition of the yard. An accurate knowledge of the quantity of leeway, correſponding to different circumſtances of obliquity of impulſe, extent of ſurface, &c. is of the utmoſt importance in the practice of navigation; and even an approximation is valuable. The ſubject is ſo very difficult that this muſt content us for the preſent.

16 How to find the quantity of leeway,

Let V be the velocity of the ſhip in the direction C b, and let the ſurfaces FG and FE be called A' and B'. Then the reſiſtance to the lateral motion is $m\,V^2 \times B' \times$ ſine ^{2}, bCB, and that to the direct motion is $mV^2 \times A' \times$ ſine ^{2}, bCK, or $m\,V^2 \times A' \times$ coſ.$^2 b$CB. Therefore theſe reſiſtances are in the proportion of $B' \times$ ſine^2. x to $A' \times$ coſ.^{2}, x (repreſenting the angle of leeway b CB by the ſymbol x).

Therefore we have CI : CK, or CI : ID $= A' \cdot$ coſ. $^2 x$: $B' \cdot$ ſine^2 x, $= A' : B' \cdot \frac{\text{ſine}^2\ x}{\text{coſ.}^2\ x} = A : B \cdot$ tangent ^{2} x.

Let the angle YCB, to which the yard is braced up, be called the TRIM of the ſails, and expreſſed by the ſymbol b. This is the complement of the angle DCI. Now CI : ID = rad. : tan. DCI, = 1 : tan. DCI, = 1 : cotan. b. Therefore we have finally 1 : cotan. $b = A' : B' \cdot$ tan ^{2} x, and $A' \cdot$ cotan. $b = B' \cdot$ tangent ^{2} x, and tan. ^{2} $x = \frac{A}{B}$ cot. b. This equation evidently aſcertains the mutual relation between the trim of the ſails and the leeway in every caſe where we can tell the proportion between the reſiſtances to the direct and broadſide motions of the ſhip, and where this proportion does not change by the obliquity of the courſe. Thus, ſuppoſe the yard braced up to an angle of 30° with the keel. Then cotan. 30° = 1,732 very nearly. Suppoſe alſo that the reſiſtance ſidewiſe is 12 times greater than the reſiſtance headwiſe. This gives $A' = 1$ and $B' = 12$. Therefore $1{,}732 = 12 \times$ tangent ^{2} x, and tangent ^{2} $x = \frac{1{,}732}{12}, = 0{,}14434$, and tan. $x = 0{,}3799$, and $x = 20°\ 48'$, very nearly two points of leeway.

This computation, or rather the equation which gives room for it, ſuppoſes the reſiſtances proportional to the ſquares of the ſines of incidence. The experiments of the Academy of Paris, of which an abſtract is given in the article *RESISTANCE of Fluids*, ſhow that this ſuppoſition is not far from the truth when the angle of incidence is great. In the preſent caſe the angle of incidence on the front FG is about 70°, and the experiments juſt now mentioned ſhow that the real reſiſtances exceed the theoretical ones only $\frac{1}{180}$. But the angle of incidence on EF is only 20° 48′. Experiment ſhows that in this inclination the reſiſtance is almoſt quadruple of the theoretical reſiſtances. Therefore the lateral reſiſtance is aſſumed much too ſmall in the preſent inſtance. Therefore a much ſmaller leeway will ſuffice for producing a lateral reſiſtance which will balance the lateral impulſe CK, ariſing from the obliquity of the ſail, viz. 30°. The matter of fact is, that a pretty good ſailing ſhip, with her ſails braced to this angle at a medium, will not make above five or ſix degrees leeway in ſmooth water and eaſy weather; and yet in this ſituation the hull and rigging preſent a very great ſurface to the wind, in the moſt improper poſitions, ſo as to have a very great effect in increaſing her leeway. And if we compute the reſiſtances for this leeway of ſix degrees by the actual experiments of the French Academy on the angle, we ſhall find the reſult not far from the truth; that is, the direct and lateral reſiſtances will be nearly in the proportion of CI to ID.

It reſults from this view of the matter, that the leeway is in general much ſmaller than what the uſual theory aſſigns.

17 which depends on the trim of the ſails.

We alſo ſee, that according to whatever law the reſiſtances change by a change of inclination, the leeway remains the ſame while the trim of the ſails is the ſame. The leeway depends only on the direction of the impulſe of the wind; and this depends ſolely on the poſition of the ſails with reſpect to the keel, whatever may be the direction of the wind. This is a very important obſervation, and will be frequently referred to in the progreſs of the preſent inveſtigation. Note, however, that we are here conſidering only the action on the ſails, and on the ſame ſails. We are not conſidering the action of the wind on the hull and rigging. This may be very conſiderable; and it is always in a lee direction, and augments the leeway; and its influence muſt be ſo much the more ſenſible as it bears a greater proportion to the impulſe on the ſails. A ſhip under courſes, or cloſe-reefed topſails and courſes, muſt make more leeway than when under all her canvas trimmed, to the ſame angle. But to introduce this additional cauſe of deviation here would render the inveſtigation too complicated to be of any uſe.

18 Illuſtration of this doctrine by experiments.

This doctrine will be conſiderably illuſtrated by attending to the manner in which a lighter is tracked along a canal, or ſwings to its anchor in a ſtream. The track rope is made faſt to ſome ſtaple or bolt E on the deck (fig. 2.), and is paſſed between two of the timber-heads of the bow D, and laid hold of at F on ſhore. The men or cattle walk along the path FG, the rope Fig. 2.

keeps

keeps extended in the directions DF, and the lighter arranges itself in an oblique position AB, and is thus dragged along in the direction $a\,b$, parallel to the side of the canal. Or, if the canal has a current in the opposite direction $b\,a$, the lighter may be kept steady in its place by the rope DF made fast to a post at F. In this case, it is always observed, that the lighter swings in a position AB, which is oblique to the stream $a\,b$. Now the force which retains it in this position, and which precisely balances the action of the stream, is certainly exerted in the direction DF; and the lighter would be held in the same manner if the rope were made fast at C amidship, without any dependence on the timberheads at D; and it would be held in the same position, if, instead of the single rope CF, it were riding by two ropes CG and CH, of which CH is in a direction right ahead, but oblique to the stream, and the other CG is perpendicular to CH or AB. And, drawing DI and DK perpendicular to AB and CG, the strain on the rope CH is to that on the rope CG as CI to CK. The action of the rope in these cases is precisely analogous to that of the sail y Y; and the obliquity of the keel to the direction of the motion, or to the direction of the stream, is analogous to the leeway. All this must be evident to any person accustomed to mechanical disquisitions.

19
On models and

A most important use may be made of this illustration. If an accurate model be made of a ship, and if it be placed in a stream of water, and ridden in this manner by a rope made fast at any point D of the bow, it will arrange itself in some determined position AB. There will be a certain obliquity to the stream, measured by the angle B$o\,b$; and there will be a corresponding obliquity of the rope, measured by the angle FCB. Let y CY be perpendicular to CF. Then CY will be the position of the yard, or trim of the sails corresponding to the leeway b CB. Then, if we shift the rope to a point of the bow distant from D by a small quantity, we shall obtain a new position of the ship, both with respect to the stream and rope; and in this way may be obtained the relation between the position of the sails and the leeway, independent of all theory, and susceptible of great accuracy; and this may be done with a variety of models suited to the most usual forms of ships.

20
on ships.
Fig. 3.

In farther thinking on this subject, we are persuaded that these experiments, instead of being made on models, may with equal ease be made on a ship of any size. Let the ship ride in a stream at a mooring D (fig. 3.) by means of a short hawser BCD from her bow, having a spring AC on it carried out from her quarter. She will swing to her moorings, till she ranges herself in a certain position AB with respect to the direction $a\,b$ of the stream; and the direction of the hawser DC will point to some point E of the line of the keel. Now, it is plain to any person acquainted with mechanical disquisitions, that the deviation BEb is precisely the leeway that the ship will make when the average position of the sails is that of the line GEH perpendicular to ED; at least this will give the leeway which is produced by the sails alone. By heaving on the spring, the knot C may be brought into any other position we please; and for every new position of the knot the ship will take a new position with respect to the stream and to the hawser. And we persist in saying, that more information will be got by this train of experiments than from any mathematical theory: for all the theories of the impulses of fluids must proceed on physical postulates with respect to the motions of the filaments, which are exceedingly conjectural.

21
The comparison of a ship to an oblong body is only useful to give clear notions on the subject.

And it must now be farther observed, that the substitution which we have made of an oblong parallelopiped for a ship, although well suited to give us clear notions of the subject, is of small use in practice: for it is next to impossible (even granting the theory of oblique impulsions) to make this substitution. A ship is of a form which is not reducible to equations; and therefore the action of the water on her bow or broadside can only be had by a most laborious and intricate calculation for almost every square foot of its surface. (See *Bezout's Cours de Mathem.* vol. v. p. 72, &c.) And this must be different for every ship. But, which is more unlucky, when we have got a parallelopiped which will have the same proportion of direct and lateral resistance for a particular angle of leeway, it will not answer for another leeway of the same ship; for when the leeway changes, the figure actually exposed to the action of the water changes also. When the leeway is increased, more of the lee-quarter is acted on by the water, and a part of the weather-bow is now removed from its action. Another parallelopiped must therefore be discovered, whose resistances shall suit this new position of the keel with respect to the real course of the ship.

We therefore beg leave to recommend this train of experiments to the notice of the ASSOCIATION FOR THE IMPROVEMENT OF NAVAL ARCHITECTURE as a very promising method for ascertaining this important poinr. And we proceed, in the next place, to ascertain the relation between the velocity of the ship and that of the wind, modified as they may be by the trim of the sails and the obliquity of the impulse.

22
The relation between the velocity of the ship and wind ascertained.
Fig. 4.

Let AB (fig. 4, 5, and 6.) represent the horizontal section of a ship. In place of all the drawing sails, that is, the sails which are really filled, we can always substitute one sail of equal extent, trimmed to the same angle with the keel. This being supposed attached to the yard DCD, let this yard be first of all at right angles to the keel, as represented in fig. 4. Let the wind blow in the direction WC, and let CE (in the direction WC continued) represent the velocity V of the wind. Let CF be the velocity v of the ship. It must also be in the direction of the ship's motion, because when the sail is at right angles to the keel, the absolute impulse on the sail is in the direction of the keel, and there is no lateral impulse, and consequently no leeway. Draw EF, and complete the parallelogram CFEe, producing eC through the centre of the yard to w. Then wC will be the relative or apparent direction of the wind, and Ce or FE will be its apparent or relative velocity: For if the line Ce be carried along CF, keeping always parallel to its first position, and if a particle of air move uniformly along CE (a fixed line in absolute space) in the same time, this particle will always be found in that point of CE where is is intersected at that instant by the moving line C; so that if Ce were a tube, the particle of air, which really moves in the line CE, would always be found in the tube Ce. While CE is the real direction of the wind, Ce will be the position of the vane

vane at the mast head, which will therefore mark the apparent direction of the wind, or its motion relative to the moving ship.

We may conceive this in another way. Suppose a cannon-shot fired in the direction CE at the passing ship, and that it passes through the mast at C with the velocity of the wind. It will not pass through the off-side of the ship at P, in the line CE: for while the shot moves from C to P, the point P has gone forward, and the point p is now in the place where P was when the shot passed through the mast. The shot will therefore pass through the ship's side in the point p, and a person on board seeing it pass through C and p will say that its motion was in the line Cp.

23 When a ship is in motion the apparent direction of the wind is always different from the real direction.

Thus it happens, that when a ship is in motion the apparent direction of the wind is always ahead of its real direction. The line w C is always found within the angle WCB. It is easy to see from the construction, that the difference between the real and apparent directions of the wind is so much the more remarkable as the velocity of the ship is greater: For the angle WC w or EC e depends on the magnitude of E e or CF, in proportion to CE. Persons not much accustomed to attend to these matters are apt to think all attention to this difference to be nothing but affectation of nicety. They have no notion that the velocity of a ship can have any sensible proportion to that of the wind. "Swift as the wind" is a proverbial expression; yet the velocity of a ship always bears a very sensible proportion to that of the wind, and even very frequently exceeds it. We may form a pretty exact notion of the velocity of the wind by observing the shadows of the summer clouds flying along the face of a country, and it may be very well measured by this method. The motion of such clouds cannot be very different from that of the air below; and when the pressure of the wind on a flat surface, while blowing with a velocity measured in this way, is compared with its pressure when its velocity is measured by more unexceptionable methods, they are found to agree with all desirable accuracy. Now observations of this kind frequently repeated, show that what we call a pleasant brisk gale blows at the rate of about 10 miles an hour, or about 15 feet in a second, and exerts a pressure of half a pound on a square foot. Mr Smeaton has frequently observed the sails of a windmill, driven by such a wind, moving faster, nay much faster, towards their extremities, so that the sail, instead of being pressed to the frames on the arms, was taken aback, and fluttering on them. Nay, we know that a good ship, with all her sails set and the wind on the beam, will in such a situation sail above ten knots an hour in smooth water. There is an observation made by every experienced seaman, which shows this difference between the real and apparent directions of the wind very distinctly. When a ship that is sailing briskly with the wind on the beam tacks about, and then sails equally well on the other tack, the wind always appears to have shifted and come more ahead. This is familiar to all seamen. The seaman judges of the direction of the wind by the position of the ship's vanes. Suppose the ship sailing due west on the starboard tack, with the wind apparently N. N. W. the vane pointing S. S. E. If the ship put about, and stands due east on the larboard tack, the vane will be found no longer to point S. S. E. but perhaps S.S.W. the wind appearing N.N.E. and the ship must be nearly close-hauled in order to make an east course. The wind appears to have shifted four points. If the ship tacks again, the wind returns to its old quarter. We have often observed a greater difference than this. The celebrated astronomer Dr Bradley, taking the amusement of sailing in a pinnace on the river Thames, observed this, and was surprised at it, imagining that the change of wind was owing to the approaching to or retiring from the shore. The boatmen told him that it always happened at sea, and explained it to him in the best manner they were able. The explanation struck him, and set him a musing on an astronomical phenomenon which he had been puzzled by for some years, and which he called THE ABERRATION OF THE FIXED STARS. Every star changes its place a small matter for half a year, and returns to it at the completion of the year. He compared the stream of light from the star to the wind, and the telescope of the astronomer to the ship's vane, while the earth was like the ship, moving in opposite directions when in the opposite points of its orbit. The telescope must always be pointed ahead of the real direction of the star, in the same manner as the vane is always in a direction ahead of the wind; and thus he ascertained the progressive motion of light, and discovered the proportion of its velocity to the velocity of the earth in its orbit, by observing the deviation which was necessarily given to the telescope. Observing that the light shifted its direction about 40″, he concluded its velocity to be about 11,000 times greater than that of the earth; just as the intelligent seaman would conclude from this apparent shifting of the wind, that the velocity of the wind is about triple that of the ship. This is indeed the best method for discovering the velocity of the wind. Let the direction of the vane at the mast-head be very accurately noticed on both tacks, and let the velocity of the ship be also accurately measured. The angle between the directions of the ship's head on these different tacks being halved, will give the real direction of the wind, which must be compared with the position of the vane in order to determine the angle contained between the real and apparent directions of the wind or the angle EC e; or half of the observed shifting of the wind will show the inclination of its true and apparent directions. This being found, the proportion of EC to FC (fig. 6.) is easily measured.

24 Observation of Dr Bradley on this subject.

We have been very particular on this point, because since the mutual actions of bodies depend on their relative motions only, we should make prodigious mistakes if we estimated the action of the wind by its real direction and velocity, when they differ so much from the relative or apparent.

25 Velocity of a ship when its sails are at right angles to the keel.

We now resume the investigation of the velocity of the ship (fig. 4.), having its sails at right angles to the keel, and the wind blowing in the direction and with the velocity CE, while the ship proceeds in the direction of the keel with the velocity CF. Produce E e, which is parallel to BC, till it meet the yard in g, and draw FG perpendicular to E g. Let a represent the angle WCD, contained between the sail and the real direction of the wind, and let b be the angle of trim DCB. Let the velocity of the wind was expressed by V, and CF the velocity of the ship by v.

The absolute impulse on the sail is (by the usual theory

theory) proportional to the ſquare of the relative velocity, and to the ſquare of the ſine of the angle of incidence; that is, to $FE^2 \times \text{ſin.}^2\, w\, CD$. Now the angle $GFE = w\, CD$, and EG is equal to $FE \times \text{ſin.}\ GFE$; and EG is equal to $Eg - gG$. But $Eg = EC \times \text{ſin.}\ ECg, = V \times \text{ſin.}\ a$; and $gG = CF, = v$. Therefore $EG = V \times \text{ſin.}\ a - v$, and the impulſe is proportional to $\overline{V \times \text{ſin.}\ a - v}^2$. If S repreſent the ſurface of the ſail, the impulſe, in pounds, will be $n\, S(V \times \text{ſin.}\ a - v)^2$.

Let A be the ſurface which, when it meets the water perpendicularly with the velocity v, will ſuſtain the ſame preſſure or reſiſtance which the bows of the ſhip actually meets with. This impulſe, in pounds, will be $m\, A\, v^2$. Therefore, becauſe we are conſidering the ſhip's motion as in a ſtate of uniformity, the two preſſures balance each other; and therefore $m\, A\, v^2 = n\, S\, (V \times \text{ſin.}\ a - v)^2$, and $\frac{m}{n}\, A\, v^2 = S\ (V \times \text{ſin.}\ a - v)^2$;

therefore $\sqrt{\frac{m}{n}}\, \sqrt{A} \times v = \sqrt{S} \times V \times \text{ſin.}\ a - v\sqrt{S}$, and

$$v = \frac{\sqrt{S} \times v \times \text{ſin.}\ a}{\sqrt{\frac{m}{n}A} + \sqrt{S}} = \frac{V \times \text{ſin.}\ a}{\sqrt{\frac{m A}{n S}} + 1} = \frac{V \times \text{ſin.}\ a}{\sqrt{q\frac{A}{S}} + 1}.$$

We ſee, in the firſt place, that the velocity of the ſhip is *(cæteris paribus)* proportional to the velocity of the wind, and to the ſine of its incidence on the ſail jointly; for while the ſurface of the ſail S and the equivalent ſurface for the bow remains the ſame, v increaſes or diminiſhes at the ſame rate with $V \cdot \text{ſin.}\ a$.— When the wind is right aſtern, the ſine of a is unity, and then the ſhip's velocity is $\frac{V}{\sqrt{\frac{m A}{n S}} + 1}$.

Note, that the denominator of this fraction is a common number; for m and n are numbers, and A and S being quantities of one kind, $\frac{A}{S}$ is alſo a number.

It muſt alſo be carefully attended to, that S expreſſes a quantity of ſail actually receiving wind with the inclination a. It will not always be true, therefore, that the velocity will increaſe as the wind is more abaft, becauſe ſome ſails will then becalm others. This obſervation is not, however, of great importance; for it is very unuſual to put a ſhip in the ſituation conſidered hitherto; that is, with the yards ſquare, unleſs ſhe be right before the wind.

If we would diſcover the relation between the velocity and the quantity of ſail in this ſimple caſe of the wind right aft, obſerve that the equation $v = \frac{V}{\sqrt{\frac{m A}{n S}} + 1}$ gives us $\sqrt{\frac{m A}{n S}}\, v + v = V$, and $\sqrt{\frac{m A}{n S}}\ v = V - v$, and $\frac{m A}{n S} v^2 = \overline{V - v}^2$, and $\frac{n S}{m A} = \frac{v^2}{(V - v)^2}$; and becauſe n and m and A are conſtant quantities, S is proportional to $\frac{v^2}{(V - v)^2}$, or the ſurface of ſail is proportional to the ſquare of the ſhip's velocity directly, and to the ſquare of the relative velocity inverſely. Thus, if a ſhip be ſailing with one-eighth of the velocity of the wind, and we would have her ſail with one-fourth of it, we muſt quadruple the ſail. This is more eaſily ſeen in another way. The velocity of the ſhip is proportional to the velocity of the wind; and therefore the relative velocity is alſo proportional to that of the wind, and the impulſe of the wind is as the ſquare of the relative velocity. Therefore, in order to increaſe the relative velocity by an increaſe of ſail only, we muſt make this increaſe of ſail in the duplicate proportion of the increaſe of velocity.

Let us, in the next place, conſider the motion of a ſhip whoſe ſails ſtand oblique to the keel. 26

Its velocity when the ſails ſtand oblique to the keel.

The conſtruction for this purpoſe differs a little from the former, becauſe, when the ſails are trimmed to any oblique poſition DCB (fig. 5. and 6.), there muſt be a deviation from the direction of the keel, or a leeway BC b. Call this x. Let CF be the velocity of the ſhip. Draw, as before, Eg perpendicular to the yard, and FG perpendicular to Eg; alſo draw FH perpendicular to the yard: then, as before, EG, which is in the ſubduplicate ratio of the impulſe on the ſail, is equal to $Eg - Gg$. Now Eg is, as before, $= V \times \text{ſin.}\ a$, and G$g$ is equal to FH, which is $= CF \times \text{ſin.}\ FCH$, or $= v \times \text{ſin.}\ (b + x)$. Therefore we have the impulſe $= n\, S\ (V \cdot \text{ſin.}\ a - v \cdot \text{ſin.}\ (b + x)^2$. Fig. 5. and 6.

This expreſſion of the impulſe is perfectly ſimilar to that in the former caſe, its only difference conſiſting in the ſubductive part, which is here $v \times \text{ſin.}\ \overline{b + x}$ inſtead of v. But it expreſſes the ſame thing as before, viz. the diminution of the impulſe. The impulſe being reckoned ſolely in the direction perpendicular to the ſail, it is diminiſhed ſolely by the ſail withdrawing itſelf *in that direction* from the wind; and as g E may be conſidered as the real impulſive motion of the wind, GE muſt be conſidered as the relative and effective impulſive motion. The impulſe would have been the ſame had the ſhip been at reſt, and had the wind met it perpendicularly with the velocity GE.

27

Connection between the impulſe and motion of the ſhip.

We muſt now ſhow the connection between this impulſe and the motion of the ſhip. The ſail, and conſequently the ſhip, is preſſed by the wind in the direction CI perpendicular to the ſail or yard with the force which we have juſt now determined. This (in the ſtate of uniform motion) muſt be equal and oppoſite to the action of the water. Draw IL at right angles to the keel. The impulſe in the direction CI (which we may meaſure by CI) is equivalent to the impulſes CL and LI. By the firſt the ſhip is impelled right forward, and by the ſecond ſhe is driven ſidewiſe. Therefore we muſt have a leeway, and a lateral as well as a direct reſiſtance. We ſuppoſe the form of the ſhip to be known, and therefore the proportion is known, or diſcoverable, between the direct and lateral reſiſtances correſponding to every angle x of leeway. Let A be the ſurface whoſe perpendicular reſiſtance is equal to the direct reſiſtance of the ſhip correſponding to the leeway x, that is, whoſe reſiſtance is equal to the reſiſtance really felt by the ſhip's bows in the direction of the keel when ſhe is ſailing with this leeway; and let B in like manner be the ſurface whoſe perpendicular reſiſtance is equal to the actual reſiſtance to the ſhip's motion in the direction LI, perpendicular to the keel. (*N. B.* This is not equivalent to A and B′ adapted to the rectangular box, but to $A' \cdot \text{coſ.}^2\ x$ and $B' \cdot \text{ſin.}^2\ x$.) We have therefore

therefore A : B = CL : LI, and $LI = \frac{CL \cdot B}{A}$. Also, because $CI = \sqrt{CL^2 + LI^2}$, we have $A : \sqrt{A^2 + B^2} = CL : CI$, and $CI = \frac{CL \cdot \sqrt{A^2+B^2}}{A}$. The resistance in the direction LC is properly measured by $m\,A\,v^2$, as has been already observed. Therefore the resistance in the direction IC must be expressed by $m\,\sqrt{A^2+B^2}\,v^2$; or (making C the surface which is equal to $\sqrt{A^2+B^2}$, and which will therefore have the same perpendicular resistance to the water having the velocity v) it may be expressed by $m\,C\,v^2$.

Therefore, because there is an equilibrium between the impulse and resistance, we have $m\,C\,v^2 = n\,S\,(V \cdot \text{sin.}\,a - v \cdot \text{sin.}\,\overline{b+x})^2$ and $\frac{m}{n}\,C\,v^2$, or $q\,C\,v^2 = S\,(V \cdot \text{sin.}\,a - v \cdot \text{sin.}\,\overline{b+x})^2$, and $\sqrt{q}\,\sqrt{C}\,v = \sqrt{S}\,(V \cdot \text{sin.}\,a - v \cdot \text{sin.}\,\overline{b+x})$.

$$\text{Therefore } v = \frac{\sqrt{S} \cdot V \cdot \text{sin.}\,a}{\sqrt{q}\,\sqrt{C} + \sqrt{S} \cdot \text{sin.}\,\overline{b+x}}, = \frac{V \cdot \text{sin.}\,a}{\sqrt{q}\,\frac{\sqrt{C}}{\sqrt{S}} + \text{sin.}\,\overline{b+x}}, = V\,\frac{\text{Sin.}\,a}{\sqrt{q}\,\frac{\sqrt{C}}{\sqrt{S}} + \text{sin.}\,\overline{b+x}}.$$

Observe that the quantity which is the coefficient of V in this equation is a common number; for sin. a is a number, being a decimal fraction of the radius 1, Sin. $\overline{b+x}$ is also a number, for the same reason. And since m and n were numbers of pounds, $\frac{m}{n}$ or q is a common number. And because C and S are surfaces, or quantities of one kind, $\frac{C}{S}$ is also a common number.

This is the simplest expression that we can think of for the velocity acquired by the ship, though it must be acknowledged to be too complex to be of very prompt use. Its complication arises from the necessity of introducing the leeway x. This affects the whole of the denominator; for the surface C depends on it, because C is $= \sqrt{A^2+B^2}$, and A and B are analogous to A' cos. $^2 x$ and B' sin. $^2 x$.

28 Important consequences deduced from the foregoing theorem.

But we can deduce some important consequences from this theorem.

While the surface S of the sail actually filled by the wind remains the same, and the angle DCB, which in future we shall call the TRIM of the sails, also remains the same, both the leeway x and the substituted surface C remains the same. The denominator is therefore constant; and the velocity of the ship is proportional to $\sqrt{S} \cdot V \cdot \text{sin.}\,a$; that is, directly as the velocity of the wind, directly as the absolute inclination of the wind to the yard, and directly as the square root of the surface of the sails.

We also learn from the construction of the figure that FG parallel to the yard cuts CE in a given ratio. For CF is in a constant ratio to Eg, as has been just now demonstrated. And the angle DCF is constant. Therefore CF · sin. b, or FH or Gg, is proportional to Eg, and OC to EC, or EC is cut in one proportion, whatever may be the angle ECD, so long as the angle DCF is constant.

We also see that it is very possible for the velocity of the ship on an oblique course to exceed that of the wind. This will be the case when the number $\frac{\text{sin.}\,a}{\sqrt{q\frac{C}{S}} + \text{sin.}\,\overline{b+x}}$ exceeds unity, or when sin. a is greater than $\sqrt{q\frac{C}{S}} + \text{sin.}\,\overline{b+x}$. Now this may easily be by sufficiently enlarging S and diminishing $b+x$. It is indeed frequently seen in fine sailers with all their sails set and not hauled too near the wind.

We remarked above that the angle of leeway x affects the whole denominator of the fraction which expresses the velocity. Let it be observed that the angle ICL is the complement of LCD, or of b. Therefore, CL : LI, or A : B = 1 : tan. ICL, = 1 : cot. b, and B = A · cotan. b. Now A is equivalent to $A' \cdot$ cos. $^2 x$, and thus b becomes a function of x. C is evidently so, being $\sqrt{A^2+B^2}$. Therefore before the value of this fraction can be obtained, we must be able to compute, by our knowledge of the form of the ship, the value of A for every angle x of leeway. This can be done only by resolving her bows into a great number of elementary planes, and computing the impulses on each and adding them into one sum. The computation is of immense labour, as may be seen by one example given by Bouguer. When the leeway is but small, not exceeding ten degrees, the substitution of the rectangular prism of one determined form is abundantly exact for all leeways contained within this limit; and we shall soon see reason for being contented with this approximation. We may now make use of the formula expressing the velocity for solving the chief problems in this part of the seaman's task.

29 Problem I. To determine the best position of the sails for standing on a given course, when the direction and velocity of the wind and its angle with the course are given.

And first let it be required to determine the best position of the sail for standing on a given course $a\,b$, when CE the direction and velocity of the wind, and its angle with the course WCF, are given. This problem has exercised the talents of the mathematicians ever since the days of Newton. In the article PNEUMATICS we gave the solution of one very nearly related to it, namely, to determine the position of the sail which would produce the greatest impulse in the direction of the course. The solution was to place the yard CD in such a position that the tangent of the angle FCD may be one half of the tangent of the angle DCW. This will indeed be the best position of the sail for beginning the motion; but as soon as the ship begins to move in the direction CF, the effective impulse of the wind is diminished, and also its inclination to the sail. The angle DCw diminishes continually as the ship accelerates; for CF is now accompanied by its equal e E, and by an angle ECe or WCw. CF increases, and the impulse on the sail diminishes, till an equilibrium obtains between the resistance of the water and the impulse of the wind. The impulse is now measured by CE² × sin.² eCD instead of CE² × sin.² ECD, that is, by EG² instead of Eg^2.

This introduction of the relative motion of the wind renders the actual solution of the problem extremely difficult.

difficult. It is very easily expressed geometrically: Divide the angle wCF in such a manner that the tangent of DCF may be half of the tangent of DCw, and the problem may be constructed geometrically as follows.

Fig. 7. Let WCF (fig. 7.) be the angle between the sail and course. Round the centre C describe the circle WDFY; produce WC to Q, so that CQ$=\frac{1}{3}$WC, and draw QY parallel to CF cutting the circle in Y; bisect the arch WY in D, and draw DC. DC is the proper position of the yard.

Draw the chord WY, cutting CD in V and CF in T; draw the tangent PD cutting CF in S and CY in R.

It is evident that WY, PR. are both perpendicular to CD, and are bisected in V and D; therefore (by reason of the parallels QY, CF) $1:3=$ QW : CW, $=$YW : TW, $=$RP : SP. Therefore PD : PS$=2:3$, and PD : DS $=2:1$. *Q. E. D.* But this division cannot be made to the best advantage till the ship has attained its greatest velocity, and the angle wCF has been produced.

We must consider all the three angles, a, b, and x, as variable in the equation which expresses the value of v, and we must make the fluxion of this equation $=o$; then, by means of the equation $B=A\cdot$ cotan. b, we must obtain the value of b and of $\dot{b}$ in terms of x and $\dot{x}$. With respect to a, observe, that if we make the angle WCF$=p$, we have $p=a+b+x$; and p being a constant quantity, we have $\dot{a}+\dot{b}+\dot{x}=o$. Substituting for a, b, $\dot{a}$, and $\dot{b}$, their values in terms of x and $\dot{x}$, in the fluxionary equation $=o$, we readily obtain x, and then a and b, which solves the problem.

Let it be required, in the next place, to determine the course and the trim of the sails most proper for plying to windward.

30 Problem II. To determine the course and trim of the sails most proper for plying to windward.

In fig. 6. draw FP perpendicular to WC. CF is the motion of the ship; but it is only by the motion PC that she gains to windward. Now CP is $=$ CF $\times$ cosin. WCF, or $v\cdot$ cosin. $(a+b+x)$. This must be rendered a maximum, as follows.

By means of the equation which expresses the value of v and the equation $B=A\cdot$ cotan. b, we exterminate the quantities v and b; we then take the fluxion of the quantity into which the expression $v\cdot$ cos. $(a+b+x)$ is changed by this operation. Making this fluxion $=o$, we get the equation which must solve the problem. This equation will contain the two variable quantities a and x with their fluxions; then make the coefficient of $\dot{x}$ equal to o, also the coefficient of $\dot{a}$ equal to o. This will give two equations which will determine a and x, and from this we get $b=p-a-x$.

31 Problem III. To determine the best course and trim of the sails for getting away from a given line of coast.

Should it be required, in the third place, to find the best course and trim of the sails for getting away from a given line of coast CM (fig. 6.), the process perfectly resembles this last, which is in fact getting away from a line of coast which makes a right angle with the wind. Therefore, in place of the angle WCF, we must substitute the angle WCM$\pm$WCF. Call this angle e. We must make $v\cdot$ cos. $(e\pm a\pm b\pm x)$ a maximum. The analytical process is the same as the former, only e is here a constant quantity.

32 Observations on the preceding problems.

These are the three principal problems which can be solved by means of the knowledge that we have obtained of the motion of the ship when impelled by an oblique sail, and therefore making leeway; and they may be considered as an abstract of this part of M. Bouguer's work. We have only pointed out the process for this solution, and have even omitted some things taken notice of by M. Bezout in his very elegant compendium. Our reasons will appear as we go on. The learned reader will readily see the extreme difficulty of the subject, and the immense calculations which are necessary even in the simplest cases, and will grant that it is out of the power of any but an expert analyst to derive any use from them; but the mathematician can calculate tables for the use of the practical seaman. Thus he can calculate the best position of the sails for advancing in a course 90° from the wind, and the velocity in that course;

33 M. Bouguer's table for finding the best position of the sails for advancing in any course.

then for 85°, 80°, 75°, &c. M. Bouguer has given a table of this kind; but to avoid the immense difficulty of the process, he has adapted it to the apparent direction of the wind. We have inserted a few of his numbers, suited to such cases as can be of service, namely, when all the sails draw, or none stand in the way of others. Column 1st is the apparent angle of the wind and course; column 2d is the corresponding angle of the sails and keel; and column 3d is the apparent angle of the sails and wind.

1 wCF	2 DCB	3 wCD

84 23	32 30	51 53
79 06	30 —	49 06
73 39	27 30	46 09
68 —	25 —	43 —

In all these numbers we have the tangent of wCD double of the tangent of DCF.

34 Inutility of these calculations.

But this is really doing but little for the seaman. The apparent direction of the wind is unknown to him till the ship is sailing with uniform velocity; and he is still uninformed as to the leeway. It is, however, of service to him to know, for instance, that when the angle of the vanes and yards is 56 degrees, the yard should be braced up to 37° 30′, &c.

But here occurs a new difficulty. By the construction of a square-rigged ship it is impossible to give the yards that inclination to the keel which the calculation requires. Few ships can have their yards braced up to 37° 30′; and yet this is required in order to have an incidence of 56°, and to hold a course 94° 25′ from the apparent direction of the wind, that is, with the wind apparently 4° 25′ abaft the beam. A good sailing ship in this position may acquire a velocity even exceeding that of the wind. Let us suppose it only one half of this velocity. We shall find that the angle WCw is in this case about 29°, and the ship is nearly going 123° from the wind, with the wind almost perpendicular to the sail; therefore this utmost bracing up of the sails is only giving them the position suited to a wind broad on the quarter. It is impossible therefore to comply with the demand of the mathematician, and the seaman must be contented to employ a less favourable disposition of his sails in all cases where his course does not lie at least eleven points from the wind.

 Let

Let us fee whether this reftriction, arifing from neceffity, leaves any thing in our choice, and makes one courfe preferable to another. We fee that there are a prodigious number of courfes, and thefe the moft ufual and the moft important, which we muft hold with one trim of the fails; in particular, failing with the wind on the beam, and all cafes of plying to windward, muft be performed with this unfavourable trim of the fails. We are certain that the fmaller we make the angle of incidence, real or apparent, the fmaller will be the velocity of the fhip; but it may happen that we fhall gain more to windward, or get fooner away from a lee-coaft, or any object of danger, by failing flowly on one courfe than by failing quickly on another.

We have feen that while the trim of the fails remains the fame, the leeway and the angle of the yard and courfe remains the fame, and that the velocity of the fhip is as the fine of the angle of real incidence, that is, as the fine of the angle of the fail and the real direction of the wind.

Fig. 8. Let the fhip AB (fig. 8.) hold the courfe CF, with the wind blowing in the direction WC, and having her yards DCD braced up to the fmalleft angle BCD which the rigging can admit. Let CF be to CE as the velocity of the fhip to the velocity of the wind; join FE and draw C w parallel to EF; it is evident that FE is the relative motion of the wind, and w CD is the relative incidence on the fail. Draw FO parallel to the yard DC, and defcribe a circle through the points COF; then we fay that if the fhip, with the fame wind and the fame trim of the fame drawing fails, be made to fail on any other courfe Cf, her velocity along CF is to the velocity along Cf as CF is to Cf; or, in other words, the fhip will employ the fame time in going from C to any point of the circumference CFO.

Join fO. Then, becaufe the angles CFO, cfO are on the fame chord CO, they are equal, and fO is parallel to dCd, the new pofition of the yard correfponding to the new pofition of the keel ab, making the angle dCb=DCB. Alfo, by the nature of the circle, the line CF is to Cf as the fine of the angle CFO to the fine of the angle COf, that is (on account of the parallels CD, OF and Cd, Of), as the fine of WCD to the fine of WCd. But when the trim of the fails remains the fame, the velocity of the fhip is as the fine of the angle of the fail with the direction of the wind; therefore CF is to Cf as the velocity on CF to that on Cf, and the propofition is demonftrated.

35 To determine the beft courfe for avoiding a rock.

Let it now be required to determine the beft courfe for avoiding a rock R lying in the direction CR, or for withdrawing as faft as poffible from a line of coaft PQ. Draw CM through R, or parallel to PQ, and let m be the middle of the arch C m M. It is plain that m is the moft remote from CM of any point of the arch C m M, and therefore the fhip will recede farther from the coaft PQ in any given time by holding the courfe C m than by any other courfe.

This courfe is eafily determined; for the arch CmM $=360^\circ$ — (arch CO + arch OM), and the arch CO is the meafure of twice the angle CFO, or twice the angle DCB, or twice $\overline{b+x}$, and the arch OM meafures twice the angle ECM.

Thus, fuppofe the fharpeft poffible trim of the fails to be 35°, and the obferved angle ECM to be 70°; then CO+OM is $70^\circ+140^\circ$ or 210°. This being taken from 360°, leaves 150°, of which the half M m is 75°, and the angle MC m is $37^\circ\ 30'$. This added to ECM makes ECm $107^\circ\ 30'$, leaving WC m=$72^\circ\ 30'$, and the fhip muft hold a courfe making an angle of $72^\circ\ 30'$ with the real direction of the wind, and WCD will be $37^\circ\ 30'$.

This fuppofes no leeway. But if we know that under all the fail which the fhip can carry with fafety and advantage fhe makes 5 degrees of leeway, the angle DC m of the fail and courfe, or $b+x$, is 40°. Then CO+OM=220°, which being taken from 360° leaves 140°, of which the half is 70°, =M m, and the angle MC $m=35^\circ$, and EC $m=105^\circ$, and WC $m=75^\circ$, and the fhip muft lie with her head 70° from the wind, making 5 degrees of leeway, and the angle WCD is 35°.

The general rule for the pofition of the fhip is, *that the line on fhipboard which bifects the angle* b+x *may alfo bifect the angle* WCM, or make the angle between the courfe and the line from which we wifh to withdraw equal to the angle between the fail and the real direction of the wind.

36 Corollaries.

It is plain that this problem includes that of plying to windward. We have only to fuppofe ECM to be 90°; then, taking our example in the fame fhip, with the fame trim and the fame leeway, we have $b+x=40^\circ$. This taken from 90° leaves 50° and WCn=90—25=65, and the fhip's head muft lie 60° from the wind, and the yard muft be 25° from it.

It muft be obferved here, that it is not always eligible to felect the courfe which will remove the fhip fafteft from the given line CM; it may be more prudent to remove from it more fecurely though more flowly. In fuch cafes the procedure is very fimple, viz. to fhape the courfe as near the wind as is poffible.

The reader will alfo eafily fee that the propriety of thefe practices is confined to thofe courfes only where the practicable trim of the fails is not fufficiently fharp. Whenever the courfe lies fo far from the wind that it is poffible to make the tangent of the apparent angle of the wind and fail double the tangent of the fail and courfe, it fhould be done.

37 The adjuftment of the fails fuppofed in the theory impracticable.

Thefe are the chief practical confequences which can be deduced from the theory. But we fhould confider how far this adjuftment of the fails and courfe can be performed. And here occur difficulties fo great as to make it almoft impracticable. We have always fuppofed the pofition of the furface of the fail to be diftinctly obfervable and meafurable; but this can hardly be affirmed even with refpect to a fail ftretched on a yard. Here we fuppofed the furface of the fail to have the fame inclination to the keel that the yard has. This is by no means the cafe; the fail affumes a concave form, of which it is almoft impoffible to affign the direction of the mean impulfe. We believe that this is always confiderably to leeward of a perpendicular to the yard, lying between CI and CE (fig. 6.). This is of fome advantage, being equivalent to a fharper trim. We cannot affirm this, however, with any confidence, becaufe it renders the impulfe on the weather-leech of the fail fo exceedingly feeble as hardly to have any effect. In failing clofe to the wind the fhip is kept fo near that the weather-leech of the fail is almoft ready to receive the wind edgewife, and to flutter or fhiver. The moft effective or drawing fails with a fide-wind, efpecially when

when plying to windward, are the staysails. We believe that it is impossible to say, with any thing approaching to precision, what is the position of the general surface of a staysail, or to calculate the intensity and direction of the general impulse; and we affirm with confidence that no man can pronounce on these points with any exactness. If we can guess within a third or a fourth part of the truth, it is all we can pretend to; and after all, it is but a guess. Add to this, the sails coming in the way of each other, and either becalming them or sending the wind upon them in a direction widely different from that of its free motion. All these points we think beyond our power of calculation, and therefore that it is in vain to give the seaman mathematical rules, or even tables of adjustment ready calculated; since he can neither produce that medium position of his sails that is required, nor tell what is the position which he employs.

This is one of the principal reasons why so little advantage has been derived from the very ingenious and promising disquisitions of Bouguer and other mathematicians, and has made us omit the actual solution of the chief problems, contenting ourselves with pointing out the process to such readers as have a relish for these analytical operations.

38 The theory itself erroneous,

But there is another principal reason for the small progress which has been made in the theory of seamanship: This is the error of the theory itself, which supposes the impulsions of a fluid to be in the duplicate ratio of the sine of incidence. The most careful comparison which has been made between the results of this theory and matter of fact is to be seen in the experiments made by the members of the Royal Academy of Sciences at Paris, mentioned in the article *RESISTANCE of Fluids*. We subjoin another abstract of them in the following table; where col. 1st gives the angle of incidence; col. 2d gives the impulsions really observed; col. 3d the impulses, had they followed the duplicate ratio of the sines; and col. 4th the impulses, if they were in the simple ratio of the sines.

Angle of incid.	Impulsion observed	Impulse as Sine ².	Impulse as Sine.
90	1000	1000	1000
84	989	989	995
78	958	957	978
72	908	905	951
66	845	835	914
60	771	750	866
54	693	655	809
48	615	552	743
42	543	448	669
36	480	346	587
30	440	250	500
24	424	165	407
18	414	96	309
12	406	43	208
6	400	11	105

Here we see an enormous difference in the great obliquities. When the angle of incidence is only six degrees, the observed impulse is forty times greater than the theoretical impulse, at 12° it is ten times greater; at 18° it is more than four times greater; and at 24° it is almost three times greater.

No wonder then that the deductions from this theory are so useless and so unlike what we familiarly observe. 39 and the deductions from it useless.
We took notice of this when we were considering the leeway of a rectangular box, and thus saw a reason for admitting an incomparably smaller leeway than what would result from the laborious computations necessary by the theory. This error in theory has as great an influence on the impulsions of air when acting obliquely on a sail; and the experiments of Mr Robins and of the Chevalier Borda on the oblique impulsions of air are perfectly conformable (as far as they go) to those of the academicians on water. The oblique impulsions of the wind are therefore much more efficacious for pressing the ship in the direction of her course than the theory allows us to suppose; and the progress of a ship plying to windward is much greater, both because the oblique impulses of the wind are more effective, and because the leeway is much smaller, than we suppose. Were not this the case, it would be impossible for a square-rigged ship to get to windward. The impulse on her sails when close hauled would be so trifling that she would not have a third part of the velocity which we see her acquire: and this trifling velocity would be wasted in leeway; for we have seen that the diminution of the oblique impulses of the water is accompanied by an increase of leeway. But we see that in the great obliquities the impulsions continue to be very considerable, and that even an incidence of six degrees gives an impulse as great as the theory allows to an incidence of 40. We may therefore, on all occasions, keep the yards more square; and the loss which we sustain by the diminution of the very oblique impulse will be more than compensated by its more favourable direction with respect to the ship's keel. Let us take an example of this. Suppose the wind about two points before the beam, making an angle of 68° with the keel. The theory assigns 43° for the inclination of the wind to the sail, and 15° for the trim of the sail. The perpendicular impulse being supposed 1000, the theoretical impulse for 45° is 465. This reduced in the proportion of radius to the sine of 25°, gives the impulse in the direction of the course only 197.

But if we ease off the lee-braces till the yard makes an angle of 50° with the keel, and allows the wind an incidence of no more than 18°, we have the experimented impulse 414, which, when reduced in the proportion of radius to the sine of 50°, gives an effective impulse 317. In like manner, the trim 56°, with the incidence 12°, gives an effective impulse 337; and the trim 62°, with the incidence only 6°, gives 353.

Hence it would at first sight appear that the angle DCB of 62° and WCD of 6° would be better for holding a course within six points of the wind than any more oblique position of the sails; but it will only give a greater initial impulse. As the ship accelerates, the wind apparently comes ahead, and we must continue to brace up as the ship freshens her way. It is not unusual for her to acquire half or two thirds of the velocity of the wind; in which case the wind comes apparently ahead more than two points, when the yards must be braced up to 35°, and this allows an impulse no greater than about 7°. Now this is very frequently

observed

obſerved in good ſhips, which in a briſk gale and ſmooth water will go five or ſix knots cloſe-hauled, the ſhip's head ſix points from the wind, and the ſails no more than juſt full, but ready to ſhiver by the ſmalleſt luff. All this would be impoſſible by the uſual theory; and in this reſpect theſe experiments of the French academy gave a fine illuſtration of the ſeaman's practice. They account for what we ſhould otherwiſe be much puzzled to explain; and the great progreſs which is made by a ſhip cloſe hauled being perfectly agreeable to what we ſhould expect from the law of oblique impulſion deducible from theſe ſo often mentioned experiments, while it is totally incompatible with the common theory, ſhould make us abandon the theory without heſitation, and ſtrenuouſly ſet about the eſtabliſhment of another, founded entirely on experiments.

40
Experiments proper for eſtabliſhing another

For this purpoſe the experiments ſhould be made on the oblique impulſions of air on as great a ſcale as poſſible, and in as great a variety of circumſtances, ſo as to furniſh a ſeries of impulſions for all angles of obliquity. We have but four or five experiments on this ſubject, *viz.* two by Mr Robins and two or three by the Chevalier Borda. Having thus gotten a ſeries of impulſions, it is very practicable to raiſe on this foundation a practical inſtitute, and to give a table of the velocities of a ſhip ſuited to every angle of inclination and of trim; for nothing is more certain than the reſolution of the impulſe perpendicular to the ſail into a force in the direction of the keel, and a lateral force.

We are alſo diſpoſed to think that experiments might be made on a model very nicely rigged with ſails, and trimmed in every different degree, which would point out the mean direction of the impulſe on the ſails, and the comparative force of theſe impulſes in different directions of the wind. The method would be very ſimilar to that for examining the impulſe of the water on the hull. If this can alſo be aſcertained experimentally, the intelligent reader will eaſily ſee that the whole motion of a ſhip under ſail may be determined for every caſe. Tables may then be conſtructed by calculation, or by graphical operations, which will give the velocities of a ſhip in every different courſe, and correſponding to every trim of ſail. And let it be here obſerved, that the trim of the ſail is not to be eſtimated in degrees of inclination of the yards; becauſe, as we have already remarked, we cannot obſerve nor adjuſt the lateen ſails in this way. But, in making the experiments for aſcertaining the impulſe, the exact poſition of the tacks and ſheets of the ſails are to be noted; and this combination of adjuſtments is to paſs by the name of a certain trim. Thus that trim of all the ſails may be called 40, whoſe direction is experimentally found equivalent to a flat ſurface trimmed to the obliquity 40°.

Having done this, we may conſtruct a figure for each trim ſimilar to fig. 8. where, inſtead of a circle, we ſhall have a curve C O M′ F′, whoſe chords CF′, *c f*′, &c. are proportional to the velocities in theſe courſes; and by means of this curve we can find the point *m*′, which is moſt remote from any line CM from which we wiſh to withdraw: and thus we may ſolve all the principal problems of the art.

We hope that it will not be accounted preſumption in us to expect more improvement from a theory founded on judicious experiments only, than from a theory of the impulſe of fluids, which is found ſo inconſiſtent with obſervation, and of whoſe fallacy all its authors, from Newton to D'Alembert, entertained ſtrong ſuſpicions. Again, we beg leave to recommend this view of the ſubject to the attention of the SOCIETY FOR THE IMPROVEMENT OF NAVAL ARCHITECTURE. 41

41
Recommended to the Society for the Improvement of Naval Architecture.

Should theſe patriotic gentlemen entertain a favourable opinion of the plan, and honour us with their correſpondence, we will cheerfully impart to them our notions of the way in which both theſe trains of experiments may be proſecuted with ſucceſs, and reſults obtained in which we may confide; and we content ourſelves at preſent with offering to the public theſe hints, which are not the ſpeculations of a man of mere ſcience, but of one who, with a competent knowledge of the laws of mechanical nature, has the experience of ſeveral years ſervice in the royal navy, where the art of working of ſhips was a favourite object of his ſcientific attention.

With theſe obſervations we conclude our diſcuſſion of the firſt part of the ſeaman's taſk, and now proceed to conſider the means that are employed to prevent or to produce any deviations from the uniform rectilineal courſe which has been ſelected. 42

42
Means employed to prevent or produce deviations from a courſe.

Here the ſhip is to be conſidered as a body in free ſpace, convertible round her centre of inertia. For whatever may be the point round which ſhe turns, this motion may always be conſidered as compounded of a rotation round an axis paſſing through her centre of gravity or inertia. She is impelled by the wind and by the water acting on many ſurfaces differently inclined to each other, and the impulſe on each is perpendicular to the ſurface. In order therefore that ſhe may continue ſteadily in one courſe, it is not only neceſſary that the impelling forces, eſtimated in their mean direction, be equal and oppoſite to the reſiſting forces eſtimated in their mean direction; but alſo that theſe two directions may paſs through one point, otherwiſe ſhe will be affected as a log of wood is when puſhed in oppoſite directions by two forces, which are equal indeed, but are applied to different parts of the log. A ſhip muſt be conſidered as a lever, acted on in different parts by forces in different directions, and the whole balancing each other round that point or axis where the equivalent of all the reſiſting forces paſſes. This may be conſidered as a point ſupported by this reſiſting force and as a ſort of fulcrum: therefore, in order that the ſhip may maintain her poſition, the energies or *momenta* of all the impelling forces round this point muſt balance each other.

When a ſhip ſails right afore the wind, with her yards ſquare, it is evident that the impulſes on each ſide of the keel are equal, as alſo their mechanical *momenta* round any axis paſſing perpendicularly through the keel. So are the actions of the water on her bows. But when ſhe ſails on an oblique courſe, with her yards braced up on either ſide, ſhe ſuſtains a preſſure in the direction CI (fig. 5.) perpendicular to the ſail. This, by giving her a lateral preſſure LI, as well as a preſſure CL ahead, cauſes her to make leeway, and to move in a line C *b* inclined to CB. By this means the balance of action on the two bows is deſtroyed; the general impulſe on the lee-bow is increaſed; and that on the weather-bow is diminiſhed. 43

43
Impulſes on a ſhip ſailing right before the wind different from thoſe on her when ſailing obliquely.

miniſhed. The combined impulſe is therefore no longer in the direction BC, but (in the ſtate of uniform motion) in the direction IC.

Suppoſe that in an inſtant the whole ſails are annihilated and the impelling preſſure CI, which preciſely balanced the reſiſting preſſure on the bows, removed. The ſhip tends, by her inertia, to proceed in the direction Cb. This tendency produces a continuation of the reſiſtance in the oppoſite direction IC, which is not directly oppoſed to the tendency of the ſhip in the direction Cb; therefore the ſhip's head would immediately come up to the wind. The experienced ſeamen will recollect ſomething like this when the ſails are ſuddenly lowered when coming to anchor. It does not happen ſolely from the obliquity of the action on the bows: It would happen to the parallelopiped of fig. 2. which was ſuſtaining a lateral impulſion $B \cdot \text{ſin.}^2 x$, and a direct impulſion $A \cdot \text{coſ.}^2 x$. Theſe are continued for a moment after the annihilation of the ſail: but being no longer oppoſed by a force in the direction CD, but by a force in the direction Cb, the force $B \cdot \text{ſin.}^2 x$ muſt prevail, and the body is not only retarded in its motion, but its head turns towards the wind. But this effect of the leeway is greatly increaſed by the curved form of the ſhip's bows. This occaſions the centre of effort of all the impulſions of the water on the leeſide of the ſhip to be very far forward, and this ſo much the more remarkably as ſhe is ſharper afore. It is in general not much abaft the foremaſt. Now the centre of the ſhip's tendency to continue her motion is the ſame with her centre of gravity, and this is generally but a little before the mainmaſt. She is therefore in the ſame condition nearly as if ſhe were puſhed at the mainmaſt in a direction parallel to Cb, and at the foremaſt by a force parallel to IC. The evident conſequence of this is a tendency to come up to the wind. This is independent of all ſituation of the ſails, provided only that they have been trimmed obliquely.

44 Griping.

This tendency of the ſhip's head to windward is called GRIPING in the ſeaman's language, and is greateſt in ſhips which are ſharp forward, as we have ſaid already. This circumſtance is eaſily underſtood. Whatever is the direction of the ſhip's motion, the abſolute impulſe on that part of the bow immediately contiguous to B is perpendicular to that very part of the ſurface. The more acute, therefore, that the angle of the bow is, the more will the impulſe on that part be perpendicular to the keel, and the greater will be its energy to turn the head to windward.

45 Propriety of the diſpoſition of the ſails of a ſhip.

Thus we are enabled to underſtand or to ſee the propriety of the diſpoſition of the ſails of a ſhip. We ſee her crowded with ſails forward, and even many ſails extended far before her bow, ſuch as the ſpritſail, the bowſprit-topſail, the fore-topmaſt ſtayſail, the jib, and flying jib. The ſails abaft are comparatively ſmaller. The ſails on the mizenmaſt are much ſmaller than thoſe on the foremaſt. All the ſtayſails hoiſted on the mainmaſt may be conſidered as headſails, becauſe their centres of effort are conſiderably before the centre of gravity of the ſhip: and notwithſtanding this diſpoſition, it generally requires a ſmall action of the rudder to counteract the windward tendency of the lee-bow. This is conſidered as a good quality when moderate; becauſe it enables the ſeaman to throw the ſails aback, and ſtop the ſhip's way in a moment, if ſhe be in danger from any thing a head; and the ſhip which does not carry a little of a weather helm, is always a dull ſailer.

46 Action of the water and the ſails.

In order to judge ſomewhat more accurately of the action of the water and ſails, ſuppoſe the ſhip A B (fig. 9.) to have its ſails on the mizenmaſt D, the mainmaſt E, and foremaſt F, braced up or trimmed alike, and that the three lines Di, Ee, Ff, perpendicular to the ſails, are in the proportion of the impulſes on the ſails. The ſhip is driven a-head and to leeward, and moves in the path aCb. This path is ſo inclined to the line of the keel that the medium direction of the reſiſtance of the water is parallel to the direction of the impulſe. A line CI may be drawn parallel to the lines Di, Ee, Ff, and equal to their ſum: and it may be drawn from ſuch a point C, that the actions on all the parts of the hull between C and B may balance the *momenta* of all the actions on the hull between C and A. This point may juſtly be called the *centre of effort*, or the *centre of reſiſtance*. We cannot determine this point for want of a proper theory of the reſiſtance of fluids. Nay, although experiments like thoſe of the Pariſian academy ſhould give us the moſt perfect knowledge of the intenſity of the oblique impulſes on a ſquare foot, we ſhould hardly be benefited by them: for the action of the water on a ſquare foot of the hull at p, for inſtance, is ſo modified by the intervention of the ſtream of water which has ſtruck the hull about B, and glided along the bow Bop, that the preſſure on p is totally different from what it would have been were it a ſquare foot or ſurface detached from the reſt, and preſented in the ſame poſition to the water moving in the direction bC. For it is found, that the reſiſtances given to planes joined ſo as to form a wedge, or to curved ſurfaces, are widely different from the accumulated reſiſtances, calculated for their ſeparate parts, agreeably to the experiments of the academy on ſingle ſurfaces. We therefore do not attempt to aſcertain the point C by theory; but it may be accurately determined by the experiments which we have ſo ſtrongly recommended; and we offer this as an additional inducement for proſecuting them.

Fig. 9.

47 Centre of effort

48 to be determined by experiments.

Draw through C a line perpendicular to CI, that is, parallel to the ſails; and let the lines of impulſe of the three ſails cut it in the points i, k, and m. This line im may be conſidered as a lever, moveable round C, and acted on at the points i, k, and m, by three forces. The rotatory momentum of the ſails on the mizenmaſt is $Di \times iC$; that of the ſails on the mainmaſt is $Ee \times kC$; and the momentum of the ſails on the foremaſt is $Ff \times mC$. The two firſt tend to preſs forward the arm Ci, and then to turn the ſhip's head towards the wind. The action of the ſails on the foremaſt tends to pull the arm Cm forward, and produce a contrary rotation. If the ſhip under theſe three ſails keeps ſteadily in her courſe, without the aid of the rudder, we muſt have $Di \times iC + Ee \times kC = Ff \times mC$. This is very poſſible, and is often ſeen in a ſhip under her mizen-topſail, main-topſail, and fore-topſail, all parallel to one another, and their ſurfaces duly proportioned by reefing. If more ſails are ſet, we muſt always have a ſimilar equilibrium. A certain number of them will have their efforts directed from the larboard arm of the lever im lying to leeward of CI, and a certain number will have their efforts directed from the ſtarboard arm lying to windward of CI. The ſum of the products of each of the firſt ſet, by their diſtances from C, muſt be equal

49 Equilibrium preſerved by the poſition of the ſails.

equal to the ſum of the ſimilar products of the other ſet. As this equilibrium is all that is neceſſary for preſerving the ſhip's poſition, and the ceſſation of it is immediately followed by a converſion; and as theſe ſtates of the ſhip may be had by means of the three ſquare ſails only, when their ſurfaces are properly proportioned—it is plain that every movement may be executed and explained by their means. This will greatly ſimplify our future diſcuſſions. We ſhall therefore ſuppoſe in future that there are only the three topſails ſet, and that their ſurfaces are ſo adjuſted by reefing, that their actions exactly balance each other round that point C of the middle line AB, where the actions of the water on the different parts of her bottom in like manner balance each other. This point C may be differently ſituated in the ſhip according to the leeway ſhe makes, depending on the trim of the ſails; and therefore although a certain proportion of the three ſurfaces may balance each other in one ſtate of leeway, they may happen not to do ſo in another ſtate. But the equilibrium is evidently attainable in every caſe, and we therefore ſhall always ſuppoſe it.

50
Conſequence of deſtroying it.

It muſt now be obſerved, that when this equilibrium is deſtroyed, as, for example, by turning the edge of the mizen-topſail to the wind, which the ſeamen call *ſhivering* the mizen-topſail, and which may be conſidered as equivalent to the removing the mizen-topſail entirely, it does not follow that the ſhip will round the point C, this point remaining fixed. The ſhip muſt be conſidered as a free body, ſtill acted on by a number of forces, which no longer balance each other; and ſhe muſt therefore *begin* to turn round a ſpontaneous axis of converſion, which muſt be determined in the way ſet forth in the article ROTATION. It is of importance to point out in general where this axis is ſituated. Therefore let G (fig. 10.) be the centre of gravity of the ſhip. Draw the line $q\,G\,v$ parallel to the yards, cutting $D\,d$ in q, $E\,e$ in r, CI in t, and $F\,f$ in v. While the three ſails are ſet, the line $q\,v$ may be conſidered as a lever acted on by four forces, *viz.* $D\,d$, impelling the lever forward perpendicularly in the point q; $E\,e$, impelling it forward in the point r; $F\,f$, impelling it forward in the point v; and CI, impelling it backward in the point t. Theſe forces balance each other both in reſpect of progreſſive motion and of rotatory energy: for CI was taken equal to the ſum of $D\,d$, $E\,e$, and $F\,f$; ſo that no acceleration or retardation of the ſhip's progreſs in her courſe is ſuppoſed.

Fig. 10.

But by taking away the mizen-topſail, both the equilibriums are deſtroyed. A part $D\,d$ of the accelerating force is taken away; and yet the ſhip, by her inertia or inherent force, tends, for a moment, to proceed in the direction $C\,p$ with her former velocity; and by this tendency exerts for a moment the ſame preſſure CI on the water, and ſuſtains the ſame reſiſtance IC. She muſt therefore be retarded in her motion by the exceſs of the reſiſtance IC over the remaining impelling forces $E\,e$ and $F\,f$, that is, by a force equal and oppoſite to $D\,d$. She will therefore be retarded in the ſame manner as if the mizen-topſail were ſtill ſet, and a force equal and oppoſite to its action were applied to G the centre of gravity, and ſhe would ſoon acquire a ſmaller velocity, which would again bring all things into equilibrium; and ſhe would ſtand on in the ſame courſe, without changing either her leeway or the poſition of her head.

But the equilibrium of the lever is alſo deſtroyed. It is now acted on by three forces only, *viz.* $E\,e$ and $F\,f$, impelling it forward in the points r and v, and IC impelling it backward in the point t. Make $r\,v : r\,o = E\,e + F\,f : F\,f$, and make $o\,p$ parallel to CI and equal to $E\,e = F\,f$. Then we know, from the common principles of mechanics, that the force $o\,p$ acting at o will have the ſame momentum or energy to turn the lever round *any* point whatever as the two forces $E\,e$ and $F\,f$ applied at r and v; and now the lever is acted on by two forces, *viz.* IC, urging it backwards in the point t, and $o\,p$ urging it forwards in the point o. It muſt therefore turn round like a floating log, which gets two blows in oppoſite directions. If we now make $IC - o\,p : o\,p = t\,o : t\,x$, or $IC - o\,p : IC = t\,o : o\,x$, and apply to the point x a force equal to $IC - o\,p$ in the direction IC; we know by the common principles of mechanics, that this force $IC - o\,p$ will produce the ſame rotation round any point as the two forces IC and $o\,p$ applied in their proper directions at t and o. Let us examine the ſituation of the point x.

The force $IC - o\,p$ is evidently $= D\,d$, and $o\,p$ is $= E\,e + F\,f$. Therefore $o\,t : t\,x = D\,d : o\,p$. But becauſe, when all the ſails were filled, there was an equilibrium round C, and therefore round t, and becauſe the force $o\,p$ acting at o is equivalent to $E\,e$ and $F\,f$ acting at r and v, we muſt ſtill have the equilibrium; and therefore we have the momentum $D\,d \times q\,t = o\,p \times o\,t$. Therefore $o\,t : t\,q = D\,d : o\,p$, and $t\,q = t\,x$. Therefore the point x is the ſame with the point q.

Therefore, when we ſhiver the mizen-topſail, the rotation of the ſhip is the ſame as if the ſhip were at reſt, and a force equal and oppoſite to the action of the mizen-topſail were applied at q or at D, or at any point in the line $D\,q$.

51
By ſhivering the mizen-topſail.

This might have been ſhown in another and ſhorter way. Suppoſe all ſails filled, the ſhip is in equilibrio. This will be diſturbed by applying to D a force oppoſite to $D\,d$; and if the force be alſo equal to $D\,d$, it is evident that theſe two forces deſtroy each other, and that this application of the force $d\,D$ is equivalent to the taking away of the mizen-topſail. But we choſe to give the whole mechanical inveſtigation; becauſe it gave us an opportunity of pointing out to the reader, in a caſe of very eaſy comprehenſion, the preciſe manner in which the ſhip is acted on by the different ſails and by the water, and what ſhare each of them has in the motion ultimately produced. We ſhall not repeat this manner of procedure in other caſes, becauſe a little reflection on the part of the reader will now enable him to trace the *modus operandi* through all its ſteps.

We now ſee that, in reſpect both of progreſſive motion and of converſion, the ſhip is affected by ſhivering the ſail D, in the ſame manner as if a force equal and oppoſite to $D\,d$ were applied at D, or at any point in the line $D\,d$. We muſt now have recourſe to the principles eſtabliſhed under the article ROTATION.

Let p repreſent a particle of matter, r its radius vector, or its diſtance $p\,G$ from an axis paſſing through the centre of gravity G, and let M repreſent the whole quantity of matter of the ſhip. Then its momentum of inertia is $= \int p \cdot r$ (ſee ROTATION, N° 18.) The ſhip, impelled in the point D by a force in the direction $d\,D$, will begin to turn round a ſpontaneous vertical axis, paſſing through a point S of the line $q\,G$, which

which is drawn through the centre of gravity G, perpendicular to the direction dD of the external force, and the distance GS of this axis from the centre of gravity is $=\frac{\int p \cdot r^2}{M \cdot Gq}$ (see ROTATION, N° 96.), and it is taken on the opposite side of G from q, that is, S and q are on opposite sides of G.

Let us express the external force by the symbol F. It is equivalent to a certain number of pounds, being the pressure of the wind moving with the velocity V and inclination a on the surface of the sail D; and may therefore be computed either by the theoretical or experimental law of oblique impulses. Having obtained this, we can ascertain the angular velocity of the rotation and the absolute velocity of any given point of the ship by means of the theorems established in the article ROTATION.

52 Action of the rudder. Fig. 11.

But before we proceed to this investigation, we shall consider the action of the rudder, which operates precisely in the same manner. Let the ship AB (fig. 11.) have her rudder in the position AD, the helm being hard a-starboard, while the ship sailing on the starboard tack, and making leeway, keeps on the course ab. The lee surface of the rudder meets the water obliquely. The very foot of the rudder meets it in the direction DE parallel to ab. The parts farther up meet it with various obliquities, and with various velocities, as it glides round the bottom of the ship and falls into the wake. It is absolutely impossible to calculate the accumulated impulse. We shall not be far mistaken in the deflection of each contiguous filament, as it quits the bottom and glides along the rudder; but we neither know the velocity of these filaments, nor the deflection and velocity of the filaments gliding without them. We therefore imagine that all computations on this subject are in vain. But it is enough for our purpose that we know the direction of the absolute pressure which they exert on its surface. It is in the direction Dd, perpendicular to that surface. We also may be confident that this pressure is very considerable, in proportion to the action of the water on the ship's bows, or of the wind on the sails; and we may suppose it to be nearly in the proportion of the square of the velocity of the ship in her course; but we cannot affirm it to be accurately in that proportion, for reasons that will readily occur to one who considers the way in which the water falls in behind the ship.

53 Greatest in a fine sailer.

It is observed, however, that a fine sailer always steers well, and that all movements by means of the rudder are performed with great rapidity when the velocity of the ship is great. We shall see by and by, that the speed with which the ship performs the angular movements is in the proportion of her progressive velocity: For we shall see that the squares of the times of performing the evolution are as the impulses inversely, which are as the squares of the velocities. There is perhaps no force which acts on a ship that can be more accurately determined by experiment than this. Let the ship ride in a stream or tideway whose velocity is accurately measured; and let her ride from two moorings, so that her bow may be a fixed point. Let a small tow-line be laid out from her stern or quarter at right angles to the keel, and connected with some apparatus fitted up on shore or on board another ship, by which the strain on it may be accurately measured; a person conversant with mechanics will see many ways in which this can be done. Perhaps the following may be as good as any: Let the end of the tow-line be fixed to some point as high out of the water as the point of the ship from which it is given out, and let this be very high. Let a block with a hook be on the rope, and a considerable weight hung on this hook. Things being thus prepared, put down the helm to a certain angle, so as to cause the ship to sheer off from the point to which the far end of the tow-line is attached. This will stretch the rope, and raise the weight out of the water. Now heave upon the rope, to bring the ship back again to her former position, with her keel in the direction of the stream. When this position is attained, note carefully the form of the rope, that is, the angle which its two parts make with the horizon. Call this angle a. Every person acquainted with these subjects knows that the horizontal strain is equal to half the weight multiplied by the cotangent of a, or that 2 is to the cotangent of a as the weight to the horizontal strain. Now it is this strain which balances and therefore measures the action of the rudder, or De in fig. 11. Therefore, to have the absolute impulse Dd, we must increase De in the proportion of radius to the secant of the angle b which the rudder makes with the keel. In a great ship sailing six miles in an hour, the impulse on the rudder inclined 30° to the keel is not less than 3000 pounds. The surface of the rudder of such a ship contains near 80 square feet. It is not, however, very necessary to know this absolute impulse Dd, because it is its part De alone which measures the energy of the rudder in producing a conversion. Such experiments, made with various positions of the rudder, will give its energies corresponding to these positions, and will settle that long disputed point, which is the best position for turning a ship. On the hypothesis that the impulsions of fluids are in the duplicate ratio of the sines of incidence, there can be no doubt that it should make an angle of 54° 44′ with the keel. But the form of a large ship will not admit of this, because a tiller of a length sufficient for managing the rudder in sailing with great velocity has not room to deviate above 30° from the direction of the keel; and in this position of the rudder the mean obliquity of the filaments of water to its surface cannot exceed 40° or 45°. A greater angle would not be of much service, for it is never for want of a proper obliquity that the rudder fails of producing a conversion.

54 How to determine it.

55 Why a ship misses stays, &c.

A ship misses stays in rough weather for want of a sufficient progressive velocity, and because her bows are beat off by the waves: and there is seldom any difficulty in wearing the ship, if she has any progressive motion. It is, however, always desirable to give the rudder as much influence as possible. Its surface should be enlarged (especially below) as much as can be done consistently with its strength and with the power of the steersmen to manage it; and it should be put in the most favourable situation for the water to get at it with great velocity; and it should be placed as far from the axis of the ship's motion as possible. These points are obtained by making the stern-post very upright, as has always been done in the French dockyards. The British ships have a much greater rake; but our builders are gradually adopting the French forms, experience having taught us that their ships, when in our possession, are much more obedient to the helm than our own.— In order to ascertain the motion produced by the action of the rudder, draw from the centre of gravity a line Gq perpendicular to Dd (Dd being drawn through the centre of effort of the rudder). Then, as in the consideration of the action of the sails, we may conceive the line qG as a lever connected with the ship, and impelled by a force Dd acting perpendicularly at q. The consequence of this will be, an incipient conversion of the ship about a vertical axis passing through some point S in the line qG, lying on the other side of G from q; and we have, as in the former case, $GS = \frac{\int p \cdot r^2}{M \cdot Gq}$.

56 The action of the rudder similar to that of the sails, and very great.

Thus the action and effects of the sails and of the rudder are perfectly similar, and are to be considered in the same manner. We see that the action of the rudder, though of a small surface in comparison of the sails, must be very great: For the impulse of water is many hundred times greater than that of the wind; and the arm qG of the lever, by which it acts, is incomparably greater than that by which any of the impulsions on the sails produces its effect; accordingly the ship yields much more rapidly to its action than she does to the lateral impulse of a sail.

Observe here, that if G were a fixed or supported axis, it would be the same thing whether the absolute force Dd of the rudder acts in the direction Dd, or its transverse part De acts in the direction De, both would produce the same rotation; but it is not so in a free body. The force Dd both tends to retard the ship's motion and to produce a rotation: It retards it as much as if the same force Dd had been immediately applied to the centre. And thus the real motion of the ship is compounded of a motion of the centre in a direction parallel to Dd, and of a motion round the centre. These two constitute the motion round S.

57 Employed as an example of the motions of conversion.

As the effects of the action of the rudder are both more remarkable and somewhat more simple than those of the sails, we shall employ them as an example of the mechanism of the motions of conversion in general; and as we must content ourselves in a work like this with what is very general, we shall simplify the investigation by attending only to the motion of conversion. We can get an accurate notion of the whole motion, if wanted for any purpose, by combining the progressive or retrograde motion parallel to Dd with the motion of rotation which we are about to determine.

In this case, then, we observe, in the first place, that the angular velocity (see ROTATION, N° 22.) is $\frac{Dh \cdot qG}{\int p r^2}$;

and, as was shown in that article, this velocity of rotation increases in the proportion of the time of the forces uniform action, and the rotation would be uniformly accelerated if the forces did really act uniformly. This, however, cannot be the case, because, by the ship's change of position and change of progressive velocity, the direction and intensity of the impelling force is continually changing. But if two ships are performing similar evolutions, it is obvious that the changes of force are similar in similar parts of the evolution. Therefore the consideration of the momentary evolution is sufficient for enabling us to compare the motions of ships actuated by similar forces, which is all we have in view at present. The velocity v, generated in any time t by the continuance of an invariable momentary acceleration (which is all that we mean by saying that it is produced by the action of a constant accelerating force), is as the acceleration and the time jointly. Now what we call the *angular velocity* is nothing but this momentary acceleration. Therefore the velocity v generated in the time t is $= \frac{F \cdot qG}{\int p r^2} t$.

58 Angular velocity.

The expression of the angular velocity is also the expression of the velocity v of a point situated at the distance 1 from the axis G.

Let z be the space or arch of revolution described in the time t by this point, whose distance from G is $= 1$. Then $\dot{z} = v\dot{t} = \frac{F \cdot qG}{\int p r^2} t\dot{t}$, and taking the fluent $z = \frac{F \cdot qG}{\int p r^2} t^2$. This arch measures the whole angle of rotation accomplished in the time t. These are therefore as the squares of the times from the beginning of the rotation.

Those evolutions are equal which are measured by equal arches. Thus two motions of 45 degrees each are equal. Therefore because z is the same in both, the quantity $\frac{F \cdot qG}{\int p r} t^2$ is a constant quantity, and t^2 is reciprocally proportional to $\frac{F \cdot qG}{\int p r^2}$, or is proportional to $\frac{\int p r^2}{F \cdot qG}$, and t is proportional to $\frac{\sqrt{\int p r^2}}{\sqrt{F \cdot qG}}$. That is to say, the times of the similar evolutions of two ships are as the square root of the momentum of inertia directly, and as the square root of the momentum of the rudder or sail inversely. This will enable us to make the comparison easily. Let us suppose the ships perfectly similar in form and rigging, and to differ only in length L and l; $\int P \cdot R^2$ is to $\int p r^2$ as L^5 to l^5. For the similar particles P and p contain quantities of matter which are as the cubes of their lineal dimensions, that is, as L^3 to l^3. And because the particles are similarly situated, R^2 is to r^2 as L^2 to l^2. Therefore $P \cdot R^2 : p \cdot r^2 = L^5 : l^5$. Now F is to f as L^2 to l^2. For the surfaces of the similar rudders or sails are as the squares of their lineal dimensions, that is, as L^2 to l^2. And, lastly, Gq is to gq as L to l, and therefore $F \cdot Gq : f \cdot gq = L^3 : l^3$. Therefore we have $T^2 : t^2 = \frac{\int P \cdot R^2}{F \cdot Gq} : \frac{\int p \cdot r^2}{f \cdot gq} = \frac{L^5}{L^3} : \frac{l^5}{l^3} = L^2 : l^2$, and $T : t = L : l$.

59 Times of similar evolutions with similar ships.

Therefore the times of performing similar evolutions with similar ships are proportional to the lengths of the ships when both are sailing equally fast; and since the evolutions are similar, and the forces vary similarly in their

their different parts, what is here demonftrated of the fmalleft incipient evolutions is true of the whole. They therefore not only defcribe equal angles of revolution, but alfo fimilar curves.

A fmall fhip, therefore, works in lefs time and in lefs room than a great fhip, and this in the proportion of its length. This is a great advantage in all cafes, particularly in wearing, in order to fail on the other tack clofe-hauled. In this cafe fhe will always be to windward and a-head of the large fhip, when both are got on the other tack. It would appear at firft fight that the large fhip will have the advantage in tacking. Indeed the large fhip is farther to windward when again trimmed on the other tack than the fmall fhip when fhe is juft trimmed on the other tack. But this happened before the large fhip had completed her evolution, and the fmall fhip, in the mean time, has been going forward on the other tack, and going to windward. She will therefore be before the large fhip's beam, and perhaps as far to windward.

We have feen that the velocity of rotation is proportional, *cæteris paribus*, to $F \times G q$. F means the abfolute impulfe on the rudder or fail, and is always perpendicular to its furface. This abfolute impulfe on a fail depends on the obliquity of the wind to its furface. The ufual theory fays, that it is as the fquare of the fine of incidence : but we find this not true. We muft content ourfelves with expreffing it by fome as yet unknown function ϕ of the angle of incidence a, and call it $\phi\, a$; and if S be the furface of the fail, and V the velocity of the wind, the abfolute impulfe is $n\, V^2\, S \times \phi\, a$. This acts (in the cafe of the mizen-topfail, fig. 10.) by the lever $q\, G$, which is equal to $DG \times \text{cof.}\, DG\, q$, and $DG\, q$ is equal to the angle of the yard and keel; which angle we formerly called b. Therefore its energy in producing a rotation is $n\, V^2\, S \times \phi\, a \times DG \times \text{cof.}\, b$. Leaving out the conftant quantities n, V^2, S, and DG, its energy is proportional to $\phi\, a \times \text{cof.}\, b$. In order, therefore, that any fail may have the greateft power to produce a rotation round G, it muft be fo trimmed that $\phi\, a \times \text{cof.}\, b$ may be a maximum. Thus, if we would trim the fails on the foremaft, fo as to pay the fhip off from the wind right a-head with the greateft effect, and if we take the experiments of the French academicians as proper meafures of the oblique impulfes of the wind on the fail, we will brace up the yard to an angle of 48 degrees with the keel. The impulfe correfponding to 48 is 615, and the cofine of 48° is 669. Thefe give a product of 411435. If we brace the fail to 54.44, the angle affigned by the theory, the effective impulfe is 405274. If we make the angle 45°, the impulfe is 408774. It appears then that 48° is preferable to either of the others. But the difference is inconfiderable, as in all cafes of maximum a fmall deviation from the beft pofition is not very detrimental. But the difference between the theory and this experimental meafure will be very great when the impulfes of the wind are of neceffity very oblique. Thus, in tacking fhip, as foon as the headfails are taken aback, they ferve to aid the evolution, as is evident : But if we were now to adopt the maxim inculcated by the theory, we fhould immediately round in the weather-braces, fo as to increafe the impulfe on the fail, becaufe it is then very fmall ; and although we by this means make yard more fquare, and therefore diminifh the rotatory momentum of this impulfe, yet the impulfe is more increafed (by the theory) than its vertical lever is diminifhed.— 60
Let us examine this a little more particularly, becaufe A nice point
it is reckoned one of the niceft points of feamanfhip to of feaman-
aid the fhip's coming round by means of the headfails; fhip.
and experienced feamen differ in their practice in this manœuvre. Suppofe the yard braced up to 40°, which is as much as can be ufually done, and that the fail fhivers (the bowlines are ufually let go when the helm is put down), the fail immediately takes aback, and in a moment we may fuppofe an incidence of 6 degrees. The impulfe correfponding to this is 400 (by experiment), and the cofine of 40° is 766. This gives 306400 for the effective impulfe. To proceed according to the theory, we fhould brace the yard to 70°, which would give the wind (now 34° on the weather-bow) an incidence of nearly 36°, and the fail an inclination of 20° to the intended motion, which is perpendicular to the keel. For the tangent of 20° is about $\frac{1}{2}$ of the tangent of 36°. Let us now fee what effective impulfe the experimental law of oblique impulfions will give for this adjuftment of the fails. The experimental impulfe for 36° is 480; the cofine of 70° is 342; the product is 164160, not much exceeding the half of the former. Nay, the impulfe for 36°, calculated by the theory, would have been only 346, and the effective impulfe only 118332. And it muft be farther obferved, that this theoretical adjuftment would tend greatly to check the evolution, and in moft cafes would entirely mar it, by checking the fhip's motion a-head, and confequently the action of the rudder, which is the moft powerful agent in the evolution ; for here would be a great impulfe directed almoft aftern.

We were juftifiable, therefore, in faying, in the beginning of this article, that a feaman would frequently find himfelf baffled if he were to work a fhip according to the rules deduced from M. Bouguer's work ; and we fee by this inftance of what importance it is to have the oblique impulfions of fluids afcertained experimentally. The practice of the moft experienced feaman is directly the oppofite to this theoretical maxim, and its fuccefs greatly confirms the ufefulnefs of thefe experiments of the academicians fo often praifed by us.

We return again to the general confideration of the rotatory motion. We found the velocity $v = \frac{F \cdot q\, G}{\int \rho\, r^2}$.

It is therefore proportional, *cæteris paribus*, to $q\, G$. We have feen in what manner $q\, G$ depends on the pofition and fituation of the fail or rudder when the point G is fixed. But it alfo depends on the pofition of G. With refpect to the action of the rudder, it is evident that it is fo much the more powerful as it is more remote from G. The diftance from G may be increafed either by moving the rudder farther aft or G farther forward. And as it is of the utmoft importance that a fhip anfwer her helm with the greateft promptitude, thofe circumftances have been attended to which diftinguifhed fine fteering fhips from fuch as had not this quality ; and it is in a great meafure to be afcribed to this, that, in the gradual improvement of naval architecture, the centre of gravity has been placed far forward. Perhaps the notion of a centre of gravity did not come into the thoughts of the rude builders in early times; but they obferved that thofe boats and fhips fteered beft which had

had their extreme breadth before the middle point, and conſequently the bows not ſo acute as the ſtern. This is ſo contrary to what one would expect, that it attracted attention more forcibly; and, being ſomewhat myſterious, it might prompt to attempts of improvement, by exceeding in this ſingular maxim. We believe that it has been carried as far as is compatible with other eſſential requiſites in a ſhip.

61 Of importance to determine the beſt place for a ſhip's centre of gravity.

We believe that this is the chief circumſtance in what is called the trim of a ſhip; and it were greatly to be wiſhed that the beſt place for the centre of gravity could be accurately aſcertained. A practice prevails, which is the oppoſite of what we are now advancing. It is uſual to load a ſhip ſo that her keel is not horizontal, but lower abaft. This is found to improve her ſteerage. The reaſon of this is obvious. It increaſes the acting ſurface of the rudder, and allows the water to come at it with much greater freedom and regularity; and it generally diminiſhes the griping of the ſhip forward, by removing a part of the bows out of the water. It has not always this effect; for the form of the harping aloft is frequently ſuch, that the tendency to gripe is diminiſhed by immerſing more of the bow in the water.

But waving theſe circumſtances, and attending only to the rotatory energy of the rudder, we ſee that it is of advantage to carry the centre of gravity forward. The ſame advantage is gained to the action of the after ſails. But, on the other hand, the action of the headſails is diminiſhed by it; and we may call every ſail a headſail whoſe centre of gravity is before the centre of gravity of the ſhip; that is, all the ſails hoiſted on the bowſprit and foremaſt, and the ſtayſails hoiſted on the mainmaſt; for the centre of gravity is ſeldom far before the mainmaſt.

Suppoſe that when the rudder is put into the poſition AD (fig. 11.), the centre of gravity could be ſhifted to g, ſo as to increaſe q G, and that this is done without increaſing the ſum of the products $p\,r^2$. It is obvious that the velocity of converſion will be increaſed in the proportion of q G to $q\,g$. This is very poſſible, by bringing to that ſide of the ſhip parts of her loading which were ſituated at a diſtance from G on the other ſide. Nay, we can make this change in ſuch a manner that $\int p\,r^2$ ſhall even be leſs than it was before, by taking care that every thing which we ſhift ſhall be nearer to g than it was formerly to G. Suppoſe it all placed in one ſpot m, and that m is the quantity of matter ſo ſhifted, while M is the quantity of matter in the whole ſhip. It is only neceſſary that $m \cdot g\,\mathrm{G}^2$ ſhall be leſs than the ſum of the products $p\,r^2$ correſponding to the matter which has been ſhifted. Now, although the matter which is eaſily moveable is generally very ſmall in compariſon to the whole matter of the ſhip, and therefore can make but a ſmall change in the place of the centre of gravity, it may frequently be brought from places ſo remote that it may occaſion a very ſenſible diminution of the quantity $\int p\,r^2$, which expreſſes the whole momentum of inertia.

62 A practice of ſeamen in putting about explained.

This explains a practice of the ſeamen in ſmall wherries or ſkiffs, who in putting about are accuſtomed to place themſelves to leeward of the maſt. They even find that they can aid the quick motions of theſe light boats by the way in which they reſt on their two feet, ſometimes leaning all on one foot, and ſometimes on the other. And we have often ſeen this evolution very ſenſibly accelerated in a ſhip of war, by the crew running ſuddenly, as the helm is put down, to the lee-bow. And we have heard it aſſerted by very expert ſeamen, that after all attempts to wear ſhip (after lying-to in a ſtorm) have failed, they have ſucceeded by the crew collecting themſelves near the weather fore-ſhrouds the moment the helm was put down. It muſt be agreeable to the reflecting ſeaman to ſee this practice ſupported by undoubted mechanical principles.

It will appear paradoxical to ſay that the evolution may be accelerated even by an addition of matter to the ſhip; and though it is only a piece of curioſity, our readers may wiſh to be made ſenſible of it. Let m be the addition, placed in ſome point m lying beyond G from q. Let S be the ſpontaneous centre of converſion before the addition. Let v be the velocity of rotation round g, that is, the velocity of a point whoſe diſtance from g is 1, and let ϱ be the radius vector, or diſtance of a particle from g. We have (ROTATION, N° 22.) $v = \dfrac{\mathrm{F} \cdot q\,g}{\int p\,\varrho^2 + m \cdot m\,g^2}$. But we know (ROTATION, N° 23.) that $\int p\,\varrho^2 = \int p\,r^2 + \mathrm{M} \cdot \mathrm{G}\,g^2$. Therefore $v = \dfrac{\mathrm{F} \cdot q\,g}{\int p\,r^2 + \mathrm{M} \cdot \mathrm{G}\,g^2 + m \cdot m\,g^2}$. Let us determine G g and $m\,g$ and $q\,g$. 63 The evolution accelerated by additional matter.

Let m G be called z. Then, by the nature of the centre of gravity, $\mathrm{M}+m : \mathrm{M} = \mathrm{G}\,m : g\,m = z : g\,m$, and $g\,m = \dfrac{\mathrm{M}}{\mathrm{M}+m}\,z$, and $m \cdot g\,m^2 = \dfrac{m\,\mathrm{M}^2}{\overline{\mathrm{M}+m}^2}\,z^2$. In like manner, $\mathrm{M} \cdot \mathrm{G}\,g^2 = \dfrac{\mathrm{M}\,m^2}{\overline{\mathrm{M}+m}^2}\,z^2$. Now $m\,\mathrm{M}^2 + \mathrm{M}\,m^2 = \mathrm{M}\,m \times \overline{\mathrm{M}+m}$. Therefore $\mathrm{M} \cdot \mathrm{G}\,g^2 + m \cdot g\,m^2 = \dfrac{\mathrm{M}\,m \times (\mathrm{M}+m)}{\overline{\mathrm{M}+m}^2}\,z^2, = \dfrac{\mathrm{M}\,m}{\mathrm{M}+m}\,z^2$. Let n be $= \dfrac{m}{\mathrm{M}+m}$, then $\mathrm{M} \cdot \mathrm{G}^2 + m \cdot g\,m^2 = \mathrm{M}\,n\,z^2$. Alſo G $g = n\,z$, being $= \dfrac{m}{\mathrm{M}+n}\,z$. Let q G be called c: then $q\,g = c + n\,z$. Alſo let SG be called e.

We have now for the expreſſion of the velocity $v = \dfrac{\mathrm{F}\,(c+n\,z)}{\int p\,r^2 + \mathrm{M}\,n\,z^2}$, or $v = \dfrac{\mathrm{F}}{\mathrm{M}} \times \dfrac{c+n\,z}{\dfrac{\int p\,r^2}{\mathrm{M}} + n\,z^2}$. But (ROTATION, N° 30) $\dfrac{\int p\,r^2}{\mathrm{M}} = c\,e$. Therefore, finally, $v = \dfrac{\mathrm{F}}{\mathrm{M}} \times \dfrac{c+n\,z}{c\,e+n\,z^2}$. Had there been no addition of matter made, we ſhould have had $v = \dfrac{\mathrm{F}}{\mathrm{M}} \times \dfrac{c}{c\,e}$. It remains to ſhow, that z may be ſo taken that $\dfrac{c}{c\,e}$ may be leſs than $\dfrac{c+n\,z}{c\,e+n\,z^2}$. Now, if c be to z as $c\,e$ to z^2, that is, if z

be

be taken equal to e, the two fractions will be equal. But if z be less than e, that is, if the additional matter is placed anywhere between S and G, the complex fraction will be greater than the fraction $\frac{c}{ce}$, and the velocity of rotation will be increased. There is a particular distance which will make it the greatest possible, namely, when z is made $=\frac{1}{n}(\sqrt{c^2+nce}-c)$, as will easily be found by treating the fraction $\frac{c+nz}{ce+nz^2}$, with z, considered as the variable quantity, for a maximum. In what we have been saying on this subject, we have considered the rotation only in as much as it is performed round the centre of gravity, although in every moment it is really performed round a spontaneous axis lying beyond that centre. This was done because it afforded an easy investigation, and any angular motion round the centre of gravity is equal to the angular motion round any other point. Therefore the extent and the time of the evolution are accurately defined.—

64 The rotation performed round a spontaneous axis.

From observing that the energy of the force F is proportional to qG, an inattentive reader will be apt to conceive the centre of gravity as the centre of motion, and the rotation as taking place, because the momenta of the sails and rudder, on the opposite sides of the centre of gravity, do not balance each other. But we must always keep in mind that this is not the cause of the rotation. The cause is the want of equilibrium round the point C (fig. 10.), where the actions of the water balance each other. During the evolution, which consists of a rotation combined with a progressive motion, this point C is continually shifting, and the unbalanced momenta which continue the rotation always respect the momentary situation of the point C. It is nevertheless always true that the energy of a force F is proportional (*cæteris paribus*) to qG, and the rotation is always made in the same direction as if the point G were really the centre of conversion. Therefore the mainsail acts always (when oblique) by pushing the stern away from the wind, although it should sometimes act on a point of the vertical lever through C, which is a-head of C.

These observations on the effects of the sails and rudder in producing a conversion, are sufficient for enabling us to explain any case of their action which may occur. We have not considered the effects which they tend to produce by inclining the ship round a horizontal axis, viz. the motions of rolling and pitching. See ROLLING and PITCHING. To treat this subject properly would lead us into the whole doctrine of the equilibrium of floating bodies, and it would rather lead to maxims of construction than to maxims of manœuvre. M. Bouguer's *Traité du Navire* and Euler's *Scientia Navalis* are excellent performances on this subject, and we are not here obliged to have recourse to any erroneous theory.

65 Different operations of the water on the ship and wind on the sails balance each other.

It is easy to see that the lateral pressure both of the wind on the sails and of the water on the rudder tends to incline the ship to one side. The sails also tend to press the ship's bows into the water, and, if she were kept from advancing, would press them down considerably. But by the ship's motion, and the prominent form of her bows, the resistance of the water to the fore part of the ship produces a force which is directed upwards. The sails also have a small tendency to raise the ship, for they constitute a surface which in general separates from the plumb-line below. This is remarkably the case in the staysails, particularly the jib and fore-topmast staysail. And this helps greatly to soften the plunges of the ship's bows into the head seas. The upward pressure also of the water on her bows, which we just now mentioned, has a great effect in opposing the immersion of the bows which the sails produce by acting on the long levers furnished by the masts. M. Bouguer gives the name of *point velique* to the point V (fig. 12.) of the mast, where it is cut by the line CV, which marks the mean place and direction of the whole impulse of the water on the bows. And he observes, that if the mean direction of all the actions of the wind on the sails be made to pass also through this point, there will be a perfect equilibrium, and the ship will have no tendency to plunge into the water or to rise out of it; for the whole action of the water on the bows, in the direction CV, is equivalent to, and may be resolved into the action CE, by which the progressive motion is resisted, and the vertical action CD, by which the ship is raised above the water. The force CE must be opposed by an equal force VD, exerted by the wind on the sails, and the force CD is opposed by the weight of the ship. If the mean effort of the sails passes above the point V, the ship's bow will be pressed into the water; and if it pass below V, her stern will be pressed down. But, by the union of these forces, she will rise and fall with the sea, keeping always in a parallel position. We apprehend that it is of very little moment to attend to the situation of this point. Except when the ship is right afore the wind, it is a thousand chances to one that the line CV of mean resistance does not pass through any mast; and the fact is, that the ship cannot be in a state of uniform motion on any other condition but the perfect union of the line of mean action of the sails, and the line of mean action of the resistance. But its place shifts by every change of leeway or of trim; and it is impossible to keep these lines in one constant point of intersection for a moment, on account of the incessant changes of the surface of the water on which she floats. M. Bouguer's observations on this point are, however, very ingenious and original.

Fig. 12.

66 Chief evolutions described.

We conclude this dissertation, by describing some of the chief movements or evolutions. What we have said hitherto is intended for the instruction of the artist, by making him sensible of the mechanical procedure. The description is rather meant for the amusement of the landsman, enabling him to understand operations that are familiar to the seaman. The latter will perhaps smile at the aukward account given of his business by one who cannot hand, reef, or steer.

To tack Ship.

THE ship must first be kept full, that is, with a very sensible angle of incidence on the sails, and by no means hugging the wind. For as this evolution is chiefly performed by the rudder, it is necessary to give the ship a good velocity. When the ship is observed to luff up of herself, that moment is to be catched for beginning the evolution, because she will by her inherent force continue this motion. The helm is then put down. When the officer calls out Helm's a-lee, the fore-sheet, fore-top bowline, jib, and stay sail sheets forward

ward are let go. The jib is frequently hauled down. Thus the obftacles to the fhip's head coming up to the wind by the action of the rudder are removed. If the mainfail is fet, it is not unufual to clue up the weather fide, which may be confidered as a headfail, becaufe it is before the centre of gravity. The mizen muft be hauled out, and even the fail braced to windward. Its power in paying off the ftern from the wind confpires with the action of the rudder. It is really an aerial rudder. The fails are immediately taken aback. In this ftate the effect of the mizen-topfail would be to obftruct the movement, by preffing the ftern the contrary way to what it did before. It is therefore either immediately braced about fharp on the other tack, or lowered. Bracing it about evidently tends to pay round the ftern from the wind, and thus affift in bringing the head up to the wind. But in this pofition it checks the progreffive motion of the fhip, on which the evolution chiefly depends. For a rapid evolution, therefore, it is as well to lower the mizen-topfail. Meantime, the headfails are all aback, and the action of the wind on them tends greatly to pay the fhip round. To increafe this effect, it is not unufual to haul the fore-top bowline again. The fails on the mainmaft are now almoft becalmed; and therefore when the wind is right ahead, or a little before, the mainfail is hauled round and braced up fharp on the other tack with all expedition. The ftayfail fheets are now fhifted over to their places for the other tack. The fhip is now entirely under the power of the headfails and of the rudder, and their actions confpire to promote the converfion. The fhip has acquired an angular motion, and will preferve it, fo that now the evolution is fecured, and fhe falls off apace from the wind on the other tack. The farther action of the rudder is therefore unneceffary, and would even be prejudicial, by caufing the fhip to fall off too much from the wind before the fails can be fhifted and trimmed for failing on the other tack. It is therefore proper to right the helm when the wind is right ahead, that is, to bring the rudder into the direction of the keel. The fhip continues her converfion by her inherent force and the action of the headfails.

When the fhip has fallen off about four points from the wind, the headfails are hauled round, and trimmed fharp on the other tack with all expedition; and although this operation was begun with the wind four points on the bow, it will be fix before the fails are braced up, and therefore the headfails will immediately fill. The after-fails have filled already, while the headfails were inactive, and therefore immediately check the farther falling off from the wind. All fails now draw, for the ftayfail fheets have been fhifted over while they were becalmed or fhaking in the wind. The fhip now gathers way, and will obey the fmalleft motion of the helm to bring her clofe to the wind.

We have here fuppofed, that during all this operation the fhip preferves her progreffive motion. She muft therefore have defcribed a curve line, advancing all the while to windward. Fig. 13. is a reprefentation of this evolution when it is performed in the completeft manner. The fhip ftanding on the courfe E *a*, with the wind blowing in the direction WF, has her helm put hard a-lee when fhe is in the pofition A. She immediately deviates from her courfe, and defcribing a curve, comes to the pofition B, with the wind blowing in the direction WF of the yards, and the fquare-fails now fhiver. The mizen topfail is here reprefented braced fharp on the other tack, by which its tendency to aid the angular motion (while it checks the progreffive motion) is diftinctly feen. The main and forefails are now fhivering, and immediately after are taken aback. The effect of this on the headfails is diftinctly feen to be favourable to the converfion, by pufhing the point F in the direction F *i*; but for the fame reafon it continues to retard the progreffive motion. When the fhip has attained to the pofition C, the mainfail is hauled round and trimmed for the other tack. The impulfe in the direction *Fi* ftill aids the converfion and retards the progreffive motion. When the fhip has attained a pofition between C and D, fuch that the main and mizen topfail yards are in the direction of the wind, there is nothing to counteract the force of the headfails to pay the fhip's head off from the wind. Nay, during the progrefs of the fhip to this intermediate pofition, if any wind gets at the main or mizen topfails, it acts on their anterior furfaces, and impels the after parts of the fhip away from the curve *a b c d*, and thus aids the revolution. We have therefore faid, that when once the fails are taken fully aback, and particularly when the wind is brought right ahead, it is fcarce poffible for the evolution to fail; as foon therefore as the main topfail (trimmed for the other tack) fhivers, we are certain that the headfails will be filled by the time they are hauled round and trimmed. The ftayfails are filled before this, becaufe their fheets have been fhifted, and they ftand much fharper than the fquare-fails; and thus every thing tends to check the falling off from the wind on the other tack, and this no fooner than it fhould be done. The fhip immediately gathers way, and holds on in her new courfe *d* G.

Fig. 13.

But it frequently happens, that in this converfion the fhip lofes her whole progreffive motion. This fometimes happens while the fails are fhivering before they are taken fully aback. It is evident, that in this cafe there is little hopes of fuccefs, for the fhip now lies like a log, and neither fails nor rudder have any action. The fhip drives to leeward like a log, and the water acting on the lee-fide of the rudder checks a little the driving of the ftern. The head therefore falls off again, and by and by the fails fill, and the fhip continues on her former tack. This is called MISSING STAYS, and it is generally owing to the fhip's having too little velocity at the beginning of the evolution. Hence the propriety of keeping the fails well filled for fome little time before. Rough weather, too, by raifing a wave which beats violently on the weather-bow, frequently checks the firft luffing of the fhip, and beats her off again.

If the fhip lofe all her motion after the headfails have been fully taken aback, and before we have brought the wind right ahead, the evolution becomes uncertain, but by no means defperate; for the action of the wind on the headfails will prefently give her fternway. Suppofe this to happen when the fhip is in the pofition C. Bring the helm over hard to windward, fo that the rudder fhall have the pofition reprefented by the fmall dotted line *e f*. It is evident, that the refiftance of the water to the ftern-way of the rudder acts in a favourable direction, pufhing the ftern outwards. In the mean time, the action of the wind on the headfails pufhes the head in the oppofite direction. Thefe actions

tions conſpire therefore in promoting the evolution; and if the wind is right ahead, it cannot fail, but may even be completed ſpeedily, becauſe the ſhip gathers ſternway, and the action of the rudder becomes very powerful; and as ſoon as the wind comes on the formerly lee-bow, the action of the water on the now lee-quarter will greatly accelerate the converſion. When the wind therefore has once been brought nearly right ahead, there is no riſk of being baffled.

But ſhould the ſhip have loſt all her headway conſiderably before this, the evolution is very uncertain: for the action of the water on the rudder may not be nearly equal to its contrary action on the lee-quarter; in which caſe, the action of the wind on the headſails may not be ſufficient to make up the difference. When this is obſerved, when the ſhip goes aſtern without changing her poſition, we muſt immediately throw the headſails completely aback, and put the helm down again, which will pay off the ſhip's head from the wind enough to enable us to fill the ſails again on the ſame tack, to try our fortune again; or we muſt BOXHAUL the ſhip, in the manner to be deſcribed by and by.

Such is the ordinary proceſs of tacking ſhip; a proceſs in which all the different modes of action of the rudder and ſails are employed. To execute this evolution in the moſt expeditious manner, and ſo as to gain as much on the wind as poſſible, is conſidered as the teſt of an expert ſeaman. We have deſcribed the proceſs which is beſt calculated for *enſuring* the movement. But if the ſhip be ſailing very briſkly in ſmooth water, ſo that there is no danger of miſſing ſtays, we may gain more to windward conſiderably by keeping faſt the fore-top bowline and the jib and ſtay-ſail ſheets till the ſquare-ſails are all ſhivering: For theſe ſails, continuing to draw with conſiderable force, and balancing each other tolerably fore and aft, keep up the ſhip's velocity very much, and thus maintain the power of the rudder. If we now let all fly when the ſquare ſails are ſhivering, the ſhip may be conſidered as without ſails, but expoſed to the action of the water on the lee-bow; from which ariſes a ſtrong preſſure of the bow to windward, which conſpires with the action of the rudder to aid the converſion. It evidently leaves all that tendency of the bow to windward which ariſes from leeway, and even what was counteracted by the formerly unbalanced action of theſe head-ſtayſails. This method lengthens the whole time of the evolution, but it advances the ſhip to windward. Obſerve, too, that keeping faſt the fore-top bowline till the ſail ſhivers, and then letting it go, inſures the taking aback of that ſail, and thus inſtantly produces an action that is favourable to the evolution.

The moſt expert ſeamen, however, differ among themſelves with reſpect to theſe two methods, and the firſt is the moſt generally practiſed in the Britiſh navy, becauſe the leaſt liable to fail. The forces which oppoſe the converſion are ſooner removed, and the production of a favourable action by the backing of the fore-top-ſail is alſo ſooner obtained, by letting go the fore-top bowline at the firſt.

Having entered ſo minutely into the deſcription and rationale of this evolution, we have ſufficiently turned the reader's attention to the different actions which cooperate in producing the motions of converſion. We ſhall therefore be very brief in our deſcription of the other evolutions.

To wear Ship.

WHEN the ſeaman ſees that his ſhip will not go about head to wind, but will miſs ſtays, he muſt change his tack the other way; that is, by turning her head away from the wind, going a little way before the wind, and then hauling the wind on the other tack. This is called WEARING or VEERING ſhip. It is moſt neceſſary in ſtormy weather with little ſail, or in very faint breezes, or in a diſabled ſhip.

The proceſs is exceedingly ſimple; and the mere narration of the procedure is ſufficient for ſhowing the propriety of every part of it.

Watch for the moment of the ſhip's falling off, and then haul up the mainſail and mizen, and ſhiver the mizen topſail, and put the helm a-weather. When the ſhip falls off ſenſibly (and not before), let go the bowlines. Eaſe away the fore-ſheet, raiſe the fore-tack, and gather aft the weather fore-ſheet, as the lee-ſheet is eaſed away. Round in the weather-braces of the fore and main-maſts, and keep the yards nearly biſecting the angle of the wind and keel, ſo that when the ſhip is before the wind the yards may be ſquare. It may even be of advantage to round in the weather-braces of the main-topſail more than thoſe of the head-ſails; for the mainmaſt is abaft the centre of gravity. All this while the mizen-topſail muſt be kept ſhivering, by rounding in the weather-braces as the ſhip pays off from the wind. Then the main top-ſail will be braced up for the other tack by the time that we have brought the wind on the weather-quarter. After this it will be full, and will aid the evolution. When the wind is right aft, ſhift the jib and ſtay-ſail ſheets. The evolution now goes on with great rapidity; therefore briſkly haul on board the fore and main tacks, and haul out the mizen, and ſet the mizen-ſtayſail as ſoon as they will take the wind the right way. We muſt now check the great rapidity with which the ſhip comes to the wind on the other tack, by righting the helm before we bring the wind on the beam; and all muſt be trimmed ſharp fore and aft by this time, that the headſails may take and check the coming-to. All being trimmed, ſtand on cloſe by the wind.

We cannot help loſing much ground in this movement. Therefore, though it be very ſimple, it requires much attention and rapid execution to do it with as little loſs of ground as poſſible. One is apt to imagine at firſt that it would be better to keep the headſails braced up on the former tack, or at leaſt not to round in the weather-braces ſo much as is here directed. When the ſhip is right afore the wind, we ſhould expect aſſiſtance from the obliquity of the head-ſails; but the the rudder being the principal agent in the evolution, it is found that more is gained by increaſing the ſhip's velocity, than by a ſmaller impulſe in the headſails more favourably directed. Experienced ſeamen differ, however, in their practice in reſpect of this particular.

To box-haul a Ship.

THIS is a proceſs performed only in critical ſituations, as when a rock, a ſhip, or ſome danger, is ſuddenly ſeen right ahead, or when a ſhip miſſes ſtays. It requires the moſt rapid execution.

The ſhip being cloſe-hauled on a wind, haul up the mainſail

mainſail and mizen, and ſhiver the top-ſails, and put the helm hard a-lee altogether. Raiſe the fore-tack, let go the head bowlines, and brace about the headſails ſharp on the other tack. The ſhip will quickly loſe her way, get ſtern-way, and then fall off, by the joint action of the headſails and of the inverted rudder. When ſhe has fallen off eight points, brace the after-ſails ſquare, which have hitherto been kept ſhivering. This will at firſt increaſe the power of the rudder, by increaſing the ſtern-way, and at the ſame time it makes no oppoſition to the converſion which is going on. The continuation of her circular motion will preſently cauſe them to take the wind on their after ſurfaces. This will check the ſtern-way, ſtop it, and give the ſhip a little head-way. Now ſhift the helm, ſo that the rudder may again act in conjunction with the headſails in paying her off from the wind. This is the critical part of the evolution, becauſe the ſhip has little or no way through the water, and will frequently remain long in this poſition. But as there are no counteracting forces, the ſhip continues to fall off. Then the weather-braces of the after-ſails may be gently rounded in, ſo that the wind acting on their hinder ſurfaces may both puſh the ſhip a little ahead and her ſtern laterally in conjunction with the rudder. Thus the wind is brought upon the quarter, and the headſails ſhiver. By this time the ſhip has acquired ſome headway. A continuation of the rotation would now fill the headſails, and their action would be contrary to the intended evolution. They are therefore immediately braced the other way, nearly ſquare, and the evolution is now completed in the ſame manner with wearing ſhip.

Some ſeamen brace all the ſails aback the moment that the helm is put hard a-lee, but the after-ſails no more aback than juſt to ſquare the yards. This quickly gives the ſhip ſtern-way, and brings the rudder into action in its inverted direction; and they think that the evolution is accelerated by this method.

There is another problem of ſeamanſhip deſerving of our attention, which cannot properly be called an evolution. This is lying-to. This is done in general by laying ſome ſails aback, ſo as to ſtop the head-way produced by others. But there is a conſiderable addreſs neceſſary for doing this in ſuch a way that the ſhip ſhall lie eaſily, and under command, ready to proceed in her courſe, and eaſily brought under weigh.

To bring-to with the fore or main topſail to the maſt, brace that ſail ſharp aback, haul out the mizen, and clap the helm hard a-lee.

Suppoſe the fore topſail to be aback; the other ſails ſhoot the ſhip ahead, and the lee-helm makes the ſhip come up to the wind, which makes it come more perpendicularly on the ſail which is aback. Then its impulſe ſoon exceeds thoſe on the other ſails, which are now ſhivering, or almoſt ſhivering. The ſhip ſtands ſtill awhile, and then falls off, ſo as to fill the after ſails, which again ſhoot her ahead, and the proceſs is thus repeated. A ſhip lying to in this way goes a good deal ahead and alſo to leeward. If the main topſail be aback, the ſhip ſhoots ahead, and comes up till the diminiſhed impulſe of the drawing ſails in the direction of the keel is balanced by the increaſed impulſe on the main-topſail. She lies a long while in this poſition, driving ſlowly to leeward; and ſhe at laſt falls off by the beating of the water on her weather-bow. She falls off but little, and ſoon comes up again.

Thus a ſhip lying-to is not like a mere log, but has a certain motion which keeps her under command. To get under weigh again, we muſt watch the time of falling off; and when this is juſt about to finiſh, brace about briſkly, and fill the ſail which was aback. To aid this operation, the jib and fore-topmaſt ſtay-ſail may be hoiſted, and the mizen brailed up: or, when the intended courſe is before the wind or large, back the fore-topſail ſharp, ſhiver the main and mizen topſail, brail up the mizen, and hoiſt the jib and fore-topmaſt ſtay-ſails altogether.

In a ſtorm with a contrary wind, or on a lee ſhore, a ſhip is obliged to lie-to under a very low ſail. Some ſail is abſolutely neceſſary, in order to keep the ſhip ſteadily down, otherwiſe ſhe would kick about like a cork, and roll ſo deep as to ſtrain and work herſelf to pieces. Different ſhips behave beſt under different ſails. In a very violent gale, the three lower ſtay-ſails are in general well adapted for keeping her ſteady, and diſtributing the ſtrain. This mode ſeems alſo well adapted for wearing, which may be done by hauling down the mizen-ſtayſail. Under whatever ſail the ſhip is brought-to in a ſtorm, it is always with a fitted ſail, and never with one laid aback. The helm is laſhed down hard a-lee; therefore the ſhip ſhoots ahead, and comes up till the ſea on her weather-bow beats her off again. Getting under weigh is generally difficult; becauſe the ſhip and rigging are lofty abaft, and hinder her from falling off readily when the helm is put hard a-weather. We muſt watch the falling off, and aſſiſt the ſhip by ſome ſmall headſail. Sometimes the crew get up on the weather fore-ſhrowds in a crowd, and thus preſent a ſurface to the wind.

THESE examples of the three chief evolutions will enable thoſe who are not ſeamen to underſtand the propriety of the different ſteps, and alſo to underſtand the other evolutions as they are deſcribed by practical authors. We are not acquainted with any performance in our language where the whole are conſidered in a connected and ſyſtematic manner. There is a book on this ſubject in French, called *Le Manœuvrier*, by M. Burdé de Ville-Huet, which is in great reputation in France. A tranſlation into Engliſh was publiſhed ſome years ago, ſaid to be the performance of the Chevalier de Sauſeuil a French officer. But this appears to be a bookſeller's puff; for it is undoubtedly the work of ſome perſon who did not underſtand either the French language, or the ſubject, or the mathematical principles which are employed in the ſcientific part. The blunders are not ſuch as could poſſibly be made by a Frenchman not verſant in the Engliſh language, but natural for an Engliſhman ignorant of French. No French gentleman or officer would have tranſlated a work of this kind (which he profeſſes to think ſo highly of) to ſerve the rivals and foes of his country. But indeed it can do no great harm in this way; for the ſcientific part of it is abſolutely unintelligible for want of ſcience in the tranſlator; and the practical part is full of blunders for want of knowledge of the French language.

We offer this account of the ſubject with all proper reſpect and diffidence. We do not profeſs to teach: but

but by pointing out the defects of the celebrated works of M. Bouguer, and the courfe which may be taken to remove them, while we preserve much valuable knowledge which they contain, we may perhaps excite fome perfons to apply to this fubject, who, by a combination of what is juft in M. Bouguer's theory, with an experimental doctrine of the impulfes of fluids, may produce a treatife of feamanfhip which will not be confined to the libraries of mathematicians, but become a manual for feamen by profeffion.

SEAMEN, fuch perfons as ferve the king or others at fea by navigation and fighting fhips, &c. See *MARITIME State*.

Seamen fighting, quarrelling, or making any difturbance, may be punifhed by the commiffioners of the navy with fine and imprifonment. Regiftered feamen are exempted from ferving in any parifh office, &c. and are allowed bounty-money befide their pay. By the law of merchants, the feamen of a veffel are accountable to the mafter or commander, the mafter to the owners, and the owners to the merchants, for damage fuftained either by negligence or otherwife. Where a feamen is hired for a voyage, and he deferts before it is ended, he fhall lofe his wages; and in cafe a fhip be loft in a ftorm, the feamen lofe their wages, as well as the owners their freight.

Means of Preferving the Health of SEAMEN. See MEDICINE, N° 351.

In addition to what has been faid on this fubject in the place referred to, we fhall fubjoin fome valuable obfervations which we have met with in the fixth volume of the Memoirs of the Royal Society of Medicine at Paris for the years 1784 and 1785.

In 1783, the marfhal de Caftries, intending to make fome changes in the regulations of the navy, particularly with regard to diet, propofed to the fociety the two following queftions: 1. " What are the moft wholefome aliments for feamen, confidering the impoffibility of procuring them frefh meat? And what kinds of falt meat or fifh, of pulfe, and of drink, are moft proper for them, and in what quantity, not omitting to inquire into the regimens in ufe amongft other maritime nations for what may be adopted by us, and into what experience has evinced the utility of, from the accounts of the moft celebrated navigators?" 2. " A number of patients labouring under different difeafes being affembled in naval hofpitals, and different conftitutions affected by the fame difeafe requiring difference of diet, what general dietetic rules for an hofpital would be beft adapted to every exigence, dividing the patients into three claffes; the firft in which liquids alone are proper, the fecond in which we begin to give folids in fmall quantities, and the ftate of convalefcence in which a fuller diet is neceffary?" A committee was appointed to draw up an anfwer to thefe, who inveftigated the fubject very minutely. The refult of their labours is there given at large. The obfervations moft worthy of notice are, that the fcurvy of the Englifh feamen, who live chiefly on falt-meat, is a putrid difeafe; whilft that of the Dutch, who ufe farinaceous vegetables and dried pulfe in large quantities, has more of an hydropical tendency. A mixture of both, even at the fame meal, is recommended. This is fupported by philofophical reafoning, and the example of Captain Cook, who was partly indebted to this mixed regimen for the prefervation of his crew. Salt fifh fhould never be ufed: falt beef grows hard, and after boiling its fibrous parts only remain, which are more calculated to load the ftomach than recruit the ftrength. Salt bacon may be kept at fea 18 months; it does not lofe its moift and nutrimental parts, and unites better with pulfe, but fhould not be ufed when rancid. Live animals kept on board fhips tend to produce difeafes amongft the crew. Rice fhould be ufed largely. Our puddings are bad food: the flour would be much better made into bread, which might be done at fea with no great trouble. Sour krout fhould be ufed freely. Muftard, vinegar, fugar, melaffes, and honey, are good antifcorbutics. Of drinks, wine is the beft: wort, fpruce-beer, or the Ruffian *quas*, are good fubftitutes. Spirits are only to be ufed in cold climates, and in fmall quantity. The greater part of the excellent memoir in anfwer to the fecond queftion, perfectly coincides with M. Duhamel du Monceaux's " Means of Preferving the Health of Seamen," and M. Poiffonnier des Perrieres's treatifes " On the Difeafes of Seamen," and " On the advantages of changing the Diet of Seamen," and his " Examination of Pringle's Differtation."

SEAPOYS, or SEPOYS, natives of Indoftan ferving in a military capacity under the European powers, and difciplined after the European manner.

The Seapoys of the Englifh Eaft India company compofe perhaps the moft numerous, regular, and beft difciplined body of black troops in the world. They are raifed from among the natives of the country, and confift of Moors or Mahometans, Raja-poots, Hindoos, Pariars, befides many intermediate cafts peculiar to themfelves; the whole modelled in all correfponding particulars, and difciplined in every refpect as the army of Great Britain.

The military eftablifhments of Bengal, Madras and Bombay, have each their refpective numbers, that of Bengal exceeding the reft. The Seapoys are formed into complete, uniform, and regular battalions, as our marching regiments at home, being intended to reprefent and anfwer fully to every purpofe in India to the like troops in Europe. A battalion confifts of 700 men, of complete effective ftrength. In each there are eight companies, including two flank ones or grenadiers. They are refpectively commanded by their own black and European officers; to each company there is attached a fubaltern, who takes the command, under whom are two native commiffioned officers, bearing the rank of fubidar and jimindar; of eight fubalterns, fix are lieutenants, the other enfigns; exclufive is a ftaff, of adjutant and furgeon. The black non-commiffioned officers anfwer to our ferjeants and corporals, and are called *havildars* and *naigues*. There is alfo to each corps an Englifh ferjeant-major, drill and ftore ferjeant; to each battalion is a band of drums and fifes, and to each a pair of colours. A captain commands the whole.

Their jackets, which are made entirely after the European faſhion, are of a red colour with yellow facings (as worn by all the infantry of the company on the Coromandel coaſt). The remaining part of their attire reſembles more the country or Indian habit, and conſiſts of a dark blue turban, broad and round at top, deſcending deep to the bottom, the ſides of which, of a concave form, are croſſed by a white band, running in front, faſtened under a roſe above. As an under garment, they have a jacket of linen. A dark blue ſaſh girding, to anſwer the turban, goes round their middle. On the thighs they have ſhort drawers, faſtened by a ſcolloped band. Their legs are bare, which renders them more ready for action or ſervice. Their arms are a firelock and bayonet; their accoutrements or croſs belts black leather, with pouches the ſame.

A battalion drawn out cannot but ſtrike the ſpectators with a lively and fanciful military impreſſion, as they unite in their exterior traits reſpectively Indian and European.

They are brought to the utmoſt exactneſs of diſcipline; go through their evolutions and manœuvres with a regularity and preciſion equal to, and not ſurpaſſed by European troops. In action they are brave and ſteady, and have been known to ſtand where Europeans have given way.

Their diſcipline puts them on a footing with European troops, with whom they are always ready to act in concert.

Their utility and ſervices are evident: they ſecure to the company the internal good order and preſervation of their territorial diſtricts, which, though poſſible to be enforced with a ſtrong hand by Europeans, requires numbers, and can only be conducted with that eaſe and addreſs peculiar to the native forces of the country.

They are conſidered with reſpect in the eyes of the other natives, though they ſufficiently, and with a good grace, feel and aſſert their own conſequence. In large garriſons, where the duty is great, as Madras, Pondicherry, Trichinopoly, Vellore, &c. two or three battalions might be preſent together, excluſive of Europeans. If ſent ſingly up the country, they are liable to be detached, ſometimes by one or more companies being ſent to a ſtation dependent on the chief garriſon or headquarters, otherwiſe they are diſperſed through the diſtricts, four or five together, with a non-commiſſioned officer (this is a part of the ſervice which is called *going on command*), on hills, or in villages, to preſerve order, convey intelligence, and aſſiſt the taſildar, renter, or cutwall of the place, in caſes of emergency. They alſo enforce the police, and prevent in ſuch caſes the country from being infeſted with thieves, which otherwiſe have combined, forming a banditti, to rob paſſengers and plunder cattle, of which there are ſo many inſtances upon record. As for ſuch Britiſh officers in the company's ſervice as are attached to battalions, they are obliged to follow the fortunes and deſtinations of their men, with their reſpective corps, leading a life often replete with adventures of a peculiar nature. An individual in ſuch caſes is frequently ſecluded from thoſe of his own colour when up the country, or detached upon command, where in a frontier garriſon or hill fort in the interior parts of India none but natives are to be found. Here he might live as he pleaſes, being perfectly abſolute within his juriſdiction. Such ſtations being lucrative, with management may produce great fortunes. Neither is the condition hard to a perſon converſant in the language of the country, or that of the Seapoys called *Moors* (which moſt officers in the company's ſervice acquire); otherwiſe the loſs of ſociety is not recompenſed by other advantages, as you forget your own language, grow melancholy, and paſs your days without comfort.

The peace eſtabliſhment at Madras conſiſts of 30 Seapoy battalions, but in time of war is augmented as occaſion requires; or frequently each corps is ſtrengthened by the addition of two companies, which are reduced again in time of peace, the officers remaining ſupernumeraries in the ſervice. In garriſon they are quartered in barracks: they live agreeably to the uſage of the country, ſleep on the ground on a mat or thin carpet. In their perſons they are cleanly, but appear to beſt advantage in their uniform. Off duty they go as the other natives in poor circumſtances; and have only a cloth round their middle and over their ſhoulders. As to the different caſts, the Moormen or Muſſulmen affect pre-eminence, as coming into the country by conqueſt. In their perſons they are rather robuſt, and in their tempers vindictive. Their religion and dreſs is diſtinct from the Hindoos, who are mild and paſſive in their temper, faithful, ſteady, and good ſoldiers. The Pariars are inferior to the others, live under different circumſtances, dwell in huts, and aſſociate not on equal terms with the reſt; they do all menial offices, are ſervants to Europeans, and think themſelves happy when by them employed, though they are equally good Seapoys.

Having thus treated of the company's Seapoys, we ſhall obſerve that they are kindly attentive to their officers when often in circumſtances requiring their aſſiſtance; are guilty of few vices; and have a ſtrong attachment for thoſe who have commanded them. That acute hiſtorian Dr Robertſon has remarked, as a proof that the ingenuity of man has recourſe in ſimilar ſituations to the ſame expedients that the European powers, have, in forming the eſtabliſhment of theſe native troops, adopted the ſame maxims, and, probably without knowing it, have modelled their battalions of Seapoys upon the ſame principles as Alexander the Great did his phalanx of Perſians.

SEARCH-WARRANT, in *Law*, a kind of general warrant iſſued by juſtices of peace or magiſtrates of towns for ſearching all ſuſpected places for ſtolen goods. In Scotland this was often done formerly; and in ſome Engliſh law-books there are precedents requiring the conſtable to ſearch all ſuch ſuſpected places as he and the party complaining ſhall think convenient; but ſuch practice is condemned by Lord Hale, Mr Hawkins, and the beſt authorities both among the Engliſh and Scotch lawyers. However, in caſe of a complaint, and oath made of goods ſtolen, and that the party ſuſpects that thoſe goods are in a particular houſe, and ſhows the cauſe of ſuch ſuſpicion, the juſtice may grant a warrant to ſearch not only that houſe but other ſuſpected places; and to attach the goods, and the party in whoſe cuſtody they are found, and bring them before him or ſome other juſtice, to give an account how he came by them, and to abide ſuch order as to law ſhall appertain;

which warrant ſhould be directed to the conſtable or other public officer, who may enter a ſuſpected houſe and make ſearch.

SEARCHER, an officer in the cuſtoms, whoſe buſineſs it is to ſearch and examine ſhips outwards bound, if they have any prohibited goods on board, &c. (12 Car. II.). There are alſo ſearchers of leather, &c. See ALNAGER.

SEARCHER, in ordnance, is an iron ſocket with branches, from four to eight in number, a little bent outwards, with ſmall points at their ends; to this ſocket is fixed a wooden handle, from eight to twelve feet long, of about an inch and a quarter diameter. After the gun has been fired, this ſearcher is introduced into it, and turned round, in order to diſcover the cavities within. The diſtances of theſe cavities, if any be found, are then marked on the outſide with chalk, when another ſearcher that has only one point, about which a mixture of wax and tallow is put, is introduced to take the impreſſion of the holes; and if there be any hole, a quarter of an inch deep, or of any conſiderable length, the gun is rejected as unſerviceable.

SEARCLOTH, or CERECLOTH, in *Surgery*, a form of external remedy ſomewhat harder than an unguent, yet ſofter than an emplaſter, though it is frequently uſed both for the one and the other. The cerecloth is always ſuppoſed to have wax in its compoſition, which diſtinguiſhes and even denominates it. In effect, when a liniment or unguent has wax enough in it, it does not differ from a cerecloth.

SEASIN, in a ſhip, the name of a rope by which the boat rides by the ſhip's ſide when in harbour, &c.

SEASONING, the firſt illneſs to which perſons habituated to colder climates are ſubject on their arrival in the Weſt Indies. This ſeaſoning, unleſs they live very temperately, or are in a proper habit of body (though ſome people are unmoleſted for many months), ſeldom ſuffers them to remain long before it makes its appearance in ſome mode or other; particularly if at firſt they expoſe themſelves in a ſhower of rain, or too long in the ſun, or in the night-air; or when the body is much heated, if they drink large draughts of cold liquors, or bathe in cold water; or uſe much exerciſe; or commit exceſs in drinking wine or ſpirits; or by heating the body and inflaming the blood; or by ſubjecting themſelves to any cauſe that may ſuddenly check perſpiration, which at firſt is generally exceſſive.

Moſeley on Tropical Diſeaſes.

Some people, from a favourable ſtate of body, have no ſeaſoning. Thin people, and very young people, are moſt likely to eſcape it. Women generally do from their temperance, and perhaps their menſtruation contributes to their ſecurity; indeed hot climates are favourable to the delicacy of their habits, and ſuitable to their modes of life. Some eſcape by great regularity of living; ſome, by the breaking out of the raſh, called the *prickly heat*; ſome by a great degree of perſpiration; and ſome by obſerving a cooling regimen. The diſorders are various that conſtitute this ſeaſoning of *new-comers* as they are called; depending on age, conſtitution, and habit of body. But all ſeaſoning diſeaſes are of the inflammatory kind; and yield to antiphlogiſtic treatment proportioned to their violence. When all precaution to guard againſt ſickneſs has failed, and prudence proved abortive to new-comers, they will have this comfort at leaſt for their pains, that their diſorders will ſeldom be ſevere or expenſive, and will generally have a ſpeedy termination; and that their ſeaſoning, as it is emphatically called, will be removed by bleeding, a doſe of ſalts, reſt, and a cooling regimen.

SEASONING of Timber. See TIMBER.

SEASONS, in *Coſmography*, certain portions or quarters of the year, diſtinguiſhed by the ſigns which the ſun then enters, or by the meridian altitudes of the ſun; conſequent on which are different temperatures of the air, different works in tillage, &c. See WEATHER.

The year is divided into four ſeaſons, ſpring, ſummer, autumn, and winter. The beginnings and endings of each whereof, ſee under its proper article. It is to be obſerved, the ſeaſons anciently began differently from what they now do: witneſs the old verſes,

Dat Clemens hyemem; dat Petrus ver cathedratus;
Æſtuat Urbanus; autumnat Bartholomæus.

SEAT, in the manege, is the poſture or ſituation of a horſeman upon the ſaddle.

SEATON, a ſmall fiſhing town on the ſouth coaſt of Devon, between Lyme and Sidmouth. Riſdon ſays "our learned antiquarians would have it to be that *Maridunum* whereof Antonine ſpake, placed between Dunnovaria and Iſca; for *Maridunum* in Britiſh is the ſame with *Seaton* in Engliſh, "a town upon a hill by the ſea-ſide." This place is memorable for the Daniſh princes landing there in the year 937.

SEBACIC ACID, ſo called, becauſe it is procured from fat. For an account of its preparation and properties, ſee CHEMISTRY, page 540. and N° 802.

ST SEBASTIAN, a handſome, populous, and ſtrong town of Spain, in the province of Guipuſcoa, with a good and well frequented harbour. It is ſeated at the foot of a mountain; and the harbour ſecured by two moles, and a narrow entrance for the ſhips. The town is ſurrounded with a double wall, and to the ſea-ſide is fortified with baſtions and half moons. The ſtreets are long, broad, and ſtraight, and paved with white flagſtones. At the top of the mountain is a citadel, with a garriſon well furniſhed with cannon. The town carries on a conſiderable trade, the greateſt part of which conſiſts of iron and ſteel, which ſome reckon to be the beſt in Europe. They alſo deal in wood, which comes from Old Caſtile. W. Long. 1. 59. N. Lat. 43. 23.—The capital of Braſil in South America is likewiſe called *Sebaſtian*.

SEBASTIANO, called *Del Piombo*, from an office in the lead mines given him by Pope Clement VII. was an eminent Venetian painter, born in 1485. He was firſt a diſciple of old Giovanni Bellino; continued his ſtudies under Giorgione; and having attained an excellent manner of colouring, went to Rome, where he inſinuated himſelf into the favour of Michael Angelo. He has the name of being the firſt who invented the art of preparing plaſter-walls for oil-painting; but was ſo ſlow and lazy in his work, that other hands were often employed to finiſh what he began. He died in 1547.

SEBESTEN. See CORDIA, BOTANY *Index*.

SEBUÆI, a ſect among the ancient Samaritans, whom St Epiphanius accuſes of changing the time expreſſed in the law, for the celebration of the great annual feaſts of the Jews.

SEBURAI, SEBURÆI, a name which the Jews give to fuch of their rabbins or doctors as lived and taught fome time after the finifhing of the Talmud.

SECACUL, in the *Materia Medica* of the ancients, a name given by Avicenna, Serapion, and others, to a root which was like ginger, and was brought from the Eaft Indies, and ufed as a provocative to venery. The interpreters of their works have rendered this word *iringo;* and hence fome have fuppofed that our *eryngium* or *eryngo* was the root meant by it: but this does not appear to be the cafe on a ftrict inquiry, and there is fome reafon to believe that the famous root, at this time called *ginfeng*, was what they meant.

SECALE, RYE, a genus of plants belonging to the triandria clafs; and in the natural method ranking under the 4th order, *Gramina*. See BOTANY and AGRICULTURE *Index*.

The *cereale*, or common rye, has glumes with rough fringes. It is a native of the ifland of Candia, was introduced into England many ages ago, and is the only fpecies of rye cultivated in this kingdom. There are, however, two varieties, the winter and fpring rye.

The winter rye, which is larger in the grain than the fpring rye, is fown in autumn at the fame time with wheat, and fometimes mixed with it; but as the rye ripens fooner than the wheat, this method muft be very exceptionable. The fpring rye is fown along with the oats, and ufually ripens as foon as the winter rye; but the grain produced is lighter, and it is therefore feldom fown except where the autumnal crop has failed.

Rye is commonly fown on poor, dry, limeftone, or fandy foils, where wheat will not thrive. By continuing to fow it on fuch a foil for two or three years, it will at length ripen a month earlier than that which has been raifed for years on ftrong cold ground.

Rye is commonly ufed for bread either alone or mixed with wheat. This mixture is called *meflin*, and was formerly a very common crop in fome parts of Britain. Mr Marfhall tells us, that the farmers in Yorkfhire believe that this mixed crop is never affected by mildew, and that a fmall quantity of rye fown among wheat will prevent this deftructive difeafe. Rye is much ufed for bread in fome parts of Sweden and Norway by the poor people. About a century ago rye-bread was alfo much ufed in England; but being made of a black kind of rye, it was of the fame colour, clammy, very detergent, and confequently not fo nourifhing as wheat.

Rye is fubject to a difeafe which the French call *ergot*, and the Englifh *horned rye;* which fometimes happens when a very hot fummer fucceeds a rainy fpring. According to Tiffot, horned rye is fuch as fuffers an irregular vegetation in the middle fubftance between the grain and the leaf, producing an excrefcence of a brownifh colour, about an inch and a half long, and two-tenths of an inch broad. Bread made of this kind of rye has a naufeous acrid tafte, and produces fpafmodic and grangrenous diforders. In 1596, an epidemic difeafe prevailed in Heffe, which the phyficians afcribed to bread made of horned rye. Some, we are told, were feized with an epilepfy, and thefe feldom ever recovered; others became lunatic, and continued ftupid the reft of their lives: thofe who apparently recovered had annual returns of their diforder in January and February; and the difeafe was faid to be contagious at leaft in a certain degree. The facts which we have now mentioned are taken from a work of Tiffot, which was never printed. The fame difeafe was occafioned by the ufe of this bread in feveral parts of the continent in the years 1648, 1675, 1702, 1716, 1722, and 1736; and has been very minutely defcribed by Hoffman, A. O. Goelicke, Vater Burghart, and J. A. Srink.

In the year 1709, one fourth part of all the rye raifed in the province of Salonia in France was horned, and the furgeon to the hofpital of Orleans had no lefs than 500 patients under his care that were diftempered by eating it: They were called *ergots*, from *ergot* (A), the French name for horned rye; they confifted chiefly of men and boys, the number of women and girls being very fmall. The firft fymptom was a kind of drunkennefs, then the local diforder began in the toes, and thence extended fometimes to the thigh, and the trunk itfelf, even after amputation, which is a good argument againft that operation before the gangrene is ftopped.

In the year 1710, the celebrated Fontenelle defcribes a cafe in the Hiftory of the Academy of Sciences of France, which exactly refembles that of the poor family at Wattifham. A peafant at Blois, who had eaten horned rye in bread, was feized with a mortification which firft caufed all the toes of one foot to fall off, then the toes of the other, afterwards the remainder of the feet, and, laftly, it ate off the flefh of both his legs and thighs, leaving the bones bare.

Horned rye is not only hurtful to man, but to other animals; it has been known to deftroy even the flies that fettled upon it; fheep, dogs, deer, geefe, ducks, fwine, and poultry, that were fed with it for experiment, died miferably, fome convulfed, others mortified and ulcerated.

SECANT, in *Geometry*, a line that cuts another or divides it into parts. The fecant of a circle is a line drawn from the circumference on one fide to a point without the circumference on the other; and it is demonftrated by geometers, that of feveral fecants drawn to the fame point, that is the longeft which paffes through the centre of the circle. The portions, however, of thefe feveral fecants that are without the circle are fo much the greater as they recede from the centre, and the leaft external portion is of that fecant which paffes through it.

SECANT, in *Trigonometry*, denotes a right line drawn from the centre of a circle, which, cutting the circumference, proceeds till it meets with a tangent to the fame circle. See GEOMETRY.

Line of SECANTS, one of thofe lines or fcales which are ufually put upon fectors. See SECTOR, n° 12.

SECEDERS, a numerous body of Prefbyterians in Scotland, who have withdrawn from the communion of the eftablifhed church. As they take up their ground

(A) *Ergot* is French for a cock's fpur, and horned rye was called *ergot* from the refemblance of its excrefcence to that part.

Seceders. ground upon the eſtabliſhment of religion from 1638 to 1650, which they hold to be the pureſt period of the Scottiſh church, we ſhall introduce our account of them by a ſhort view of eccleſiaſtical hiſtory from that period to the era of their ſeceſſion. With our uſual candour and impartiality we mean to give a fair ſtatement of thoſe events with which, as they ſay, their ſeceſſion is connected.

James I. having for ſome time previous to his death entertained a wiſh to form the church of Scotland as much as poſſible upon the model of that in England, his ſon Charles, with the aſſiſtance of Archbiſhop Laud, endeavoured to carry the deſign into execution, by eſtabliſhing canons for eccleſiaſtical diſcipline, and introducing a liturgy into the public ſervice of the church.—Numbers of the clergy and laity of all ranks took the alarm at what they conſidered to be a bold and dangerous innovation; and after frequent applications to the throne, they at laſt obtained the royal proclamation for a free parliament and general aſſembly. The aſſembly met in 1638, and began their labours with a repeal of all the acts of the ſix preceding parliaments, which had favoured the deſigns of James. They condemned the liturgy, together with every branch of the hierarchy. They cited all the Scottiſh biſhops to their bar; and after having excommunicated nine of them, and depoſed five from their epiſcopal office, they reſtored kirk-ſeſſions, preſbyteries, and ſynods provincial as well as national. See PRESBYTERIANS.

Theſe proceedings were ratified by the parliament which met in 1640. The law of patronage was in full force for ſeveral years after this period; yet great care was taken that no miniſter ſhould be obtruded on the Chriſtian people contrary to their inclinations; and in 1649 it was aboliſhed as an oppreſſive grievance.

The reſtoration of Charles II. in 1660 changed the face of affairs in the church of Scotland. All that the general aſſembly had done from 1638 to 1650 was rendered null and void, the covenants were pronounced to be unlawful, epiſcopacy was reſtored, and the king was declared to be the ſupreme head of the church in all cauſes civil and eccleſiaſtical. During this period the Preſbyterians were ſubjected to fines and impriſonment, while numbers of them were publicly executed for their adherence to their political and religious tenets.

The Revolution in 1688 gave a different turn to the affairs of the church. The firſt parliament which met after that event, aboliſhed prelacy and the king's ſupremacy in eccleſiaſtical affairs. They ratified the Weſtminſter Confeſſion of Faith, together with the Preſbyterian form of church-government and diſcipline, "as agreeable to the word of God, and moſt conducive to the advancement of true piety and godlineſs, and the eſtabliſhment of peace and tranquillity within theſe realms." That ſame parliament aboliſhed patronage, and lodged the election of miniſters in the hands of heritors and elders, with the conſent of the congregation.

In the reign of Queen Anne the true Proteſtant religion was ratified and eſtabliſhed, together with the Preſbyterian form of church-government and diſcipline; and the unalterable continuance of both was declared to be an eſſential condition of the union of the two kingdoms in all time coming. In 1712 the law reſpecting patronage was revived, in reſentment, it has been ſaid, of that warm attachment which the church of Scotland diſcovered to the family of Hanover; but the ſeverity of that law was greatly mitigated by the firſt parliament of George I. ſtat. 50. by which it is enacted, that, if the preſentee do not ſignify his acceptance, the preſentation ſhall become void and null in law. The church, however, did not avail herſelf of this ſtatute; and an event which happened not many years afterwards gave riſe to the *ſeceſſion*.

2 Origin of

In 1732 more than 40 miniſters preſented an addreſs to the general aſſembly, ſpecifying in a variety of inſtances what they conſidered to be great defections from the eſtabliſhed conſtitution of the church, and craving a redreſs of theſe grievances. A petition to the ſame effect, ſubſcribed by ſeveral hundreds of elders and private Chriſtians, was offered at the ſame time; but the aſſembly refuſed a hearing to both, and enacted, that the election of miniſters to vacant charges, where an accepted preſentation did not take place, ſhould be competent only to a conjunct meeting of elders and heritors, being Proteſtants. To this act many objections were made by numbers of miniſters and private Chriſtians. They aſſerted that more than 30 to one in every pariſh were not poſſeſſed of landed property, and were on that account deprived of what they deemed their natural right to chooſe their own paſtors. It was alſo ſaid, that this act was extremely prejudicial to the honour and intereſt of the church, as well as to the edification of the people; and in fine, that it was directly contrary to the appointment of Jeſus Chriſt, and the practice of the apoſtles, when they filled up the firſt vacancy in the apoſtolic college, and appointed the election of deacons and elders in the primitive church.—Many of thoſe alſo who were thought to be the beſt friends of the church, expreſſed their fears that this act would have a tendency to overturn the eccleſiaſtical conſtitution which was eſtabliſhed at the Revolution.

3 They oppoſe the meaſures of the general aſſembly;

Mr Ebenezer Erſkine, miniſter at Stirling, diſtinguiſhed himſelf by a bold and determined oppoſition to the meaſures of the aſſembly in 1732. Being at that time moderator of the ſynod of Perth and Stirling, he opened the meeting at Perth with a ſermon from Pſalm cxviii. 22. "The ſtone which the builders rejected is become the head ſtone of the corner." In the courſe of his ſermon he remonſtrated with no ſmall degree of freedom againſt the act of the preceding aſſembly with regard to the ſettlement of miniſters, and alleged that it was contrary to the word of God and the eſtabliſhed conſtitution of the church. A formal complaint was lodged againſt him for uttering ſeveral offenſive expreſſions in his ſermon before the ſynod. Many of the members declared that they heard him utter nothing but ſound and ſeaſonable doctrine; but his accuſers inſiſting on their complaint, obtained an appointment of a committee of ſynod to collect what were called the offenſive expreſſions, and to lay them before the next diet in writing. This was done accordingly; and Mr Erſkine gave in his anſwers to every article of the complaint. After three days warm reaſoning on this affair, the ſynod by a majority of ſix found him cenſurable; againſt which ſentence he proteſted, and appealed to the next general aſſembly. When the aſſembly met in May 1733, it affirmed the ſentence of the ſynod, and appointed Mr Erſkine to be rebuked

4 For which their miniſters are cenſured,

and

Seceders. and admoniſhed from the chair. Upon which he proteſted, that, as the aſſembly had found him cenſurable, and had rebuked him for doing what he conceived to be agreeable to the word of God and the ſtandards of the church, he ſhould be at liberty to preach the ſame truths, and to teſtify againſt the ſame or ſimilar evils, on every proper occaſion. To this proteſt Meſſrs William Wilſon miniſter at Perth, Alexander Moncrief miniſter at Abernethy, and James Fiſher miniſter at Kinclaven, gave in a written adherence, under the form of inſtrument; and theſe four withdrew, intending to return to their reſpective charges, and act agreeably to their proteſt whenever they ſhould have an opportunity. Had the affair reſted here, there never would have been a ſeceſſion; but the aſſembly reſolving to carry on the proceſs, cited them by their officer to compear next day. They obeyed the citation; and a committee was appointed to retire with them, in order to perſuade them to withdraw their proteſt. The committee having reported that they ſtill adhered to their proteſt, the aſſembly ordered them to appear before the commiſſion in Auguſt following and retract their proteſt; and if they ſhould not comply and teſtify their ſorrow for their conduct, the commiſſion was empowered to ſuſpend them from the exerciſe of their miniſtry, with certification that if they ſhould act contrary to ſaid ſentence, the commiſſion ſhould proceed to an higher cenſure.

5 Suſpended from the exerciſe of their office,

The commiſſion met in Auguſt accordingly; and the four miniſters ſtill adhering to their proteſt, were ſuſpended from the exerciſe of their office, and cited to the next meeting of the commiſſion in November following. From this ſentence ſeveral miniſters and elders, members of the commiſſion, diſſented. The commiſſion met in November, and the ſuſpended miniſters compeared. Addreſſes, repreſentations, and letters from ſeveral ſynods and preſbyteries, relative to the buſineſs now before the commiſſion, were received and read. The ſynods of Dumfries, Murray, Roſs, Angus and Mearns, Perth and Stirling, craved that the commiſſion would delay proceeding to a higher cenſure. The ſynods of Galloway and Fife, as alſo the preſbytery of Dornoch, addreſſed the commiſſion for lenity, tenderneſs, and forbearance, towards the ſuſpended miniſters; and the preſbytery of Aberdeen repreſented, that in their judgement, the ſentence of ſuſpenſion inflicted on the foreſaid miniſters was too high, and that it was a ſtretch of eccleſiaſtical authority. Many members of the commiſſion reaſoned in the ſame manner, and alleged that the act and ſentence of laſt aſſembly did not oblige them to proceed to an higher cenſure at this meeting of the commiſſion. The queſtion, however, was put, Proceed to an higher cenſure, or not? and the votes being numbered, were found equal on both ſides: upon which Mr John Goldie the moderator gave his caſting vote to proceed to a higher cenſure; which ſtands in their minutes in theſe words: "The commiſſion did and hereby do looſe the relation of Mr Ebenezer Erſkine miniſter at Stirling, Mr William Wilſon miniſter at Perth, Mr Alexander Moncrief miniſter at Abernethy,

6 deprived of their livings;

and Mr James Fiſher miniſter at Kinclaven, to their reſpective charges, and declare them no longer miniſters of this church; and do hereby prohibit all miniſters of this church to employ them, or any of them, in any miniſterial function. And the commiſſion do declare the churches of the ſaid miniſters vacant from and after the date of this ſentence."

This ſentence being intimated to them, they proteſted, that their miniſterial office and relation to their reſpective charges ſhould be held *as* valid as if no ſuch ſentence had paſſed; and that they were now obliged to make a *ſeceſſion* from the prevailing party in the eccleſiaſtical courts; and that it ſhall be lawful and warrantable for them to preach the goſpel, and diſcharge every branch of the paſtoral office, according to the word of God and the eſtabliſhed principles of the church of Scotland. Mr Ralph Erſkine miniſter at Dunfermline, Mr Thomas Mair miniſter at Orwel, Mr John M'Laren miniſter at Edinburgh, Mr John Currie miniſter at Kinglaſſie, Mr James Wardlaw miniſter at Dunfermline, and Mr Thomas Nairn miniſter at Abbotſhal, proteſted againſt the ſentence of the commiſſion, and that it ſhould be lawful for them to complain of it to any ſubſequent general aſſembly of the church.

The ſeceſſion properly commenced at this date. And accordingly the ejected miniſters declared in their proteſt that they were laid under the diſagreeable neceſſity of ſeceding, not from the principles and conſtitution of the church of Scotland, to which, they ſaid, they ſtedfaſtly adhered, but from the preſent church-courts, which had thrown them out from miniſterial communion. The aſſembly, however, which met in May 1734 did ſo far modify the above ſentence, that they empowered the ſynod of Perth and Stirling to receive the ejected miniſters into the communion of the church, and reſtore them to their reſpective charges; but with this expreſs direction, "that the ſaid ſynod ſhould not take upon them to judge of the legality or formality of the former procedure of the church judicatories in relation to this affair, or either approve or cenſure the ſame." As this appointment neither condemned the act of the preceding aſſembly nor the conduct of the commiſſion, the ſeceding miniſters conſidered it to be rather an act of grace than of juſtice, and therefore they ſaid they could not return to the church-courts upon this ground; and they publiſhed to the world the reaſons of their refuſal, and the terms upon which they were willing to return to the communion of the eſtabliſhed church. They now erected themſelves into an eccleſiaſtical court, which they called the *Aſſociated Preſbytery*, and preached occaſionally to numbers of the people who joined them in different parts of the country. They alſo publiſhed what they called an *Act, Declaration, and Teſtimony*, to the doctrine, worſhip, government, and diſcipline of the church of Scotland, and againſt ſeveral inſtances, as they ſaid, of defection from theſe, both in former and in the preſent times. Some time after this ſeveral miniſters of the eſtabliſhed church joined them, and the Aſſociated Preſbytery now conſiſted of eight miniſters. But the general aſſembly which met in 1738 finding that the number of Seceders was much increaſed, ordered the eight miniſters to be ſerved with a libel, and to be cited to the next meeting of the aſſembly in 1739. They now appeared at the bar as a conſtituted preſbytery, and having formally declined the aſſembly's authority, they immediately withdrew. The aſſembly which met next year depoſed them from the office of the miniſtry; which, however, they continued to exerciſe in their reſpective congregations, who ſtill adhered to them, and erected meeting houſes, where they preached till their

7 and degraded.

Seceders their death. Mr James Fisher, the last survivor of them, was, by an unanimous call in 1741, translated from Kinclaven to Glasgow, where he continued in the exercise of his ministry among a numerous congregation, respected by all ranks in that large city, and died in 1775 much regretted by his people and friends. In 1745 the seceding ministers were become so numerous, that they were erected into three different presbyteries, under one synod, when a very unprofitable dispute divided them into two parties.

8
They divide among themselves about the legality of the burgess oath.

The burgess oath in some of the royal boroughs of Scotland contains the following clause: "I profess and allow with my heart the true religion presently professed within this realm, and authorized by the laws thereof. I will abide at and defend the same to my life's end, renouncing the Romish religion called *Papistry*." Messrs Ebenezer and Ralph Erskine, James Fisher, and others, affirmed that this clause was no way contrary to the principles on which the secession was formed, and that therefore every Seceder might lawfully swear it. Messrs Alexander Moncrief, Thomas Mair, Adam Gib, and others, contended on the other hand that the swearing of the above clause was a virtual renunciation of their testimony. And this controversy was so keenly agitated, that they split into two different parties, and now met in different synods. Those of them who assert the lawfulness of swearing the burgess oath are called *Burghers*, and the other party who condemn it are called *Antiburgher Seceders*. Each party claiming to itself the lawful constitution of the *Associate Synod*, the Antiburghers, after several previous steps, excommunicated the Burghers on the ground of their sin and of their contumacy in it. This rupture took place in 1747, since which period no attempts to effect a reunion have been successful. They remain under the jurisdiction of different synods, and hold separate communion, although much of their former hostility has been laid aside. The Antiburghers consider the Burghers as too lax and not sufficiently stedfast to their testimony. The Burghers on the other hand contend that the Antiburghers are too rigid, in that they have introduced new terms of communion into the society. The Antiburghers having adopted ideas with regard to what they call *covenanting*, which the Burghers never approved (A), have been in use of renewing in their several congregations the Scottish Covenant, by causing their people formally swear to maintain it. In other respects the differences between the two parties are not material. The Antiburghers are most numerous on the north of the Tay, and the Burghers on the south of it.

9
and form separate communions.

10
History of the Burgher Seceders.

What follows in this article is a further account of those who are commonly called the *Burgher Seceders*. These have a greater number of people in their communion than the Antiburghers, and for some years past they have greatly increased in the southern and western districts of Scotland. As there were among them from the commencement of their secession several students who had been educated at one or other of the universities, they appointed one of their ministers to give lectures in theology, and train up candidates for the ministry. Messrs William Wilson minister at Perth and Alexander Moncrief minister at Abernethy were their professors of theology before their separation from the Antiburghers.

Since that period Mr Ebenezer Erskine minister at Stirling, Mr James Fisher minister at Glasgow, Mr John Swanston minister at Kinross, and Mr John Brown minister at Haddington, have succeeded each other in this office. At present Mr George Lawson minister at Selkirk is their professor of theology, and there are between thirty and forty students who attend his lectures annually. The number of their ministers is about an hundred, and each of their congregations contains from two hundred and fifty to three thousand persons; and there are among them at present more than twenty vacant charges. Where a congregation is very numerous, as in Stirling, Dunfermline, and Perth, it is formed into a collegiate charge, and provided with two ministers. They are erected into six different presbyteries, united in one general synod, which commonly meets at Edinburgh in May and September (B). They have also a synod in Ireland composed of three or four different presbyteries. They are legally tolerated in Ireland; and government some years ago granted 500l. per annum, and of late an additional 500l. which, when divided among them, affords to each minister about 20l. over and above the stipend which he receives from his hearers. These have besides a presbytery in Nova Scotia; and some years ago, it is said, that the Burgher and the Antiburgher ministers residing in the United States formed a coalition and joined in a general synod, which they call the *Synod* of *New York* and *Pennsylvania*. They all preach the doctrines contained in the Westminster Confession of Faith and Catechisms, as they believe these to be founded on the sacred scriptures. They catechise their hearers publicly, and visit them from house to house once every year.

(A) This is the account which the Burghers give of their own notions respecting the covenant. One of the most enlightened of their opponents, however, assures us that they acknowledge covenanting to be a *moral duty*, and that the solemn vows of our ancestors are obligatory. But since the breach in the synod they have never engaged in this work; giving, as their reason, that this is not the proper season.

(B) The constitution of the Antiburgher church differs very little from that of the Burghers. The supreme court among them is designed *The General Associate Synod*, having under its jurisdiction three provincial synods in Scotland and one in Ireland. In the former country there are eleven presbyteries; in the latter, four. They have a few congregations in England, and a presbytery in connection with them in North America. The number of ministers belonging to the general synod is a hundred and thirty-seven; and in Scotland there are nineteen vacancies. They, as well as the Burgher Seceders, have a professor of theology, whose lectures every candidate for the office of a preacher is obliged to attend, we have been told, for no less than five or six sessions! Surely the session must be of short duration.

Seceders. year. They will not give the Lord's ſupper to thoſe who are ignorant of the principles of the goſpel, nor to ſuch as are ſcandalous and immoral in their lives. They condemn private baptiſm, nor will they admit thoſe who are groſsly ignorant and profane to be ſponſors for their children. Believing that the people have a natural right to chooſe their own paſtors, the ſettlement of their miniſters always proceeds upon a popular election; and the candidate who is elected by the majority is ordained among them. Convinced that the charge of ſouls is a truſt of the greateſt importance, they carefully watch over the morals of their ſtudents, and direct them to ſuch a courſe of reading and ſtudy as they judge moſt proper to qualify them for the profitable diſcharge of the paſtoral duties. At the ordination of their miniſters they uſe a *formula* of the ſame kind with that of the eſtabliſhed church, which their miniſters are bound to ſubſcribe when called to it; and if any of them teach doctrines contrary to the Scriptures or the Weſtminſter Confeſſion of Faith, they are ſure of being thrown out of their communion. By this means uniformity of ſentiment is preſerved among them; nor has any of their miniſters, excepting one, been proſecuted for error in doctrine ſince the commencement of their ſeceſſion.

11 Their rules of faith,

They believe that the holy ſcriptures are the ſole criterion of truth, and the only rule to direct mankind to glorify and enjoy God, the chief and eternal good; and that "the Supreme Judge, by which all controverſies of religion are to be determined, and all the decrees of councils, opinions of ancient writers, doctrines of men and private ſpirits, are to be examined, and in whoſe ſentence we are to reſt, can be no other but the Holy Spirit ſpeaking in the Scriptures." They are fully perſuaded, however, that the ſtandards of public authority in the church of Scotland exhibit a juſt and conſiſtent view of the meaning and deſign of the holy ſcriptures with regard to doctrine, worſhip, government, and diſcipline; and they in ſo far differ from the diſſenters in England, in that they hold theſe ſtandards to be not only articles of peace and a teſt of orthodoxy, but as a bond of union and fellowſhip. They conſider a ſimple declaration of adherence to the ſcriptures as too equivocal a proof of unity in ſentiment, becauſe Arians, Socinians, and Arminians, make ſuch a confeſſion of their faith, while they retain ſentiments which they (the Seceders) apprehend are ſubverſive of the great doctrines of the goſpel. They believe that Jeſus Chriſt is the only King and Head of the Church, which is his body; that it is his ſole prerogative to enact laws for the government of his kingdom, which is not of this world; and that the church is not poſſeſſed of a legiſlative, but only of an executive power, to be exerciſed in explaining and applying to their proper objects and ends thoſe laws which Chriſt hath publiſhed in the ſcriptures. Thoſe doctrines which they teach relative to faith and practice are exhibited at great length in an explanation of the Weſtminſter Aſſembly's Shorter Catechiſm, by way of queſtion and anſwer, in two volumes, compoſed chiefly by Mr James Fiſher late of Glaſgow, and publiſhed by deſire of their ſynod.

For theſe 50 years paſt, the grounds of their ſeceſſion, they allege, have been greatly enlarged by the public adminiſtrations of the eſtabliſhed church, and particularly by the uniform execution of the law reſpecting patronage, which, they ſay, has obliged many thouſands of private Chriſtians to withdraw from the pariſh-churches and join their ſociety.

It is certain, however, that their number has rapidly increaſed of late, eſpecially in the large cities of the kingdom. They have three different congregations in Edinburgh, two in Glaſgow, and two in London, beſides ſeveral others in the north of England. In moſt of their congregations they celebrate the Lord's ſupper twice in the year, and they catechiſe their young people concerning their knowledge of the principles of religion previouſly to their admiſſion to that ſacrament. When any of them fall into the ſin of fornication or adultery, the ſcandal is regularly purged according to the form of proceſs in the eſtabliſhed church; and thoſe of the delinquents who do not ſubmit to adequate cenſure are publicly declared to be fugitives from diſcipline, and are expelled the ſociety. They never accept a ſum of money as a commutation for the offence. They condemn all clandeſtine and irregular marriages, nor will they marry any perſons unleſs they have been proclaimed in the pariſh-church on two different Lord's days at leaſt. 12

When they ſeparated from the eſtabliſhed church, they remained firm in their attachment to the ſtate; and they were not many years formed into a diſtinct ſociety, when they expelled from their communion a Mr Thomas Nairn miniſter at Kirkcaldy, who had taught doctrines inimical to the civil government of the nation. In 1745 there was not one of their number who joined the pretender to the Britiſh crown. They are ſtill of the ſame ſentiments; and in their public aſſemblies they always pray for our ſovereign King George, with the royal family, and for all who are in authority under them. They are ſo far from wiſhing the overthrow of the preſent civil government, that when the nation was lately in danger of being thrown into a fermentation by the circulation of inflammatory and ſeditious writings, they warmly recommended peace and order in ſociety. The ſame remarks, we believe, are equally applicable to the Antiburgher ſeceders. No legal diſqualifications, as in the caſe of the diſſenters in England, exclude them from any place of public truſt in the municipal government of the country; and ſome of them are frequently in the magiſtracy of the royal boroughs. They are not, however, legally tolerated, but are ſupported by the mildneſs of adminiſtration and the liberal ſpirit of the times. Avowing their adherence to the doctrines contained in the public ſtandards of the church of Scotland, together with the preſbyterian form of government, from which they never intended to ſecede, they deny that they are either ſchiſmatics or ſectaries, as they have been frequently called: and when they withdrew from the eccleſiaſtical courts, they did not, they ſay, conſtitute a church of their own, different from the national church, but profeſs to be a part of that church, endeavouring to hold by her reformed principles, in oppoſition to thoſe deviations from them which they have ſpecified in their *Act and Teſtimony*. Moſt of them live in habits of friendſhip and intimacy with their brethren of the eſtabliſhment, and they profeſs an affectionate regard for all thoſe of every denomination who love Jeſus Chriſt in ſincerity and truth. In the late re-exhibition of their teſtimony, they have declared to the world, that, were the grounds of their ſeceſſion happily removed, they would account it one of the moſt ſingular felicities of

and political principles.

13 Their moderation.

their

their time to return with pleasure to the communion of the established church.

SECHIUM, a genus of plants belonging to the monœcia class; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. See BOTANY *Index*.

SECKENDORF, GUY LEWIS DE, a very learned German, descended from an ancient and noble family, was born at Aurach in Franconia in 1626. He was a good linguist, learned in law, history, and divinity; and is said to have been a tolerable painter and engraver. He was honourably employed by several of the German princes; and died counsellor of state to Frederic III. elector of Brandenburg, and chancellor of the university of Halle, in 1692. He wrote many books, particularly "A history and defence of the Lutheran religion," 2 vols folio, Frankfort, 1602, in Latin.

SECKER, THOMAS, a learned and respectable prelate of the church of England, was born, in 1693, at a village called *Sibthorp*, in the vale of Belvoir, in Nottinghamshire. His father was a Protestant dissenter, a pious, virtuous, and sensible man; who, having a small paternal fortune, followed no profession. His mother was the daughter of Mr Brough, a substantial gentleman farmer of Shelton in the same county. He received his education at several private schools and academies in the country, being obliged, by various accidents, frequently to change his masters.

Notwithstanding this disadvantage, he had at the age of 19 not only made considerable progress in Greek and Latin, and read the best writers in both languages, but had acquired a knowledge of French, Hebrew, Chaldee, and Syriac; had learned geography, logic, algebra, geometry, conic sections, and gone through a course of lectures on Jewish antiquities and other points, preparatory to the critical study of the Bible. He had been destined by his father for orders among the Dissenters. With this view, during the latter years of his education, his studies were chiefly turned towards divinity, in which he had made such quick advances, that by the time he was 23 he had carefully read over a great part of the Scriptures, particularly the New Testament, in the original, and the best comments upon it; Eusebius's Ecclesiastical History, The Apostolical Fathers, Whiston's Primitive Christianity, and the principal writers for and against Ministerial and Lay Conformity.—But though the result of these inquiries was a well-grounded belief of the Christian revelation, yet not being at that time able to decide on some abstruse speculative doctrines, nor to determine absolutely what communion he should embrace; he resolved, like a wise and honest man, to pursue some profession, which should leave him at liberty to weigh those things more maturely in his thoughts, and not oblige him to declare or teach publicly opinions which were not yet thoroughly settled in his own mind.

In 1716, therefore, he applied himself to the study of physic, and after gaining all the medical knowledge he could, by reading the usual preparatory books, and attending the best lectures during that and the following winter in London, in order to improve himself farther, in January 1718-19 he went to Paris. There he lodged in the same house with the famous anatomist Mr Winslow, whose lectures he attended, as he did those of the materia medica, chemistry, and botany, at the king's gardens. He saw the operations of surgery at the *Hotel Dieu*, and attended also for some time M. Gregoire, the accoucheur, but without any design of ever practising that or any other branch of surgery. Here he became acquainted with Mr Martin Benson, afterwards bishop of Gloucester, one of the most agreeable and virtuous men of his time; with whom he quickly became much connected, and not many years after was united to him by the strictest bonds of affinity as well as affection.

During the whole of Mr Secker's continuance at Paris, he kept up a constant correspondence with Mr Joseph Butler, afterwards bishop of Durham, with whom he became acquainted at the academy of one Mr Jones, kept first at Gloucester, and afterward at Tewksbury. Mr Butler having been appointed preacher at the Rolls on the recommendation of Dr Clarke and Mr Edward Talbot, son to Bishop Talbot, he now took occasion to mention his friend Mr Secker, without Secker's knowledge, to Mr Talbot, who promised, in case he chose to take orders in the church of England, to engage the bishop his father to provide for him. This was communicated to Mr Secker in a letter from Mr Butler about the beginning of May 1720. He had not at that time come to any resolution of quitting the study of physic; but he began to foresee many obstacles to his pursuing that profession; and having never discontinued his application to theology, his former difficulties both with regard to conformity and some other doubtful points had gradually lessened, as his judgement became stronger, and his reading and knowledge more extensive. It appears also from two of his letters still in being, written from Paris to a friend in England, (both of them prior to the date of Mr Butler's above mentioned), that he was greatly dissatisfied with the divisions and disturbances which at that particular period prevailed among the Dissenters.

In this state of mind Mr Butler's unexpected proposal found him; which he was therefore very well disposed to take into consideration; and after deliberating on the subject of such a change for upwards of two months, he resolved at length to embrace the offer, and for that purpose quitted France about the beginning of August 1720.

On his arrival in England, he was introduced to Mr Talbot, with whom he cultivated a close acquaintance; but it was unfortunately of very short duration; for in the month of December that gentleman died of the smallpox. This was a great shock to all his friends, who had justly conceived the highest expectations of him; but especially to an amiable lady whom he had lately married, and who was very near sinking under so sudden and grievous a stroke. Mr Secker, beside sharing largely in the common grief, had peculiar reason to lament an accident that seemed to put an end to all his hopes; but he had taken his resolution, and he determined to persevere. It was some encouragement to him to find that Mr Talbot had, on his deathbed, recommended him, together with Mr Benson and Mr Butler, to his father's notice. Thus did that excellent young man (for he was but 29 when he died), by his nice discernment of characters, and his considerate good nature, provide most effectually, in a few solemn moments, for the welfare of that church from which he himself was so prematurely snatched away; and at the same

Secker.

ſame time raiſed up, when he leaſt thought of it, the trueſt friend and protector to his wife and unborn daughter; who afterwards found in Mr Secker all that tender care and aſſiſtance which they could have hoped for from the neareſt relation.

It being judged neceſſary by Mr Secker's friends that he ſhould have a degree at Oxford; and having been informed, that if he ſhould previouſly take the degree of Doctor in Phyſic at Leyden, it would probably help him in obtaining the other, he went over and took his degree there in March 1721: and, as part of his exerciſe for it, he compoſed and printed a diſſertation *de Medicina Statica*, which is ſtill extant, and is thought by the gentlemen of that profeſſion to be a ſenſible and learned performance.

In April the ſame year, he entered himſelf a gentleman commoner of Exeter college, Oxford; after which he obtained the degree of Bachelor of Arts, in conſequence of the chancellor's recommendatory letter to the convocation.

He now ſpent a conſiderable part of his time in London, where he quickly gained the eſteem of ſome of the moſt learned and ingenious men of thoſe days, particularly of Dr Clarke, rector of St James's, and the celebrated Dean Berkeley, afterwards biſhop of Cloyne, with whom he every day became more delighted, and more cloſely connected. He paid frequent viſits of gratitude and friendſhip to Mrs Talbot, widow of Mr Edward Talbot, by whom ſhe had a daughter five months after his deceaſe. With her lived Mrs Catharine Benſon, ſiſter to Biſhop Benſon, whom in many reſpects ſhe greatly reſembled. She had been for ſeveral years Mrs Talbot's inſeparable companion, and was of unſpeakable ſervice to her at the time of her huſband's death, by exerting all her courage, activity, and good ſenſe (of which ſhe poſſeſſed a large ſhare), to ſupport her friend under ſo great an affliction, and by afterwards attending her ſickly infant with the utmoſt care and tenderneſs, to which, under Providence, was owing the preſervation of a very valuable life.

Biſhop Talbot being in 1721 appointed to the ſee of Durham, Mr Secker was in 1722 ordained deacon by him in St James's church, and prieſt not long after in the ſame place, where he preached his firſt ſermon March 28. 1723. The biſhop's domeſtic chaplain at that time was Dr Rundle, a man of warm fancy and very brilliant converſation, but apt ſometimes to be carried by the vivacity of his wit into indiſcreet and ludicrous expreſſions, which created him enemies, and, on one occaſion, produced diſagreeable conſequences.—With him Mr Secker was ſoon after aſſociated in the biſhop's family, and both taken down by his lordſhip to Durham in July 1723.

In the following year the biſhop gave Mr Secker the rectory of Houghton-le-Spring. This preferment putting it in his power to fix himſelf in the world, in a manner agreeable to his inclinations, he ſoon after made a propoſal of marriage to Mrs Benſon; which being accepted, they were married by Biſhop Talbot in 1725. At the earneſt requeſt of both, Mrs Talbot and her daughter conſented to live with them, and the two families from that time became one.

About this time Biſhop Talbot alſo gave preferments to Mr Butler and Mr Benſon, whoſe riſe and progreſs in the church is here interwoven with the hiſtory of Mr Secker. In the winter of 1725-6, Mr Butler firſt publiſhed his incomparable ſermons; on which, as Dr Beilby Porteous and Dr Stinton inform us, Mr Secker took pains to render the ſtyle more familiar, and the author's meaning more obvious: yet they were at laſt by many called obſcure. Mr Secker gave his friend the ſame aſſiſtance in that noble work the Analogy of Religion, &c.

He now gave up all the time he poſſibly could to his reſidence at Houghton, applying himſelf with alacrity to all the duties of a country clergyman, and ſupporting that uſeful and reſpectable character throughout with the ſtricteſt propriety. He omitted nothing which he thought would be of uſe to the ſouls and bodies of the people entruſted to his care. He brought down his converſation and his ſermons to the level of their underſtandings; he viſited them in private, he catechiſed the young and ignorant, he received his country neighbours and tenants very kindly and hoſpitably, and was of great ſervice to the poorer ſort of them by his ſkill in phyſic, which was the only uſe he ever made of it. Though this place was in a very remote part of the world, yet the ſolitude of it perfectly ſuited his ſtudious diſpoſition, and the income ariſing from it bounded his ambition. Here he would have been content to live and die; here, as he has often been heard to declare, he ſpent ſome of the happieſt hours of his life; and it was no thought or choice of his own that removed him to a higher and more conſpicuous ſituation; but Mrs Secker's health, which now began to decline, and was thought to be injured by the dampneſs of the ſituation, obliged him to think of exchanging it for a more healthy one. Accordingly, an exchange was made through the friendly interpoſition of Mr Benſon (who generouſly ſacrificed his own intereſt on this occaſion, by relinquiſhing a prebend of his own to ſerve his friend) with Dr Finney, prebendary of Durham, and rector of Ryton; and Mr Secker was inſtituted to Ryton and the prebend June 3. 1727. For the two following years he lived chiefly at Durham, going every week to officiate at Ryton, and ſpending there two or three months together in the ſummer.

In July 1732 he was appointed chaplain to the king; for which favour he was indebted to Dr Sherlock, who having heard him preach at Bath, had conceived the higheſt opinion of his abilities, and thought them well worthy of being brought forward into public notice. From that time an intimacy commenced between them, and he received from that great prelate many ſolid proofs of eſteem and friendſhip.

His month of waiting at St James's happened to be Auguſt, and on Sunday the 27th of that month he preached before the queen, the king being then abroad. A few days after, her majeſty ſent for him into her cloſet, and held a long converſation with him; in the courſe of which he took an opportunity of mentioning to her his friend Mr Butler. He alſo, not long after this, on Mr Talbot's being made lord chancellor, found means to have Mr Butler effectually recommended to him for his chaplain. The queen alſo appointed him clerk of her cloſet; from whence he roſe, as his talents became more known, to thoſe high dignities which he afterwards attained.

Mr Secker now began to have a public character, and ſtood high in the eſtimation of thoſe who were allowed

Secker.

lowed to be the best judges of merit: he had already given proofs of abilities that plainly indicated the eminence to which he must one day rise, as a preacher and a divine; and it was not long before an opportunity offered of placing him in an advantageous point of view. Dr Tyrrwhit, who succeeded Dr Clarke as rector of St James's in 1729, found that preaching in so large a church endangered his health. Bishop Gibson, therefore, his father-in-law, proposed to the crown that he should be made residentiary of St Paul's, and that Mr Secker should succeed him in the rectory. This arrangement was so acceptable to those in power, that it took place without any difficulty. Mr Secker was instituted rector the 18th of May 1733; and in the beginning of July went to Oxford to take his degree of Doctor of Laws, not being of sufficient standing for that of divinity. On this occasion it was that he preached his celebrated Act Sermon, on the advantages and duties of academical education, which was universally allowed to be a masterpiece of sound reasoning and just composition: it was printed at the desire of the heads of houses, and quickly passed through several editions. It is now to be found in the second collection of Occasional Sermons, published by himself in 1766.

It was thought that the reputation he acquired by this sermon, contributed not a little toward that promotion which very soon followed its publication. For in December 1734, he received a very unexpected notice from Bishop Gibson, that the king had fixed on him to be bishop of Bristol. Dr Benson was about the same time appointed to the see of Gloucester, as was Dr Fleming to that of Carlisle; and the three new bishops were all consecrated together in Lambeth Chapel, Jan. 19. 1734-5, the consecration-sermon being preached by Dr Thomas, afterwards bishop of Winchester.

The honours to which Dr Secker was thus raised in the prime of life did not in the least abate his diligence and attention to business; for which, indeed, there was now more occasion than ever. His learned biographers, Messrs Porteous and Stinton, now relate the manner in which he set about the visitation of his diocese, and the ceremony of confirmation, which he performed in a great number of places; he also preached in several churches, sometimes twice a-day. The affairs of his parish of St James's being likewise in great disorder, he took extraordinary pains to regulate and adjust every thing, particularly the management of the poor; and thus even in a temporal view became of signal service to his parishioners. But, say our authors, "it was their spiritual welfare which engaged, as it ought to do, his chief attention. As far as the circumstances of the times, and the populousness of that part of the metropolis allowed, he omitted not even those private admonitions and personal applications which are often attended with the happiest effects. He allowed out of his own income a salary for reading early and late prayers, which had formerly been paid out of the offertory money. He held a confirmation once every year, examined the candidates several weeks before in the vestry, and gave them religious tracts, which he also distributed at other times very liberally to those that needed them. He drew up, for the use of his parishioners, that admirable course of *Lectures on the Church Catechism* which hath been lately published, and not only read them once every week on the usual days, but also every Sunday evening, either at the church or one of the chapels belonging to it."

The sermons which at the same time, we are told, he set himself to compose, "were truly excellent and original. His faculties were now in their full vigour, and he had an audience to speak before that rendered the utmost exertion of them necessary. He did not, however, seek to gratify the higher part, by amusing them with refined speculations, or ingenious essays, unintelligible to the lower part, and unprofitable to both; but he laid before them all, with equal freedom and plainness, the great Christian duties belonging to their respective stations, and reproved the follies and vices of every rank among them, without distinction or palliation. He studied human nature thoroughly in all its various forms, and knew what sort of arguments would have most weight with each class of men. He brought the subject home to their bosoms, and did not seem to be merely saying useful things in their presence, but addressing himself personally to every one of them. Few ever possessed, in a higher degree, the rare talent of touching on the most delicate subjects with the nicest propriety and decorum, of saying the most familiar things without being low, the plainest without being feeble, the boldest without giving offence. He could descend with such singular ease and felicity into the minutest concerns of common life, could lay open with so much address the various workings, artifices, and evasions of the human mind, that his audience often thought their own particular cases alluded to, and heard with surprise their private sentiments and feelings, their ways of reasoning and principles of acting, exactly stated and described. His preaching was, at the same time, highly rational, and truly evangelical. He explained with perspicuity, he asserted with dignity, the peculiar characteristic doctrines of the gospel. He inculcated the utility, the necessity of them, not merely as speculative truths, but as actual instruments of moral goodness, tending to purify the hearts and regulate the lives of men; and thus, by God's gracious appointment, as well as by the inseparable connection between true faith and right practice, leading them to salvation.

"These important truths he taught with the authority, the tenderness, the familiarity, of a parent instructing his children. Though he neither possessed nor affected the artificial eloquence of an orator who wants to amuse or to mislead, yet he had that of an honest man who wants to convince, of a Christian preacher who wants to reform and to save those that hear him. Solid argument, manly sense, useful directions, short, nervous, striking sentences, awakening questions, frequent and pertinent applications of scripture; all these following each other in quick succession, and coming evidently from the speaker's heart, enforced by his elocution, his figure, his action, and above all, by the corresponding sanctity of his example, stamped conviction on the minds of his hearers, and sent them home with impressions not easy to be effaced. It will readily be imagined that with these powers he quickly became one of the most admired and popular preachers of his time."

In 1737 he succeeded to the see of Oxford, on the promotion of Dr Potter to that of Canterbury, then vacant by the death of Archbishop Wake.

In the spring of 1748, Mrs Secker died of the gout in her stomach. She was a woman of great sense and

 merit,

Secker. merit, but of a weak and sickly constitution. The bishop's affection and tenderness for her was suited to his character. In 1750, he was installed dean of St Paul's, for which he gave in exchange the rectory of St James's and his prebend of Durham. "It was no wonder (say our authors) that, after presiding over so extensive and populous a parish for upwards of 17 years, he should willingly consent to be released from a burden which began now to grow too great for his strength. When he preached his farewel sermon, the whole audience melted into tears: he was followed with the prayers and good wishes of those whom every honest man would be most ambitious to please; and there are numbers still living who retain a strong and grateful remembrance of his incessant and tender solicitude for their welfare. Having now more leisure both to prosecute his own studies and to encourage those of others, he gave Dr Church considerable assistance in his *First and Second Vindication of the Miraculous Powers*, &c. against Dr Middleton, and he was of equal use to him in his *Analysis of Lord Bolingbroke's Works*. About the same time began the late Archdeacon Sharp's controversy with the followers of Mr Hutchinson, which was carried on to the end of the year 1755." Bishop Secker, we are told, read over all Dr Sharp's papers, amounting to three volumes 8vo, and corrected and improved them throughout. But the ease which this late change of situation gave him was soon disturbed by a heavy and unexpected stroke, the loss of his three friends, Bishops Butler, Benson, and Berkeley, who were all cut off within the space of one year.

Our authors next give an account of the part which Dr Secker bore, in the house of lords, in respect to the famous repeal of the Jew bill; for which the duke of Newcastle moved, and was seconded by the Bishop, in a speech which, we are told, was remarkably well received. At length his distinguished merit prevailed over all the political obstacles to his advancement, and placed him, without any efforts or application of his own, in that important station which he had shown himself so well qualified to adorn. On the death of Archbishop Hutton, he was promoted to the see of Canterbury, and was confirmed at Bow-church, April 21. 1758; on which occasion our authors observe, that in accepting this high and burdensome station, Dr Secker acted on that principle which influenced him through life; that he sacrificed his own ease and comfort to considerations of public utility; that the mere secular advantages of grandeur were objects below his ambition; and were, as he knew and felt, but poor compensations for the anxiety and difficulties attending them. He had never once through his whole life asked preferment for himself, nor shown any unbecoming eagerness for it; and the use he made of his newly acquired dignity very clearly showed, that rank, and wealth, and power, had in no other light any charms for him, than as they enlarged the sphere of his active and industrious benevolence.

He sought out and encouraged men of real genius or extensive knowledge; he expended 300l. in arranging and improving the manuscript library at Lambeth; and observing with concern, that the library of printed books in that palace had received no additions since the time of Archbishop Tennison, he made it his business to collect books in all languages from most parts of Europe at a very great expence, with a view of supplying that chasm; which he accordingly did, by leaving them to the library at his death, and thereby rendered that collection one of the noblest and most useful in the kingdom.

All designs and institutions which tended to advance good morals and true religion, he patronized with zeal and generosity: he contributed largely to the maintenance of schools for the poor; to rebuilding or repairing parsonage houses and places of worship; and gave no less than 600l. towards erecting a chapel in the parish of Lambeth. To the society for promoting Christian knowledge he was a liberal benefactor; and to that for propagating the gospel in foreign parts, of which he was the president, he paid much attention; was constant at all the meetings of its members, even sometimes when his health would but ill permit, and superintended their deliberations with consummate prudence and temper.

Whenever any publications came to his knowledge that were manifestly calculated to corrupt good morals, or subvert the foundations of Christianity, he did his utmost to stop the circulation of them; yet the wretched authors themselves he was so far from wishing to treat with any undue rigour, that he has more than once extended his bounty to them in distress. And when their writings could not properly be suppressed (as was too often the case) by lawful authority, he engaged men of abilities to answer them, and rewarded them for their trouble. His attention was everywhere. Even the falsehoods and misrepresentation of writers in the newspapers, on religious or ecclesiastical subjects, he generally took care to have contradicted; and when they seemed likely to injure, in any material degree, the cause of virtue and religion, or the reputation of eminent and worthy men, he would sometimes take the trouble of answering them himself. One instance of this kind, which does him honour, and deserves mention, was his defence of Bishop Butler, who, in a pamphlet published in 1767, was accused of having died a Papist. The conduct which he observed towards the several divisions and denominations of Christians in this kingdom was such as showed his way of thinking to be truly liberal and catholic. The dangerous spirit of popery, indeed, he thought should always be kept under proper legal restraints, on account of its natural opposition not only to the religious but the civil rights of mankind. He therefore observed its movements with care, and exhorted his clergy to do the same, especially those who were situated in the midst of Roman Catholic families; against whose influence they were charged to be upon their guard, and were furnished with proper books or instructions for that purpose. He took all fit opportunities of combating the errors of the church of Rome in his own writings (A); and the best answers that were published to some of the late bold apologies for popery were written at his instance, and under his direction.

Secker.

With the Diffenters his Grace was fincerely defirous of cultivating a good underftanding. He confidered them, in general, as a confcientious and valuable clafs of men. With fome of the moft eminent of them, Watts, Doddridge, Leland, Chandler, Lardner, he maintained an intercourfe of friendfhip or civility. By the moft candid and confiderate part of them he was highly reverenced and efteemed; and to fuch among them as needed help he fhowed no lefs kindnefs and liberality than to thofe of his own communion.

Nor was his concern for the Proteftant caufe confined to his own country. He was well known as the great patron and protector of it in various parts of Europe; from whence he had frequent applications for affiftance, which never failed of being favourably received. To feveral foreign Proteftants he allowed penfions, to others he gave occafional relief, and to fome of their univerfities was an annual benefactor.

In public affairs, his Grace acted the part of an honeft citizen, and a worthy member of the Britifh legiflature. From his firft entrance into the houfe of peers, his parliamentary conduct was uniformly upright and noble. He kept equally clear from the extremes of factious petulance and fervile dependence; never wantonly thwarting adminiftration from motives of party zeal or private pique, or perfonal attachment, or a paffion for popularity; nor yet going every length with every minifter from views of intereft or ambition. He admired and loved the conftitution of his country, and wifhed to preferve it unaltered and unimpaired. So long as a due regard to this was maintained, he thought it his duty to fupport the meafures of government; but whenever they were evidently inconfiftent with the public welfare, he oppofed them with freedom and firmnefs. Yet his oppofition was always tempered with the utmoft fidelity, refpect, and decency, to the excellent prince upon the throne; and the moft candid allowances for the unavoidable errors and infirmities even of the very beft minifters, and the peculiarly difficult fituation of thofe who govern a free and high-fpirited people. He feldom fpoke in parliament, except where the interefts of religion and virtue feemed to require it; but whenever he did, he fpoke with propriety and ftrength, and was heard with attention and deference. Though he never attached himfelf blindly to any fet of men, yet his chief political connections were with the late duke of Newcaftle and Lord Chancellor Hardwicke. To thefe he principally owed his advancement; and he had the good fortune to live long enough to fhow his gratitude to them or their defcendants.

For more than ten years, during which Dr Secker enjoyed the fee of Canterbury, he refided conftantly at his archiepifcopal houfe at Lambeth. A few months before his death, the dreadful pains he felt had compelled him to think of trying the Bath waters: but that defign was ftopped by the fatal accident which put an end to his life.

His Grace had been for many years fubject to the gout, which, in the latter part of his life, returned with more frequency and violence, and did not go off in a regular manner, but left the parts affected for a long time very weak, and was fucceeded by pains in different parts of the body. About a year and a half before he died, after a fit of the gout, he was attacked with a pain in the arm, near the fhoulder, which having continued about 12 months, a fimilar pain feized the upper and outer part of the oppofite thigh, and the arm foon became eafier. This was much more grievous than the former, as it quickly difabled him from walking, and kept him in almoft continual torment, except when he was in a reclining pofition. During this time he had two or three fits of the gout; but neither the gout nor the medicines alleviated thefe pains, which, with the want of exercife, brought him into a general bad habit of body.

On Saturday July 30. 1768, he was feized, as he fat at dinner, with a ficknefs at his ftomach. He recovered before night; but the next evening, while his phyficians were attending, and his fervants raifing him on his couch, he fuddenly cried out that his thigh-bone was broken. The fhock was fo violent, that the fervants perceived the couch to fhake under him, and the pain fo acute and unexpected, that it overcame the firmnefs he fo remarkably poffeffed. He lay for fome time in great agonies; but when the furgeons arrived, and difcovered with certainty that the bone was broken, he was perfectly refigned, and never afterwards afked a queftion about the event. A fever foon enfued. On Tuefday he became lethargic, and continued fo till about five o'clock on Wednefday afternoon, when he expired with great calmnefs, in the 75th year of his age.

On examination, the thigh-bone was found to be carious about four inches in length, and at nearly the fame diftance from its head. The difeafe took its rife from the internal part of the bone, and had fo entirely deftroyed its fubftance, that nothing remained at the part where it was broken but a portion of its outward integument; and even this had many perforations, one of which was large enough to admit two fingers, and was filled with a fungous fubftance arifing from within the bone. There was no appearance of matter about the caries, and the furrounding parts were in a found ftate. It was apparent that the torture which he underwent during the gradual corrofion of this bone muft have been inexpreffibly great. Out of tendernefs to his family he feldom made any complaints to them, but to his phyficians he frequently declared his pains were fo excruciating, that unlefs fome relief could be procured he thought it would be impoffible for human nature to fupport them long. Yet he bore them for upwards of fix months with aftonifhing patience and fortitude; fat up generally the greater part of the day, admitted his particular friends to fee him, mixed with his family at the ufual hours, fometimes with his ufual cheerfulnefs; and, except fome very flight defects of memory, retained all his faculties and fenfes in their full vigour till within a few days of his death. He was buried, purfuant

5th of November; and a great number of occafional paffages to the fame purpofe, in various parts of his lectures, fermons, and other works.

ſuant to his own directions, in a covered paſſage, leading from a private door of the palace to the north door of Lambeth church; and he forbade any monument or epitaph to be placed over him.

By his will he appointed the Rev. Dr Daniel Burton, canon of Chriſt-church, and Mrs Catherine Talbot, already mentioned in the courſe of theſe memoirs, his executors; and left 13,000l. in truſt to the Drs Porteous and Stinton, his chaplains; to pay the intereſt thereof to Mrs Talbot and her daughter during their joint lives, or the life of the ſurvivor; and after the deceaſe of both thoſe ladies, 11,000l. of the ſaid 13,000l. are to be transferred to charitable purpoſes; amongſt which are 1000l. to the Society for the Propagation of the Goſpel, and 1000l. to the ſame ſociety for a biſhop or biſhops in the king's dominions in America.

The following deſcription is given of his perſon: He was tall and comely; in the early part of his life ſlender, and rather conſumptive; but as he advanced in years his conſtitution gained ſtrength, and his ſize increaſed, yet never to a degree of corpulency that was diſproportionate or troubleſome.

The dignity of his form correſponded with the greatneſs of his mind, and inſpired at all times reſpect and awe; but peculiarly ſo when he was engaged in any of the more ſolemn functions of religion, into which he entered with ſuch devout earneſtneſs and warmth, with ſo juſt a conſciouſneſs of the place he was in, and the buſineſs he was about, as ſeemed to raiſe him above himſelf, and added new life and ſpirit to the natural gracefulneſs of his appearance.

His countenance was open, ingenious, and expreſſive of every thing right. It varied eaſily with his ſpirits and his feelings, ſo as to be a faithful interpreter of his mind, which was incapable of the leaſt diſſimulation. It could ſpeak dejection, and, on occaſion, anger, very ſtrongly; but when it meant to ſhow pleaſure or approbation, it ſoftened into a moſt gracious ſmile, and diffuſed over all his features the moſt benevolent and reviving complacency that can be imagined.

SECOND, in *Geometry*, *Chronology*, &c. the 60th part of a prime or minute, whether of a degree or of an hour.

SECOND, in *Muſic*, one of the muſical intervals; being only the difference between any ſound and the next neareſt ſound, whether above or below it.

SECOND Major, in *Muſic*. See INTERVAL.

SECOND Minor, in *Muſic*. See INTERVAL.

SECOND Sight, in Erſe called *Taiſch*, is a mode of ſeeing ſuperadded to that which nature generally beſtows. This gift or faculty, which is neither voluntary nor conſtant, is in general rather troubleſome than agreeable to the poſſeſſors of it, who are chiefly found among the inhabitants of the Highlands of Scotland, thoſe of the Weſtern iſles, of the iſle of Man, and of Ireland. It is an impreſſion made either by the mind upon the eye, or by the eye upon the mind, by which things diſtant or future are perceived, and ſeen as if they were preſent. A man on a journey far from home falls from his horſe; another, who is perhaps at work about the houſe, ſees him bleeding on the ground, commonly with a landſcape of the place where the accident befals him. Another ſeer, driving home his cattle, or wandering in idleneſs, or muſing in the ſunſhine, is ſuddenly ſurpriſed by the appearance of a bridal ceremony, or funeral proceſſion, and counts the mourners or attendants, of whom, if he knows them, he relates the names; if he knows them not, he can deſcribe the dreſſes. Things diſtant are ſeen at the inſtant they happen.

Of things future, Johnſon ſays that he knows no rule pretended to for determining the time between the ſight and the event; but we are informed by Mr Groſe, that in general the time of accompliſhment bears ſome relation to the time of the day in which the impreſſions are received. Thus viſions ſeen early in the morning (which ſeldom happens) will be much ſooner accompliſhed than thoſe appearing at noon; and thoſe ſeen at noon will take place in a much ſhorter time than thoſe happening at night; ſometimes the accompliſhment of the laſt does not fall out within a year or more.

Theſe viſions are not confined to ſolemn or important events; nor is it true, as is commonly reported, that to the ſecond ſight nothing is preſented but phantoms of evil. The future viſit of a mountebank, or piper; a plentiful draught of fiſh; the arrival of common travellers; or, if poſſible, ſtill more trifling matters than theſe, —are foreſeen by the ſeers. A gentleman told Dr Johnſon, that when he had once gone far from his own iſland, one of his labouring ſervants predicted his return, and deſcribed the livery of his attendant, which he had never worn at home; and which had been, without any previous deſign, occaſionally given him.

As many men eminent for ſcience and literature have admitted the reality of this apparently uſeleſs gift, we ſhall, without interpoſing our own opinion, give the reflections of two of the firſt characters of the age upon it, and leave our readers to form their own judgment. By Dr Beattie of Aberdeen it is thus accounted for.

The Highlands of Scotland are a pictureſque but a melancholy country. Long tracts of mountainous deſert, covered with dark heath, and often obſcured by miſty weather; narrow valleys, thinly inhabited, and bounded by precipices reſounding with the fall of torrents; a ſoil ſo rugged, and a climate ſo dreary, as in many parts to admit neither the amuſements of paſturage nor the labours of agriculture; the mournful daſhing of waves along the friths and lakes that interſect the country; the portentous noiſes which every change of the wind and every increaſed diminution of the waters is apt to raiſe in a lonely region full of echoes and rocks and caverns; the groteſque and ghaſtly appearance of ſuch a landſcape by the light of the moon: objects like theſe diffuſe a gloom over the fancy, which may be compatible enough with occaſional and ſocial merriment, but cannot fail to tincture the thoughts of a native in the hour of ſilence and ſolitude. If theſe people, notwithſtanding their reformation in religion, and more frequent intercourſe with ſtrangers, do ſtill retain many of their old ſuperſtitions, we need not doubt but in former times they muſt have been much more enſlaved to the horrors of imagination, when beſet with the bugbears of Popery and Paganiſm. Moſt of their ſuperſtitions are of a melancholy caſt. That of *ſecond ſight*, by which ſome are ſtill ſuppoſed to be haunted, is conſidered by themſelves as a misfortune, on account of the many dreadful images it is ſaid to obtrude upon the fancy. It is ſaid that ſome of the Alpine regions do likewiſe lay claim to a ſort of ſecond ſight.

Nor

Second. Nor is it wonderful, that perfons of a lively imagination, immured in deep folitude, and furrounded with the ftupendous fcenery of clouds, precipices, and torrents, fhould dream (even when they think themfelves awake) of thofe few ftriking ideas with which their lonely lives are diverfified: of corpfes, funeral proceffions, and other fubjects of terror; or of marriages, and the arrival of ftrangers, and fuch like matters of more agreeable curiofity.

Let it be obferved alfo, that the ancient Highlanders of Scotland had hardly any other way of fupporting themfelves than by hunting, fifhing, or war; profeffions that are continually expofed to fatal accidents. And hence, no doubt, additional horrors would often haunt their folitude, and a deeper gloom overfhadow the imagination even of the hardieft native.

A fufficient evidence can hardly be found for the reality of the *fecond fight*, or at leaft of what is commonly underftood by that term. A treatife on the fubject was publifhed in the year 1762, in which many tales were told of perfons whom the author believed to have been favoured, or haunted, with thefe illuminations; but moft of the tales were trifling and ridiculous: and the whole work betrayed, on the part of the compiler, fuch extreme credulity, as could not fail to prejudice many readers againft his fyftem.

That any of thefe vifionaries are apt to be fwayed in their declarations by finifter views, we will not fay: but this may be faid with confidence, that none but ignorant people pretend to be gifted in this way. And in them it may be nothing more, perhaps, than fhort fits of fudden fleep or drowfinefs, attended with lively dreams, and arifing from fome bodily diforder, the effect of idlenefs, low fpirits, or a gloomy imagination. For it is admitted, even by the moft credulous Highlanders, that as knowledge and induftry are propagated in their country, the fecond fight difappears in proportion; and nobody ever laid claim to the faculty who was much employed in the intercourfe of focial life (A). Nor is it at all extraordinary, that one fhould have the appearance of being awake, and fhould even think one's felf fo, during thofe fits of dofing; that they fhould come on fuddenly, and while one is engaged in fome bufinefs. The fame thing happens to perfons much fatigued, or long kept awake, who frequently fall afleep for a moment, or for a long fpace, while they are ftanding, or walking, or riding on horfeback. Add but a lively dream to this flumber, and (which is the frequent effect of difeafe) take away the confcioufnefs of having been afleep, and a fuperftitious man may eafily miftake his dream for a waking vifion; which, however, is foon forgotten when no fubfequent occurrence recals it to his memory; but which, if it fhall be thought to refemble any future event, exalts the poor dreamer into a Highland prophet. This conceit makes him more recluse and more melancholy than ever; and fo feeds his difeafe, and multiplies his vifions: which, if they are not diffipated by bufinefs or fociety, may continue to haunt him as long as he lives; and which, in their progrefs through the neighbourhood, receive fome new tinctures of the marvellous from every mouth that promotes their circulation. As to the prophetical nature of this fecond fight, it cannot be admitted at all. That the Deity fhould work a miracle in order to give intimation of the frivolous things that thefe tales are made up of, the arrival of a ftranger, the nailing of a coffin, or the colour of a fuit of clothes; and that thefe intimations fhould be given for no end, and to thofe perfons only who are idle and folitary, who fpeak Gaelic, or who live among mountains and deferts—is like nothing in nature or providence that we are acquainted with, and muft therefore, unlefs it were confirmed by fatisfactory proof (which is not the cafe), be rejected as abfurd and incredible.

Thefe vifions, fuch as they are, may reafonably enough be afcribed to a diftempered fancy. And that in them, as well as in our ordinary dreams, certain appearances fhould, on fome rare occafions, refemble certain events, is to be expected from the laws of chance; and feems to have in it nothing more marvellous or fupernatural, than that the parrot, who deals out his fcurrilities at random, fhould fometimes happen to falute the paffenger by his right appellation.

To the confidence of thefe objections Dr Johnfon replies, that by prefuming to determine what is fit, and what is beneficial, they prefuppofe more knowledge of the univerfal fyftem than man has attained; and therefore depend upon principles too complicated and extenfive for our comprehenfion; and that there can be no fecurity in the confequence when the premifes are not underftood; that the fecond fight is only wonderful becaufe it is rare, for, confidered in itfelf, it involves no more difficulty than dreams, or perhaps than the regular exercife of the cogitative faculty; that a general opinion of communicative impulfes, or vifionary reprefentations, has prevailed in all ages and all nations; that particular inftances have been given with fuch evidence, as neither Bacon nor Bayle has been able to refift; that fudden impreffions, which the event has verified, have been felt by more than own or publifh them; that the fecond fight of the Hebrides implies only the local frequency of a power, which is nowhere totally unknown; and that where we are unable to decide by antecedent reafon, we muft be content to yield to the force of teftimony. By pretenfion to fecond fight, no profit was ever fought or gained. It is an involuntary affection, in which neither hope nor fear are known to have any part. Thofe who profefs to feel it do not boaft of it as a privilege, nor are confidered by others as advantageoufly diftinguifhed. They have no temptation to feign, and their hearers have no motive to encourage the impofture.

SECOND Terms, in *Algebra*, thofe where the unknown quantity has a degree of power lefs than it has in the term where it is raifed to the higheft. The art of throwing thefe fecond terms out of an equation, that is,

(A) This, however, is denied by Johnfon, who affirms that the Iflanders of all degrees, whether of rank or underftanding, univerfally admit it except the minifters, who, according to him, reject it, in confequence of a fyftem, againft conviction. He affirms, too, that in 1773, there was in the Hebrides a fecond-fighted gentleman, who complained of the terrors to which he was expofed.

is, of forming a new equation where they have no place, is one of the most ingenious and useful inventions in all algebra.

SECONDARY, in general, something that acts as second or in subordination to another.

SECONDARY or *Secundary*, an officer who acts as second or next to the chief officer. Such are the secondaries of the courts of king's bench and common pleas; the secondaries of the compters, who are next the sheriffs of London in each of the two compters; two secondaries of the pipe; secondaries to the remembrancers, &c.

SECONDARY Circles of the Ecliptic are circles of longitude of the stars; or circles which, passing through the poles of the ecliptic, are at right angles to the ecliptic. See *CIRCLES of Latitude*.

SECONDARY Qualities of Bodies. See METAPHYSICS, N° 153.

SECONDAT. See MONTESQUIEU.

SECRETARIES BIRD, the falco serpentarius and sagittarius of Linnæus, but classed by Latham under the genus VULTUR. See ORNITHOLOGY *Index*.

SECRETARY, an officer who, by his master's orders, writes letters, dispatches, and other instruments, which he renders authentic by his signet. Of these there are several kinds; as, 1. Secretaries of state, who are officers that have under their management and direction the most important affairs of the kingdom, and are obliged constantly to attend on the king: they receive and dispatch whatever comes to their hands, either from the crown, the church, the army, private grants, pardons, dispensations, &c. as likewise petitions to the sovereign, which, when read, are returned to them; all which they dispatch according to the king's direction. They have authority to commit persons for treason, and other offences against the state, as conservators of the peace at common law, or as justices of the peace throughout the kingdom. They are members of the privy-council, which is seldom or never held without one of them being present. As to the business and correspondence in all parts of this kingdom, it is managed by either of the secretaries without any distinction; but with respect to foreign affairs, the business is divided into two provinces or departments, the southern and the northern, comprehending all the kingdoms and states that have any intercourse with Great Britain; each secretary receiving all letters and addresses from, and making all dispatches to, the several princes and states comprehended in his province. Ireland and the Plantations are under the direction of the elder secretary, who has the southern province, which also comprehends, France, Italy, Switzerland, Spain, Portugal, and Turkey; the northern province includes the Low Countries, Germany, Denmark, Sweden, Poland, and Muscovy. Each of the secretaries has an apartment in all the royal houses, both for their own accommodation and their officers; they have also a table at the king's charge, or else board-wages. The two secretaries for Britain have each two under secretaries, and one chief clerk; with an uncertain number of other clerks and translators, all wholly depending on them. To the secretaries of state belong the custody of that seal properly called the *signet*, and the direction of two other offices, one called the *paper-office*, and the other the *signet-office*. In addition to these, there is a secretary for the war department, whose office must be temporary. 2. Secretary of an embassy, a person attending an ambassador, for writing dispatches relating to the negociation. There is a great difference between the secretaries of an embassy and the ambassador's secretary; the last being a domestic or menial of the ambassador, and the first a servant or minister of the prince. 3. The secretary of war, an officer of the war-office, who has two chief clerks under him, the last of which is the secretary's messenger. There are also secretaries in most of the other offices.

SECRETION, in the animal economy. See PHYSIOLOGY *Index*.

SECT, a collective term, comprehending all such as follow the doctrines and opinions of some famous divine, philosopher, &c.

SECTION, in general, denotes a part of a divided thing, or the division itself. Such, particularly, are the subdivisions of a chapter; called also *paragraphs* and *articles*: the mark of a section is §.

SECTION, in *Geometry*, denotes a side or surface of a body or figure cut off by another; or the place where lines, planes, &c. cut each other.

SECTOR, in *Geometry*, is a part of a circle comprehended between two radii and the arch: or it is a mixed triangle, formed by two radii and the arch of a circle.

SECTOR, is also a mathematical instrument, of great use in finding the proportion between quantities of the same kind: as between lines and lines, surfaces and surfaces, &c. whence the French call it the *compass of proportion*. The great advantage of the sector above the common scales, &c. is, that it is made so as to fit all radii and all scales. By the lines of chords, sines, &c. on the sector, we have lines of chords, sines, &c. to any radius betwixt the length and breadth of the sector when open. 1 Sector

The real inventor of this valuable instrument is unknown; yet of so much merit has the invention appeared, that it was claimed by Galileo, and disputed by nations.

The sector is founded on the fourth proposition of the sixth book of Euclid; where it is demonstrated, that similar triangles have their homologous sides proportional. An idea of the theory of its construction may be conceived thus. Let the lines AB, AC (Plate CCCCLXXVIII. fig. 1.) represent the legs of the sector; and AD, AE, two equal sections from the centre: if, now the points CB and DE be connected, the lines CB and DE will be parallel; therefore the triangles ADE, ACB will be similar; and consequently the sides AD, DE, AB, and BC, proportional; that is, as AD : DE : : AB : BC : whence, if AD be the half, third, or fourth part of AB; DE will be a half, third, or fourth part of CB: and the same holds of all the rest. If, therefore, AD be the chord, sine, or tangent, of any number of degrees to the radius AB; DE will be the same to the radius BC. Plate cccclxxviii. Fig. 1.

Description of the Sector. The instrument consists of two rules or legs, of brass or ivory, or any other matter, representing the radii, moveable round an axis or joint, the middle of which expresses the centre; whence are drawn on the faces of the rulers several scales, which may be distinguished into single and double. 2 described.

The double scales, or lines graduated upon the faces of Fig. 3. & 4.

of the inſtrument, and which are to be uſed as ſectoral lines, proceed from the centre; and are, 1. Two ſcales of equal parts, one on each leg, marked LIN. or L.; each of theſe ſcales, from the great extenſiveneſs of its uſe, is called the *line of lines*. 2. Two lines of chords marked CHO. or C. 3. Two lines of ſecants marked SEC. or S. A line of polygons marked POL. Upon the other face the ſectoral lines are, 1. Two lines of ſines marked SIN. or S. 2. Two lines of tangents marked TAN. or T. 3. Between the line of tangents and ſines there is another line of tangents to a leſſer radius, to ſupply the defect of the former, and extending from 45° to 75°, marked *t*.

Each pair of theſe lines (except the line of polygons) is ſo adjuſted as to make equal angles at the centre; and conſequently at whatever diſtance the ſector be opened, the angles will be always reſpectively equal. That is, the diſtance between 10 and 10 on the line of lines, will be equal to 60 and 60 on the line of chords, 90 and 90 on the line of ſines, and 45 and 45 on the line of tangents.

Beſides the ſectoral ſcales, there are others on each face, placed parallel to the outward edges, and uſed as thoſe of the common plane ſcale. 1. There are a line of inches. 2. A line of latitudes. 3. A line of hours. 4. A line of inclination of meridians. 5. A line of chords. Three logarithmic ſcales, namely, one of numbers, one of ſines, and one of tangents. Theſe are uſed when the ſector is fully opened, the legs forming one line (A).

3 To read and eſtimate the diviſions on the ſector and lines.

The value of the diviſions on moſt of the lines are determined by the figures adjacent to them; theſe proceed by tens, which conſtitute the diviſions of the firſt order, and are numbered accordingly; but the value of the diviſions on the line of lines, that are diſtinguiſhed by figures, is entirely arbitrary, and may repreſent any value that is given to them; hence the figures, 1, 2, 3, 4, &c. may denote either 10, 20, 30, 40, or 100, 200, 300, 400, and ſo on.

The line of lines is divided into ten equal parts, numbered 1, 2, 3, to 10; theſe may be called *diviſions of the firſt order*; each of theſe is again ſubdivided into 10 other equal parts, which may be called *diviſions of the ſecond order*; each of theſe is divided into two equal parts, forming *diviſions of the third order*. The diviſions on all the ſcales are contained between four parallel lines; thoſe of the third order extend to the moſt diſtant; thoſe of the third to the leaſt; thoſe of the ſecond to the intermediate parallel.

When the whole line of lines repreſents 100, the diviſions of the firſt order, or thoſe to which the figures are annexed, repreſent tens; thoſe of the ſecond order units; thoſe of the third order the halves of theſe units. If the whole line repreſent ten, then the diviſions of the firſt order are units; thoſe of the ſecond tenths; the thirds twentieths.

In the line of tangents, the diviſions to which the numbers are affixed, are the degrees expreſſed by thoſe numbers. Every fifth degree is denoted by a line ſomewhat longer than the reſt; between every number and each fifth degree, there are four diviſions longer than the intermediate adjacent ones, theſe are whole degrees; the ſhorter ones, or thoſe of the third order, are 30 minutes.

From the centre, to 60 degrees, the line of ſines is divided like the line of tangents, from 60 to 70; it is divided only to every degree, from 70 to 80, to every two degrees, from 80 to 90; the diviſion muſt be eſtimated by the eye.

The diviſions on the line of chords are to be eſtimated in the ſame manner as the tangents.

The leſſer line of tangents is graduated every two degrees, from 45 to 50; but from 50 to 60 to every degree; from 60 to the end, to half degrees.

The line of ſecants from 0 to 10 is to be eſtimated by the eye; from 20 to 50, it is divided to every two degrees; from 50 to 60, to every degree; from 60 to the end, to every half degree.

Uſe of the Line of Equal Parts on the SECTOR. 1. To divide a given line into any number of equal parts, ſuppoſe ſeven. Take the given line in your compaſſes; and ſetting one foot in a diviſion of equal parts, that may be divided by ſeven, for example 70, whoſe ſeventh part is 10, open the ſector till the other point fall exactly on 70, in the ſame line on the other leg. In this diſpoſition, applying one point of the compaſſes to 10 in the ſame line; ſhut them till the other fall in 10 in the ſame line on the other leg, and this opening will be the ſeventh part of the given line. Note, if the line to be divided be too long to be applied to the legs of the ſector, divide only one half or one fourth by ſeven, and the double or quadruple thereof will be the ſeventh part of the whole. 4 Diviſion of a given line by the line of equal parts.

2. To meaſure the lines of the perimeter of a polygon, one of which contains a given number of equal parts. Take the given line in your compaſſes, and ſet it parallel, upon the line of equal parts, to the number on each leg expreſſing its length. The ſector remaining thus, ſet off the length of each of the other lines parallel to the former, and the number each of them falls on will expreſs its length. 5 To meaſure the perimeter of a polygon.

3. A right line being given, and the number of parts it contains, ſuppoſe 120, to take from it a ſhorter line, containing any number of the ſame parts, ſuppoſe 25. Take the given line in your compaſſes, open the ſector till the two feet fall on 120 on each leg; then will the diſtance between 25 on one leg, and the ſame number on the other, give the line required. 6 Subtraction.

4. To multiply by the line of equal parts on the ſector. Take the lateral diſtance from the centre of the line to the given multiplicator; open the ſector till you fit that lateral diſtance to the parallel of 1 and 1, or 10 and 10, and keep the ſector in that diſpoſition; then take in the compaſſes the parallel diſtance of the multiplicand, which diſtance, meaſured laterally on the ſame line, will give the product required. Thus, ſuppoſe it were required to find the product of 8 multiplied by 4: take the lateral diſtance from the centre of the line to 4 in your compaſſes, i. e. place one foot of the compaſſes in the beginning of the diviſions, and extend the other along the line to 4. Open the ſector till you fit this lateral diſtance to the parallel of 1 and 1, or 7 Multiplication.

(A) The lines are placed in different orders on different ſectors, but they may eaſily be found by theſe general directions.

1, or 10 and 10. Then take the parallel diſtance of 8, the multiplicand; i. e. extend the compaſſes from 8, in this line, on one leg, to 8 in the ſame line on the other; and that extent, meaſured laterally, will give the product required.

8 Diviſion in general.

5. To divide by the line of equal parts on the ſector. Extend the compaſſes laterally from the beginning of the line to 1, and open the ſector till you fit that extent to the parallel of the diviſor; then take the parallel diſtance of the dividend, which extent, meaſured in a lateral direction, will give the quotient required. Thus, ſuppoſe it was required to divide 36 by 4: extend the compaſſes laterally, the beginning of the line to 1, and fit to that extent the parallel of 4, the diviſor; then extend the compaſſes parallel, from 36 on one leg to 36 on the other, and that extent, meaſured laterally, will give 9, the quotient required.

9 Proportion.

6. Proportion by the line of equal parts. Make the lateral diſtance of the ſecond term the parallel diſtance of the firſt term, the parallel diſtance of the third term is the fourth proportional. *Example.* To find a fourth proportional to 8, 4, and 6, take the lateral diſtance of 4, and make it the parallel diſtance of 8; then the parallel diſtance of 6, extended from the centre, ſhall reach to the fourth proportional 3.

In the ſame manner, a third proportional is found to two numbers. Thus, to find a third proportional to 8 and 4, the ſector remaining as in the former example, the parallel diſtance of 4, extended from the centre, ſhall reach to the third proportional 2. In all theſe caſes, if the number to be made a parallel diſtance be too great for the ſector, ſome aliquot part of it is to be taken, and the anſwer is to be multiplied by the number by which the firſt number was divided.

10 Line of chords.

Uſe of the Line of Chords on the SECTOR. 1. To open the ſector ſo as the two lines of chords may make an angle or number of degrees, ſuppoſe 40. Take the diſtance from the joint to 40, the number of the degrees propoſed, on the line of chords; open the ſector till the diſtance from 60 to 60, on each leg, be equal to the given diſtance of 40; then will the two lines on the ſector form an angle of 40 degrees, as was required.

2. The ſector being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre; the number whereon it terminates will ſhow the degrees, &c. required.

3. To lay off any number of degrees upon the circumference of a circle. Open the ſector till the diſtance between 60 and 60 be equal to the radius of the given circle; then take the parallel extent of the chord of the number of degrees on each leg of the ſector, and lay it off on the circumference of the given circle.—Hence any regular polygon may be eaſily inſcribed in a given circle.

11 Line of polygons.

Uſe of the Line of Polygons on the SECTOR. 1. To inſcribe a regular polygon in a given circle. Take the ſemidiameter of the given circle in the compaſſes, and adjuſt it to the number 6, on the line of polygons, on each leg of the ſector: then, the ſector remaining thus opened, take the diſtance of the two equal numbers, expreſſing the number of ſides the polygon is to have; *e. gr.* the diſtance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. Theſe diſtances carried about the circumference of the circle, will divide it into ſo many equal parts.

2. To deſcribe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compaſſes, and apply it to the extent of the number 5, 5, on the lines of polygons. The ſector thus opened, upon the ſame lines take the extent from 6 to 6; this will be the ſemidiameter of the circle the polygon is to be inſcribed in. If then, with this diſtance, from the ends of the given line, you deſcribe two arches of a circle, their interſection will be the centre of the circle.

3. On a right line, to deſcribe an iſoceles triangle, having the angles at the baſe double that at the vertex. Open the ſector, till the ends of the given line fall on 10 and 10 on each leg; then take the diſtance from 6 to 6. This will be the length of the two equal ſides of the triangle.

Uſe of the Lines of Sines, Tangents, and Secants, on the SECTOR. By the ſeveral lines diſpoſed on the ſector, we have ſcales to ſeveral radii; ſo that having a length or radius given, not exceeding the length of the ſector when opened, we find the chord, ſine, &c. thereto: *e. gr.* Suppoſe the chord, ſine, or tangent of 10 degrees, to a radius of 3 inches required; make 3 inches the aperture between 60 and 60, on the lines of chords of the two legs; then will the ſame extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of the ſines on the other ſide; ſo that to whatever radius the line of chords is ſet, to the ſame are all the others ſet. In this diſpoſition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compaſſes, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of ſines, it will be the ſine of 10 degrees. Laſtly, if the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

12 Sines, tangents, and ſecants.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, viz. 35, muſt be taken, as before; which diſtance, repeated twice, gives the chord of 70 degrees. To find the tangent of 70 degrees to the ſame radius, the ſmall line of tangents muſt be uſed, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the ſmall line; the extent between 70 and 70 degrees on the ſame, will be the tangent of 70 degrees to 3 inches radius.

To find the ſecant of an arch, make the given radius the aperture between 0 and 0 on the lines of ſecants: then will the aperture of 10 and 10, or 70 and 70, on the ſaid lines, give the tangent of 10° or 70°.

If the converſe of any of theſe things were required, that is, if the radius be required, to which a given line is the ſine, tangent, or ſecant, it is but making the given line, if a chord, the aperture on the line of chords between 10 and 10, and then the ſector will ſtand at the radius required; that is, the aperture between 60 and 60 on the ſaid line is the radius. If the given line were a ſine, tangent, or ſecant, it is but making it the aperture of the given number of degrees; then will the diſtance of 90 and 90 on the ſines, of 45 and 45 on the tangents, of 0 and 0 on the ſecants, be the radius.

SECTOR *of an Ellipſe, of an Hyperbola, &c.* is a part reſembling

resembling the circular sector, being contained by three lines, two of which are radii, or lines drawn from the centre of the figure to the curve, and the intercepted arc or part of that curve.

SECTOR of a Sphere, is the solid generated by the revolution of the sector of a circle about one of its radii; the other radius describing the surface of a cone, and the circular arc a circular portion of the surface of the sphere of the same radius. So that the spherical sector consists of a right cone, and of a segment of the sphere having the same common base with the cone. Hence the solid content of it will be found by multiplying the base or spherical surface by the radius of the sphere, and taking one third of the product.

Astronomical SECTOR. See *ASTRONOMICAL Sector.*

Dialing SECTOR. See DIALING.

SECULAR, that which relates to affairs of the present world, in which sense the word stands opposed to *spiritual, ecclesiastical:* thus we say secular power, &c.

SECULAR, is more peculiarly used for a person who lives at liberty in the world, not shut up in a monastery, nor bound by vows, or subjected to the particular rules of any religious community; in which sense it stands opposed to *regular*. The Romish clergy are divided into secular and regular, of which the latter are bound by monastic rules, the former not.

SECULAR Games, in antiquity, solemn games held among the Romans once in an age. These games lasted three days and as many nights; during which time sacrifices were performed, theatrical shews exhibited, with combats, sports, &c. in the circus. The occasion of these games, according to Valerius Maximus, was to stop the progress of a plague. Valerius Publicola was the first who celebrated them at Rome in the year of the city 245. The solemnity was as follows: The whole world was invited by a herald to a feast which they had never seen already, nor ever should see again. Some days before the games began, the quindecemviri in the Capitol and the Palatine temple, distributed to the people purifying compositions, of various kinds, as flambeaus, sulphur, &c. From hence the populace passed to Diana's temple on the Aventine mount, with wheat, barley, and oats, as an offering. After this, whole nights were spent in devotion to the Destinies. When the time of the games was fully come, the people assembled in the Campus Martius, and sacrificed to Jupiter, Juno, Apollo, Latona, Diana, the Parcæ, Ceres, Pluto, and Proserpine. On the first night of the feast the emperor, with the quindecemviri, caused three altars to be erected on the banks of the Tiber, which they sprinkled with the blood of three lambs, and then proceeded to regular sacrifice. A space was next marked out for a theatre, which was illuminated with innumerable flambeaus and fires. Here they sung hymns, and celebrated all kinds of sports. On the day after, having offered victims at the Capitol, they went to the Campus Martius, and celebrated sports to the honour of Apollo and Diana. These lasted till next day, when the noble matrons, at the hour appointed by the oracle, went to the Capitol to sing hymns to Jupiter. On the third day, which concluded the solemnity, twenty seven boys, and as many girls, sung in the temple of Palatine Apollo hymns and verses in Greek and Latin, to recommend the city to the protection of those deities whom they designed particularly to honour by their sacrifices.

The inimitable Carmen Seculare of Horace was composed for this last day, in the Secular Games, held by Augustus.

It has been much disputed whether these games were held every hundred, or every hundred and ten years. Valerius Antius, Varro, and Livy, are quoted in support of the former opinion: In favour of the latter may be produced the quindecemviral registers, the edicts of Augustus, and the words of Horace in the Secular poem,

Cætus undenos decies per annos.

It was a general belief, that the girls who bore a part in the song should be soonest married; and that the children who did not dance and sing at the coming of Apollo, should die unmarried, and at an early period of life.

SECULAR Poem, a poem sung or rehearsed at the secular games; of which kind we have a very fine piece among the works of Horace, being a sapphic ode at the end of his epodes.

SECULARIZATION, the act of converting a regular person, place, or benefice, into a secular one. Almost all the cathedral churches were anciently regular, that is, the canons were to be religious; but they have been since secularized. For the secularization of a regular church, there is required the authority of the pope, that of the prince, the bishop of the place, the patron, and even the consent of the people. Religious that want to be released from their vow, obtain briefs of secularization from the pope.

SECUNDINES, in *Anatomy*, the several coats or membranes wherein the fœtus is wrapped up in the mother's womb; as the chorion and amnios, with the placenta, &c.

SECUNDUS, JOANNES NICOLAIUS, an elegant writer of Latin poetry, was born at the Hague in the year 1511. His descent was from an ancient and honourable family in the Netherlands; and his father Nicolaus Everardus, who was born in the neighbourhood of Middleburg, seems to have been high in the favour of the emperor Charles V. as he was employed by that monarch in several stations of considerable importance. We find him first a member of the grand parliament or council of Mechelen, afterwards president of the states of Holland and Zealand at the Hague, and lastly holding a similar office at Mechelen, where he died, August 5. 1532, aged 70.

These various employments did not occupy the whole of Everardus's time. Notwithstanding the multiplicity of his business, he found leisure to cultivate letters with great success, and even to act as preceptor to his own children, who were five sons and three daughters. They all took the name of Nicolaii from their father; but on what account our author was called *Secundus* is not known. It could not be from the order of his birth, for he was the youngest son. Perhaps the name was not given him till he became eminent; and then, according to the fashion of the age, it might have its rise from some pun, such as his being *Poetarum nemini Secundus*. Poetry, however, was by no means the profession which his father wished him to follow. He intended him for the law, and when he could no longer direct his studies himself, placed him under the care of

Jacobus Valeardus. This man is faid to have been every way well qualified to difcharge the important truft which was committed to him; and he certainly gained the affection of his pupil, who, in one of his poems, mentions the death of Valeardus with every apppearance of unfeigned forrow. Another tutor was foon provided; but it does not appear that Secundus devoted much of his time to legal purfuits. Poetry and the fifter arts of painting and fculpture had engaged his mind at a very early period; and the imagination, on which thefe have laid hold, can with difficulty fubmit to the dry ftudy of mufty civilians. Secundus is faid to have written verfes when but ten years old; and from the vaft quantity which he left behind him, we have reafon to conclude that fuch writing was his principal employment. He found time, however, to carve figures of all his own family, of his miftreffes, of the emperor Charles V. of feveral eminent perfonages of thofe times, and of many of his intimate friends; and in the laft edition of his works publifhed by Scriverius at Leyden, 1631, there is a print of one of his miftreffes with this inicription round it; VATIS AMATORIS JULIA SCULPTA MANU.

Secundus having nearly attained the age of twenty-one, and being determined, as it would feem, to comply as far as poffible with the wifhes of his father, quitted Mechelen, and went to France, where at *Bourges*, a city in the *Orleanois*, he ftudied the civil law under the celebrated *Andreas Alciatus*. Alciatus was one of the moft learned civilians of that age; but what undoubtedly endeared him much more to our author was his general acquaintance with polite literature, and more particularly his tafte in poetry. Having ftudied a year under this eminent profeffor, and taken his degrees, Secundus returned to Mechelen, where he remained only a very few months. In 1533 he went into Spain with warm recommendations to the count of Naffau and other perfons of high rank; and foon afterwards became fecretary to the cardinal archbifhop of Toledo in a department of bufinefs which required no other qualifications than what he poffeffed in a very eminent degree, a facility in writing with elegance the Latin language. It was during his refidence with this cardinal that he wrote his *Bafia*, a feries of wanton poems, of which the fifth, feventh, and ninth *carmina* of *Catullus* feem to have given the hint. Secundus was not, however, a fervile imitator of Catullus. His expreffions feem to be borrowed rather from *Tibullus* and *Propertius*; and in the warmth of his defcriptions he furpaffes every thing that has been written on fimilar fubjects by *Catullus*, *Tibullus*, *Propertius*, *C. Gallus*, *Ovid*, or *Horace*.

In 1535 he accompanied the emperor Charles V. to the fiege of Tunis, but gained no laurels as a foldier. The hardfhips which were endured at that memorable fiege were but little fuited to the foft difpofition of a votary of Venus and the mufes; and upon an enterprife which might have furnifhed ample matter for an epic poem, it is remarkable that Secundus wrote nothing which has been deemed worthy of prefervation. Having returned from his martial expedition, he was fent by the cardinal to Rome to congratulate the pope upon the fuccefs of the emperor's arms; but was taken fo ill on the road, that he was not able to complete his journey. He was advifed to feek, without a moment's delay, the benefit of his native air; and that happily recovered him.

Having now quitted the fervice of the archbifhop of Toledo, Secundus was employed in the fame office of fecretary by the bifhop of Utrecht; and fo much had he hitherto diftinguifhed himfelf by the claffical elegance of his compofitions, that he was foon called upon to fill the important poft of private Latin fecretary to the emperor, who was then in Italy. This was the moft honourable office to which our author was ever appointed; but before he could enter upon it death put a ftop to his career of glory. Having arrived at *Saint Amnnd* in the diftrict of *Tournny*, in order to meet, upon bufinefs, with the bifhop of Utrecht, he was on the 8th of October 1536 cut off by a violent fever, in the very flower of his age, not having quite completed his twenty-fifth year. He was interred in the church of the Benedictines, of which his patron, the bifhop, was *abbot* or *pro-abbot*; and his near relations erected to his memory a marble monument, with a plain Latin infcription.

The works of Secundus have gone through feveral editions, of which the beft and moft copious is that of Scriverius already mentioned. It confifts of JULIA, *Eleg.* lib. i.; AMORES, *Eleg.* lib. ii.; AD DIVERSOS *Eleg.* lib. iii.; BASIA, ftyled by the editor *incomparabilis et divinus prorfus liber*; EPIGRAMMATA; ODARUM *liber unus*; EPISTOLARUM *liber unus Elegiaca*; EPISTOLARUM *liber alter*, *heroico carmine fcriptus*; FUNERUM *liber unus*; SYLVÆ *et* CARMINUM *fragmenta*; POEMATA *nonnulla fratrum*; ITINERARIA *Secundi tria*, &c.; EPISTOLÆ *totidem*, *foluta oratione*. Of thefe works it would be fuperfluous in us to give any character after the ample teftimonies prefixed to them of *Lelius Greg. Gyraldus*, the elder *Scaliger*, *Theodore Beza*, and others equally celebrated in the republic of letters, who all fpeak of them with rapture. A French critic, indeed, after having affirmed that the genius of Secundus never produced any thing which was not excellent in its kind, adds, with too much truth, *Mais fa mufe eft un peu trop lafcive*. For this fault our author makes the following apology in an epigram addreffed to the grammarians;

Carmina cur fpargam cunctis lafciva libellis,
 Queritis? Infulfos arceo grammaticos.
Fortia magnanimi canerem fi Cæfaris arma,
 Factave DIVORUM religiofa VIRUM:
Quot mifer exciperemque notas, patererque lituras?
 Quot ferem teneris fupplicium pueris?
At nunc uda mihi dictant cum BASIA carmen,
 Pruriet et verfu mentula multa meo:
Me leget innuptæ juvenis placiturus amicæ,
 Et placitura nova blanda puella viro:
Et quemcunque juvat lepidorum de grege vatum
 Otia feftivis ludere deliciis.
Lufibus et lætis procul hinc abfiftite, SÆVI
 GRAMMATICI, injuftas et cohibite manus.
Ne puer, ab malleis cæfus lacrymanfque leporis;
 DURAM FORTE MEIS OSSIBUS OPTET HUMUM.

SECURIDACA, a genus of plants belonging to the clafs diadelphia. See BOTANY *Index*.

SECUTORES, a fpecies of gladiators among the Romans, whofe arms were a helmet, a fhield, and a fword or a leaden bullet. They were armed in this manner, becaufe they had to contend with the retiarii, who

Secutores || Sedition.

were dreſſed in a ſhort tunic, bore a three-pointed lance in their left hand, and a net in their right. The retiarius attempted to caſt his net over the head of the ſecutor; and if he ſucceeded, he drew it together and ſlew him with his trident: but if he miſſed his aim, he immediately betook himſelf to flight till he could find a ſecond opportunity of entangling his adverſary with his net. He was purſued by the ſecutor, who endeavoured to diſpatch him in his flight.

Secutores was alſo a name given to ſuch gladiators as took the place of thoſe killed in the combat, or who engaged the conqueror. This poſt was uſually taken by lot.

SEDAN is a town in France, in the department of the Ardennes, in E. Long. 4. 45. N. Lat. 49. 46. This is the capital of a principality of the ſame name, ſituated on the Maeſe, ſix miles from Bouillon, and fifteen from Charleville. Its ſituation on the frontiers of the territory of Liege, Namur, and Limburg, formerly rendered it one of the keys of the kingdom. It is extremely well fortified, and defended by a ſtrong citadel. The caſtle is ſituated on a rock, ſurrounded with large towers and ſtrong walls; here you ſee a moſt beautiful magazine of ancient arms. The governor's palace is oppoſite the caſtle. From the ramparts you have a moſt agreeable proſpect of the Maeſe and the neighbouring country. Though the town is but ſmall, yet it is full of tradeſmen, as tanners, weavers, dyers, &c. the manufacture of fine cloth in this city employing a great number of hands. The principality of Sedan formerly belonged to the duke of Bouillon, who was obliged in the beginning of the laſt century to reſign it to the crown.

SEDAN-CHAIR is a covered vehicle for carrying a ſingle perſon, ſuſpended by two poles, and borne by two men, hence denominated *chairmen.* They were firſt introduced in London in 1634, when Sir Sanders Duncomb obtained the ſole privilege to uſe, let, and hire a number of the ſaid covered chairs for fourteen years.

SEDGMOOR, a large and rich tract of land in Somerſetſhire, memorable for the defeat of the duke of Monmouth, in 1685. It lies between Somerton and Bridgewater.

SEDITION, among civilians, is uſed for a factious commotion of the people, or an aſſembly of a number of citizens without lawful authority, tending to diſturb the peace and order of the ſociety. This offence is of different kinds: ſome ſeditions more immediately threatening the ſupreme power, and the ſubverſion of the preſent conſtitution of the ſtate; others tending only towards the redreſs of private grievances. Among the Romans, therefore, it was variouſly puniſhed, according as its end and tendency threatened greater miſchief. See lib. i. *Cod. de Seditioſis*, and *Mat. de Crimin.* lib. ii. n. 5. *de Læſa Majeſtate.* In the puniſhment, the authors and ringleaders were juſtly diſtinguiſhed from thoſe who, with leſs wicked intention, joined and made part of the multitude.

The ſame diſtinction holds in the law of England and in that of Scotland. Some kinds of ſedition in England amount to high treaſon, and come within the ſtat. 25 Edw. III. as levying war againſt the king. And ſeveral ſeditions are mentioned in the Scotch acts of parliament as treaſonable. *Bayne's Crim. Law of Scotland*, p. 33, 34. The law of Scotland makes riotous and tumultuous aſſemblies a ſpecies of ſedition. But the law there, as well as in England, is now chiefly regulated by the riot act, made 1 Geo. I. only it is to be obſerved, that the proper officers in Scotland, to make the proclamation thereby enacted, are ſheriffs, ſtewards, and bailies of regalities, or their deputies; magiſtrates of royal boroughs, and all other inferior judges and magiſtrates; high and petty conſtables, or other officers of the peace, in any county, ſtewartry, city, or town. And in that part of the iſland, the puniſhment of the offence is any thing ſhort of death which the judges, in their diſcretion, may appoint.

Sedition || Sedley.

SEDATIVES, in *Medicine*, a general name for ſuch medicines as weaken the powers of nature, ſuch as blood-letting, cooling ſalts, purgatives, &c.

SE-DEFENDENDO, in *Law*, a plea uſed for him that is charged with the death of another, by alleging that he was under a neceſſity of doing what he did in his own defence: as that the other aſſaulted him in ſuch a manner, that if he had not done what he did, he muſt have been in hazard of his own life. See HOMICIDE and MURDER.

SEDIMENT, the ſettlement or dregs of any thing, or that groſs heavy part of a fluid body which ſinks to the bottom of the veſſel when at reſt.

SEDLEY, SIR CHARLES, an Engliſh poet and wit the ſon of Sir John Sedley of Aylesford in Kent, was born about the year 1639. At the reſtoration he came to London to join the general jubilee; and commenced wit, courtier, poet, and gallant. He was ſo much admired, that he became a kind of oracle among the poets; which made King Charles tell him, that Nature had given him a patent to be Apollo's viceroy. The productions of his pen were ſome plays, and ſeveral delicately tender amorous poems, in which the ſoftneſs of the verſes was ſo exquiſite, as to be called by the duke of Buckingham *Sedley's witchcraft.* "There were no marks of genius or true poetry to be deſcried, (ſay the authors of the *Biographia Britannica*); the art wholly conſiſted in raiſing looſe thoughts and lewd deſires, without giving any alarm; and ſo the poiſon worked gently and irreſiſtibly. Our author, we may be ſure, did not eſcape the infection of his own art, or rather was firſt tainted himſelf before he ſpread the infection to others."—A very ingenious writer of the preſent day, however, ſpeaks much more favourably of Sir Charles Sedley's writings. "He ſtudied human nature; and was diſtinguiſhed for the art of making himſelf agreeable, particularly to the ladies; for the verſes of Lord Rocheſter, beginning with, *Sedley has that prevailing gentle art*, &c. ſo often quoted, allude not to his *writings*, but to his *perſonal addreſs.*" [*Langhorn's Effuſions*, &c.].—But while he thus grew in reputation for wit and in favour with the king, he grew poor and debauched: his eſtate was impaired, and his morals were corrupted. One of his frolics, however, being followed by an indictment and a heavy fine, Sir Charles took a more ſerious turn, applied himſelf to buſineſs, and became a member of parliament, in which he was a frequent ſpeaker. We find him in the houſe of commons in the reign of James II. whoſe attempts upon the conſtitution he vigorouſly withſtood; and he was very active in bringing on the revolution. This was thought more extraordinary, as he had received favours from James. But that prince had taken a fancy to Sir

Charles's

Charles's daughter (though it seems she was not very handsome), and, in consequence of his intrigues with her, he created Miss Sedley countess of Dorchester. This honour, so far from pleasing, greatly shocked Sir Charles. However libertine he himself had been, yet he could not bear the thoughts of his daughter's dishonour; and with regard to her exaltation, he only considered it as rendering her more conspicuously infamous. He therefore conceived a hatred for the king; and from this, as well as other motives, readily joined to dispossess him of the throne. A witty saying of Sedley's, on this occasion, is recorded. "I hate ingratitude, (said Sir Charles); and therefore, as the king has made my daughter a countess, I will endeavour to make his daughter a queen;" meaning the princess Mary, married to the prince of Orange, who dispossessed James of the throne at the revolution. He lived to the beginning of Queen Anne's reign; and his works were printed in two vols. 8vo. 1719.

SEDR, or SEDRE, the high-priest of the sect of Ali among the Persians. The sedre is appointed by the emperor of Persia, who usually confers the dignity on his nearest relation. The jurisdiction of the sedre extends over all effects destined for pious purposes, over all mosques, hospitals, colleges, sepulchres, and monasteries. He disposes of all ecclesiastical employments, and nominates all the superiors of religious houses. His decisions in matters of religion are received as so many infallible oracles: he judges of all criminal matters in his own house without appeal. His authority is balanced by that of the mudsitehid, or first theologue of the empire.

SEDUCTION, is the act of tempting and drawing aside from the right path, and comprehends every endeavour to corrupt any individual of the human race. This is the import of the word in its largest and most general sense; but it is commonly employed to express the act of tempting a virtuous woman to part with her chastity.

The *seducer* of female innocence practises the same stratagems of fraud to get possession of a woman's person, that the *swindler* employs to get possession of his neighbour's goods or money; yet the law of honour, which pretends to abhor *deceit*, and which impels its votaries to *murder* every man who presumes, however justly, to suspect them of fraud, or to question their veracity, applauds the address of a successful intrigue, though it be well known that the seducer could not have obtained his end without swearing to the truth of a thousand falsehoods, and calling upon God to witness promises which he never meant to fulfil.

The law of honour is indeed a very capricious rule, which accommodates itself to the pleasures and conveniences of higher life; but the law of the land, which is enacted for the equal protection of high and low, may be supposed to view the guilt of seduction with a more impartial eye. Yet for this offence, even the laws of this kingdom have provided no other punishment than a pecuniary satisfaction to the injured family; which, in England, can be obtained only by one of the quaintest fictions in the world, by the father's bringing his action against the seducer for the loss of his daughter's service during her pregnancy and nurturing. See Paley's *Moral Philosophy*, Book III. Part iii. Chap. 3.

The moralist, however, who estimates the merit or demerit of actions, not by laws of human appointment, but by their general consequences as established by the laws of nature, must consider the seducer as a criminal of the deepest guilt. In every civilized country, and in many countries where civilization has made but small progress, the virtue of women is collected as it were into a single point, which they are to guard above all things, as that on which their happiness and reputation wholly depend. At first sight this may appear a capricious regulation; but a moment's reflection will convince us of the contrary. In the married state so much confidence is necessarily reposed in the fidelity of women to the beds of their husbands, and evils so great result from the violation of that fidelity, that whatever contributes in any degree to its preservation, must be agreeable to him who, in establishing the laws of nature, intended them to be subservient to the real happiness of all his creatures. But nothing contributes so much to preserve the fidelity of wives to their husbands, as the impressing upon the minds of women the highest veneration for the virtue of chastity. She who, when unmarried, has been accustomed to grant favours to different men, will not find it easy, if indeed possible, to resist afterwards the allurements of variety. It is therefore a wise institution, and agreeable to the will of Him who made us, to train up women so as that they may look upon the loss of their chastity as the most disgraceful of all crimes; as that which sinks them in the order of society, and robs them of all their value. In this light virtuous women actually look upon the loss of chastity. The importance of that virtue has been so deeply impressed upon their minds, and is so closely associated with the principle of honour, that they cannot think but with abhorrence upon the very deed by which it is lost. He therefore who by fraud and falsehood persuades the unsuspecting girl to deviate in one instance from the honour of the sex, weakens in a great degree her moral principle; and if he reconcile her to a repetition of her crime, he destroys that principle entirely, as she has been taught to consider all other virtues as inferior to that of chastity. Hence it is that the hearts of prostitutes are generally steeled against the miseries of their fellow-creatures; that they lend their aid to the seducer in his practices upon other girls; that they lie and swear and steal without compunction; and that too many of them hesitate not to commit murder if it can serve any selfish purpose of their own.

The loss of virtue, though the greatest that man or woman can sustain, is not the only injury which the seducer brings on the girl whom he deceives. She cannot at once reconcile herself to prostitution, or even to the loss of character; and while a sense of shame remains in her mind, the misery which she suffers must be exquisite. She knows that she has forfeited what in the female character is most valued by both sexes; and she must be under the perpetual dread of a discovery. She cannot even confide in the honour of her seducer, who may reveal her secret in a fit of drunkenness, and thus rob her of her fame as well as of her virtue; and while she is in this state of anxious uncertainty, the agony of her mind must be insupportable. That it is so in fact, the many instances of child murder by unmarried women of every rank leave us no room to doubt. The affection of a mother to her new-born child is one of the most unequivocal and strongest instincts in human nature

nature (see INSTINCT); and nothing short of the extremity of distress could prompt any one so far to oppose her nature as to embrue her hands in the blood of her imploring infant.

Even this deed of horror seldom prevents a detection of the mother's frailty, which is indeed commonly discovered, though no child has been the consequence of her intrigue. He who can seduce is base enough to betray; and no woman can part with her honour, and retain any well-grounded hope that her amour shall be kept secret. The villain to whom she surrendered will glory in his victory, if it was with difficulty obtained; and if she surrendered at discretion, her own behaviour will reveal her secret. Her reputation is then irretrievably lost, and no future circumspection will be of the smallest avail to recover it. She will be shunned by the virtuous part of her own sex, and treated as a mere instrument of pleasure by the other. In such circumstances she cannot expect to be married with advantage. She may perhaps be able to captivate the heart of a heedless youth, and prevail upon him to unite his fate to her's before the delirium of his passion shall give him time for reflection; she may be addressed by a man who is a stranger to her story, and married while he has no suspicion of her secret; or she may be solicited by one of a station inferior to her own, who, though acquainted with every thing that has befallen her, can barter the delicacy of wedded love for some pecuniary advantage; but from none of these marriages can she look for happiness. The delirium which prompted the first will soon vanish, and leave the husband to the bitterness of his own reflections, which can hardly fail to produce cruelty to the wife. Of the secret, to which, in the second case, the lover was a stranger, the husband will soon make a discovery, or at least find room for harbouring strong suspicions; and suspicions of having been deceived in a point so delicate have hitherto been uniformly the parents of misery. In the third case, the man married her merely for money, of which having got the possession, he has no farther inducement to treat her with respect. Such are some of the consequences of seduction, even when the person seduced has the good fortune to get afterwards a husband; but this is a fortune which few in her circumstances can reasonably expect. By far the greater part of those who have been defrauded of their virtue by the arts of the seducer sink deeper and deeper into guilt, till they become at last common prostitutes. The public is then deprived of their service as wives and parents; and instead of contributing to the population of the state, and to the sum of domestic felicity, these outcasts of society become seducers in their turn, corrupting the morals of every young man whose appetites they can inflame, and of every young woman whom they can entice to their own practices.

All this complication of evil is produced at first by arts, which, if employed to deprive a man of his property, would subject the offender to the execration of his fellow-subjects, and to an ignominious death: but while the forger of a bill is pursued with relentless rigour by the ministers of justice, and the swindler loaded with universal reproach, the man who by fraud and forgery has enticed an innocent girl to gratify his desires at the expence of her virtue, and thus introduced her into a path which must infallibly lead to her own ruin, as well as to repeated injuries to the public at large, is not despised by his own sex, and is too often caressed even by the virtuous part of the other. Yet the loss of property may be easily repaired; the loss of honour is irreparable! It is vain to plead in alleviation of this guilt, that women should be on their guard against the arts of the seducer. Most unquestionably they should; but arts have been used which hardly any degree of caution would have been sufficient to counteract. It may as well be said that the trader should be on his guard against the arts of the forger, and accept of no bill without previously consulting him in whose name it is written. Cases, indeed, occur in trade, in which this caution would be impossible; but he must be little acquainted with the workings of the human heart, who does not know that situations likewise occur in life, in which it is equally impossible for a girl of virtue and tenderness to resist the arts of the man who has completely gained her affections.

The mentioning of this circumstance leads us to consider another species of seduction, which, though not so highly criminal as the former, is yet far removed from innocence; we mean the practice which is too prevalent among young men of fortune of employing every art in their power to gain the hearts of heedless girls whom they resolve neither to marry nor to rob of their honour. Should a man adhere to the latter part of this resolution, which is more than common fortitude can always promise for itself, the injury which he does to the object of his amusement is yet very great, as he raises hopes of the most sanguine kind merely to disappoint them, and diverts her affections perhaps for ever from such men as, had they been fixed on one of them, might have rendered her completely happy. Disappointments of this kind have sometimes been fatal to the unhappy girl; and even when they have neither deprived her of life, nor disordered her reason, they have often kept her wholly from marriage, which, whatever it be to a man, is that from which every woman expects her chief happiness. We cannot therefore conclude this article more properly than with warning our female readers not to give up their hearts hastily to men whose station in life is much higher than their own; and we beg leave to assure every one of them, that the man who solicits the last favour under the most solemn promise of a subsequent marriage, is a base seducer, who prefers a momentary gratification of his own to her honour and happiness through life, and has no intention to fulfil his promise. Or, if he should by any means be compelled to fulfil it, she may depend upon much ill treatment in return for her premature compliance with his base desires.

SEDUM, ORPINE, a genus of plants belonging to the decandria class, and in the natural method ranking under the 13th order, *Succulentæ*. See BOTANY *Index*.

SEED, in *Physiology*, a substance prepared by nature for the reproduction and conservation of the species both in animals and plants. See BOTANY and PHYSIOLOGY.

SEEDLINGS, among gardeners, denote such roots of gilliflowers, &c. as come from seed sown. Also the young tender shoots of any plants that are newly sown.

SEEDS, PRESERVATION OF, in a state fit for vegetation, is a matter of great and general importance, because,

cauſe, if it be poſſible to accompliſh it, we ſhall thus be enabled to rear many uſeful plants in one country which are there unknown, being indigenous only in others at a great diſtance from it.

A gentleman informs us, that many years ago he obſerved ſome ſeeds which had got accidentally among raiſins, being ſuch as are raiſed in England with difficulty, after being ſent from abroad in the uſual manner. He ſowed them in pots within a framing; and as every one of them grew, he ſent orders to his ſons, who were at that time abroad, to pack up all kinds of ſeeds they could procure, in abſorbent paper, and ſend ſome of them ſurrounded by raiſins, and others by brown moiſt ſugar; concluding, that the preſervation of the former ſeeds had been owing to a peculiarly favourable ſtate of the moiſture thus afforded them. He likewiſe concluded that, as many of our common ſeeds, ſuch as clover, charlock, &c. would lie dormant for ages within the earth, well preſerved for vegetation whenever they were thrown to its ſurface, and expoſed to the influence of the atmoſphere, ſo likewiſe might theſe foreign ſeeds be equally preſerved, at leaſt for many months, by the kindly covering and genial moiſture afforded them by ſugar or raiſins. This opinion was fully verified, as not one in twenty of them failed to vegetate, while the ſame ſpecies of ſeeds ſent home in common parcels along with them, did not vegetate at all. Having examined them prior to their being committed to the earth, he obſerved that there was a prevailing dryneſs in the latter, while the former looked healthy and freſh, not being in the ſmalleſt degree infeſted by inſects, as was the caſe with the others. It has been repeatedly tried to convey ſeeds cloſed up in bottles, but this method has failed of ſucceſs, a larger proportion of air, as well as a proper ſtate of moiſture, perhaps being neceſſary. It may be requiſite to obſerve, that no difference was made in the package of the ſeeds, reſpecting their being kept in huſks, pods, &c. ſo as to give thoſe preſerved in raiſins or ſugar any advantage over the others, the whole being ſent equally guarded by their natural teguments*.

* *Tranſactions of the Society of Arts*, vol. xvi.

SEEDY, in the brandy trade, a term uſed by the dealers to denote a fault that is found in ſeveral parcels of French brandy, which renders them unſaleable. The French ſuppoſe that theſe brandies obtain the flavour which they expreſs by this name, from weeds that grow among the vines from whence the wine of which this brandy is preſſed was made.

SEEING, the perceiving of external objects by means of the eye. For an account of the organs of ſight, and the nature of viſion, ſee ANATOMY and OPTICS *Index*.

SEEKS, a religious ſect ſettled at Patna, and ſo called from a word contained in one of the commandments of their founder, which ſignifies *learn thou*. In books giving an account of oriental ſects and oriental cuſtoms, we find mention made both of *Seeks* and *Seiks;* and we are ſtrongly inclined to think that the ſame tribe is meant to be denominated by both words. If ſo, different authors write very differently of their principles and manners. We have already related ſomething of the character of the *Seiks* under the article HINDOOS; but in the Aſiatic Reſearches, Mr Wilkins gives a much more amiable account of the *Seeks*, which we lay before our readers with pleaſure.

The Seeks are a ſect diſtinguiſhed both from the Muſſulmans and the worſhippers of Brahma; and, from our author's account of them, muſt be an amiable people. He aſked leave to enter into their chapel: They ſaid it was a place of worſhip, open to all men, but intimated that he muſt take off his ſhoes. On complying with this ceremony, he was politely conducted into the hall, and ſeated upon a carpet in the midſt of the aſſembly. The whole building forms a ſquare of about 40 feet. The hall is in the centre, divided from four other apartments by wooden arches, upon pillars of the ſame materials. The walls above the arches were hung with European looking-glaſſes in gilt frames, and with pictures. On the left hand, as one enters, is the chancel, which is furniſhed with an altar covered with cloth of gold, raiſed a little above the ground in a declining poſition. About it were ſeveral flower-pots and roſe-water bottles, and three urns to receive the donations of the charitable. On a low deſk, near the altar, ſtood a great book, of folio ſize, from which ſome portions are daily read in the divine ſervice. When notice was given that it was *noon*, the congregation arranged themſelves upon the carpet on each ſide of the hall. The great book and deſk were brought from the altar, and placed at the oppoſite extremity. An old ſilver-haired man kneeled down before the deſk, with his face towards the altar, and by him ſat a man with a drum, and two or three with cymbals. The book was now opened, and the old man began to chant to the time of the inſtruments, and at the concluſion of every verſe moſt of the congregation joined chorus in a reſponſe, with countenances exhibiting great marks of joy. Their tones were not harſh; the time was quick; and Mr Wilkins learned that the ſubject was a hymn in praiſe of the unity, omnipreſence, and omnipotence of the Deity. The hymn concluded, the whole company got up and preſented their faces, with joined hands, towards the altar in the attitude of prayer. The prayer was a ſort of litany pronounced by a young man in a loud and diſtinct voice; the people joining, at certain periods, in a general reſponſe. This prayer was followed by a ſhort bleſſing from the old man, and an invitation to the aſſembly to partake of a friendly feaſt. A ſhare was offered to Mr Wilkins, who was too polite to refuſe it. It was a kind of ſweetmeat compoſed of ſugar and flower mixed up with clarified butter. They were next ſerved with a few ſugar plums; and thus ended the feaſt and ceremony.

In the courſe of converſation Mr Wilkins learned that the founder of this ſect was *Naneek Sah*, who lived about 400 years ago; who left behind him a book, compoſed by himſelf in verſe, containing the doctrines he had eſtabliſhed; that this book teaches, that there is but one God, filling all ſpace, and pervading all matter; and that there will be a day of retribution, when virtue will be rewarded, and vice puniſhed. (Our author forgot to aſk in what manner). It forbids murder, theft, and ſuch other deeds as are by the majority of mankind eſteemed crimes, and inculcates the practice of all the virtues; but, particularly, a univerſal philanthropy and hoſpitality to ſtrangers and travellers. It not only commands univerſal toleration, but forbids diſputes with thoſe of another perſuaſion. If any one ſhow a ſincere inclination to be admitted among them, any five or more Seeks being aſſembled in any place, even on the highway, they ſend to the firſt ſhop where ſweet-

meats

meats are fold, and procure a very fmall quantity of a particular kind called *batâfâ* (Mr Wilkins does not tell us of what it is compofed), which having diluted in pure water, they fprinkle fome of it on the body and eyes of the profelyte, whilft one of the beft inftructed repeats to him the chief canons of their faith, and exacts from him a folemn promife to abide by them the reft of his life. They offered to admit Mr Wilkins into their fociety; but he declined the honour, contenting himfelf with their alphabet, which they told him to guard as the apple of his eye, as it was a facred character. Mr Wilkins finds it but little different from the Dewanagari. The language itfelf is a mixture of Perfian, Arabic, and Shanfcrit, grafted upon the provincial dialect of Punjah, which is a kind of Hindowee, or, as we commonly call it, *Moors*.

SEGALIEN, a large ifland feparated from the coaft of Chinefe Tartary by a narrow channel. It is called Tchoka by the natives, and Oku-Jeffu by the Chinefe. It is fituated between 46° and 54° N. Lat.; but its breadth from eaft to weft is unknown. The frigates under the command of Peroufe came to anchor in different bays, to the fineft of which, in 48° 59′ N. Lat. and 140° 32′ E. Long. from Paris, the French commodore gave the name of Baie d'Eftaing.

Segalien is well wooded, and mountainous towards the centre, but flat and level along the coaft, the foil of which is peculiarly favourable to agriculture; and vegetation is extremely vigorous. The whole furface is almoft covered with forefts of pine, birch, oak, and willow trees; and the feas, rivers, and brooks, abound with excellent falmon and trout. In general, the weather is mild and foggy; and the inhabitants are healthy and ftrong, and many of them live to an extreme old age. The prefents received by the natives from the French, were only valued in proportion to their utility. They make ufe of looms, which are complete inftruments, though fmall. The inhabitants in general do not exceed five feet in height, although fome of the talleft meafure about five feet four inches. Their countenances are animated and agreeable; their cheeks are large, their nofe rounded at the extremity; they have ftrong voices, and rather thick lips, which are of a dull red.

The women are not fo tall as the men, but of a more rounded and delicate form, with dreffes nearly fimilar; their upper lip is tattoed all over of a blue colour; the hair of their head is black, fmooth, and of a moderate ftrength, worn about fix inches long behind, and they cut it into a brufh on the top of their head and over the temples. They wear furtouts of fkin or quilted nankeen, which reaches to the calf of the leg, and fometimes lower, by which the ufe of drawers is in a great meafure rendered unneceffary. They all wear girdles, like the lower orders among the Chinefe, from which a knife is fufpended as a defence againft the bears, and a number of fmall pockets for holding their flint and fteel, pipe and box of tobacco, for they are very great fmokers. Their huts are fmall in proportion to the number of inhabitants they contain, but fufficient to defend them againft the rain and other inclemencies of the atmofphere. The roof confifts of two inclined planes, from 10 to 12 feet high at their union, and three or four on the fides; the breadth of the roof is 15, and its length 18 feet. They ufe iron pots in cooking, alfo fhells, veffels made of wood and birch bark, of different forms and workmanfhip. They have two meals a-day, the one at noon, and the other in the evening. Each family has its own hunting and fifhing implements, and their arms are bows, javelins, and a kind of fpontoon, which laft is employed in hunting the bear.

The only domeftic animals are dogs, of a middling fize, with fhaggy hair, pricked ears, and a long fharp muzzle, with a loud but not favage cry.

The people of Segalien are of a mild and unfufpicious difpofition, and appear to hold a commercial intercourfe with the Chinefe through the medium of the Mantchou Tartars, with the Ruffians to the north of their ifland, and the Japanefe to the fouth; but the articles of trade confift only of a few furs and whale oil.

SEGEBERG, a town of Germany, in the duchy of Holftein, and in Wagria; with a caftle ftanding on a high mountain, confifting of limeftone, large quantities of which are carried to Hamburg and Lubeck. It belongs to Denmark, and is feated on the river Treve, in E. Long. 10. 9. N. Lat. 54. 0.

SEGEDIN, a ftrong town of Lower Hungary, in the county of Czongrad, with a caftle. The Imperialifts took it from the Turks in 1686. It is feated at the confluence of the rivers Teffe and Mafroch, in E. Long. 20. 35. N. Lat. 46. 28.

SEGMENT *of a* CIRCLE, in *Geometry*, is that part of the circle contained between a chord and an arch of the fame circle.

SEGMENTS, LINE OF, two particular lines on Gunter's fector. They lie between the lines of fines and fuperficies, and are numbered, 5, 6, 7, 8, 9, 10. They reprefent the diameter of a circle, fo divided into 100 parts, that a right line drawn through thefe parts, and perpendicular to the diameter, fhall cut the circle into two fegments, the greater of which fhall have the fame proportion to the whole circle, as the parts cut off have to 100.

SEGNA, a city of Croatia, belonging to the houfe of Auftria, and feated on the coaft of the gulf of Venice. It was formerly a place of ftrength and great importance; but it has fuffered many calamities, and its inhabitants at prefent do not amount to 7000. In the beginning of this century it fent 50 merchant fhips to fea; but the inconveniency of its fituation and badnefs of its harbour, in which the fea is never calm, difcouraged navigation, and Segna has now very few fhips belonging to it. Among the cuftoms of the Segnans, Mr Fortis mentions one relative to the dead, which for its fingularity may be worthy of notice.

"All the relations and friends of the family go to kifs the corpfe, by way of taking leave, before burial. Each of them uncovers the face, over which a handkerchief is fpread, more or lefs rich according to the family; having kiffed the dead perfon, every one throws another handkerchief over the face; all which remain to the heirs, and fometimes there are 20, 30, and more at this ceremony. Some throw all thefe handkerchiefs into the grave with the corpfe, and this, in former times, was the general cuftom; but then they were rich. This feems to have been brought into ufe as a fubftitute for the ancient *vafi lachrymatorii*." E. Long. 15. 21. N. Lat. 45. 22.

Fortis's Travels into Dalmatia.

SEGNI, an ancient town of Italy, in the Campagna of

Sego, Segovia. of Rome, with a bishop's see, and the title of duchy. It is said that organs were first invented here. It is seated on a mountain. E. Long. 13. 15. N. Lat. 41. 50.

SEGO, the metropolis of the kingdom of Bambarra in Africa, on the banks of the Niger, in N. Lat. 14. 4. and W. Long. 2. 1. It consists of four distinct towns, two on the northern bank of the river, called Sego Korro, and Sego Boo; and two on the southern bank, called Sego Soo Korro, and Sego See Korro, all surrounded with lofty mud walls, and the houses are constructed of clay, several of them two stories high, and even white-washed. Mosques are to be seen in every quarter, and the streets, though narrow, are sufficiently broad for every useful purpose, where wheel-carriages are wholly unknown. According to Mr Park, the inhabitants of Sego amount to 30,000; and it is the constant residence of the king of Bambarra, a considerable part of whose revenue arises from the fare given by passengers for crossing the river. The people, however, are not so hospitable as in many other African towns, as the Moors are here very numerous, whose bigotry renders them the implacable enemies of every white man, if suspected of being a Christian.

Mr Park being therefore prohibited from living in Sego, resided for three days in an adjacent village, and was dismissed on the fourth, after receiving 5000 kowries from the king, to enable him to buy provisions in the course of his journey; and although it amounted only to 20s. sterling, so very cheap were the necessaries of life in Bambarra, that he found it sufficient to procure provisions for himself, and corn for his horse, for not fewer than 50 days.

SEGORBE, a town of Spain, in the kingdom of Valencia, with the title of a duchy, and a bishop's see. It is seated on the side of a hill, between the mountains, in a soil very fertile in corn and wine, and where there are quarries of fine marble. It was taken from the Moors in 1245; and the Romans thought it worth their while to carry some of the marble to Rome. W. Long. 0. 3. N. Lat. 39. 48.

SEGOVIA, an ancient city of Spain, of great power in the time of the Cæsars, is built upon two hills near the banks of the Arayda in Old Castile. W. Long. 3. 48. N. Lat. 41. 0. It is still a bishop's see, and is distinguished for some venerable remains of antiquity. In the year 1525 the city contained 5000 families, but now they do not surpass 2000, a scanty population for 25 parishes; yet, beside 21 churches and a cathedral, there are 21 convents.

The first object in Segovia that attracts the eye is the aqueduct, which the singular situation of the city renders necessary. As it is built upon two hills, and the valley by which they are separated, and extends considerably in every direction, it was difficult for a part of the citizens to be supplied with water. The difficulty was removed, according to the opinion of the learned, in the reign of Trajan, by this aqueduct, which is one of the most astonishing and the best preserved of the Roman works. In the opinion of Mr Swinburne, who surveyed it in 1776, and who seems to have given a very accurate account of the curiosities of Segovia, it is superior in elegance of proportion to the Pont du Gard at Nismes. It is so perfectly well preserved, that it does not seem leaky in any part. From the first low arches to the reservoir in the town, its length is 2400 Spanish feet; its greatest height (in the Plaza del Azobejo at the foot of the walls) is 104; it is there composed of a double row of arches, built of large square stones without mortar, and over them a hollow wall of coarser materials for the channel of the water, covered with large oblong flags. Of the lower range of arcades, which are 15 feet wide by 65 high, there are 42. The upper arches are 119 in number, their height 27 Spanish feet, their breadth seventeen, the transverial thickness, or depth of the piers, eight feet.

Swinburne's Travels through Spain.

The cathedral is a mixture of the Gothic and Moorish architecture. The inside is very spacious and of majestic simplicity. The windows are well disposed, and the great altar has been lately decorated with the finest Grenadan marble. But it is to be regretted, that in this cathedral, as well as in most others of Spain, the choir is placed in the middle of the nave. The church is nearly upon the model of the great church of Salamanca, but it is not so highly finished.

Travels in Spain by the Chev. de Bourgoanne.

The alcazar, or ancient palace of the Moors, stands in one of the finest positions possible, on a rock rising above the open country. A fine river washes the foot of the precipice, and the city lies admirably well on each side on the brow of the hill; the declivity is woody, and the banks charmingly rural; the snowy mountains and dark forests of Saint Ildefonzo compose an awful back-ground to the picture. Towards the town there is a large court before the great outward tower, which, as the prison of Gil Blas, is so well described by Le Sage, that the subject requires no farther explanation. The rest of the buildings form an antique palace, which has seldom been inhabited by any but prisoners since the reign of Ferdinand and Isabella, who were much attached to this situation. There are some magnificent halls in it, with much gilding in the ceilings, in a semi-barbarous taste. All the kings of Spain are seated in state along the cornice of the great saloon; but it is doubtful whether they are like the princes whose names they bear; if that resemblance, however, be wanting, they have no other merit to claim. The royal apartments are now occupied by a college of young gentlemen cadets, educated at the king's expence in all the sciences requisite for forming an engineer. The grand-master of the ordnance resides at Segovia, which is the head establishment of the Spanish artillery.

The mint is below the alcazar, a large building, the most ancient place of coinage in the kingdom. The machines for melting, stamping, and milling the coin, are worked by water: but there is reason to believe that Seville has at present more business, as being nearer the source of riches, the port of Cadiz, where the ingots of America are landed.

The unevenness of the crown of the hill gives a wild look to this city. Most of the streets are crooked and dirty, the houses wooden and very wretched; nor do the inhabitants appear much the richer for their cloth manufactory. Indeed, it is not in a very flourishing condition, but what cloth they make is very fine.

The country about Segovia has the reputation of being the best for rearing the kind of sheep that produces the beautiful Spanish wool; but as those flocks wander over many other parts of the kingdom, Segovia seems to have no exclusive title to this reputation. Segovia (says Mr Townsend, whose valuable travels will be read with much pleasure) was once famous for its cloth made on the

the king's account; but other nations have ſince become rivals in this branch, and the manufacture in this city has been gradually declining. When the king gave it up to a private company, he left about 3000l. in trade; but now he is no longer a partner in the buſineſs. In the year 1612 were made here 25,500 pieces of cloth, which conſumed 44,625 quintals of wool, employed 34,189 perſons; but at preſent they make only about 4000 pieces. The principal imperfections of this cloth are, that the thread is not even, and that much greaſe remains in it when it is delivered to the dyer; in conſequence of which the colour is apt to fail. Yet, independently of imperfections, ſo many are the diſadvantages under which the manufacture labours, that foreigners can afford to pay 3l. for the aroba of fine wool, for which the Spaniard gives no more than 20s. and after all his charges can command the market even in the ports of Spain.

Townſend's Journey through Spain.

SEGOVIA, *New*, a town of North America, in New Spain, and in the audience of Guatimala; ſeated on the river Yare, on the confines of the province of Honduras. W. Long. 84. 30. N. Lat. 13. 25.

SEGOVIA, a town of America, in Terra Firma, and in the province of Venezuela, ſeated on a river, near a very high mountain, where there are mines of gold. W. Long. 65. 30. N. Lat. 8. 20.

SEGOVIA, a town of Aſia, in the iſland of Manila, and one of the largeſt of the Philippines, ſeated at the north end of the iſland, 240 miles north of Manila, and ſubject to Spain. E. Long. 120. 59. N. Lat. 18. 36.

SEGREANT, is the herald's word for a griffin when drawn in a leaping poſture, and diſplaying his wings as if ready to fly.

SEGUE, in the Italian muſic, is often found before *aria*, *alleluja*, *amen*, &c. to ſhow that thoſe portions or parts are to be ſung immediately after the laſt note of that part over which it is writ; but if theſe words *ſi placet*, or *ad libitum*, are joined therewith, it ſignifies, that theſe portions may be ſung or not at pleaſure.

SEGUIERIA, a genus of plants belonging to the claſs polyandria. See BOTANY *Index*.

SEJANT, a term uſed in heraldry, when a lion, or other beaſt, is drawn in an eſcutcheon ſitting like a cat with his fore-feet ſtraight.

SEJANUS, ÆLIUS, a native of Vulſinum in Tuſcany, who diſtinguiſhed himſelf in the court of Tiberius. His father's name was Seius Strabo; a Roman knight, commander of the pretorian guards. His mother was deſcended from the Junian family. Sejanus firſt gained the favour of Caius Cæſar, the grandſon of Auguſtus, but afterwards he attached himſelf to the intereſt and the views of Tiberius, who then ſat on the imperial throne. The emperor, who was naturally of a ſuſpicious temper, was free and open with Sejanus, and while he diſtruſted others, he communicated his greateſt ſecrets to this fawning favourite. Sejanus improved this confidence; and when he had found that he poſſeſſed the eſteem of Tiberius, he next endeavoured to become the favourite of the ſoldiers, and the darling of the ſenate. As commander of the pretorian guards he was the ſecond man in Rome, and in that important office he made uſe of inſinuations and every mean artifice to make himſelf beloved and revered. His affability and condenſcenſion gained him the hearts of the common ſoldiers, and, by appointing his own favourites and adherents to places of truſt and honour, all the officers and centurions of the army became devoted to his intereſt. The views of Sejanus in this were well known; yet, to advance with more ſucceſs, he attempted to gain the affection of the ſenators. In this he met with no oppoſition. A man who has the diſpoſal of places of honour and dignity, and who has the command of the public money, cannot but be the favourite of thoſe who are in need of his aſſiſtance. It is even ſaid, that Sejanus gained to his views all the wives of the ſenators, by a private and moſt ſacred promiſe of marriage to each of them, whenever he had made himſelf independent and ſovereign of Rome. Yet, however ſucceſsful with the beſt and nobleſt families in the empire, Sejanus had to combat numbers in the houſe of the emperor; but theſe ſeeming obſtacles were ſoon removed. All the children and grandchildren of Tiberius were ſacrificed to the ambition of the favourite under various pretences; and Druſus the ſon of the emperor, by ſtriking Sejanus, made his deſtruction ſure and inevitable. Livia, the wife of Druſus, was gained by Sejanus; and, though the mother of many children, ſhe was prevailed upon to aſſiſt her adulterer in the murder of her huſband, and ſhe conſented to marry him when Druſus was dead. No ſooner was Druſus poiſoned, than Sejanus openly declared his wiſh to marry Livia. This was ſtrongly oppoſed by Tiberius; and the emperor, by recommending Germanicus to the ſenators for his ſucceſſor, rendered Sejanus bold and determined. He was more urgent in his demands; and, when he could not gain the conſent of the emperor, he perſuaded him to retire to ſolitude from the noiſe of Rome and the troubles of the government. Tiberius, naturally fond of eaſe and luxury, yielded to his repreſentations, and retired to Campania, leaving Sejanus at the head of the empire. This was highly gratifying to the favourite, but he was not without a maſter. Prudence and moderation might have made him what he wiſhed to be; but having offended the emperor beyond forgiveneſs, he reſolved to retrieve his loſs, and by one vigorous effort to decide the fate of the empire. He called together his friends and followers; he paid court to ſuch as ſeemed diſſaffected; he held forth rewards and promiſes; and, having increaſed the number of his partiſans, formed a bold conſpiracy, reſolved by any means to ſeize the ſovereign power.

Lempriere's Dictionary.

A powerful league was formed with aſtoniſhing rapidity, and great numbers of all deſcriptions, ſenators as well as military men, entered into the plot. Among theſe, Satrius Secundus was the confidential friend and prime agent of the miniſter. Whatever was this man's motive, whether fear, or views of intereſt, or ingratitude (for no principle of honour can be imputed to him), he reſolved to betray the ſecret to Tiberius. For this purpoſe he addreſſed himſelf to Antonia, the daughter of Anthony the triumvir, the widow of Druſus, and the mother of Germanicus. When this illuſtrious woman, who was honoured by the court and revered by the people, heard the particulars, ſhe ſent diſpatches to the emperor by one of her ſlaves. Tiberius was aſtoniſhed, but not diſmayed. The danger preſſed; his habitual ſlowneſs was out of ſeaſon; the time called for vigour and deciſive meaſures. He ſent Macro to Rome, with a ſpecial commiſſion to take upon him the command of the prætorian guards. He added full inſtructions for his

Murphy's Tacit. Book v.

Sejanus. his conduct in all emergencies. Early in the morning on the 15th, before the kalends of November, a report was ſpread, that letters had arrived at Rome, in which the emperor ſignified his intentions to aſſociate Sejanus with himſelf in the tribunitian power. The ſenate was ſummoned to meet in the temple of Apollo, near the imperial palace. Sejanus attended without delay. A party of the prætorians followed him. Macro met him in the veſtibule of the temple. He approached the miniſter with all demonſtrations of profound reſpect, and taking him aſide, "Be not ſurpriſed (he ſaid) that you have no letter from the prince: it is his pleaſure to declare you his colleague in the tribunitian power; but he thinks that a matter of ſo much importance ſhould be communicated to the fathers by the voice of the conſuls. I am going to deliver the emperor's orders." Sejanus, elated with joy, and fluſhed with his new dignity, entered the ſenate-houſe; Macro followed him. As ſoon as the conſuls arrived, he delivered the letter from Tiberius, and immediately went forth to the prætorian guards. He informed them, that by order of the prince, a large donative was to be diſtributed among the ſoldiers. He added, that, by a new commiſſion, he himſelf was appointed their commanding officer; and, if they followed him to the camp, they would there receive the promiſed bounty. The lure was not thrown out in vain: the prætorian guards quitted their ſtation. Laco, who ſtood near at hand, immediately ſurrounded the ſenate-houſe with a body of the city cohorts.

The letter to the conſuls was confuſed, obſcure, and tedious, only glancing at Sejanus, till at laſt the language of invective left no room for doubt. Sejanus kept his ſeat like a man benumbed, ſenſeleſs and ſtupid with aſtoniſhment. His friends, who a little before congratulated him on his new dignity, deſerted him on every ſide. He was commanded by the conſul to riſe and follow him, and being loaded with irons, was conducted to priſon. His downfal filled the city with exultation. The populace, who worſhipped him in the hour of proſperity, rejoiced to ſee the ſad cataſtrophe to which he was now reduced. They followed in crowds, rending the air with ſhouts, and pouring forth a torrent of abuſe and ſcurrilous language. The priſoner endeavoured to hide his face; but the mob delighted to ſee remorſe and ſhame and guilt and horror in every feature of his diſtracted countenance. They reviled him for his acts of cruelty; they laughed at his wild ambition; they tore down his images, and daſhed his ſtatues to pieces. He was doomed by Tiberius to ſuffer death on that very day; but, as he had a powerful faction in the ſenate, it was not thought adviſeable, for the mere formality of a regular condemnation, to hazard a debate. Private orders were given to Macro to diſpatch him without delay; but the conſul, ſeeing the diſpoſitions of the people, and the calm neutrality of the prætorian guards, judged it beſt to re-aſſemble the fathers. They met in the temple of Concord. With one voice Sejanus was condemned to die, and the ſentence was executed without delay. He was ſtrangled in the priſon. His body was dragged to the Gemoniæ, and, after every ſpecies of inſult from the populace, at the end of three days was thrown into the Tiber. Such was the tragic end of that ambitious favourite. He fell a terrible example to all, who, in any age or country, may hereafter endeavour by their vices to riſe above their fellow-citizens.

Seignior || Seiſin.

SEIGNIOR, is, in its general ſignification, the ſame with *lord*, but is particularly uſed for the lord of the fee as of a manor, as *ſeigneur* among the feudiſts is he who grants a fee or benefit out of the land to another; and the reaſon is, becauſe having granted away the uſe and profit of the land, the property or dominion he ſtill retains in himſelf.

SEIGNIORAGE, is a royalty or prerogative of the king, whereby he claims an allowance of gold and ſilver brought in the maſs to be exchanged for coin. As ſeigniorage, put of every pound weight of gold, the king had for his coin 5s. of which he paid to the maſter of the mint ſometimes 1s. and ſometimes 1s. 6d. Upon every pound weight of ſilver, the ſeigniorage anſwered to the king in the time of Edward III. was 18 pennyweights, which then amounted to about 1s. out of which he ſometimes paid 8d. at others 9d. to the maſter. In the reign of King Henry V. the king's ſeigniorage of every pound of ſilver was 15d. &c.

SEIGNIORY, is borrowed from the French *ſeigneurie*, i. e. *dominatus*, *imperium*, *principatus;* and ſignifies with us a manor or lordſhip, *ſeigniory de ſokemans*. *Seigniory in groſs*, ſeems to be the title of him who is not lord by means of any manor, but immediately in his own perſon; as *tenure in capite*, whereby one holds of the king, as of his crown, is *ſeigniory in groſs*.

SEIKS. See HINDOSTAN.

SEISIN, in *Law*, ſignifies poſſeſſion. In this ſenſe we ſay, *premier ſeiſin*, for the firſt poſſeſſion, &c.

Seiſin is divided into that *in deed* or *in fact*, and that *in law*. A ſeiſin in *deed* is where a poſſeſſion is actually taken: but a ſeiſin in *law* is, where lands deſcend, and the party has not entered thereon; or, in other words, it is where a perſon has a right to lands, &c. and is by wrong diſſeiſed of them. A ſeiſin in law is held to be ſufficient to avow on; though to the bringing of an aſſize, actual ſeiſin is required; and where ſeiſin is alleged, the perſon pleading it muſt ſhow of what eſtate he is ſeiſed, &c.

Seiſin of a ſuperior ſervice is deemed to be a ſeiſin of all ſuperior and caſual ſervices that are incident thereto; and ſeiſin of a leſſee for years, is ſufficient for him in reverſion.

Livery of SEISIN, in *Law*, an eſſential ceremony in the conveyance of landed property; being no other than the pure feodal inveſtiture, or delivery of corporal poſſeſſion of the land or tenement. This was held abſolutely neceſſary to complete the donation; *Nam feudam ſine inveſtitura nullo modo conſtitui potuit:* and an eſtate was then only perfect when, as Fleta expreſſes it in our law, *fit juris et ſeiſinæ conjunctio*. See FEOFMENT.

Inveſtitures, in their original riſe, were probably intended to demonſtrate in conquered countries the actual poſſeſſion of the lord; and that he did not grant a bare litigious right, which the ſoldier was ill qualified to proſecute, but a peaceable and firm poſſeſſion. And, at a time when writing was ſeldom practiſed, a mere oral gift, at a diſtance from the ſpot that was given, was not likely to be either long or accurately retained in the memory of byſtanders, who were very little intereſted in the grant. Afterwards they were retained as a public and notorious act, that the country might take notice of and

teſtify

Seisin. testify the transfer of the estate; and that such as claimed title by other means might know against whom to bring their actions.

In all well governed nations, some notoriety of this kind has been ever held requisite, in order to acquire and ascertain the property of lands. In the Roman law, *plenum dominium* was not said to subsist unless where a man had both the *right* and the *corporal possession*; which possession could not be acquired without both an actual intention to possess, and an actual seisin or entry into the premisses, or part of them in the name of the whole. And even in ecclesiastical promotions, where the freehold passes to the person promoted, corporal possession is required at this day to vest the property completely in the new proprietor; who, according to the distinction of the canonists, acquires the *jus ad rem*, or inchoate and imperfect right, by nomination and institution; but not the *jus in re*, or complete and full right, unless by corporal possession. Therefore in dignities possession is given by instalment; in rectories and vicarages by induction; without which no temporal rights accrue to the minister, though every ecclesiastical power is vested in him by institution. So also even in descents of lands, by our law, which are cast on the heir by act of the law itself, the heir has not *plenum dominium*, or full and complete ownership, till he has made an actual corporal entry into the lands: for if he dies before *entry* made, *his* heir shall not be entitled to take the possession, but the heir of the person who was last actually seised. It is not therefore only a mere right to enter, but the actual entry, that makes a man complete owner; so as to transmit the inheritance to his own heirs: *non jus, sed seisina, facit stipitem.*

Yet the corporal tradition of lands being sometimes inconvenient, a symbolical delivery of possession was in many cases anciently allowed; by transferring something near at hand, in the presence of credible witnesses, which by agreement should serve to represent the very thing designed to be conveyed; and an occupancy of this sign or symbol was permitted as equivalent to occupancy of the land itself. Among the Jews we find the evidence of a purchase thus defined in the book of Ruth: "Now this was the manner in former time in Israel, concerning redeeming and concerning changing, for to confirm all things: a man plucked off his shoe, and gave it to his neighbour; and this was a testimony in Israel." Among the ancient Goths and Swedes, contracts for the sale of lands were made in the presence of witnesses, who extended the cloak of the buyer, while the seller cast a clod of the land into it, in order to give possession; and a staff or wand was also delivered from the vender to the vendee, which passed through the hands of the witnesses. With our Saxon ancestors the delivery of a turf was a necessary solemnity to establish the conveyance of lands. And, to this day, the conveyance of our copyhold estates is usually made from the seller to the lord or his steward by delivery of a rod or verge, and then from the lord to the purchaser by re-delivery of the same in the presence of a jury of tenants.

Conveyances in writing were the last and most refined improvement. The mere delivery of possession, either actual or symbolical, depending on the ocular testimony and remembrance of the witnesses, was liable to be forgotten or misrepresented, and became frequently incapable of proof. Besides, the new occasions and necessities introduced by the advancement of commerce, required means to be devised of charging and incumbering estates, and of making them liable to a multitude of conditions and minute designations, for the purposes of raising money, without an absolute sale of the land; and sometimes the like proceedings were found useful in order to make a decent and competent provision for the numerous branches of a family, and for other domestic views. None of which could be effected by a mere, simple, corporal transfer of the soil from one man to another, which was principally calculated for conveying an absolute unlimited dominion. Written deeds were therefore introduced, in order to specify and perpetuate the peculiar purposes of the party who conveyed: yet still, for a very long series of years, they were never made use of, but in company with the more ancient and notorious method of transfer by delivery of corporal possession. Seisin.

Livery of seisin, by the common law, is necessary to be made upon every grant of an estate of freehold in hereditaments corporeal, whether of inheritance or for life only. In hereditaments incorporeal it is impossible to be made; for they are not the object of the senses: and in leases for years, or other chattel interests, it is not necessary. In leases for years indeed an actual *entry* is necessary, to vest the estate in the lessee: for a bare lease gives him only a right to enter, which is called his interest in the term, or *interesse termini*: and when he enters in pursuance of that right, he is then, and not before, in possession of his term, and complete tenant for years. This entry by the tenant himself serves the purpose of notoriety, as well as livery of seisin from the granter could have done; which, it would have been improper to have given in this case, because that solemnity is appropriated to the conveyance of a freehold. And this is one reason why freeholds cannot be made to commence *in futuro*, because they cannot (at the common law) be made but by livery of seisin; which livery, being an actual manual tradition of the land, must take effect *in præsenti*, or not at all.

Livery of seisin is either in *deed* or in *law*.

Livery in *deed* is thus performed. The feoffor, lessor, or his attorney, together with the feoffee, lessee, or his attorney, (for this may as effectually be done by deputy or attorney as by the principals themselves in person), come to the land or to the house; and there, in the presence of witnesses, declare the contents of the feoffment or lease on which livery is to be made. And then the feoffor, if it be of land, doth deliver to the feoffee, all other persons being out of the ground, a clod or turf, or a twig or bough there growing, with words to this effect: "I deliver these to you in the name of seisin of all the lands and tenements contained in this deed." But, if it be of a house, the feoffor must take the ring or latch of the door, the house being quite empty, and deliver it to the feoffee in the same form; and then the feoffee must enter alone, and shut the door, and then open it, and let in the others. If the conveyance or feoffment be of divers lands, lying scattered in one and the same county, then in the feoffor's possession, livery of seisin of any parcel, in the name of the rest, sufficeth for all; but if they be in several counties, there must be as many liveries as there are counties. For, if the title to these lands comes to be disputed, there must

must be as many trials as there are counties, and the jury of one county are no judges of the notoriety of a fact in another. Besides, anciently, this seisin was obliged to be delivered *coram paribus de vicineto*, before the peers or freeholders of the neighbourhood, who attested such delivery in the body or on the back of the deed; according to the rule of the feodal law, *Pares debent interesse investituræ feudi, et non alii*: for which this reason is expressly given; because the peers or vassals of the lord, being bound by their oath of fealty, will take care that no fraud be committed to his prejudice, which strangers might be apt to connive at. And though afterwards the ocular attestation of the *pares* was held unnecessary, and livery might be made before any credible witnesses, yet the trial, in case it was disputed, (like that of all other attestations), was still reserved to the *pares* or jury of the county. Also, if the lands be out on lease, though all lie in the same county, there must be as many liveries as there are tenants: because no livery can be made in this case, but by the consent of the particular tenant; and the consent of one will not bind the rest. And in all these cases it is prudent, and usual, to endorse the livery of seisin on the back of the deed, specifying the manner, place, and time of making it; together with the names of the witnesses. And thus much for livery in deed.

Livery in *law* is where the same is not made *on* the land, but *in sight of it* only; the feoffor saying to the feoffee, "I give you yonder land, enter and take possession." Here, if the feoffee enters during the life of the feoffor, it is a good livery, but not otherwise; unless he dares not enter through fear of his life or bodily harm; and then his continual claim, made yearly in due form of law, as near as possible to the lands, will suffice without an entry. This livery in law cannot, however, be given or received by attorney, but only by the parties themselves.

SEIZE, in the sea-language, is to make fast or bind, particularly to fasten two ropes together with rope-yarn. The seizing of a boat is a rope tied to a ring or little chain in the fore-ship of the boat, by which means it is fastened to the side of the ship.

SEIZURE, in commerce, an arrest of some merchandise, moveable, or other matter, either in consequence of some law or of some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, are subject to seizure. In seizures among us, one half goes to the informer, and the other half to the king.

SELAGO, a genus of plants belonging to the didynamia class; and in the natural method ranking under the 48th order, *Aggregatæ*. See BOTANY *Index*.

SELDEN, JOHN, called by Grotius *the glory of England*, was born at Salvington in Sussex in 1584. He was educated at the free school at Chichester; whence he was sent to Hart Hall in the university of Oxford, where he staid four years. In 1612, he entered himself in Clifford's Inn, in order to study the law; and about two years after removed to the Inner Temple, where he soon acquired great reputation by his learning. He had already published several of his works; and this year wrote verses in Latin, Greek, and English, upon Mr William Browne's Britannia's Pastorals. In 1614, he published his Titles of Honour; and in 1616, his Notes on Sir John Fortescue's book *De Laudibus Legum Angliæ*. In 1618, he published his History of Tythes; which gave great offence to the clergy, and was animadverted upon by several writers; and for that book he was called before the high commission court, and obliged to make a public acknowledgment of his sorrow for having published it. In 1621, being sent for by the parliament, though he was not then a member of that house, and giving his opinion very strongly in favour of their privileges in opposition to the court, he was committed to the custody of the sheriff of London, but was set at liberty after five weeks confinement. In 1623, he was chosen burgess for Lancaster; but, amidst all the divisions of the nation, kept himself neuter, prosecuting his studies with such application, that though he was the next year chosen reader of Lyon's Inn, he refused to perform that office. In 1625, he was chosen burgess for Great Bedwin in Wiltshire, to serve in the first parliament of King Charles I. in which he declared himself warmly against the duke of Buckingham; and on his Grace's being impeached by the House of Commons, was appointed one of the managers of the articles against him. In 1627 and 1628, he opposed the court party with great vigour. The parliament being prorogued to January 20. 1629, Mr Selden retired to the earl of Kent's house at Wrest, in Bedfordshire, where he finished his *Marmora Arundeliana*. The parliament being met, he, among others, again distinguished himself by his zeal against the court; when the king dissolving the parliament, ordered several of the members to be brought before the King's Bench bar, and committed to the Tower. Among these was Mr Selden, who insisting on the benefit of the laws, and refusing to make his submission, was removed to the King's Bench prison. Being here in danger of his life on account of the plague then raging in Southwark, he petitioned the lord high treasurer, at the end of Trinity term, to intercede with his Majesty that he might be removed to the Gate-house, Westminster, which was granted: but in Michaelmas term following, the judges objecting to the lord treasurer's warrant, by which he had been removed to the Gate-house, an order was made for conveying him back to the King's Bench, whence he was released in the latter end of the same year; but fifteen years after, the parliament ordered him 5000l. for the losses he had sustained on this occasion. He was afterwards committed with several other gentlemen, for dispersing a libel; but the author, who was abroad, being discovered, they were at length set at liberty. In 1634, a dispute arising between the English and Dutch concerning the herring-fishery on the British coast, he was prevailed upon by Archbishop Laud to draw up his *Mare Clausum*, in answer to Grotius's *Mare Liberum*: which greatly recommended him to the favour of the court. In 1640, he was chosen member for the university of Oxford; when he again opposed the court, though he might, by complying, have raised himself to very considerable posts. In 1643, he was appointed one of the lay-members to sit in the assembly of divines at Westminster, and was the same year appointed keeper of the records in the Tower. Whilst he attended his duty in the assembly, a warm debate arose respecting the distance of Jericho from Jerusalem. The party which contended for the shortest distance, urged, as a proof of their opinion being well founded, that fishes were carried from the one city to the other, and sold in the market. Their adversaries were ready to yield to the force of this conclusive argument, when Selden, who despised both parties, as well as the frivolousness of their dispute, exclaimed, "Perhaps the fishes were salted!" This unexpected remark left the victory doubtful, and renewed the debate; and our author, who was sick of such trifling, soon found employment more suited to his genius; for, in 1645, he was made one of the commissioners of the admiralty. The same year he was unanimously elected master of Trinity college, Cambridge; but declined accepting. He died in 1654; and was interred in the Temple-church, where a monument is erected to his memory. Dr Wilkes observes, that he was a man of uncommon gravity and greatness of soul, averse to flattery, liberal to scholars, charitable to the poor; and though he had great latitude in his principles with regard to ecclesiastical power, yet he had a sincere regard for the church of England. He wrote many learned works besides those already mentioned; the principal of which are, 1. *De Jure Naturali et Gentium juxta Disciplinam Hebræorum.* 1. *De Nuptiis et Divorciis.* 3. *De Anno Civili veterum Hebræorum.* 4. *De Nummis.* 5. *De Diis Syris.* 6. *Uxor Hebraica.* 7. *Jani Anglorum Facies altera,* &c. All his works were printed together in 1726, in 3 vols folio.

SELENITE, in *Mineralogy*, the crystallized sulphate of lime or gypsum. See LIME, in MINERALOGY *Index.* Selenite literally signifies *moon-stone*, and is pressive of the colour and soft lustre of the mineral.

SELENOGRAPHY, a branch of cosmography, which describes the moon and all the parts and appearances thereof, as geography does those of the earth. See MOON, and ASTRONOMY *Index.*

SELEUCIA, in *Ancient Geography*, surnamed *Babylonia*, because situated on its confines, at the confluence of the Euphrates and Tigris. Ptolemy places it in Mesopotamia. It is called also *Seleucia ad Tigrim*, (Polybius, Strabo, Isidorus Characenus); washed on the south by the Euphrates, on the east by the Tigris, (Theophylactus); generally agreed to have been built or enlarged by Seleucus Nicanor, master of the east after Alexander; by means of which Babylon came to be deserted. It is said to have been originally called *Coche*, (Ammian, Eutropius); though others, as Arrian, distinguish it, as a village, from *Selucia*: and, according to Zosimus, the ancient name of Selucia was *Zochasia.* Now called *Bagdad.* E. Long. 44. 21. N. Lat. 33. 10. There were many other cities of the same name, all built by Seleucus Nicanor.

SELEUCIDÆ, in *Chronology.* Era of the Seleucidæ, or the Syro-Macedonian era, is a computation of time, commencing from the establishment of the Seleucidæ, a race of Greek kings, who reigned as successors of Alexander the Great in Syria, as the Ptolemies did in Egypt. This era we find expressed in the books of the Maccabees, and on a great number of Greek medals struck by the cities of Syria, &c. The Rabbins call it the *era of contracts*, and the Arabs *therik dilkarnain*, that is, the "era of the two horns." According to the best accounts, the first year of this era falls in the year 311 B. C. being 12 years after Alexander's death.

SELEUCUS, NICANOR, one of the chief generals under Alexander the Great, and, after his death, founder of the race of princes called *Seleucidæ.* He is equally celebrated as a renowned warrior, and as the father of his people; yet his virtues could not protect him from the fatal ambition of Ceraunus, one of his courtiers, by whom he was assassinated 280 B. C.

SELF-HEAL, the PRUNELLA VULGARIS, Lin. This herb was recommended by the older physicians as a mild restringent and vulnerary; but its virtues appear to be very feeble, and therefore it is now rarely used.

SELF Command, is that steady equanimity which enables a man in every situation to exert his reasoning faculty with coolness, and to do what the present circumstances require. It depends much upon the natural temperament of the body, and much upon the moral cultivation of the mind. He who enjoys good health, and has braced his frame by exercise, has always a greater command of himself than a man of equal mental powers, who has suffered his constitution to become relaxed by indolence; and he who has from his early youth been accustomed to make his passions submit to his reason, must, in any sudden emergency, be more capable of acting properly than he who has tamely yielded to his passion. Hence it is that recluse and literary men, when forced into the bustle of public life, are incapable of acting where promptness is requisite; and that men who have once or twice yielded to a sense of impending danger seldom acquire afterwards that command of themselves which may be necessary to extricate them from subsequent dangers. In one of the earliest battles fought by the late king of Prussia, the sovereign was among the first men who quitted the field: had he behaved in the same manner a second and a third time, he would never have become that hero whose actions astonished Europe. A celebrated engineer among ourselves, who was well known to the writer of this short article, had little science, and was a stranger to the principles of his own art; but being possessed of a firm and vigorous frame, and having been accustomed to struggle with dangers and difficulties, he had such a constant command of himself, as enabled him to employ with great coolness every necessary resource in the day of battle.

But it is not only in battle, and in the face of immediate danger, that self-command is necessary to enable a man to act with propriety. There is no situation in life where difficulties, greater or less, are not to be encountered; and he who would pass through life with comfort to himself, and with utility to the public, must endeavour to keep his passions in constant subjection to his reason. No man can enjoy without inquietude what he cannot lose without pain; and no man who is overwhelmed with despondency under any sudden misfortune can exert the talents necessary to retrieve his circumstances. We ought, therefore, by every means to endeavour to obtain a constant command of ourselves; and nowhere shall we find better lessons for this purpose than in ancient Lacedemon. There certain occupations were appointed for each sex, for every hour, and for every season of life. In a life always active, the passions have no opportunity to deceive, seduce, or corrupt; and the nervous system acquires a firmness which makes it a fit instrument to a vigorous mind.

SELF-Defence implies not only the preservation of one's life, but also the protection of his property, because caufe without property life cannot be preferved in a civilized nation. The extent of property effential to life is indeed fmall, and this confideration may enable us to decide a queftion which fome moralifts have made intricate. By what means, it has been afked, may a man protect his property? May he kill the perfon who attacks it, if he cannot otherwife repel the attack?

That a man, in the ftate of nature, may kill the perfon who makes an attack on his life, if he cannot otherwife repel the attack, is a truth which has never been controverted; and he may do the fame in civil fociety, if his danger be fo imminent that it cannot be averted by the interpofition of the protection provided for individuals by the ftate. In all poffible fituations, except the three following, whatever is abfolutely neceffary to the prefervation of life may be lawfully performed, for the law of felf-prefervation is the firft and moft facred of thofe laws which are impreffed on every mind by the author of nature.

The three excepted fituations are thofe of a foldier in the day of battle, of a criminal about to fuffer by the laws of his country, and of a man called upon to renounce his religion. The foldier hazards his life in the moft honourable of all caufes, and cannot betray his truft, or play the coward, without incurring a high degree of moral turpitude. He knows that the very profeffion in which he is engaged neceffarily fubjects him to danger; and he voluntarily incurred that danger for the good of his country, which, with great propriety, annexes to his profeffion peculiar privileges and much glory. The criminal under fentence of death cannot, without adding to his guilt, refift the execution of that fentence; for the power of inflicting punifhment is effential to fociety, and fociety is the ordinance of God, (fee SOCIETY). The man who is called upon to renounce his religion ought to fubmit to the cruelleft death rather than comply with that requeft, fince religion is his only fecurity for future and permanent happinefs. But in every other fituation, that which is abfolutely neceffary to the prefervation of life is undoubtedly lawful. Hence it is, that a perfon finking in water is never thought to be guilty of any crime, though he drag his neighbour after him by his endeavours to fave himfelf; and hence, too, a man in danger of perifhing by fhipwreck may drive another from a plank which cannot carry them both, for fince one of two lives muft be loft, no law, human or divine, calls upon either of them to prefer his neighbour's life to his own.

But though the rights of felf-defence authorife us to repel every attack made upon our life, and in cafes of extremity to fave ourfelves at the expence of the life of our innocent neighbour, it is not fo evident that, rather than give to an unjuft demand a few fhillings or pounds, we may lawfully deprive a fellow creature of life, and the public of a citizen. A few pounds loft may be eafily regained; but life when loft can never be recovered. If thefe pounds, indeed, be the whole of a man's property; if they include his clothes, his food, and the houfe where he fhelters his head—there cannot be a doubt but that, rather than part with them, he may lawfully kill the aggreffor, for no man can exift without fhelter, food, and raiment. But it is feldom that an attempt is made, or is indeed practicable, to rob a man at once of all that he poffeffes. The queftion then of any importance is, May a man put a robber to death rather than part with a fmall part of his property? Mr Paley doubts whether he could innocently do fo in a ftate of nature, "becaufe it cannot be contended to be for the augmentation of human happinefs, that one man fhould lofe his life or limb, rather than another a pennyworth of his property." He allows, that in civil fociety the life of the aggreffor may be always taken away by the perfon aggrieved, or meant to be aggrieved, when the crime attempted is fuch as would fubject its perpetrator to death by the laws of his country.

It is not often that we feel ourfelves difpofed to differ in opinion from this moft valuable and intelligent writer; but on the prefent occafion we cannot help thinking that he does not reafon with his ufual precifion. To us he even feems to lofe fight of his own principles. No legiflature can have a right to take away life in civil fociety, but in fuch cafes as individuals have the fame right in a ftate of nature. If therefore a man in the ftate of nature, have not a right to protect his property by killing the aggreffor, when it cannot be otherwife protected, it appears to us felf-evident that no legiflature can have a right to inflict the punifhment of death upon fuch offences; but if the laws inflicting death upon the crime of robbery be morally evil, it is certain that an individual cannot be innocent when he prevents robbery by the death of the robber, merely becaufe he knows that the laws of his country have decreed that punifhment againft thofe convicted of that crime. But we think that the protection of property by the death of the aggreffor may be completely vindicated upon more general principles. It is neceffary, in every ftate, that property be protected, or mankind could not fubfift; but in a ftate of nature every man muft be the defender of his own property, which in that ftate muft neceffarily be fmall: and if he be not allowed to defend it by every mean in his power, he will not long be able to protect it at all. By giving him fuch liberty, a few individuals may, indeed, occafionally lofe their lives and limbs for the prefervation of a very fmall portion of private property; but we believe that the fum of human happinefs will be more augmented by cutting off fuch worthlefs wretches than by expofing property to perpetual depredation; and therefore, if general utility be the criterion of moral good, we muft be of opinion that a man may in every cafe lawfully kill a robber rather than comply with his unjuft demand.

But if a man may without guilt preferve his property by the death of the aggreffor, when it cannot be preferved by any other means, much more may a woman have recourfe to the laft extremity to protect her chaftity from forcible violation. This, indeed, is admitted by Mr Paley himfelf, and will be controverted by no man who reflects on the importance of the female character, and the probable confequences of the fmalleft deviation from the eftablifhed laws of female honour. See SEDUCTION.

SELF-Knowledge, the knowledge of one's own character, abilities, opinions, virtues, and vices. This has always been confidered as a difficult though important acquifition. It is difficult, becaufe it is difagreeable to inveftigate our errors, our faults, and vices; becaufe we are apt to be partial to ourfelves, even when we have done wrong; and becaufe time and habitual attention are

Self. are requisite to enable us to discover our real character. But these difficulties are more than counterbalanced by the advantages of self-knowledge.

By knowing the extent of our abilities, we shall never rashly engage in enterprises where our ineffectual exertions may be productive of harm: by investigating our opinions, we may discover those which have no foundation, and those also which lead us insensibly into vice. By examining our virtues and vices, we shall learn what principles ought to be strengthened, and what habits ought to be removed.

Man is a rational and intelligent being, capable of great improvement, and liable to great vices. If he act without examining his principles, he may be hurried by blind passion into crimes. If he aspire at noble and valuable acquisitions, he must act upon a plan, with deliberation and fore thought; for he is not like a vegetable, which attains perfection by the influence of external causes: he has powers within himself which must be exerted, and exerted with judgement, in order to attain the perfection of his nature. To enable him to employ these powers aright, he must know, first, what is his duty; and, secondly, he must often review his principles and conduct, that he may discover whether he is performing his duty, or in what circumstances he has failed. When he finds that he has fallen into error and vice, he will naturally inquire what causes have produced this effect, that he may avoid the same for the time to come. This is the method by which every reformation in religion and science has been produced, and the method by which the arts have been improved. Before Lord Bacon introduced the new way of philosophizing, he must first have considered wherein true philosophy consisted; secondly, he must have inquired in what respects the ancient method of philosophizing was false or useless: and after determining these two points, he was qualified to describe the way by which the study of philosophy could be successfully pursued without deviating into hypothesis and error. Luther found out the errors of the church of Rome by comparing their doctrines with the Scriptures. But had this comparison never been made, the reformation could never have taken place. Without self-knowledge, or without that knowledge of our character which is derived from a comparison of our principles and conduct with a perfect standard of morality, we can never form plans and resolutions, or make any exertion to abandon the vicious habits which we have contracted, and strengthen those virtuous principles in which we are deficient.

As much may be learned from the errors of those who have been in similar situations with ourselves; so many useful cautions may be obtained from our own errors; and he that will remember these, will seldom be twice guilty of the same vice.

It was evidently the intention of Providence that man should be guided chiefly by experience. It is by the observation which we make on what we see passing around us, or from what we suffer in our own persons, that we form maxims for the conduct of life. The more minutely [illegible] our principles, and the more maxims [illegible], we shall be the better fitted to attain moral [illegible].

With respect [illegible] to [illegible] the errors which we [illegible], either [illegible]

defects or by negligence, is also of great importance; Self. for the greatest genius and most profound scholar are liable to these errors, and often commit them as well as the weak and illiterate. But by observing them, and tracing them to their causes, they at length acquire an habitual accuracy. It is true, that men of feeble minds can never by knowing their own defects exalt themselves to the rank of genius; but such knowledge will enable them to improve their understandings, and so to appreciate their own powers, as seldom to attempt what is beyond their strength. They may thus become useful members of society; and though they will not probably be admired for their abilities, they will yet escape the ridicule which is poured upon vanity.

It is difficult to lay down precise rules for the acquisition of this self-knowledge, because almost every man is blinded by a fallacy peculiar to himself. But when one has got rid of that partiality which arises from self-love, he may easily form a just estimate of his moral improvements, by comparing the general course of his conduct with the standard of his duty; and if he has any doubt of the extent of his intellectual attainments, he will most readily discover the truth by comparing them with the attainments of others who have been most successful in the same pursuits. Should vanity arise in his mind from such a comparison, let him then compare the extent of his knowledge with what is yet to be known, and he will then be in little danger of thinking of himself more highly than he ought to think. See Prejudice and *Self Partiality*.

Self-Love, is that instinctive principle which impels every animal, rational and irrational, to preserve its life and promote its own happiness. It is very generally confounded with selfishness; but we think that the one propensity is distinct from the other. Every man loves himself; but every man is not selfish. The selfish man grasps at all *immediate* advantages, regardless of the consequences which his conduct may have upon his neighbour. Self-love only prompts him who is actuated by it to procure to himself the greatest possible sum of happiness during the whole of his existence. In this pursuit the rational self-lover will often forego a present enjoyment to obtain a greater and more permanent one in reversion; and he will as often submit to a present pain to avoid a greater hereafter. Self-love, as distinguished from selfishness, always comprehends the whole of a man's existence, and in that extended sense of the phrase, we hesitate not to say that every man is a self-lover; for, with eternity in his view, it is surely not possible for the most disinterested of the human race not to prefer himself to all other men, if their future and everlasting interests could come into competition. This indeed they never can do; for though the introduction of evil into the world, and the different ranks which it makes necessary in society, put it in the power of a man to raise himself, in the present state, by the depression of his neighbour, or by the practice of injustice, yet in the pursuit of a prize which is to be gained only by [illegible] righteousness, and piety, there can be no [illegible] competition. The success of [illegible] of the [illegible], self-love is [illegible] useful [illegible] It has [illegible] question in morals, whether it [illegible] action, however, [illegible]

Self.

Those who maintain the affirmative side of this question say, that the prospect of immediate pleasure, or the dread of immediate pain, is the only apparent motive to action in the minds of infants, and indeed of all who look not before them, and infer the future from the past. They own, that when a boy has had some experience, and is capable of making comparisons, he will often decline an immediate enjoyment which he has formerly found productive of future evil more than equivalent to all its good; but in doing so they think, and they think justly, that he is still actuated by the principle of self-love, pursuing the greatest good of which he knows himself to be capable. After experiencing that truth, equity, and benevolence in all his dealings is the readiest, and indeed the only certain method of securing to himself the kindness and good offices of his fellow creatures, and much more when he has learned that they will recommend him to the Supreme Being, upon whom depends his existence and all his enjoyments, they admit that he will practice truth, equity, and benevolence; but still, from the same principle, pursuing his own ultimate happiness as the object which he has always in view. The prospect of this great object will make him feel an exquisite pleasure in the performance of the actions which he conceives as necessary to its attainment, till at last, without attending in each instance to their consequences, he will, by the great associating principle which has been explained elsewhere (see METAPHYSICS, Part I. chap. i.) feel a refined enjoyment in the actions themselves, and perform them, as occasions offer, without deliberation or reflection. Such, they think, is the origin of benevolence itself, and indeed of every virtue.

Those who take the other side of the question, can hardly deny that self-love thus modified may prompt to virtuous and apparently disinterested conduct; but they think it degrading the dignity of a man to suppose him actuated solely by motives which can be traced back to a desire of his own happiness. They observe, that the Author of our nature has not left the preservation of the individual, or the continuance of the species, to the deductions of our reason, computing the sum of happiness which the actions necessary to these ends produce to ourselves: on the contrary, He has taken care of both, by the surer impulse of instinct planted in us for these very purposes. And is it conceivable, say they, that He would leave the care of our fellow-creatures a matter of indifference, till each man should be able to discover or be taught that by loving his neighbour, and doing him all the good in his power, he would be most effectually promoting his own happiness? It is dishonouring virtue, they continue, to make it proceed in any instance from a prospect of happiness, or a dread of misery; and they appeal from theory to fact, as exhibited in the conduct of savage tribes, who deliberate little on the consequences of their actions.

Their antagonists reply, that the conduct of savage tribes is to be considered as that of children in civilized nations, regulated entirely by the examples which they have before them; that their actions cannot be the offspring of innate instincts, otherwise savage virtues would, under similar circumstances, everywhere be the same, which is contrary to fact; that virtue proceeds from an interested motive on either supposition; and that the motive which the instinctive scheme holds up is the most selfish of the two. The other theory supposes, that the governing motive is the hope of *future* happiness and the dread of *future* misery; the instinctive scheme supplies a *present* motive in the self-complacency arising in the heart from a consciousness of right conduct. The former is a rational motive, the latter has nothing more to do with reason than the enjoyment arising from eating or drinking, or from the intercourse between the sexes. But we mean not to pursue the subject farther, as we have said enough on it in the articles BENEVOLENCE, INSTINCT, PASSION, and PHILANTHROPY. We shall therefore conclude with observing, that there is certainly a virtuous as well as a vicious self-love, and that "true self-love and social are the same."

SELF-Murder. See SUICIDE.

SELF-Partiality, is a phrase employed by some philosophers * to express that weakness of human nature through which men overvalue themselves when compared with others. It is distinguished from general partiality, by those who make use of the expression, because it is thought that a man is led to overrate his own accomplishments, either by a particular instinct, or by a process of intellect different from that by which he overrates the accomplishments of his friends or children. The former kind of partiality is wholly selfish; the latter partakes much of benevolence.

* *See Lord Kaimes's Art of Thinking.*

This distinction may perhaps be deemed plausible by those who consider the human mind as little more than a bundle of instincts; but it must appear perfectly ridiculous to such as resolve the greater part of apparent instincts into early and deep-rooted associations of ideas. If the partialities which most men have to their friends, their families, and themselves, be instinctive, they are certainly instincts of different kinds; but an instinctive partiality is a contradiction in terms. Partiality is founded on a comparison between two or more objects; but genuine instincts form no comparisons. See INSTINCT. No man can be said to be partial to the late Dr Johnson, merely for thinking highly of his intellectual powers; nor was the doctor partial to himself, though he thought in this respect with the generality of his countrymen; but if, upon a comparison with Milton, he was deemed the greater poet of the two, such a judgement will be allowed to be partial, whether formed by himself or by any of his admirers. We apprehend, however, that the process of its formation was the same in every mind by which it was held.

The origin of self-partiality is not difficult to be found: and our partialities to our friends may be traced to a similar source. By the constitution of our nature we are impelled to shun pain and to pursue pleasure; but remorse, the severest of all pains, is the never-failing consequence of vicious conduct. Remorse arises from the dread of that punishment which we believe will in a future state be inflicted on vice unrepented of in this; and therefore every vicious person endeavours by all possible means to banish that dread from his own mind. One way of effecting this is to compare his own life with the lives of others; for he fancies that if numbers be as wicked as himself, the benevolent Lord of all things will not involve them in one common ruin. Hence, by magnifying to himself the temptations which led him astray, and diminishing the injuries which his conduct has done in the world, and by adopting a course diametrically the reverse, when estimating the

the morality or immorality of the conduct of his neighbours, he soon comes to believe that he is at least not more wicked than they. Thus is self-partiality formed in the mind, and quickly blinds him who is under its influence so completely, as to hide from him the very faults which he sees and blames in others. Hence the coward thinks himself only cautious, the miser frugal. Partiality is formed in the very same manner to natural or acquired accomplishments, whether mental or corporeal. These always procure respect to him who is possessed of them; and as respect is accompanied with many advantages, every man wishes to obtain it for himself. If he fail in his attempts, he consoles himself with the persuasion that it is at least due to his merits, and that it is only withheld by the envy of the public. He compares the particular branch of science or bodily accomplishment in which he himself most excels, with those which have conferred splendor on his rival; and easily finds that his own excellencies are of the highest order, and entitled to the greatest share of public esteem. Hence the polite scholar despises the mathematician; the reader of Aristotle and Plato all the modern discoveries in physical and moral science; and the mere experimentalist holds in the most sovereign contempt a critical knowledge of the ancient languages. The pupil of the ancients denies the merits of the moderns, whilst the mere modern allows nothing to the ancients; and thus each becomes partial to his own acquisitions, and of course to himself, for having been at the trouble to make them.

Partiality to our friends and families is generated in the very same way. Whenever we acquire such an affection for them as to consider their happiness as adding to our own (see PASSION), we magnify their excellencies, and diminish their defects, for the same reason, and by the same process, that we magnify and diminish our own. All partialities, however, are prejudices, and prejudices of the worst kind. They ought therefore to be guarded against with the utmost care, by the same means which we have elsewhere recommended (see PREJUDICE and METAPHYSICS, N° 98.); and he who is partial to his own virtue or his own knowledge, will do well to compare the former, not with the conduct of his neighbour, but with the express rule of his duty; and to consider the latter as no farther valuable than as it contributes to the sum of human happiness.

SELIM I. emperor of the Turks, was the second son of Bajazet II. He made war upon his father, and though defeated in 1511, he at last dethroned him and took him prisoner, and immediately dispatched him by poison, together with his elder brother Achmet, and his younger Korkud, an amiable and enlightened prince. Having established his throne by these crimes, he marched against Campson-Guary sovereign of Egypt, gained a great victory at Aleppo, and slew their general. But though the sultan perished in that battle, the Mameluks determined to oppose the emperor. Selim entering their country at the head of his army, defeated the Egyptians in two battles, and ordered Toumonbai, the new elected sultan, who had fallen into his hands, to be hung on a gibbet. He then took Cairo and Alexandria, and in a short time reduced all Egypt to subjection. Thus ended the dominion of the Mameluks in Egypt, which had continued for more than 260 years. He confirmed the ancient privileges of the Venetians in Egypt and Syria, by which they carried on their commerce with India, and formed a league with them to destroy the power of the Portuguese in that country. (See INDIA, N° 37.) Selim had before this gained a great victory over the Persians, and stripped them of Tauris and Keman. He was preparing to attack Christendom when he was seized with an ulcerous sore in the back. Thinking that the air of Adrianople would restore his health, he ordered himself to be conducted thither; but he died at Clari in Thrace on his road to that city, in the year 1520, in the very spot where he had poisoned his father. He reigned eight years, and lived 54. He was a prince of great courage, sobriety, and liberality: he was fond of history, and wrote some verses. But these good qualities were obscured by the most abominable crimes that ever disgraced human nature; he made his way to the throne by shedding the blood of his father, and secured it by murdering his brothers and eight nephews, and every bashaw who had been faithful to his duty.

SELINUM, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 45th order, *Umbellatæ*. See BOTANY *Index*.

SELKIRK, ALEXANDER, whose adventures gave rise to a well-known historical romance, was born at Largo, in Fife-shire in Scotland, about the year 1676, and was bred a seaman. He went from England, in 1703, in the capacity of sailing-master of a small vessel called the *Cinque-Ports Galley*, Charles Pickering captain, burthen about 90 tons, with 16 guns and 63 men, and in September the same year sailed from Cork, in company with another ship of 26 guns and 120 men, called the St George, commanded by that famous navigator William Dampier, intended to cruise against the Spaniards in the South sea. On the coast of Brazil, Pickering died, and was succeeded in his command by his lieutenant Thomas Stradling. They proceeded on their voyage round Cape Horn to the island of Juan Fernandes, whence they were driven by the appearance of two French ships of 36 guns each, and left five of Stradling's men there on shore, who were taken off by the French. Hence they sailed to the coast of America, where Dampier and Stradling quarrelled, and separated by agreement, on the 19th of May 1704. In September following, Stradling came again to the island of Juan Fernandes, where Selkirk and his captain had a difference, which, with the circumstance of the ship's being very leaky, and in bad condition, induced him to determine on staying there alone; but when his companions were about to depart, his resolution was shaken, and he desired to be taken on board again. The captain, however, refused to admit him, and he was obliged to remain, having nothing but his clothes, bedding, a gun, and a small quantity of powder and ball; a hatchet, knife, and kettle; his books, and mathematical and nautical instruments. He kept up his spirits tolerably till he saw the vessel put off, when (as he afterwards related) his heart yearned within him, and melted at parting with his comrades and all human society at once.

" ——Yet believe me, Arcas,
Such is the rooted love we bear mankind,

 Al-

Selkirk.

All ruffians as they were, I never heard
A found fo difmal as their parting oars."
Thomfon's Agamemnon.

Thus left fole monarch of the ifland, with plenty of the neceffaries of life, he found himfelf in a fituation hardly fupportable. He had fifh, goat's flefh, turnips and other vegetables; yet he grew dejected, languid, and melancholy, to fuch a degree, as to be fcarce able to refrain from doing violence to himfelf. Eighteen months paffed before he could, by reafoning, reading his bible, and ftudy, he thoroughly reconciled to his condition. At length he grew happy, employing himfelf in decorating his huts, chafing the goats, whom he equalled in fpeed, and fcarcely ever failed of catching. He alfo tamed young kids, laming them to prevent their becoming wild; and he kept a guard of tame cats about him, to defend him when afleep from the rats, who were very troublefome. When his clothes were worn out, he made others of goats fkins, but could not fucceed in making fhoes, with the ufe of which, however, habit, in time, enabled him to difpenfe. His only liquor was water. He computed that he had caught 1000 goats during his abode in the ifland; of which he had let go 500, after marking them by flitting their ears. Commodore Anfon's people, who were there about 30 years after, found the firft goat which they fhot upon landing, was thus marked, and as it appeared to be very old, concluded that it had been under the power of Selkirk. But it appears by Captain Carteret's account of his voyage in the Swallow floop, that other perfons practifed this mode of marking, as he found a goat with his ears thus flit on the neighbouring ifland of Mas-a-fuera, where Selkirk never was. He made companions of his tame goats and cats, often dancing and finging with them. Though he conftantly performed his devotions at ftated hours, and read aloud; yet, when he was taken off the ifland, his language, from difufe of converfation, had become fcarcely intelligible. In this folitude he continued four years and four months; during which time only two incidents happened which he thought worth relating, the occurrences of every day being in his circumftances nearly fimilar. The one was, that, purfuing a goat eagerly, he caught it juft on the edge of a precipice, which was covered with bufhes, fo that he did not perceive it, and he fell over to the bottom, where he lay (according to Captain Roger's account) 24 hours fenfelefs; but, as he related to Sir R. Steele, he computed, by the alteration of the moon, that he had lain three days. When he came to himfelf, he found the goat lying under him dead. It was with great difficulty that he could crawl to his habitation, whence he was unable to ftir for ten days, and did not recover of his bruifes for a long time. The other event was the arrival of a fhip, which he at firft fuppofed to be French: and fuch is the natural love of fociety in the human mind, that he was eager to abandon his folitary felicity, and furrender himfelf to them, although enemies; but upon their landing, approaching them, he found them to be Spaniards, of whom he had too great a dread to truft himfelf in their hands. They were by this time fo near that it required all his agility to efcape, which he effected by climbing into a thick tree, being fhot at feveral times as he ran off. Fortunately the Spaniards did not difcover him, though they ftayed fome time under the tree where he was hid, and killed fome goats juft by. In this folitude Selkirk remained until the 2d of February 1709, when he faw two fhips come into the bay, and knew them to be Englifh. He immediately lighted a fire as a fignal; and on their coming on fhore, found they were the Duke Captain Rogers, and the Duchefs Captain Courtney, two privateers from Briftol. He gave them the beft entertainment he could afford; and, as they had been a long time at fea without frefh provifions, the goats which he caught were highly acceptable. His habitation confifting of two huts, one to fleep in, the other to drefs his food in, was fo obfcurely fituated, and fo difficult of accefs, that only one of the fhip's officers would accompany him to it. Dampier, who was pilot on board the Duke, and knew Selkirk very well, told Captain Rogers, that, when on board the Cinque-Ports, he was the beft feaman in the veffel; upon which Captain Rogers appointed him mafter's mate of the Duke. After a fortnight's ftay at Juan Fernandes, the fhips proceeded on their cruize againft the Spaniards; plundered a town on the coaft of Peru; took a Manilla fhip off California; and returned by way of the Eaft Indies to England, where they arrived the 1ft of October 1711; Selkirk having been abfent eight years, more than half of which time he had fpent alone in the ifland. The public curiofity being excited refpecting him, he was induced to put his papers into the hands of Defoe, to arrange and form them into a regular narrative. Thefe papers muft have been drawn up after he left Juan Fernandes, as he had no means of recording his tranfactions there. Captain Cooke remarks, as an extraordinary circumftance, that he had contrived to keep an account of the days of the week and month; but this might be done, as Defoe makes Robinfon Crufoe do, by cutting notches in a poft, or many other methods. From this account of Selkirk, Defoe took the idea of writing a more extenfive work, the romance of Robinfon Crufoe, and very difhoneftly defrauded the original proprietor of his fhare of the profits. Of the time or place or manner of this extraordinary man's death we have received no account; but in 1798 the cheft and mufket which Selkirk had with him on the ifland were in the poffeffion of his grand-nephew, John Selkirk weaver in Largo.

The circumftances of Selkirk's feclufion from human fociety during his ftay on Juan Fernandes, and the fentiments which that fituation naturally infpired, have been fo finely and characteriftically depicted by Mr Cowper, that many of our readers, we doubt not, will be gratified if we give the verfes alluded to a place here.

I am monarch of all I furvey,
 My right there is none to difpute;
From the centre all round to the fea,
 I am lord of the fowl and the brute.
Oh, folitude! where are the charms
 That fages have feen in thy face?
Better dwell in the midft of alarms,
 Than reign in this horrible place.
I am out of humanity's reach,
 I muft finifh my journey alone,
Never hear the fweet mufic of fpeech;
 I ftart at the found of my own.

The

Selkirk.

The beasts that roam over the plain,
My form with indifference see;
They are so unacquainted with man,
Their tameness is shocking to me.
Society, friendship, and love,
Divinely bestow'd upon man,
Oh, had I the wings of a dove,
How soon would I taste you again!
My sorrows I then might assuage
In the ways of religion and truth,
Might learn from the wisdom of age,
And be cheer'd by the sallies of youth.
Religion! what treasure untold
Resides in that heavenly word!
More precious than silver and gold,
Or all that this earth can afford.
But the sound of the church-going bell
These valleys and rocks never heard,
Ne'er sigh'd at the sound of a knell,
Or smil'd when a sabbath appear'd.
Ye winds that have made me your sport,
Convey to this desolate shore
Some cordial endearing report
Of a land I shall visit no more.
My friends, do they now and then send
A wish or a thought after me?
O tell me I yet have a friend,
Though a friend I am never to see.
How fleet is a glance of the mind!
Compar'd with the speed of its flight,
The tempest itself lags behind,
And the swift-winged arrows of light.
When I think of my own native land,
In a moment I seem to be there;
But alas! recollection at hand
Soon hurries me back to despair.
But the sea-fowl is gone to her nest,
The beast is laid down in his lair.
Ev'n here is a season of rest,
And I to my cabin repair.
There's mercy in every place;
And mercy, encouraging thought!
Gives even affliction a grace,
And reconciles man to his lot.

SELKIRK, the capital of the county of the same name, is a small town pleasantly situated on a rising ground, and enjoys an extensive prospect in all directions, especially in the course of the river Ettrick. It is remarkable for those plaintive airs produced in its neighbourhood, the natural simplicity of which are the pride of Scotland and the admiration of strangers.

The citizens of this burgh, like the other inhabitants of the sheriffdom of Ettrick forest, rendered themselves famous by adhering to the fortune of their sovereign James IV. Of 100 citizens who followed that monarch to the plains of Flodden, a few returned loaded with spoils taken from the English. Of the trophies of that day, there yet remains in the possession of the corporation of weavers, a standard taken by a member of that body. It may also be mentioned, that the sword of William Brydone, the town-clerk, who led the citizens to the battle, and was knighted for his valour, still remains, it is said, in the [illegible] citizen of Selkirk, his lineal descendent. The desperate valour of the citizens, however, so exasperated the English, that they reduced their defenceless town to ashes; but their grateful sovereign, James V. shewed his sense of their services by a grant of an extensive track of Ettrick forest, the trees for building their houses, and the property as a reward for their heroism. Selkirk is a royal burgh, uniting with Lanark, Linlithgow and Peebles, in sending a member to parliament. W. Long. 2. 46. N. Lat. 55. 26.

Selkirk || Selkirk-shire.

SELKIRK-SHIRE, called also the *Sheriffdom of Ettrick Forest*, a county of Scotland, extending about 20 miles in length from east to west, and about 12 in breadth from south to north. It borders on the north with part of Tweeddale and Mid-Lothian; on the south and east with Teviotdale; and on the west with Annandale. This county was formerly reserved by the Scottish princes for the pleasure of the chace, and where they had houses for the reception of their train. At that time the face of the country was covered with woods, in which there were great numbers of red and fallow deer, whence it had the name of *Ettrick Forest*. The woods, however, are now almost entirely cut down, and the county is chiefly supported by the breed of sheep. They are generally sold into the south, but sometimes into the Highlands, about the month of March, where they are kept during summer; and after being improved by the mountain-grass, are returned into the Lowlands in the beginning of winter.

This county, though not very populous at present, was once the nurse of heroes, who were justly accounted the bulwark of their native soil, being ever ready to brave danger and death in its defence. Of this we have a memorable proof in the pathetic lamentations of their wives and daughters for the disaster of the field of Flodden, "where their brave foresters were a' wed away." The rivers Ettrick and Yarrow unite a little above the town of Selkirk, and terminate in the Tweed. For five miles above its junction with the Etterick, the Tweed is still adorned with woods, and leads the pleased imagination to contemplate what this country must have been in former times. The Yarrow, for about five miles above its junction with Ettrick, exhibits nature in a bold and striking aspect. Its native woods still remain, through which the stream has cut its turbid course, deeply ingulphed amidst rugged rocks. Here, certainly in a flood, stood the descriptive Thomson when he saw it

Statist. Account of Scotland, vol. ii.

"Work and boil, and foam and thunder through."

On a peninsula, cut out by the surrounding stream, in the middle of this fantastically wild scene of grandeur and beauty, stand the castle of Newark, which has been supposed by many to be the birthplace of Mary Scot the flower of Yarrow.

The population of this county in 1801 amounted to 5070, but the following is the population of the different parishes at two different periods, according to the Statistical History.

SELL, or SILL, in building, is of two kinds, viz. *Ground Sell*, denoting the loweft piece of timber in a wooden building, and that on which the whole fuperftructure is raifed; and *fell of a window* or *of a door*, which is the bottom piece in the frame of them on which they reft.

SELLA TURCICA, is a deep impreffion between the clinoid procefs of the fphenoid bone. See ANATOMY *Index*.

SELTZER WATER, is a mineral water which fprings up at Lower Seltzer, a village in the electorate of Triers, about 10 miles from Frankfort on the Mayne, and 36 from Coblentz.

Seltzer water is brought to this country in ftone bottles, which are clofely corked and fealed, and contain about 3 pints each; and when they are well fecured, it keeps unchanged for a confiderable time.

Seltzer water, according to the analyfis of Bergman, contains in an Englifh wine pint,

	grs.
Carbonate of lime	3
——— of magnefia	5
——— of foda	4
Muriate of foda	17.5
	29.5

The fame quantity of water alfo yields 17 cubic inches of a gafeous fubftance, which is found to be almoft entirely pure carbonic acid gas.

This water has been long in high repute, on account of its medical virtues, and we have no doubt that it may be ufed with confiderable benefit in many of thofe complaints which arife from a deranged ftate of the ftomach and bowels. The ufual dofe of this water is from half a pint to a pint; but in moft cafes it may be drunk freely. From its agreeable tafte, and its exhilarating effects on the fpirits, it is extenfively employed at table as a common drink in Germany and Holland. In this country alfo, both the real and artificial Seltzer water is largely ufed for the fame purpofe. Seltzer water may be artificially imitated, by adding the ingredients diluted by analyfis, and in the fame proportion.

SEM, or SHEM, the fon of Noah, memorable for his filial piety in concealing the folly and difgrace of his father, for which he received a remarkable benediction, about 2476 B. C. He lived to the age of 600 years.

Ras SEM. See *RAS Sem* and *PETRIFIED City*.

SEMECARPUS, a genus of plants belonging to the pentandria clafs. See BOTANY *Index*.

SEMEN, SEED. See BOTANY *Index*.

With refpect to number, plants are either furnifhed with one feed, as fea-pink and biftort; two, as woodroof and the umbelliferous plants; three, as fpurge; four, as the lip-flowers of Tournefort and rough-leaved plants of Ray; or many, as ranunculus, anemone, and poppy.

The form of feeds is likewife extremely various, being either large or fmall, round, oval, heart-fhaped, kidney-fhaped, angular, prickly, rough, hairy, wrinkled, fleek or fhining, black, white, or brown. Moft feeds have only one cell or internal cavity; thofe of leffer burdock, valerian, lamb's lettuce, cornelian, cherry, and febeften, have two.

With refpect to fubftance, feeds are either foft, membranaceous, or of a hard bony fubftance; as in gromwell, tamarind, and all the nuciferous plants.

In point of magnitude, feeds are either very large, as in the cocoa-nut; or very fmall, as in campanula, *ammannia*, rampions, and throat-wort.

With refpect to fituation, they are either difperfed promifcuoufly through the pulp (*femina nidulantia*), as in water-lily; affixed to a future or joining of the valves of the feed-veffel, as in the crofs-fhaped and pea-bloom flowers; or placed upon a *placenta* or receptacle within the feed veffel, as in tobacco and thorn-apple.

Seeds are faid to be naked (*femina nuda*) which are not contained in a cover or veffel: fuch are thofe of the lip and compound flowers, the umbelliferous and rough-leaved plants. Covered feeds (*femina tecta*) are contained in fome veffel, whether of the capfule, pod, berry, apple, or cherry kind.

A fimple feed is fuch as bears neither crown, wing, nor downy *pappus*; the varieties in feeds, arifing from thefe circumftances, are particularly enumerated under their refpective heads.

In affimilating the animal and vegetable kingdoms, Linnæus denominates feeds the eggs of plants. The fecundity of plants is frequently marvellous; from a fingle plant or ftalk of Indian Turkey wheat, are produced, in one fummer, 2000 feeds; of elecampane, 3000; of fun-flower, 4000; of poppy, 32,000; of a fpike of cat's tail, 10,000 and upwards: a fingle fruit, or feed-veffel, of tobacco, contains 1000 feeds; that of white poppy, 8000. Mr Ray relates, from experiments made by himfelf, that 1012 tobacco feeds are equal in weight to one grain; and that the weight of the whole quantum of feeds in a fingle tobacco plant, is fuch as muft, according to the above proportion, determine their number to be 360,000. The fame author eftimates the annual produce of a fingle ftalk of fpleenwort to be upwards of one million of feeds.

The diffemination of plants refpects the different methods or vehicles by which nature has contrived to difperfe their feeds for the purpofe of increafe. Thefe by naturalifts are generally reckoned four.

1. Rivers and running waters. 2. The wind. 3. Animals. 4. An elaftic fpring, peculiar to the feeds themfelves.

1. The feeds which are carried along by rivers and torrents are frequently conveyed many hundreds of leagues from their native foil, and caft upon a very different climate, to which, however, by degrees they render themfelves familiar.

2. Thofe which are carried by the wind, are either *winged*, as in fir-tree, trumpet-flower, tulip-tree, birch, arbor-vitæ, meadow rue, and jeffamine, and fome umbelliferous plants; furnifhed with a *pappus*, or downy crown, as in valerian, poplar, reed, fucculent fwallow-wort, cotton-tree, and many of the compound flowers; placed

placed within a winged *calyx* or ſeed-veſſel, as in ſcabious, ſea-pink, dock, dioſcorea, aſh, maple, and elm-trees, logwood and woad; or laſtly, contained within a ſwelled *calyx* or ſeed-veſſel, as in winter cherry, cucubalus, melilot, bladder-nut, fumatory, bladder-ſena, heart-ſeed, and chick-peaſe.

3. Many birds ſwallow the ſeeds of vanelloe, juniper, miſletoe, oats, millet, and other graſſes, and void them entire. Squirrels, rats, parrots, and other animals, ſuffer many of the ſeeds which they devour to eſcape, and thus in effect diſſeminate them. Moles, ants, earthworms, and other inſects, by ploughing up the earth, admit a free paſſage to thoſe ſeeds which have been ſcattered upon its ſurface. Again, ſome ſeeds attach themſelves to animals, by means of crotchets, hooks, or hairs, which are either affixed to the ſeeds themſelves, as in hound's tongue, mouſe-ear, vervain, carrot, baſtard-parſley, ſanicle, water hemp-agrimony, *arctopus* and *verbeſina*; to their calyx, as in burdock, agrimony, *rhexia*, ſmall wild bugloſs, dock, nettle, pellitory, and ſeed-wort, or to their fruit or ſeed-veſſel, as in liquorice, enchanter's nightſhade, croſs-wort, cleavers, French honey-ſuckle, and arrow-headed graſs.

4. The ſeeds which diſperſe themſelves by an elaſtic force, have that force reſident either in their *calyx*, as in oats, and the greater number of ferns; in their *pappus*, as in centaurea crupina; or in their *capſule*, as in geranium, herb-bennet, African ſpiræa, fraxinella, horſe-tail, balſam, Malabar nut, cucumber, elaterium, and male balſam apple.

SEMEN, in the animal economy. See PHYSIOLOGY and ANATOMY *Index*.

SEMEN Sanctum, or *Santonicum*. See ARTEMISIA.

SEMENDRIAH, a town of Turkey in Europe, in the province of Servia, with a good citadel. It is the capital of a ſangiacate, was taken by the Turks in 1690, and is ſeated on the Danube, in E. Long. 21. 45. N. Lat. 45. 0.

SEMENTINÆ FERIÆ, in antiquity, feaſts held annually among the Romans, to obtain of the gods a plentiful harveſt. They were celebrated in the temple of Tellus, where ſolemn ſacrifices were offered to Tellus and Ceres. Theſe feaſts were held about ſeed-time, uſually in the month of January; for, as Macrobius obſerves, they were moveable feaſts.

SEMI, a word borrowed from the Latin, ſignifying *half*; but only uſed in compoſition with other words, as in the following articles.

SEMI-Arians, in eccleſiaſtical hiſtory, a branch of the ancient Arians, conſiſting, according to Epiphanius, of ſuch as, in appearance, condemned the errors of that hereſiarch, but yet acquieſced in ſome of the principles thereof, only palliating and hiding them under ſofter and more moderate terms. Though they ſeparated from the Arian faction (ſee ARIANS), they could never be brought to acknowledge that the Son was homoouſios, that is, conſubſtantial, or of the ſame ſubſtance with the Father; they would only allow him to be homoeuſios, that is, of a like ſubſtance with the Father, or ſimilar to the Father in his eſſence, not by nature, but by a peculiar privilege.

The ſemi-arianiſm of the moderns conſiſts in their maintaining that the Son was from all eternity begotten by the *will* of the Father, contrary to the doctrine of the orthodox, who ſeem to teach that the eternal generation is *neceſſary*. Such at leaſt are the reſpective opinions of Dr Clarke and Biſhop Bull. See THEOLOGY.

SEMICIRCLE, in *Geometry*, half a circle, or that figure comprehended between the diameter of the circle and half its circumference.

SEMICOLON, in *Grammar*, one of the points or ſtops uſed to diſtinguiſh the ſeveral members of a ſentence from each other.

The mark or character of the ſemicolon is (;), and has its name as being of ſomewhat leſs effect than a colon; or as demanding a ſhorter pauſe.

The proper uſe of the ſemicolon is to diſtinguiſh the conjunct members of a ſentence. Now, by a conjunct member of a ſentence is meant ſuch a one as contains at leaſt two ſimple members.—Whenever, then, a ſentence can be divided into ſeveral members of the ſame degree, which are again diviſible into other ſimple members, the former are to be ſeparated by a ſemicolon. For inſtance: "If fortune bear a great ſway over him, who has nicely ſtated and concerted every circumſtance of an affair; we muſt not commit every thing, without reſerve, to fortune, leſt ſhe have too great a hold of us." Again: *Si quantum in agro locisque deſertis audacia poteſt, tantum in foro atque judiciis impudentia valeret; non minus in cauſa cederet Aulus Cæcinna Sexta Æbutii impudentiæ, quam tum in vi facienda ceſſit audaciæ.* An inſtance in a more complex ſentence we have in Cicero: *Res familiaris primum bene parta ſit, nulloque turpi quæſtu: tum quam plurimis, modo dignis, ſe utilem præbeat; deinde augeatur ratione, diligentia, parſimonia; nec libidini potius luxuriæque, quam liberalitati et beneficentiæ pareat.*

But though the proper uſe of the ſemicolon be to diſtinguiſh conjunct members, it is not neceſſary that all the members thus divided be conjunct. For upon dividing a ſentence into great and equal parts, if one of them be conjunct, all thoſe other parts of the ſame degree are to be diſtinguiſhed by a ſemicolon.—Sometimes alſo it happens, that members that are oppoſite to each other, but relate to the ſame verb, are ſeparated by a ſemicolon. Thus Cicero: *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc ſcelus*, &c. To this likewiſe may be referred ſuch ſentences, where the whole going before, the parts follow as "The parts of oratory are four; invention, diſpoſition, elocution, and pronunciation."

SEMICUBIUM, in *Medicine*, an half-bath, wherein the patient is only placed up to the navel.

SEMIDIAMETER, half the diameter, or a right line drawn from the centre of a circle or ſphere to its circumference: being the ſame with what is otherwiſe called the *radius*.

SEMIFLOSCULUS, in *Botany*, a term uſed to expreſs the flowers of the ſyngeneſia claſs. Theſe ſemifloſculi are petals, hollow in their lower part, but in their upper flat, and continued in the ſhape of a tongue.

SEMITONE, in *Muſic*. See INTERVAL.

SEMINAL, ſomething belonging to the ſemen or ſeed.

SEMINARY, in its primary ſenſe, the ground where any thing is ſown, to be afterwards tranſplanted.

SEMINARY, in a figurative ſenſe, is frequently applied to places of education, whence ſcholars are tranſplanted into life.—In Catholic countries it is particularly used for a kind of college or school, where youth are instructed in the ceremonies, &c. of the sacred ministry. Of these there are great numbers; it being ordained by the council of Trent, that there be a seminary belonging to each cathedral, under the direction of the bishop.

SEMINATION, denotes the manner or act of shedding and dispersing the seeds of plants. See SEMEN.

SEMIPELAGIANS, in *Ecclesiastical History*, a name given to such as retain some tincture of Pelagianism. See PELAGIANS.

The doctrines of this sect, as well as those of their predecessors the Pelagians, have their common source in Pelagius, a native of Britain, of whom we have already taken notice. He is said to have been but a simple monk, and not in orders. Having gone to Rome about the end of the fourth century, he lived there for some years with reputation, and was considered both pious and virtuous. Rufinus a priest of Aquileia, having come to Rome in the year 397, is affirmed by some to have been the person who suggested to Pelagius his peculiar doctrines.

In the year 400 Pelagius began to teach his opinions at Rome, both by speech and writing. He was not the only person who taught these doctrines, of which we have elsewhere enumerated the heads. His friend and companion Celestius, an abler man than himself, maintained them likewise, and with much more address and subtlety. After having promulgated them in Rome, they went into Sicily, where they lived for some time. Thence, in the year 411, they passed over into Africa. Pelagius soon after went into Palestine, whilst Celestius remained at Carthage, and was preparing himself to take the order of priesthood; but it being soon discovered that he taught a new doctrine *, he was accused by the deacon Paulinus in a synod held at Carthage in 412, at which Aurelius the bishop presided. Celestius, on being charged by Paulinus with denying original sin, made answer, "That in truth he doubted whether the sin of Adam was transmitted to his posterity." He did not however own that children had no need of baptism, although this was one of the Pelagian tenets: on the contrary, he wrote a little discourse, in which he acknowledged, that children had need of redemption, and that they could not obtain it without baptism. The bishops at the council of Carthage condemned the doctrines of Celestius, and excommunicated him. From this sentence he appealed to the bishop of Rome; but he neglected to pursue his appeal, and went to Ephesus, where he endeavoured to get himself ordained priest. In the mean time, Pelagius having retired into Palestine, was kindly received by St Jerome's enemy, John of Jerusalem. With him he entered into an engagement to attack the reputation of that author. St Jerome defended himself from their fault, and attacked the doctrine of Pelagius †, and in this undertaking he was then assisted by St Austine. About this time, Orosius having come from Spain into Africa and thence into Palestine, published there the proceedings against Celestius at Carthage, and was present at a council by the bishop of Jerusalem wherein he held a conference with Pelagius in his presence; and the bishop having shown too much partiality for Pelagius, Orosius would not acknowledge him for judge, but demanded that the decision of that affair, which was among the Latins, might be referred to judges who understood the language. This happened in the year 415, at which time there were in Palestine two French prelates, who, being driven from their dioceses, fled into that country, and having been apprized of the opinions of Pelagius and Celestius, drew up an abridgement from their own books of the errors imputed to them ‡. To this they joined the articles condemned in the synod of Carthage, and some others, which were sent from Sicily by Hilarius to St Augustine, and then presented the abridgement to the bishop of Cæsarea. The matter was referred to a council of 14 bishops, at which, when the memoir was read, Pelagius explained himself upon some articles, and denied that he was the author of others. He also disowned the propositions condemned at Carthage, and some others ascribed to Celestius. He did not even hesitate to condemn them; upon which the bishops decided, that, since Pelagius approved the doctrine of the church, and rejected and condemned what was contrary to its belief, they acknowledged him to be of the ecclesiastical and catholic communion.

Orosius returning to Africa, took with him the memoir against Pelagius, and presented it to a meeting of bishops * held at Carthage in 416. Having read over what had been done at a former meeting against Celestius, they declared, that both he and Pelagius ought to be anathematized if they did not publicly renounce and condemn the errors imputed to them. The bishops of this meeting, and those of Numidia assembled the same year at Milivetum, wrote upon the subject to Pope Innocent, who approved of the judgement of the African prelates, and declared Pelagius, Celestius, and their followers excommunicated †. Innocent gave an account of this judgement to the bishops of the East, and the matter seemed altogether at an end, when he died; but Celestius having been made priest at Ephesus, and having gone to Constantinople, whence he was driven by Atticus bishop of that city, who also wrote against him to Asia and to Africa, he came to Rome in the beginning of the pontificate of Zozimus, and undertook to pursue the appeal, which he had formerly made from the judgement of the synod of Carthage. Having cited his accuser Paulinus, and offered to justify himself, he presented a Confession of Faith, in which he acknowledged that children ought to be baptized, in order to inherit the kingdom of heaven; but he denied that the sin of Adam was transmitted to his children. He appeared before the bishops and clergymen assembled by the pope, and declared, that he condemned all the errors with which he had been charged. The pope delayed his judgement for two months, and in the mean time received a letter and a confession of faith from Pelagius, very artfully drawn up. When the time for judgement arrived, Zozimus held a synod, and said, that he thought the declarations of Pelagius and Celestius sufficient for their justification. He was displeased at the two French bishops for not appearing against them, and wrote two letters on that head, one to the bishops of Africa, and another in particular to Aurelius, bishop of Carthage. The African bishops, to the number of 214, without regarding the judgement passed at Rome, assembled at Carthage, and, having confirmed their former decisions, condemned the doctrines of the Pelagians. They wrote to

Semipelagians.

to the biſhop of Reme to acquaint him, that he had been deceived by Celeſtius, and diſcovered to him the equivocations of his letter and of the Confeſſion of Faith of Pelagius, ſending him a memoir of the errors of which he ſhould require a diſtinct and preciſe revocation from the two heretics. The pope made anſwer, that, although his authority was ſo great, that none durſt diſſent from his judgement, ſtill that he was willing to communicate the matter to them, and would let it remain in the ſame ſtate, until a new deliberation could take place. This letter was preſented to a council held at Carthage in 418, at which eight canons were drawn up againſt the Pelagian hereſy. The biſhop of Rome, in the mean time, was inclined to examine again the affair of Celeſtius, and to endeavour to draw from him diſtinct and preciſe anſwers according to the plan ſuggeſted by the African biſhops in their memoir; but Celeſtius would not come forward, and accordingly withdrew from Rome. From his flight the pope concluded, that he impoſed upon him formerly, and that he held the new doctrines; and, accordingly, changing his opinion with reſpect to him, he approved of the decrees of the African prelates, and renewed the condemnations of his predeceſſor, Pope Innocent, againſt him and Pelagius *. This judgement he publiſhed in a letter which was ſent to all the biſhops. About the ſame time an edict was publiſhed by the emperor Honorius againſt Pelagius and Celeſtius, ordering, that they ſhould be baniſhed from Rome, and that all their followers ſhould be ſent into exile.

* See *the Letters of St Auguſtine.*

In the following year Honorius publiſhed another edict, by which it was ordered, that the biſhops who would not ſign the pope's letter, ſhould be deprived of their churches. Accordingly, Julian the biſhop of Eclana, who was afterwards head of the party, and ſeventeen other biſhops, were caſhiered; upon which they wrote a letter to Rufus, biſhop of Theſſalonica, and demanded a univerſal council from the emperor, which he refuſed. Celeſtius returned again to Rome, but was again expelled the city; whilſt his followers, being expelled from Italy, retired to different countries. Some of them came over into Britain, and others went into the Eaſt. Atticus baniſhed them from Conſtantinople, and they were alſo baniſhed from Epheſus. Theodotus, biſhop of Antioch, condemned them in a ſynod held at Dioſpolis, and baniſhed Pelagius and his followers out of Paleſtine, whither they had returned. Julian the biſhop was condemned in a provincial ſynod of Cilicia, whither he had retired to Theodorus biſhop of Mopſueſta, who was obliged to anathematize him. What became of Pelagius is unknown, as hiſtory gives no farther account of him; but Celeſtius having returned to Rome, and being driven thence by Pope Celeſtin, went with Julian and ſome other biſhops of their party to Conſtantinople, where they endeavoured to prevail upon the emperor Theodoſius to aſſemble a council, inſtead of which he ordered them to leave the city. After this they joined with the Neſtorians †, and were condemned together with them in a general council held at Epheſus in 431; and there now remained but a ſmall number of Pelagians diſperſed in the Weſt. Julian after having endeavoured ſeveral times to get himſelf reinſtated in his biſhopric, was at laſt obliged to retire into Sicily, where he died.

† *Proſper in his Chronicle.*

To the Pelagians ſucceeded the Semipelagians, who rejected the doctrines of the former with reſpect to original ſin and the power of free will to do good ‡. They owned, that man had need of the grace of God to perſevere in well-doing; but they believed, that the beginning of good will and faith did not neceſſarily depend upon grace; for that man, by the mere force of nature, might deſire to do good, and that God ſeconded that good will by his aſſiſtance, which depended upon liberty, and was given to all men. Beſides theſe, they maintained ſome other peculiar tenets. The origin of ſome of their opinions is founded in this, that ſome of the books which were written by St Auguſtine in his laſt years, with reſpect to the controverſies which aroſe in the monaſtery of Adrumetum, relative to correction, grace, and predeſtination, having been carried into Gaul, happened to give offence to ſeveral perſons, and particularly to the monks of Lerins, who conſidered his doctrines hoſtile to that of free will. This led them to think and to maintain, that, in order to be ſaved, it was neceſſary to leave to man the power of knowing and deſiring good by the force of nature, ſo that the beginning might come from man. Several conſiderable perſons in Gaul, and even ſome biſhops, but particularly the prieſts, were of this opinion. Caſſian, deacon of Conſtantinople, and afterwards prieſt at Marſeilles, authorized it in his conferences, and Fauſtus, biſhop of Riez, ſupported it very ſtrenuouſly. St Auguſtine ſtood up to oppoſe this doctrine from its very firſt appearance, and was ſupported by Proſper and Hilarius. Pope Celeſtin complained to the biſhops of Gaul, that they ſuffered their prieſts to ſpeak ill of the doctrines of St Auguſtine; and Popes Gelaſius and Hormiſdas condemned the books of Fauſtus; and laſt of all, the council of Orange, held in 529, condemned particularly the principal tenets of the Semipelagians, and put an end at that time to the controverſy, about 100 years after the death of St Auguſtine.—See the hiſtories of Moſheim, Dupin and Fleury, &c. &c.

‡ *Hilary's Letters to Auguſtine.*

The Semipelagians were very numerous; and their doctrines, though variouſly explained, were received in many of the monaſtic ſchools in Gaul, whence they ſpread themſelves far and wide through Europe. With reſpect to the Greeks and other Chriſtians of the Eaſt, we may remark, that they had adopted the Semipelagian tenets, even before they were promulgated in Gaul by Caſſian and Fauſtus.

After the period, however, at which the Semipelagian doctrines were condemned in the council of Orange, we find but little notice taken of this ſect by hiſtorians. Although its tenets were maintained by a few in the ſucceeding centuries, the ſect could boaſt of no eminent leaders, and ſunk into obſcurity. In the beginning, indeed, of the reformation, ſome of the Pelagian tenets were again brought into circulation. Every one is acquainted with the hoſtility of Luther to the doctrine of free will, who went ſo far into the oppoſite extreme as to entitle one of his works againſt the celebrated Eraſmus on this ſubject, "*De Servo Arbitrio.*" But notwithſtanding that Luther was their leader, this doctrine of his was not adopted by ſome of the moſt eminent of the reformers. His learned friend, the mild and worthy Melancthon, although he at firſt (either from not having ſufficiently conſidered the ſubject, or becauſe this doctrine was ſo unpalatable to the great body of the reformers on account of the authority of Luther), joined with

Semipelagians.

with Luther in his hostility to the doctrine of free will, so far as to say, that free will could have no effect, under the influence of grace, shortly after changed his opinion so as to run into the opposite extreme. For although Luther at his outset had affirmed, that the prescience of God annihilated free will in all his creatures, he was so softened down into moderation at the time of the drawing up of the famous Confession of Augsburg, as to allow Melancthon, who composed it, to insert these words, "that it was necessary to allow free-will to all who possessed the use of reason, not however in such things as regarded God, which they could not commence, *or at least which they could not complete*, without his assistance and grace, but in the affairs, or works, of the present life solely, and in order to perform their duty towards society *." In this passage two truths are clearly admitted: 1. That there is free-will in man; and 2. That of itself it has no efficacy in such works as are purely Christian or religious. But although this be evident, and although it would seem as if he attributed the efficacy of religious works solely to the grace of God, yet the restricting words "*at least*," show, that he was of opinion, that free-will, by its own natural force and efficacy, though it could not complete, *could at least commence*, Christian or religious works, without the assistance of grace. To such of our readers as are acquainted with ecclesiastical history, it is unnecessary to remark, that this was one of the leading tenets of the Semipelagians. But Melancthon did not stop here. It is true, that, in order to keep well with the reformers, he was obliged, in those public instruments which he drew up, to insinuate rather than avow his partiality for the doctrine of free-will, the exercise of which, we see, he confined in the Confession of Augsburg to such actions merely as regarded civil life and our duties to society. In the Saxon Confession of Faith, however, he proceeds a step farther, and says "that the will is free: that God neither wishes for, nor approves, nor co-operates in the production of sin; but that the free-will of man and of the devils is the true cause of their sin and of their fall." Many no doubt will be of opinion, that Melancthon merits praise for having thus corrected Luther, and for having more clearly expressed his own opinion, than he had done in the Confession of Augsburg. He even proceeds farther, and extends the exercise of free-will to religious or Christian works. For after having explained in the Saxon Confession of Faith the nature of free-will, and the manner in which it makes a choice, and having also shown, that it is not of itself sufficient in those works, or actions, which regard a future life, he affirms twice "that the will, even after having received the influence of the Holy Spirit, does not remain idle," that is to say, it is not merely passive under the influence of grace, but can reject it, or co-operate with it, at pleasure. Necessity, it is true, obliged him to express his opinion rather obscurely. But what he insinuates only in these last quoted words, is clearly and fully expressed in one of his letters to Calvin. "I had, says he, a friend who, in reasoning upon predestination, believed equally the two following things; namely, that every thing happens amongst men as it is ordained by Providence, but that there is, nevertheless, a contingency in actions or in events. He confessed, however, that he was unable to reconcile these two things. For my part, (continues Melancthon), who am of opinion, that God neither wishes for, nor is the cause of sin, I acknowledge this contingency in the feebleness of our judgement, in order that the ignorant may confess, that David fell of himself, and voluntarily, into sin; that he had it in his power to preserve the grace of the Holy Spirit which he had within him, and that in this combat, or trial, it is necessary to acknowledge some exercise or action of the will *". This opinion he confirms and illustrates by a passage from St Basil, where he says, "Have but the will, or the inclination, and God is with you." By which words Melancthon seems to insinuate, that the will is not only active in the works of religion, but even begins them without grace. This, however, was not the meaning of St Basil, as is evident from several other parts of his writings; but that it was the opinion of Melancthon appears fully from this passage, as well as from that which we have cited from the Confession of Augsburg, in which he insinuates, that the error is not in saying, that the will can of itself commence, but in thinking, that it can without grace finish or complete, religious or Christian works. Thus it appears, that he considered the will capable of rejecting the influence of grace, since he declares, that David could preserve the Holy Spirit when he lost it, as well as he could lose it when he kept it within him. But although this was his decided opinion, he durst not avow it fully in the Saxon Confession of Faith, but was obliged to content himself with insinuating it gently in these words, "The will, even after receiving the grace of the Holy Spirit, is not idle or without action." All this precaution, however, was insufficient to save Melancthon from censure. Francowitz, better known by the name of Illyricus, being jealous of him and his enemy, by his influence with his party procured the condemnation of these words of the Saxon Confession, and of the passage from St Basil, at two synods held by the Reformers; at the same time, that one party of the Lutherans were unwilling to adopt Melancthon's opinion, "that the will is not passive, when under the influence of grace," we are at a loss to think how they could deny it, since they almost unanimously confess, that a person under the influence of grace may reject and lose it. This opinion is avowed in the Confession of Augsburg and in Melancthon's Apology. It was even, long after that, decided upon anew, inculcated strongly in their book of Concord, and was brought frequently against them by their opponents as a proof of inconsistency and contradiction.

These are not the only instances in which the Lutherans were charged with Semipelagian principles. One of the ablest and the most learned of their opponents, we cannot help thinking, had in more than one instance made good the charge against them. To prove this we need only refer to the remarks that have been made on the eight celebrated propositions in the third book of Concord, relative to the co-operation of the will with grace. According to the first seven of these propositions, an attentive listening to the preaching of the word of God produceth grace; and according to the fifth, any man, even a libertine or an infidel, is free, or has it in his power to listen attentively to the preaching of the word of God. He has it then in his power to give to himself that which to him is productive of grace, and may thus be the sole author of his own conversion or

* See the 18th article, and Melancthon's Apology.

Semipelagians, Semiramis.

or regeneration. In the eighth propoſition it is affirmed, that we are not permitted to doubt, but that the grace of the Holy Spirit, even though it may not be felt, does accompany an attentive hearing of the word of God; and to do away every doubt about the ſpecies of attention which they mean, we muſt obſerve, that they ſpeak of attention in as much as it precedes the grace of the Holy Spirit, and of that attention which, in conſequence of its dependence on free-will, we have it in our power to beſtow upon the word or not, juſt as we pleaſe. It is the exerciſe of this free attention which they ſay operates grace. But here it would ſeem, that they were in extremes; for, as they ſaid upon one hand, that, when the Holy Spirit begins to move us, we act not at all; ſo they maintained on the other, that this operation of the Holy Spirit, which converts us without any co-operation on our part, is neceſſarily attendant upon an act of our wills, in which the Holy Spirit has no ſhare, and in which our liberty acts purely by its natural force or power. Such of our readers as are anxious to examine the progreſs of the Pelagian and Semipelagian principles after the dawn of the Reformation, we muſt refer to the works of the principal reformers and to thoſe of their adverſaries, as well as to the different writers upon eccleſiaſtical hiſtory.

SEMIRAMIS, in fabulous hiſtory, a celebrated queen of Aſſyria, daughter of the goddeſs Derceto, by a young Aſſyrian. She was expoſed in a deſert; but her life was preſerved by doves for one whole year, till Simmas, one of the ſhepherds of Ninus, found her and brought her up as his own child. Semiramis, when grown up, married Menones, the governor of Nineveh, and accompanied him to the ſiege of Bactria; where, by her advice and prudent directions, ſhe haſtened the king's operations, and took the city. Theſe eminent ſervices, together with her uncommon beauty, endeared her to Ninus. The monarch aſked her of her huſband, and offered him his daughter Soſana in her ſtead; but Menones, who tenderly loved Semiramis, refuſed; and when Ninus had added threats to entreaties, he hanged himſelf. No ſooner was Menones dead, than Semiramis, who was of an aſpiring ſoul, married Ninus, by whom ſhe had a ſon called *Ninyas*. Ninus was ſo fond of Semiramis, that at her requeſt he reſigned the crown, and commanded her to be proclaimed queen and ſole empreſs of Aſſyria. Of this, however, he had cauſe to repent: Semiramis put him to death, the better to eſtabliſh herſelf on the throne; and when ſhe had no enemies to fear at home, ſhe began to repair the capital of her empire, and by her means Babylon became the moſt ſuperb and magnificent city in the world. She viſited every part of her dominions, and left everywhere immortal monuments of her greatneſs and benevolence. To render the roads paſſable and communication eaſy, ſhe hollowed mountains and filled up valleys, and water was conveyed at a great expence by large and convenient aqueducts to barren deſerts and unfruitful plains. She was not leſs diſtinguiſhed as a warrior: Many of the neighbouring nations were conquered; and when Semiramis was once told as ſhe was dreſſing her hair, that Babylon had revolted, ſhe left her toilette with precipitation, and though only half dreſſed, ſhe refuſed to have the reſt of her head adorned before the ſedition was quelled and tranquillity re-eſtabliſhed. Semiramis has been accuſed of licentiouſneſs; and ſome authors have obſerved that ſhe regularly called the ſtrongeſt and handſomeſt men in her army to her arms, and afterwards put them to death, that they might not be living witneſſes of her incontinence. Her paſſion for her ſon was alſo unnatural; and it was this criminal propenſity which induced Ninyas to deſtroy his mother with his own hands. Some ſay that Semiramis was changed into a dove after death, and received immortal honours in Aſſyria. It is ſuppoſed that ſhe lived about 11 centuries before the Chriſtian era, and that ſhe died in the 62d year of her age and the 25th of her reign. Many fabulous reports have been propagated about Semiramis, and ſome have declared that for ſome time ſhe diſguiſed herſelf and paſſed for her ſon Ninyas. *Lempriere's Bibliotheca Claſſica.*

Semiramis, Senate.

SEMPERVIVUM, HOUSE LEEK, a genus of plants belonging to the claſs dodecandria; and in the natural method ranking under the 13th order, *Succulentæ*. See BOTANY *Index*.

SENAAR, or SENNAAR. See SENNAAR.

SENATE, in general, is an aſſembly or council of ſenators; that is, of the principal inhabitants of a ſtate, who have a ſhare in the government.

The ſenate of ancient Rome is of all others the moſt celebrated. It exerciſed no contentious juriſdiction; but appointed judges, either from among the ſenators or knights, to determine proceſſes: it alſo appointed governors of provinces, and diſpoſed of the revenues of the commonwealth, &c. Yet did not the whole ſovereign power reſide in the ſenate, ſince it could not elect magiſtrates, make laws, or decide of war and peace; in all which caſes the ſenate was obliged to conſult the people.

The ſenate, when firſt inſtituted by Romulus, conſiſted of 100 members; to whom he afterwards added the ſame number when the Sabines had migrated to Rome. Tarquin the ancient made the ſenate conſiſt of 300, and this number remained fixed for a long time; but afterwards it fluctuated greatly, and was increaſed firſt to 700, and afterwards to 900 by Julius Cæſar, who filled the ſenate with men of every rank and order. Under Auguſtus the ſenators amounted to 1000, but this number was reduced, and fixed to 600. The place of a ſenator was always beſtowed upon merit: the monarchs had the privilege of chooſing the members; and after the expulſion of the Tarquins, it was one of the rights of the conſuls, till the election of the cenſors, who from their office ſeemed moſt capable of making choice of men whoſe character was irreproachable, whoſe morals were pure, and relations honourable. Only particular families were admitted into the ſenate; and when the plebeians were permitted to ſhare the honours of the ſtate, it was then required that they ſhould be born of free citizens. It was alſo required that the candidates ſhould be knights before their admiſſion into the ſenate. They were to be above the age of 25, and to have previouſly paſſed through the inferior offices of quæſtor, tribune of the people, edile, pretor, and conſul.

The ſenate always met of courſe on the 1ſt of January, for the inauguration of the new conſuls; and in all months, univerſally, there were three days, viz. the kalends, nones, and ides, on which it regularly met: but it always met on extraordinary occaſions, when called together by conſul, tribune, or dictator.

To render their decrees valid and authentic, a certain number of members was requiſite, and ſuch as

 were

were abſent without ſome proper cauſe were always fined. In the reign of Auguſtus, 400 ſenators were requiſite to make a ſenate. Nothing was tranſacted before ſunriſe or after ſunſet. In their office the ſenators were the guardians of religion, they diſpoſed of the provinces as they pleaſed, they prorogued the aſſemblies of the people, they appointed thankſgivings, nominated their ambaſſadors, diſtributed the public money, and in ſhort had the management of every thing political or civil in the republic, except the creating of magiſtrates, the enacting of laws, and the declaration of war or peace, which were confined to the aſſemblies of the people.

SENATOR, in general, denotes a member of ſome ſenate.

The dignity of a Roman ſenator could not be ſupported without the poſſeſſion of 80,000 ſeſterces, or about 7000l. Engliſh money; and therefore ſuch as ſquandered away their money, and whoſe fortune was reduced below this ſum, were generally ſtruck out of the liſt of ſenators. This regulation was not made in the firſt ages of the republic, when the Romans boaſted of their poverty. The ſenators were not permitted to be of any trade or profeſſion. They were diſtinguiſhed from the reſt of the people by their dreſs; they wore the laticlave, half boots of a black colour, with a creſcent or ſilver buckle in the form of a C; but this laſt honour was confined only to the deſcendants of thoſe hundred ſenators who had been elected by Romulus, as the letter C ſeems to imply. See the preceding article.

Among us, ſenator is a member of parliament. In the laws of King Edward the Confeſſor, we are told that the Britons called thoſe *ſenators* whom the Saxons called afterwards *aldermen* and *borough-maſters*; though not for their age, but their wiſdom; for ſome of them were young men, but very well ſkilled in the laws. Kenulph king of the Mercians granted a charter, which ran thus, viz. *Conſilio et conſenſu* epiſcoporum *et* ſenatorum *gentis ſuæ largitus fuit dicto monaſterio*, &c.

In Scotland, the lords of ſeſſion are called *ſenators* of the college of juſtice.

SENATUS AUCTORITAS. See the next article.

SENATUS-Conſultum, which made part of the Roman law. When any public matter was introduced into the ſenate, which was always called *referre ad ſenatum*, any ſenator whoſe opinion was aſked, was permitted to ſpeak upon it as long as he pleaſed, and on that account it was often uſual for the ſenators to protract their ſpeeches till it was too late to determine. When the queſtion was put, they paſſed to the ſide of that ſpeaker whoſe opinion they approved, and a majority of votes was eaſily collected, without the trouble of counting the numbers. When the majority was known, the matter was determined, and a *ſenatus conſultum* was immediately written by the clerks of the houſe, at the feet of the chief magiſtrates, and it was ſigned by all the principal members of the houſe. When there was not a ſufficient number of members to make a ſenate, the deciſion was called *ſenatus auctoritas*, but it was of no force if it did not afterwards paſs into a *ſenatus conſultum*.

The *ſenatus conſulta* were at firſt left in the cuſtody of the kings, and afterward of the conſuls, who could ſuppreſs or preſerve them; but about the year of Rome 304, they were always depoſited in the temple of Ceres, and afterwards in the treaſury, by the ediles of the people.

SENECA, Lucius Annæus, a Stoic philoſopher, was born at Corduba in Spain, about the beginning of the Chriſtian era, of an equeſtrian family, which had probably been tranſplanted thither in a colony from Rome. He was the ſecond ſon of Marcus Annæus Seneca, commonly called the *rhetorician*, whoſe remains are printed under the title of *Suaſoriæ et Controverſiæ, cum Declamationum Excerptis*; and his youngeſt brother Annæus Mela (for there were three of them) had the honour of being father to the poet Lucan. He was removed to Rome, together with his father and the reſt of his family, while he was yet in his infancy. There he was educated in the moſt liberal manner, and under the beſt maſters. He learned eloquence from his father; but his genius rather leading him to philoſophy, he put himſelf under the ſtoics Attalus, Sotion, and Papirius Fabianus; men famous in their way, and of whom he has made honourable mention in his writings. It is probable, too, that he travelled when he was young, ſince we find him, in ſeveral parts of his works, particularly in his *Quæſtiones Naturales*, making very exact and curious obſervations upon Egypt and the Nile.—But this, though entirely agreeable to his own humour, did not at all correſpond with that ſcheme or plan of life which his father had drawn out for him; who, therefore, forced him to the bar, and put him upon ſoliciting for public employments; ſo that he afterwards became quæſtor, prætor, and, as Lipſius will have it, even conſul.

In the firſt year of the reign of Claudius, when Julia the daughter of Germanicus was accuſed of adultery by Meſſalina, and baniſhed, Seneca was baniſhed too, being charged as one of the adulterers. Corſica was the ſeat of his exile, where he lived eight years; "happy in the midſt of thoſe things which uſually make other people miſerable;" *inter eas res beatus, quæ ſolent miſeros facere*: and here he wrote his books of conſolation, addreſſed to his mother Helvia, and to his friend Polybius, and perhaps ſome of thoſe tragedies which go under his name; for he ſays, *modo ſe levioribus ſtudiis ibi oblectaſſe*. Agrippina being married to Claudius, upon the death of Meſſalina, ſhe prevailed with the emperor to recal Seneca from baniſhment; and afterwards procured him to be tutor to her ſon Nero, whom ſhe deſigned for the empire. Africanus Burrhus, a prætorian præfect, was joined with him in this important charge: and theſe two preceptors, who were entruſted with equal authority, had each his reſpective department. By the bounty and generoſity of his royal pupil, Seneca acquired that prodigious wealth which rendered him in a manner equal to kings. His houſes and walks were the moſt magnificent in Rome. His villas were innumerable: and he had immenſe ſums of money placed out at intereſt in almoſt every part of the world. The hiſtorian Dio reports him to have had 250,000l. ſterling at intereſt in Britain alone; and reckons his calling it in all at a ſum, as one of the cauſes of a war with that nation.

All this wealth, however, together with the luxury and effeminacy of a court, does not appear to have had any ill effect upon the temper and diſpoſition of Seneca. He continued abſtemious, exact in his manners, and, above all, free from the vices fo commonly prevalent in fuch places, flattery and ambition. "I had rather (faid he to Nero) offend you by fpeaking the truth, than pleafe you by lying and flattery: *maluerim veris offendere, quam placere adulando*." How well he acquitted himfelf in quality of preceptor to his prince, may be known from the five firft years of Nero's reign, which have always been confidered as a perfect pattern of good government; and if that emperor had but been as obfervant of his mafter through the whole courfe of it, as he was at the beginning, he would have been the delight, and not, as he afterwards proved, the curfe and deteftation of mankind. But when Poppæa and Tigellinus had got the command of his humour, and hurried him into the moft extravagant and abominable vices, he foon grew weary of his mafter, whofe life muft indeed have been a conftant rebuke to him. Seneca, perceiving that his favour declined at court, and that he had many accufers about the prince, who were perpetually whifpering in his ear the great riches of Seneca, his magnificent houfes and fine gardens, and what a favourite through means of thefe he was grown with the people, made an offer of them all to Nero. Nero refufed to accept them: which, however, did not hinder Seneca from changing his way of life; for, as Tacitus relates, he "kept no more levees, declined the ufual civilities which had been paid to him, and, under a pretence of indifpofition, or fome engagement or other, avoided as much as poffible appearing in public."

Nero, in the mean time, who, as it is fuppofed, had difpatched Burrhus by poifon, could not be eafy till he had rid himfelf of Seneca alfo: For Burrhus was the manager of his military concerns, and Seneca conducted his civil affairs. Accordingly, he attempted, by means of Cleonicus, a freedman of Seneca, to take him off by poifon; but this not fucceeding, he ordered him to be put to death, upon an information that he was privy to Pifo's confpiracy againft his perfon. Not that he had any real proof of Seneca's being concerned in this plot, but only that he was glad to lay hold of any pretence for deftroying him.—He left Seneca, however, at liberty to choofe his manner of dying; who caufed his veins to be opened immediately. His wife Paulina, who was very young in comparifon of himfelf, had yet the refolution and affection to bear him company, and thereupon ordered her veins to be opened at the fame time; but as Nero was not willing to make his cruelty more odious and infupportable than there feemed occafion for, he gave orders to have her death prevented: upon which her wounds were bound up, and the blood ftopped, in juft time enough to fave her; though, as Tacitus fays, fhe looked fo miferably pale and wan all her life after, that it was eafy to read the lofs of her blood and fpirits in her countenance. In the mean time, Seneca, finding his death flow and lingering, defired Statius Annæus his phyfician to give him a dofe of poifon, which had been prepared fome time before in cafe it fhould be wanted; but this not having its ufual effect, he was carried to a hot bath, where he was at length ftifled with the fteams. He died, as Lipfius conjectures, in the 63d or 64th year of his age, and in about the 10th or 11th of Nero's reign. Tacitus, on mentioning his death, obferves, that, as he entered the bath, he took of the water, and with it fprinkled fome of his neareft domeftics, faying, "That he offered thofe libations to Jupiter the Deliverer." Thefe words are an evident proof that Seneca was not a Chriftian, as fome have imagined him to have been; and that the 13 epiftles from Seneca to St Paul, and from St Paul to Seneca, are fuppofititious pieces. His philofophical works are well known.—They confift of 124 *epiftles* and diftinct treatifes; and, except his books of phyfical queftions, are chiefly of the moral kind, treating of anger, confolation, providence, tranquillity of mind, conftancy, clemency, the fhortnefs of life, a happy life, retirement, benefits. He has been juftly cenfured by Quintilian and other critics, as one of the firft corrupters of the Roman ftyle; but his works are highly valuable, on account of the vaft erudition which they difcover, and the beautiful moral fentiments which they contain.

SENECIO, GROUNDSEL; a genus of plants belonging to the clafs fyngenefia, and to the order of polygamia fuperflua; and in the natural method ranking under the 49th order, *Compofitæ*. See BOTANY *Index*.

SENEGAL, a part of Negroland in Africa, the boundaries of which are not known. See GUINEA.

Ifle of SENEGAL, fometimes called *Saint Louis*, is a fmall ifland in the mouth of the river Senegal, and according to Mafkelyne's tables is fituated in N. Lat. 15. 53. W. Long. 16. 31. The Dutch were the firft Europeans who fettled at Senegal; but their colony was expelled by the French in 1687. It was taken by the Englifh in 1692; and retaken by the French the year following. It was a fecond time taken poffeffion of by the Englifh in 1758; but in 1779 the French recovered it, and it was ceded by the Britifh crown by the treaty of 1783.

The beft account of this ifland which we have feen, is given in the interefting voyage of M. Saugnier to the coaft of Africa. This adventurer vifited Senegal in June 1785.

"The ifland (fays he), properly fpeaking, is only a bank of fand in the middle of the river. It is 1000 geometrical paces long, and about 60 in its greateft width; is almoft on a level with the river and with the fea, being defended from the latter by Barbary point, which is of greater elevation than the colony. The eaftern branch of the river is the more confiderable of the two, being about 400 toifes acrofs; the weftern branch is only from 50 to 200 toifes wide. The ifle confifts entirely of burning fands, on the barren furface of which you fometimes meet with fcattered flints, thrown out among their ballaft by veffels coming from Goree, or with the ruins of buildings formerly erected by Europeans. There is fcarcely fuch a thing as a garden upon the ifland; European feeds in general not thriving here. It is not furprifing that the foil is fo unproductive; for the air is ftrongly impregnated with fea falt, which pervades every thing, and confumes even iron in a very fhort fpace of time. The heats are exceffive, and rendered ftill more infupportable by the reflection of the fand; fo that from ten in the morning until four in the afternoon it is almoft impoffible to do any work. During the months of January, February, March, and April, the heats are moderated; but in Auguft and the following months they become fo oppreffive as even to affect the natives themfelves. What effect then muft they have upon the Europeans, fuddenly tranfported into this burning climate? The nights are a little lefs fultry; not always, however, but only when the fea-breeze fets in. It is then that the inhabitants of the colony breathe a frefher air, for which they have been

Senegal. been longing the whole of the day; but the air in our climate would seem a burning vapour. The nights are neverthelefs troublefome, notwithftanding the comforts of the fea-breeze. The inftant the fun is fet, we are affailed by an infinity of gnats, which are called *mufquitos;* their ftings are very painful, and their multitudes incredible. The inhabitants find but a poor defence in their gauze-curtains. For my own part, accuftomed as I had been to live among the Moors, I was but little annoyed by thefe infects. Being half a favage, I felt no defire to recommend myfelf to the favourable regard of the fair fex, and I was therefore under no neceffity of taking care of my perfon. In imitation of my former mafters, I fmeared myfelf with butter, and this expedient preferved me at all times from thefe impertinent ftingers, thefe fpiteful enemies to the repofe of the human kind.

" If the profpect of Senegal is not agreeable to the eye, much lefs are its environs, which are covered over only with fand, and overrun with mangoes. It may be faid, without exaggeration, that there is not a more forlorn fituation to be found on the face of the inhabited globe, or a place in which the common neceffaries of life are procured with greater difficulties. Water, that indifpenfable aliment of man, is here not potable. Wells are dug in the fand to the depth of five or fix feet, and water is obtained by thefe means; but whatever pains are taken to frefhen it, it ever retains a brackifh tafte. I have diftilled this water myfelf, and obferved that it always had a difagreeable favour, which cannot fail to be hurtful to the health: it is true, that when the river is high, its ftreams are frefh, but the water is only the more dangerous. It proves the caufe of moft of thofe maladies which carry off the Europeans fo rapidly, that at the end of every three years the colony has a frefh fet of inhabitants. The blacks themfelves, although accuftomed to the climate, are not in this feafon free from difeafe."

The fort of St Louis is a quadrangle, and has two baftions of confiderable ftrength; but the greateft fecurity of the fort is its natural fituation. The cannon of the fort are numerous, and the arfenal well fupplied with fmall arms and ftores. Befides this fort the French had no other upon the river, except Fort St Jofeph, which ftands about four leagues below the cataract at Govina, though they had a few factories in different parts.

The principal commodity of this country is that of gum Senegal (fee *Gum-Senegal*), which is a valuable branch of commerce, as it is ufed in many arts and manufactures, particularly by the painters in water-colours, the filk weavers, and dyers.

The French import from the river Senegal not only gum-arabic, but elephants teeth, hides, bees-wax, gold-duft, cotton, oftrich feathers, ambergris, indigo, and civet.

Notwithftanding the barrennefs of the fpot, Senegal contains more than 6000 negroes, including the captives of the Tapades, or negroes born of the black inhabitants of the country. They are never put up to fale unlefs convicted of fome crime. Their huts, conftructed in the form of bee-hives, and fupported upon four ftakes, furnifh the habitations of the negro inhabitants. The entire height of thefe huts may rife to about 12 feet, the width in every direction is commonly from 10 to 12. The beds are compofed of hurdles laid upon crofs-bars, fupported by forked ftakes at the height of about a foot from the ground. Here the flaves fleep promifcuoufly, men, women, girls, and boys. A fire is made in the middle of the hut, which is filled with fmoke, fufficient to ftifle any man but a negro. Senegal.

The men are tall, and the women are accounted the handfomeft negreffes of all Africa. The Senegalians may be confidered as the moft courageous people of that part of the world, without even excepting the Moors. Their courage, however, is more nearly allied to temerity than to bravery. In the courfe of the voyage to Galam, they meet the greateft dangers with gaiety and fong; they dread neither mufket nor cannon, and are equally fearlefs of the cayman or crocodile. Should one of their companions be killed, and devoured by thefe animals before their face, they are not deterred from plunging into the water, if the working of the fhip require it. Thefe excellent qualifications which diftinguifh them, and on which they value themfelves fo much, do not, however, preferve them from the common contagion of the country, which inclines them all to rapine. They are emulous to furpafs one another in all the arts of over-reaching and fraud. The conduct of the Europeans has, no doubt, encouraged thefe vices as much as the leffons of the marabous, who inculcate the duty of plundering the Chriftians to the utmoft of their power.

The Yolof negroes of Senegal are either Chriftians or Mahometans, or rather one and the other, or with more truth neither; religion being a matter of indifference to them. Thofe on the continent are of the fame way of thinking, and their religious practices are kept up only for the fake of form. A bar of iron, a few beads, will make them change their opinion at will. By fuch means are they acted upon; a fufficient proof of their want of all religious principle. The marabous, or priefts, and the men of their law, are no better than the reft. " I have examined the character of feveral of this order of men (fays M. Saugnier), and even among the nation of the Poules, who are confidered as great fanatics, I difcovered that they were only publicly attached to their opinions. ' This white man (fay they) does fo; he is better informed than I, and why fhould not I imitate his example?'" This way of reafoning is common to all that tract of country.

The colony of Senegal is furrounded with iflands, which, on account of the proximity of the fea, are all more unhealthy than that on which the town is built. They are full of ftanding pools, that, when dried up by the fun, exhale a putrid vapour that carries mortality with it, and defolates thefe iflands. It is doubtlefs the fame caufe that takes off fo many of the French at Senegal during the dangerous feafon of the year. This alfo may be in part occafioned by the bad quality of the water, which flows from the ponds in the neighbourhood of the colony, and though incorporated with that of the river, comes down little agitated by the current, and is eafily diftinguifhed by a vapidnefs of tafte. This particular is, in my opinion, effentially worthy of notice, and if properly attended to by our medical men, might become the means of preferving many lives.

SENEGAL-River, fee NIGER. As fo little is known refpecting this river, which is one of the greateft in Africa, any additional information muft be interefting.

 We

Senegal.

We shall therefore present our readers with the account contained in the communications presented to the Association for promoting the discovery of the Interior Parts of Africa, which, as far as we know, is the latest and most authentic.

The river known to Europeans by the name of *Niger* or *Senegal* runs on the south of the kingdom of Cashna, in its course towards Tombuctou; and if the report which Ben Alli heard in that town may be credited, it is afterwards lost in the sands on the south of the country of Tombuctou. In the map (A), only the known part of its course is marked by a line; and the suppositious part by dots. It may be proper to observe, that the Africans have two names for this river; that is, *Neel il Abeed*, or river of the Negroes; and *Neel il Kibeer*, or the great river. They also term the Nile (that is the Egyptian river) *Neel Shem;* so that the term *Neel*, from whence our Nile, is nothing more than the appellative of river; like Ganges, or Sinde.

Of this river the rise and termination are unknown, but the course is from east to west. So great is its rapidity, that no vessel can ascend its stream; and such is the want of skill, or such the absence of commercial inducements among the nations who inhabit its borders, that even with the current, neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds accommodations for the passage of himself and of his goods; but even there, though the ferrymen, by the indulgence of the sultan of Cashna, are exempted from all taxes, the boat which conveys the merchandise is nothing more than an ill-constructed raft; for the planks are fastened to the timbers with ropes, and the seams are closed both within and without by a plaster of tough clay, of which a large provision is always carried on the raft, for the purpose of excluding the stream wherever its entrance is observed.

The depth of the river at the place of passage, which is more than a hundred miles to the south of the city of Cashna, the capital of the empire of that name, is estimated at 23 or 24 feet English. Its depth is from 10 to 12 peeks, each of which is 27 inches.

Its width is such, that even at the island of Gongoo, where the ferrymen reside, the sound of the loudest voice from the northern shore is scarcely heard; and at Tombuctou, where the name of *Gnewa*, or black, is given to the stream, the width is described as being that of the Thames at Westminster. In the rainy season it swells above its banks, and not only floods the adjacent lands, but often sweeps before it the cattle and cottages of the short-sighted or too confident inhabitants.

That the people who live in the neighbourhood of the Niger should refuse to profit by its navigation, may justly surprise the traveller: but much greater is his astonishment, when he finds that even the food which the bounty of the stream would give, is uselessly offered to their acceptance; for such is the want of skill, or such the settled dislike of the people to this sort of provision, that the fish with which the river abounds are left in undisturbed possession of its waters.

Seneka || Senn.

SENEKA, or SENEGA, *Rattlesnake-root*, *Milk-wort*. See POLYGALA, BOTANY and MATERIA MEDICA Index.

SENESCHAL, (*Seneschallus*), derived from the German *sein*, "a house or place," and *scale*, "an officer." is a steward, and signifies one who has the dispensing of justice in some particular causes: As the high seneschal or steward of England: *Seneschal de la hotel de roy*, "steward of the king's household, seneschal, or steward of courts, &c." *Co. Lit.* 61. *Croke's Jurisd.* 102. *Kitch.* 83. See STEWARD.

SENN, a sort of itinerant cow-keeper in Switzerland, particularly in the canton of Appenzell. These men do not raise as much hay as is requisite for their cattle during the winter, and some of them have no grass lands. To supply this defect, they employ agents throughout the canton, whose province it is to inform them where good hay may be obtained, when the senn, who is in want of fodder, agrees with the more opulent farmers for the winter, to whom he successively drives his cattle when they return from the grass, in consequence of which he often visits five different places during the winter. The person who sells the hay provides the senn with stabling for his beasts, and with board and lodgings for himself and family. The senn pays the stipulated price for the hay, and allows his host as much milk, whey, and a kind of lean cheese, as may be made use of in the family, and also leaves him the manure of his cows. In the middle of April, the senn again issues forth with his herd to the fertile Alps, which he rents during the summer.

Fine cattle are the pride of the cow-keeper who inhabits the Alps. He adorns his best cows with large bells suspended from broad thongs, which are manufactured and sold by the inhabitants of the Tyrol. These are fastened round the cow's neck by means of a large buckle. The largest of these bells measure a foot in diameter, swelling out in the middle, and tapering towards the end. The whole peal of bells, including the thongs, is worth 150 guilders, while the apparel of the senn himself, even in his best attire, is not worth more than 20 guilders. These bells are chiefly worn in the spring, when driven to the Alps, and in the autumn or winter. It is surprising to see how proud and pleased the cows stalk forth when ornamented with their bells. One would scarcely imagine how sensible these animals are of their rank, and even touched with vanity and jealousy! Should the leading cow be deprived of her honours, she is grieved at the disgrace, which is manifested by her constant lowing, abstaining from food, and growing lean. The rival, on whom the badge of distinction has devolved, feels her marked vengeance, being wounded and persecuted by her in the most furious manner, until the former either recovers her bell, or is removed from the herd. However singular this may appear, it is rendered indisputable by the concurring testimony of centuries.

The voice of the senn brings the cows together, when dispersed on the Alps, who is then said to allure them. That the cattle can well distinguish the note of their keeper,

(A) The map alluded to is that which accompanies the volume which contains the proceedings of the Associations. This work was printed in 1791.

Senna, Sennaar.

keeper, appears from their haftening to him, though at a great diftance. He furnifhes that cow which is in the habit of ftraying fartheft with a fmall bell, and by her arrival he knows that all the reft are affembled.

SENNA, the leaf of the caffia fenna of Linnæus. See CASSIA, BOTANY and MATERIA MEDICA *Index*.

Senna appears to have been cultivated in England in the time of Parkinfon (1640); and Miller tells us, that by keeping thefe plants in a hotbed all the fummer, he frequently had them in flower; but adds, it is very rarely that they perfect their feeds in England. There can be little doubt, however, but that fome of the Britifh poffeffions may be found well enough adapted to the growth of this vegetable, and that the patriotic views of the Society for encouraging Arts, &c. which has offered a reward to thofe who fucceed in the attempt, will be ultimately accomplifhed.

Woodville's Medical Botany.

Senna, which is in common ufe as a purgative, was firft known to the Arabian phyficians Serapion and Mefue: the firft among the Greeks who takes any notice of it is Actuarius, but he only fpeaks of the fruit, and not of the leaves. To remove the difagreeable tafte of this medicine, Dr Cullen recommends coriander feeds; and, for preventing the gripings with which it is fometimes attended, he thinks the warmer aromatics, as cardamoms or ginger, would be more effectual.

The *Senna Italica*, or blunt-leaved fenna, is a variety of the Alexandrian fpecies; which, by its cultivation in the fouth of France (Provence), has been found to affume this change. It is lefs purgative than the pointed-leaved fenna, and is therefore to be given in larger dofes. It was employed as a cathartic by Dr Wright at Jamaica, where it grows on the fand banks near the fea.

Lond. Med. Jour. vol. viii.

SENNAAR, a country of Africa, bordering upon Abyffinia, with the title of a kingdom; the prefent government of which was eftablifhed in the 16th century by a race of negroes named, in their own language, *Shillook*. This country, together with all the northern parts of Africa, had been overrun by the Saracens during the rapid conquefts of the caliphs; but inftead of erecting any diftinct principalities here, as in other parts, they had incorporated themfelves with the old inhabitants called *Shepherds*, whom they found at their arrival; had converted them to their religion, and become one people with them. In 1504 the Shillook, a people before unknown, came from the weftern banks of the river Bahiar el Abiad, which empties itfelf into the Nile, and conquered the country; allowing the Arabs, however, to retain their poffeffions on condition of paying them a certain tribute. Thefe founded the city of Sennaar, and have ever fince continued to carry on an intercourfe with Egypt in the way of merchandife. At the eftablifhment of their monarchy the whole nation were Pagans, but foon after became converts to Mohammedanifm, and took the name of *Funge*, an appellation fignifying "lords or conquerors," and likewife free citizens. Mr Bruce, who paffed through this country in his return from Abyffinia, gives a lift of 20 kings who have reigned in it fince the conqueft of the Shillook.

This country is inhabited by a people fo barbarous and brutifh, that no hiftory of them can be expected. One of the moft remarkable of their cuftoms is, that the king afcends the throne with the expectation of being murdered whenever the general council of the nation thinks proper. The dreadful office of executioner belongs to one fingle officer, ftyled, in the language of the country, *Sid el Coom*; and who is always a relation of the monarch himfelf. It was from his regifters that Mr Bruce took the lift of the kings already mentioned, with the number of years they reigned, and which may therefore be received as authentic. The Sid el Coom in office at the time that Mr Bruce vifited this country was named Achmet, and was one of his beft friends. He had murdered the late king, with three of his fons, one of whom was an infant at its mother's breaft; he was alfo in daily expectation of performing the fame office to the reigning fovereign. He was by no means referved concerning the nature of his office, but anfwered freely every queftion that was put to him. When afked by Mr Bruce why he murdered the king's young fon in his father's prefence? he anfwered, that he did it from a principle of duty to the king himfelf, who had a right to fee his fon killed in a lawful and regular manner, which was by cutting his throat with a fword, and not in a more painful or ignominious way, which the malice of his enemies might poffibly have inflicted.

Sennaar.

Bruce's Travels, vol. iv.

The king, he faid, was very little concerned at the fight of his fon's death, but he was fo very unwilling to die himfelf, that he often preffed the executioner to let him efcape; but finding his intreaties ineffectual, he fubmitted at laft without refiftance. On being afked whether he was not afraid of coming into the prefence of the king, confidering the office he might poffibly have to perform? he replied, that he was not in the leaft afraid on this account; that it was his duty to be with the king every morning, and very late in the evening; that the king knew he would have no hand in promoting his death; but that, when the matter was abfolutely determined, the reft was only an affair of decency; and it would undoubtedly be his own choice, rather to fall by the hand of his own relation in private than by a hired affaffin, an Arab, or a Chriftian flave, in the fight of the populace. Baady the king's father, having the misfortune to be taken prifoner, was fent to Atbara to Welled Haffan the governor of that province to be put to death there. But the king, who was a ftrong man, and always armed, kept fo much upon his guard, that Welled could find no opportunity of killing him but by running him through the back with a lance as he was wafhing his hands. For this Welled himfelf was afterwards put to death; not on account of the murder itfelf, but becaufe, in the firft place, he, who was not the proper executioner, had prefumed to put the king to death; and, in the next, becaufe he had done it with a lance, whereas the only lawful inftrument was a fword.

On the death of any of the fovereigns of this country, his eldeft fon fucceeds to the throne of courfe; on which as many of his brothers as can be found are apprehended, and put to death by the Sid el Coom in the manner already related. Women are excluded from the fovereignty here as well as in Abyffinia. The princeffes of Sennaar, however, are worfe off than thofe of Abyffinia, having no fettled income, nor being treated in any degree better than the daughters of private perfons. The king is obliged, once in his lifetime, to plough and fow a piece of ground; whence he is named *Baady*, the "countryman or peafant;" a title

Sennaar.

title as common among the monarchs of Sennaar as Cæſar was among the Romans. The royal family were originally negroes; but as the kings frequently marry Arab women, the white colour of the mother is communicated to the child. This, we are told by Mr Bruce, is invariably the caſe, when a negro man of Sennaar marries an Arab woman; and it holds equally good, when an Arab man marries a negro woman; and he likewiſe informs us, that he never ſaw one black Arab all the time he was at Sennaar.

The ſoil and climate of this country is extremely unfavourable both to man and beaſt. The men are ſtrong and remarkable for their ſize, but ſhort lived; and there is ſuch a mortality among the children, that were it not for a conſtant importation of ſlaves, the metropolis would be depopulated. The ſhortneſs of their lives, however, may perhaps be accounted for, from their indulging themſelves from their infancy in every kind of exceſs. No horſe, mule, or aſs, will live at Sennaar or for many miles round it. The caſe is the ſame with bullocks, ſheep, dogs, cats, and poultry; all of them muſt go to the ſands every half-year. It is difficult to account for this mortality; though Mr Bruce aſſures us it is the caſe everywhere about the metropolis of this country, where the ſoil is a fat earth, during the firſt ſeaſon of the rains. Two greyhounds which he brought along with him from Atbara, and the mules he brought from Abyſſinia, lived only a few weeks after their arrival at Sennaar. Several of the kings of Sennaar have tried to keep lions, but it was always found impoſſible to preſerve them alive after the rains. They will live, however, as well as other quadrupeds, in the ſands, at no great diſtance from the capital. No ſpecies of tree except the lemon flowers near this city; the cultivation of the roſe has often been attempted, but always without ſucceſs. In other reſpects, however, the ſoil of Sennaar is exceedingly fertile, being ſaid to yield 300 fold; but this is thought by Mr Bruce to be a great exaggeration. It is all ſown with dora or millet, which is the principal food of the people; wheat and rice are alſo produced here, which are ſold by the pound, even in years of plenty. The ſoil all round is ſtrongly impregnated with ſalt, ſo that a ſufficient quantity to ſerve the inhabitants is extracted from it.

SENNAAR, a city of Africa, the capital of the kingdom of that name. It ſtands according to Mr Bruce's obſervations, in N. Lat. 13° 34′ 36″, E. Long. 33° 30′ 30″, on the weſt ſide of the Nile, and cloſe upon the banks of it; the ground on which it ſtands being juſt high enough to prevent the inundation. The town is very populous, and contains a great many houſes. In Poncet's time they were all of one ſtory; but now moſt of the officers have houſes of two ſtories high. They are built of clay mixed with a very little ſtraw, and have all flat roofs; which ſhows that the rains here muſt be much leſs in quantity than to the ſouthward. During the time of Mr Bruce's reſidence here, however, there was one week of continual rain, and the Nile, after loud thunder and great darkneſs to the ſouth, increaſed violently; the whole ſtream being covered with the wrecks of houſes and their furniture; ſo that he ſuppoſed it had deſtroyed many villages to the ſouthward. About 12 miles to the north-weſt of Sennaar is a collection of villages named *Shaddly*, from a great ſaint of that name, who conſtructed ſeveral granaries here. Theſe are no other than large pits dug in the ground, and well plaſtered in the inſide with clay, then filled with grain when it is at its loweſt price, and afterwards covered up and plaſtered again at top: theſe pits they call *matamores*. On any proſpect of dearth they are opened, and the corn ſold to the people. About 24 miles north of Shaddly there is another ſet of granaries name *Wed-Aboud*, ſtill greater than Shaddly; and upon theſe two the ſubſiſtence of the Arabs principally depends: for as theſe people are at continual war with each other, and direct their fury rather againſt the crops than the perſons of their enemies, the whole of them would be unavoidably ſtarved, were it not for this extraordinary reſource. Small villages of ſoldiers are ſcattered up and down this country to guard the grain after it is ſown, which is only that ſpecies of millet named *dora*; the ſoil, it is ſaid, being incapable of producing any other. There are great hollows made in the earth at proper diſtances throughout the country, which fill with water in the rainy ſeaſon, and are afterwards of great uſe to the Arabs as they paſs from the cultivated parts to the ſands. The fly, which is ſuch a dreadful enemy to the cattle, is never ſeen to the northward of Shaddly.

To the weſtward of theſe granaries the country is quite full of trees as far as the river Aoiad, or El-aice. In this extenſive plain there ariſe two ridges of mountains, one called *Jibbel Moira*, or the *Mountain of water*; the other *Jibbel Segud*, or the *Cold Mountain*. Both of them enjoy a fine climate, and ſerve for a protection to the farms about Shaddly and Aboud already mentioned. Here alſo are fortreſſes placed in the way of the Arabs, which ſerve to oblige them to pay tribute in their flight from the cultivated country, during the rains, to the dry lands of Atbara. Each of theſe diſtricts is governed by a deſcendant of their ancient and native princes, who long reſiſted all the power of the Arabs. Sacrifices of a horrid nature are ſaid to have been offered up on theſe mountains till about the year 1554, when one of the kings of Sennaar beſieged firſt one and then the other of the princes in their mountains; and having forced them to ſurrender, he faſtened a chain of gold to each of their ears, expoſed them in the market place at Sennaar, and ſold them for ſlaves at leſs than a farthing each. Soon after this they were circumciſed, converted to the Mahometan religion, and reſtored to their kingdoms.

"Nothing (ſays Mr Bruce) is more pleaſant than the country around Sennaar in the end of Auguſt and beginning of September. The grain, being now ſprung up, makes the whole of this immenſe plain appear a level green land, interſperſed with great lakes of water, and ornamented at certain intervals with groups of villages; the conical tops of the houſes preſenting at a diſtance the appearance of ſmall encampments. Through this very extenſive plain winds the Nile, a delightful river there, above a mile broad, full to the very brim, but never overflowing. Everywhere on theſe banks are ſeen herds of the moſt beautiful cattle of various kinds. The banks of the Nile about Sennaar reſemble the pleaſanteſt part of Holland in the ſummer ſeaſon; but ſoon after, when the rains ceaſe, and the ſun exerts its utmoſt influence, the dora begins to ripen, the leaves to turn yellow and to rot, the lakes to putrefy, ſmell, become full of vermin, and all its beauty ſuddenly diſappears: bare ſcorched Nubia returns, and all its terrors of poi-

Sennaar. Vol. iv. p. 475.

moving sands, glowing and ventilated with poisonous winds, which are followed by a troop of terrible attendants; epilepsies, apoplexies, violent fevers, obstinate agues, and lingering painful dysenteries, still more obstinate and mortal.

"War and treason seem to be the only employment of this horrid people, whom Heaven has separated by almost impassable deserts from the rest of mankind; confining them to an accursed spot, seemingly to give them an earnest in time of the only other curse which he has reserved to them for an eternal hereafter."

With regard to the climate of the country round Sennaar, Mr Bruce has several very curious observations. The thermometer rises in the shade to 119 degrees; but the degree indicated by this instrument does not at all correspond with the sensations occasioned by it, nor with the colour of the people who live under it. "Nations of blacks (says he) live within latitude 13 and 14 degrees; about 10 degrees south of them, nearly under the line, all the people are white, as we had an opportunity of observing daily in the Galla. Sennaar, which is in latitude 13 degrees, is hotter by the thermometer 50 degrees, when the sun is most distant from it, than Gondar, which is a degree farther south, when the sun is vertical.—Cold and hot (says our author) are terms merely relative, not determined by the latitude, but elevation of the place. When, therefore, we say *hot*, some other explanation is necessary concerning the place where we are, in order to give an adequate idea of the sensations of that heat upon the body, and the effects of it upon the lungs. The degree of the thermometer conveys this but very imperfectly; 90 degrees is excessively hot at Loheia in Arabia Felix; and yet the latitude of Loheia is but 15 degrees; whereas 90 degrees at Sennaar is only warm as to sense; though Sennaar, as we have already said, is in latitude 13 degrees.

"At Sennaar, then, I call it *cold*, when one fully clothed and at rest feels himself in want of fire. I call it *cool*, when one fully clothed and at rest feels he could bear more covering all over, or in part, than he has at that time. I call it *temperate*, when a man so clothed, and at rest, feels no such want, and can take moderate exercise, such as walking about a room without sweating. I call it *warm*, when a man, so clothed, does not sweat when at rest; but, on taking moderate exercise, sweats, and again cools. I call it *hot*, when a man at rest, or with moderate exercise, sweats excessively. I call it *very hot*, when a man with thin, or little clothing, sweats much, though at rest. I call it *excessive hot*, when a man, in his shirt and at rest, sweats excessively, when all motion is painful, and the knees feel feeble, as if after a fever. I call it *extreme hot*, when the strength fails, a disposition to faint comes on, a straitness is found in the temples, as if a small cord was drawn tight about the head, the voice impaired, the skin dry, and the head seems more than ordinarily large and light. This, I apprehend, denotes death at hand; but this is rarely if ever effected by the sun alone, without the addition of that poisonous wind which pursued us through Atbara, where it has, no doubt, contributed to the total extinction of every thing that hath the breath of life. A thermometer, graduated upon this scale, would exhibit a figure very different from the common one; for I am convinced by experiment, that a web of the finest muslin, wrapt round the body at Sennaar, will occasion at mid-day a greater sensation of heat in the body, than a rise of 5 degrees in the thermometer of Fahrenheit. Sennaar.

"At Sennaar, from 70 to 78 degrees of Fahrenheit's thermometer is cool; from 79 to 92 temperate; at 92 degrees begins warmth. Although the degree of the thermometer marks a greater heat than is felt by the body of us strangers, it seems to me that the sensations of the natives bear still a less proportion to that degree than ours. On the 2d of August, while I was lying perfectly enervated on a carpet in a room deluged with water at 12 o'clock, the thermometer at 116, I saw several black labourers pulling down a house, working with great vigour, without any symptoms of being incommoded."

The dress of the people of Sennaar consists only of a long shirt of blue cloth, which wraps them up from the under part of the neck to the feet. It does not, however, conceal the neck in the men, though it does in the women. The men sometimes have a sash tied about their middle; and both men and women go barefooted in the houses, whatever their rank may be. The floors of their apartments, especially those of the women, are covered with Persian carpets. Both men and women anoint themselves, at least once a-day, with camel's grease mixed with civet, which, they imagine, softens their skins, and preserves them from cutaneous eruptions; of which they are so fearful, that they confine themselves to the house if they observe the smallest pimple on their skins. With the same view of preserving their skins, though they have a clean shirt every day, they sleep with a greased one at night, having no other covering but this. Their bed is a tanned bull's hide, which this constant greasing softens very much; it is also very cool, though it gives a smell to their bodies from which they cannot be freed by any washing.

Our author gives a very curious description of the queens and ladies of the court at Sennaar. He had access to them as a physician, and was permitted to pay his visit alone. He was first shown into a large square apartment, where there were about 50 black women, all quite naked excepting a very narrow piece of cotton rag about their waists. As he was musing whether these were all queens, one of them took him by the hand, and led him into another apartment much better lighted than the former. Here he saw three women sitting upon a bench or sofa covered with blue Surat cloth; they themselves being clothed from the neck to the feet with cotton shirts of the same colour. These were three of the king's wives; his favourite, who was one of the number, appeared to be about six feet high, and so corpulent that our traveller imagined her to be the largest creature he had seen next to the elephant and rhinoceros. Her features perfectly resembled those of a negro: a ring of gold passed through her under lip, and weighed it down, till, like a flap, it covered her chin, leaving her teeth bare, which were small and very fine. The inside of her lip was made black with antimony. Her ears reached down to her shoulders, and had the appearance of wings: there was a gold ring in each of them about five inches in diameter, and somewhat smaller than a man's little finger; the weight of which had drawn down the hole where her ear was pierced

pierced so much that three fingers might easily pass above the ring. She had a gold necklace like that called *Esclavage*, of several rows, one below another; to which were hung rows of sequins pierced. She had two manacles of gold upon her ancles, larger than those used for chaining felons. Our author could not imagine how it was possible for her to walk with them, till he was informed that they were hollow. The others were dressed much in the same manner; only there was one who had chains coming from her ears to the outside of each nostril, where they were fastened. A ring was also put through the gristle of her nose, and which hung down to the opening of her mouth; having all together something of the appearance of a horse's bridle; and Mr Bruce thinks that she must have breathed with difficulty.

The poorer sort of the people of Sennaar live on the flour or bread of millet; the rich make puddings of this, toasting the flour before the fire, and putting milk and butter into it; besides which they use beef partly roasted and partly raw. They have very fine and fat horned cattle, but the meat commonly sold in the market is camel's flesh. The liver and spare rib of this animal are always eaten raw; nor did our author see one instance to the contrary all the time he was in the country. Hog's flesh is not sold in the market; but all the common people of Sennaar eat it openly; those in office, who pretend to be Mahometans, doing the same in secret.

There are no manufactures in this country, and the principal article of trade is blue Surat cloth. In former times, when caravans could pass with safety, Indian goods were brought in quantities from Jidda to Sennaar, and then dispersed over the country of the blacks. The returns were made in gold, a powder called *tibbar*, civet, rhinoceroses horns, ivory, ostrich feathers, and above all slaves or glass, more of these being exported from Sennaar than from all the east of Africa. This trade, however, as well as that of the gold and ivory, is almost destroyed; though the gold is still reputed to be the best and purest in Africa, and is therefore bought at Mocha to be carried to India, where it all centres at last.

SENNERTUS, Daniel, an eminent physician, was born in 1572 at Breslaw; and in 1593 he was sent to Wittemberg, where he made great progress in philosophy and physic. He visited the universities of Leipsic, Jena, Francfort on the Oder, and Berlin; but soon returned to Wittemberg, where he was promoted to the degree of doctor of physic, and soon after to a professorship in the same faculty. He was the first who introduced the study of chemistry into that university; he gained a great reputation by his works and practice, and was very generous to the poor. He died of the plague at Wittemberg, in 1637. He raised himself enemies by contradicting the ancients. He thought the seed of all living creatures animated, and that the soul of this seed produces organization. He was accused of impiety for asserting that the souls of beasts are not material; for this was affirmed to be the same thing with asserting that they are immortal; but he rejected this consequence, as he well might do. See Metaphysics, Part III. chap. vi.

SENONES, in *Ancient Geography*, a people of Gallia Celtica, situated on the Sequana to the south of the Parisii, near the confluence of the Jeauna or Yonne with the above mentioned river. Their most considerable exploit was their invasion of Italy, and taking and burning Rome, as related under that article. This was done by a colony of them long before transported into Italy, and settled on the Adriatic. Their capital, Agendicum in Gaul, was in the lower age called *Senones*, now *Sens*. In Italy the Senones extended themselves as far as the river Aesis; but were afterwards driven beyond the Rubicon, which became the boundary of Gallia Cisalpina, (Polybius, Strabo.)

SENSATION, in *Philosophy*, the perception of external objects by means of the senses. See Metaphysics, Part I. chap. i.

SENSE, a faculty of the soul whereby it perceives external objects by means of the impressions they make on certain organs of the body. See Metaphysics, Part I. and Anatomy, N° 137, &c.

Common Sense, is a term that has been variously used both by ancient and modern writers. With some it has been synonymous with public sense; with others it has denoted prudence; in certain instances, it has been confounded with some of the powers of taste; and, accordingly, those who commit egregious blunders with regard to decorum, saying and doing what is offensive to their company, and inconsistent with their own character, have been charged with a defect in common sense. Some men are distinguished by an uncommon acuteness in discovering the characters of others; and this talent has been sometimes called *common sense*; similar to which is that use of the term, which makes it to signify that experience and knowledge of life which is acquired by living in society. To this meaning Quintilian refers, speaking of the advantages of a public education: *Sensum ipsum qui communis dicitur, ubi discet, cum se a congressu, qui non hominibus solum, sed mutis quoque animalibus naturalis est, segregarit?* Lib. i. cap. 2.

But the term *common sense* hath in modern times been used to signify that power of the mind which perceives truth, or commands belief, not by progressive argumentation, but by an instantaneous, instinctive, and irresistible impulse; derived neither from education nor from habit, but from nature; acting independently of our will, whenever its object is presented, according to an established law, and therefore called *sense*; and acting in a similar manner upon all, or at least upon a great majority of mankind, and therefore called *common sense*. See Metaphysics, N° 127.

Moral Sense, is a determination of the mind to be pleased with the contemplation of those affections, actions, or characters, of rational agents, which we call *good* or *virtuous*.

This moral sense of beauty in actions and affections may appear strange at first view: some of our moralists themselves are offended at it in Lord Shaftesbury, as being accustomed to deduce every approbation or aversion from rational views of interest. It is certain that his Lordship has carried the influence of the moral sense very far, and some of his followers have carried it farther. The advocates for the selfish system seem to drive their opinions to the opposite extreme, and we have elsewhere endeavoured to show that the truth lies between the contending parties. See Moral Philosophy, N° 27—32.

Senſes.

Public SENSE is defined by the noble author of the Characteriſtics to be an innate propenſity to be pleaſed with the happineſs of others, and to be uneaſy at their miſery. It is found, he ſays, in a greater or leſs degree in all men, and was ſometimes called κοινονοημα, or *ſenſus communis*, by ancient writers.

Of the reality of this public ſenſe we have great doubts. The conduct of ſavages, who are more under the influence of original inſtinct than civilized men, gives no countenance to it. Their affections ſeem all to be ſelfiſh, or at leaſt to ſpring from ſelf-love variouſly modified. For the happineſs of their wives they have very little regard, conſidering them merely as inſtruments of their own pleaſure, and valuing them for nothing elſe. Hence they make them toil, while they themſelves indulge in liſtleſs idleneſs. To their children we believe they exhibit ſtrong ſymptoms of attachment, as ſoon as they derive aſſiſtance from them in war, or in the buſineſs of the chace; but during the helpleſs years of infancy, the child is left by the ſelfiſh father wholly to the care and protection of its wretched mother; who, impelled by the *ſtorge* of all females to their young, cheriſhes her offspring with great fondneſs.—The ſavage is, indeed, ſuſceptible of ſtrong attachments, ſimilar to that which we call friendſhip; but ſuch attachments are no proofs of diſintereſted benevolence, or what his Lordſhip calls the *public ſenſe*. Two barbarous heroes are probably firſt linked together by the obſervation of each other's proweſs in war, or their ſkill in purſuing their game; for ſuch obſervation cannot fail to ſhow them that they may be uſeful to one another; and we have elſewhere ſhown how real friendſhip may ſpring from ſentiments originally ſelfiſh. The ſavage is very much attached to his horde or tribe, and this attachment reſembles patriotiſm: but patriotiſm itſelf is not a ſentiment of pure benevolence delighting in the happineſs of others, and grieving at their miſery; for the patriot prefers his own country to all others, and is not very ſcrupulous with reſpect to the rectitude of the means by which he promotes its intereſt, or depreſſes its rivals. The ſavage purſues with relentleſs rigour the enemies of himſelf or of the tribe to which he belongs; ſhows no mercy to them when in his power, but puts them to the cruelleſt death, and carries their ſcalps to the leader of his party. Theſe facts, which cannot be controverted, are perfectly irreconcileable with innate benevolence, or a public ſenſe comprehending the whole race of men; and ſhow the truth of that theory by which we have in another place endeavoured to account for all the paſſions, ſocial as well as ſelfiſh. See PASSION.

SENSES, PLEASURES AND PAINS OF. The natural agreeableneſs, diſagreeableneſs and indifference of our ſenſations and perceptions, preſent to the mind an important and extenſive field of inquiry; and on this ſubject we ſhall here make a few obſervations. All our ſenſes have been certainly beſtowed upon us for wiſe and beneficent purpoſes; and, accordingly, we find, that all of them, when properly cultivated, or exerciſed and improved, are capable of affording us much pleaſure. The ſenſes of ſmell and of taſte ſeem rather intended for the preſervation of our animal exiſtence, and in this point of view are properly an object of the natural hiſtory of man; whilſt the other three ſeem to be more peculiarly intended for our mental improvement, and accordingly form an object of intellectual and of moral philoſophy. And agreeably to this we know that we derive a great deal of very uſeful knowledge, in an eaſy and ſimple manner, concerning the objects that ſurround us, in the early part of life, from all the ſenſes, particularly from ſight and touch, and this too without labour or ſtudy. But this is not the only purpoſe for which the ſenſes were deſigned.

Senſes.

It being thus certain, that the ſenſes were beſtowed upon us partly to preſerve our animal exiſtence, and partly for our mental improvement, it ſeems reaſonable, even *à priori*, to expect that nature would attach ſome pleaſure to ſuch uſe and exerciſe of them, as are calculated to promote theſe ends, and pain to the contrary; particularly in thoſe inſtances in which ſhe has left the management of them ſubject to our own controul. And accordingly we cannot but obſerve what delight we derive from our ſenſes, eſpecially in the morning of life, by which it would ſeem, that nature intended thus winningly to invite us to the proper exerciſe and improvement of them; and as it were unconſciouſly, acquire much uſeful knowledge. It is this ſpecies of pleaſure that ſupports and excites boys in the conſtant and often immoderate exerciſe of their organs of voluntary motion; the powers of which are thus increaſed and invigorated.

The exerciſe and improvement of the ſenſes being ſubſervient to our intellectual improvement, nature has alſo kindly attached much refined and rational pleaſure to the mental exertions; ſo that we are thus ſeduced, as it were, to the cultivation of the various extraordinary powers and faculties of the mind.

It is evident that nature has given ſuch organs and faculties to man, as are calculated not only to make him live, but alſo to render life agreeable. Here too we obtain a ſlight glimpſe at leaſt of ſome of the final cauſes of the pleaſures of ſenſe. But if it be aſked how it happens, that there are ſuch wide diverſities between our ſenſations, ſome being by nature very agreeable to all men, and ſome as diſagreeable, whilſt there are others ſo indifferent, as to give neither pleaſure nor pain, we muſt confeſs, that we can give no ſatisfactory anſwer, to ſhew how ſo many very different ſenſations are produced by various kinds of impreſſions made on certain organs of the body, and how all theſe different impreſſions excite ſuch ſenſations as ſuggeſt not only correſponding perceptions and external qualities, but at the ſame time affect the mind with pleaſure, pain, trouble, anxiety, or diſguſt. To be ſucceſsful in theſe inquiries, we muſt preſuppoſe ſome knowledge of the nature of the connection ſubſiſting between the mind and body, which there is reaſon to think is placed beyond the limits preſcribed by nature to human reſearch.

The pleaſure or pain which conſtantly attends certain ſenſations is not uniform in degree, but varies conſiderably, not only in different individuals, but even in the ſame perſons at different times. It is not thus with the ſenſations themſelves. Theſe are always conſtant and uniform. The ſame kind of impreſſion, when the organs &c. are ſound, uniformly and invariably produce ſimilar ſenſations; and theſe are as invariably followed by the perception of their own peculiar exciting cauſes. For any particular impreſſion is never known to excite in the ſame perſon a new ſenſation, or the perception of an external object different from that which it previouſly ſuggeſted,

ſuggeſted, excepting in caſes of diſeaſe. And when it does rarely occur, as in thoſe who cannot diſtinguiſh a particular colour, ſmell or taſte, from certain others, we uniformly attribute it to diſeaſe or malconformation. Were we not thus to have uniformly ſimilar ſenſations and perceptions of external objects from ſimilar impreſſions, the ſenſes would not be at all ſubſervient to our intellectual improvement; ſince, by giving different leſſons concerning the ſame or ſimilar objects at different times, they would render it impoſſible for us to be certain of any thing, or to benefit by experience.

The effects of cuſtom, which are at all times ſo conſiderable and evident with reſpect both to the mind and body, (as in the caſe of particular organs or faculties much improved by attention and exerciſe,) have little or no influence at all in interrupting or modifying this uniformity in our ſenſations and perceptions. For no ſound, or properly organized perſon will, either naturally or by cuſtom, ever miſtake hardneſs for ſoftneſs, red for green, or ſweet for bitter. But the influence of cuſtom in modifying the pains and pleaſures of ſenſe is well known and conſiderable. For a perſon, who can moſt accurately diſtinguiſh ſweetneſs from ſourneſs, will at the ſame time, either by particular conformation, or more frequently in conſequence of uſe and habit, prefer wormwood or tobacco to honey.

But although we may deſpair of being ever able to diſcover the phyſical cauſe of the pleaſures and pains of the ſenſes, we may, however, advance a little by obſerving and regiſtering particular facts. It is, accordingly, of uſe to remark, that every ſpecies of ſenſation, if its nature be otherwiſe unchanged, is agreeable or diſagreeable in proportion to its ſtrength or intenſeneſs. For there is no ſenſation, however agreeable, that will not become diſagreeable, and even intolerable, if it be immoderately intenſe. Whilſt on the contrary, thoſe, which by their ſtrength and nature are very troubleſome, if rendered more mild and moderate become not only tolerable, but agreeable. Thus, with reſpect to the ſenſes it would ſeem, that pain and pleaſure are only different degrees of the ſame feeling, and when we conſider the great varieties of which the ſenſation, not only of different organs, but even of any one of them, is ſuſceptible, and that each degree of theſe may be accompanied with pleaſure or pain, more or leſs, we muſt conclude that the pains and pleaſures of ſenſe are capable of numberleſs modifications both in degree and in kind.

We frequently obſerve, that ſenſations which were at firſt agreeable, if often repeated, loſe their reliſh, though the nature and ſtrength of the impreſſions be the ſame; whilſt others from being at firſt very diſagreeable, as the taſte of tobacco and opium, become very pleaſing, though the nature and ſtrength of the impreſſions have ſuffered no change. For the explanation of ſuch facts as theſe we muſt have recourſe to the effects of cuſtom. Thus, in both theſe oppoſite caſes, the ſenſations from being often repeated, loſe part of the ſtrength, and of the novelty, of courſe, of their firſt impreſſions; and, with reſpect to the former inſtance, being unable to command the attention, become in the courſe of time almoſt wholly, or altogether neglected, whilſt in the latter caſe, from being very offenſive, they become highly agreeable. But if it be aſked why habit and cuſtom produce theſe effects, and in what manner, we are unable to explain it farther, than by ſaying, ſince the fact is unqueſtionable, that ſuch is the nature of the human conſtitution. Of the effects themſelves, no man can entertain a doubt; and their cauſes, though at preſent unknown, may by time and inquiry be further developed and ſimplified. "The labyrinth," ſays Dr Reid, "may be too intricate, and the thread too fine, to be traced through all its windings; but if we ſtop where we can trace it no farther, and ſecure the ground we have gained, there is no harm done; a quicker eye may in time trace it further."

Theſe principles are capable of affording us ſtill farther explanations. Why are new ſenſations always more agreeable and variety ſo pleaſing? Becauſe they fix the attention more, and are not as yet blunted by frequent repetition or by habit. It is becauſe ſome ſenſations loſe their wonted effects by cuſtom and by repetition, that we require ſtronger ones, or at leaſt ſtronger impreſſions on the organs and nerves, to increaſe or continue our pleaſures. It is alſo in conſequence of their becoming leſs poignant through habit that we neglect ſo many pleaſures, which we hardly know to be ſuch, till they have flown for ever; and it is becauſe in the morning of life every thing has more novelty, and becauſe habit has not deſtroyed their reliſh, that the pleaſures of youth are much more intenſe than thoſe of age. The degree of pleaſure is ſimilar to that which a blind man would feel on being made to ſee, or to that which a man would enjoy on ſuddenly acquiring a new ſenſitive faculty, although by long uſe and habit theſe pleaſures are at preſent for the moſt part or wholly blotted away.

Although moſt ſenſations, when ſtrong and lively enough to make themſelves accurately and eaſily diſtinguiſhed, generally pleaſe moſt, each in its own kind and manner; ſtill, as there are different kinds of pleaſure, different ſenſations may pleaſe the mind in various ways; and accordingly, it is not from the luſtre of the midday ſun, nor from the beautiful and lively appearance of all nature at noon, ſolely that the eyes derive pleaſure, any more than grand muſical ſounds are the only things that pleaſe the ear. For we often contemplate with a very different and a very conſiderable degree of pleaſure the ſublime and awful ſcenes of nature, the twilight darkneſs of the ſhady grove, and even the gloomy horror of night itſelf. We liſten with delight to the tempeſt ſhaking the foreſt, as well as to the gentle murmurs of the paſſing ſtream. There is even a time when nothing gives ſo much pleaſure as darkneſs, ſilence, and the abſence of all ſenſation.

Amidſt the great variety of good and evil with which we are every where ſurrounded, it is a matter of the higheſt importance to be able to diſcern aright. This we ſhould be incapable of doing were we not endowed with agreeable as well as painful ſenſations. Theſe ſerve to direct our choice. Whatever contributes in any degree to our preſervation and to the improvement of our organs and faculties, is accompanied with pleaſure; and on the contrary, when we are threatened with danger a painful ſenſation gives us the alarm. It is to the eſtabliſhment of this law that we are indebted for the duration of our lives, the improved and vigorous ſtate of our faculties, and the enjoyment of that ſmall portion of happineſs allotted to us by nature. "God, (ſays a French writer) having endowed man with various faculties, bodily as well as intellectual, in order to promote his happineſs, Senſes

piness, he vouchſafes to conduct him to this noble end, not only by the deductions of reaſon, but alſo by the force of inſtinct and ſenſation, which are more powerful and efficacious principles. Thus nature, by a ſenſation of pain, inſtantaneouſly appriſes us of what might prove hurtful to us; and, on the contrary, by an agreeable ſenſation, gently leads us to whatever may tend to the preſervation of our exiſtence, and to the perfect ſtate of our faculties, theſe being the two points on which our happineſs depends. Our faculties can neither be of uſe, nor diſplay themſelves farther than as we exerciſe them; motion or action is therefore ſo neceſſary to us, that without it we muſt inevitably ſink into a deplorable ſtate of inſenſibility and languor. On the other hand, as we are weak and limited creatures, all exceſſive and violent action would impair and deſtroy our organs; we muſt therefore uſe only moderate motion or exerciſe, ſince by theſe means the uſe or perfection of our faculties is reconciled with our chief intereſt, which is ſelf-preſervation. Now it is to this happy medium, I mean to a moderate exerciſe of our faculties that the author of our nature has ſo wiſely annexed pleaſure.

The pleaſures of ſenſe are thus confined within narrow limits; for they cannot be much increaſed without pain, or often repeated without loſing their reliſh, at leaſt in a great meaſure; nor can they be long continued, partly for the ſame reaſon, and becauſe they exhauſt the mind, or rather the nervous ſyſtem. Hence we ſee that our animal appetites are confined within a narrow range, as is evident from the effects of exceſs in eating and drinking. All our ſenſitive powers are impaired; whilſt, on the contrary, our intellectual powers are ſtrengthened and improved by uſe and exerciſe. And in proportion as we indulge our ſenſitive powers, our deſires of indulgence increaſe, whilſt the pleaſures, which are the objects of theſe deſires, become regularly leſs poignant. Theſe, indeed, are wiſe regulations of nature; for it would ſeem as if ſhe intended to whiſper gently to us in this way, by means of practical experience, that we are not born ſolely for the enjoyment of pleaſure, at leaſt not for that of the pleaſures of the ſenſes: for all of them, as we have already remarked, if much indulged, lead to liſtleſsneſs and diſguſt, and ſometimes to conſiderable pain. And indeed, juſt as pleaſure paſſes thus readily into trouble and pain, ſo does the ſudden ceſſation of pain, at leaſt when this has been conſiderable, produce often extraordinary pleaſure. So that we may here apply the beautiful allegory of the divine Socrates, " that although pleaſure and pain are contrary in their nature, and have their faces turned different ways, yet that Jupiter hath tied them ſo together, that he who lays hold of the one draws the other along with it."

We have juſt ſaid, that the *ſudden* ceſſation of pain, at leaſt when this has been conſiderable, produces often extraordinary pleaſure. But this opinion ſeems to be denied in a late inquiry concerning taſte. " Among the pleaſures of ſenſe," ſays Mr Knight, " more particularly among thoſe belonging to touch, there is a certain claſs, which, though ariſing from negative cauſes, are nevertheleſs real and poſitive pleaſures: as when we gradually ſink from any violent or exceſſive degree of action or irritation into a ſtate of tranquillity and repoſe. I ſay *gradually*; for if the tranſition be ſudden and abrupt, it will not be pleaſant; the pleaſure ariſing from the inverted action of the nerves, and not from the utter ceſſation of action. From this inverted action ariſes the gratification which we receive from a cool breeze, when the body has been exceſſively heated; or from the rocking of a cradle, or the gentle motion of a boat, or eaſy carriage, after having been fatigued with violent exerciſe. Such, too, is that which twilight, or the gloomy ſhade of a thicket, affords to the eye after it has been dazzled by the blaze of the mid-day ſun; and ſuch, likewiſe, is that which the ear receives from the gradual diminution of loudneſs of tone in muſic." That pleaſure follows a gradual ceſſation of any violent action or irritation, we mean not to deny; but we are at a loſs to comprehend how it follows, that the tranſition from ſtrong pain, if it be ſudden and abrupt, will not be pleaſant.

But although the pleaſures of ſenſe be thus limited, theſe limits are very different with reſpect to the different ſenſes. Some of them are ſoon exhauſted, and do not any longer diſtinguiſh well the objects that correſpond to them; nor are they pleaſed with thoſe objects which were at firſt very agreeable, and which they diſtinguiſh with ſufficient accuracy; whilſt others continue to perform their functions longer, and enjoy a more continued pleaſure. Thus the ſenſes of ſmell and of taſte are almoſt immediately ſatiated; the ſenſe of hearing more ſlowly; but the ſight is in this reſpect the laſt of all to be fatigued or ſatiated: whilſt the pleaſures that ariſe from the exerciſe of our mental faculties are by far the moſt durable of all. " Exerciſe of the mind is as neceſſary as that of the body to preſerve our exiſtence. The ſenſes of other animals, being more quick than ours, are ſufficient to direct them to follow what is agreeable to their nature, or to ſhun whatever is contrary thereto. But we are endowed with reaſon in order to ſupply the deficiency of our ſenſes; and pleaſure preſents herſelf as an incitement to exerciſe, in order to keep the mind from a ſtate of hurtful inactivity. Pleaſure is not only the parent of ſports and amuſements, but alſo of arts and ſciences: and as the whole univerſe is, as it were, forced by our induſtry to pay tribute to our wants and deſires, we cannot but acknowledge our obligation to that law of nature, which has annexed a degree of pleaſure to whatever exerciſes without fatiguing the mind. The pleaſure accompanying it is ſometimes ſo great that it tranſports the very ſoul, ſo that ſhe ſeems as it were diſengaged from the body. We know what is recorded in hiſtory concerning Archimedes (A), and ſeveral other geometricians both ancient and modern. If we

(A) When Syracuſe was taken by the Romans under Marcellus, Archimedes was in his ſtudy, ſo intent upon ſome geometrical problems, that he neither heard the clamour of the Romans, nor perceived that the city was taken. In this tranſport of ſtudy and contemplation a ſoldier came on him with his drawn ſword; Archimedes, on ſeeing him, beſought him to hold his hand till he had finiſhed the problem he was about. But the ſoldier, deaf to his intreaty, ran him through the body, although Marcellus, upon entering the city, had given orders that Archimedes ſhould be ſpared.

Senses.

we doubt the truths of such facts, we must at least acknowlege their probability, since we meet every day with a number of similar examples. When we see a chess-player so deeply immersed in thought as to be in a manner lost to his outward senses, should we not imagine him to be wholly engrossed with the care of his own private affairs, or of the public weal? but the object of all this profound meditation is the pleasure of exercising the mind by the movement of a piece of ivory. From this exercise of the mind also arises the pleasure we sometimes take in refined and delicate sentiments, which, after the manner of Virgil's shepherdess, (*Et fugit ad salices, sed se cupit ante videri*), are sometimes artfully concealed, but so as to afford us the pleasure of discovering them *."

Theorie des Sentimens agreables.

From some of the foregoing remarks we also see that nature points out to us the superiority and excellence of our mental faculties, thus suggesting to us that we ought to cultivate them most, as being our better and our nobler part, to the cultivation of which that of our sensitive faculties should be merely subservient. But, although our pleasures are thus by nature rendered in a great degree independent of ourselves, still we have it in our power to make them all more durable, by varying and mixing them with one another, or by interposing between those that are very agreeable others that are less pleasing, so as that no individual pleasure shall be in excess.

Besides the circumstances already noticed, there are others of a very different kind, which have also considerable influence on the pleasures of the senses; such as different conditions of the whole body, particularly of the nerves, or of certain organs or functions, to which functions some organs of sense, and perhaps even the sensation of these, are in a great measure subservient. This is one of the causes why many pleasures, which we cultivate with all our might, cannot be immortal. If a person be thirsty, spring water is nectar to him; if hungry, any kind of food is agreeable, even the smell of food is grateful. To a man in a heat, or in a fever, cold is pleasing; and to one in a cold fit nothing is so agreeable as heat. To these same persons, at other times, so far are these things from being agreeable, that they are often disgusting. The most decided glutton cannot always relish a sumptuous feast.

Besides the sensations excited by external objects, there are others also which cause pain and pleasure. If the action of the muscles be strong, easy, and cheerful, and not continued so as to fatigue us, it causes pleasure. On the contrary, when this action is attended with a sense of listlessness, lassitude, difficulty, and debility, it causes pain more or less. In fine, various states and affections of the mind, such as the exercise of memory, imagination, and judgement, nearly for similar reasons, are sometimes painful, at other times agreeable. "Animi affectus, qui modici grate excitant, vehementes, aut graves et diuturni, hujus pariter ac corporis vires frangunt; hominem interdum statim extinguunt, sæpius longa valetudine macerant. Somni etiam, quo ad exhaustas vires reficiendas egemus, excessus, vel defectus, et animo et corpori nocet"—"Desidia, sive animi sive corporis, utriusque vires languescunt: nimia exercitatione haud minus læduntur. Statuit enim provida rerum parens, ut singularum partium, et universi corporis animique vires usu roborentur et acuantur; et huic itidem certos fines posuit: ita ut neque quem voluit natura usus impune omittatur, neque ultra modum intendatur *."

* Gregory's Conspectus.

"Of such sensations and feelings as are agreeable or disagreeable, we may remark," says Dr Reid, "that they differ much, not only in degree, but in kind and in dignity. Some belong to the animal part of our nature, and are common to us with the brutes: others belong to the rational and moral part. The first are more properly called *sensations*, the last *feelings*. The French word *sentiment* is common to both."

"The Author of nature, in the distribution of agreeable and painful feelings, hath wisely and benevolently consulted the good of the human species; and hath even shewn us, by the same means, what tenor of conduct we ought to hold. For, *first*, The painful sensations of the animal kind are admonitions to avoid what would hurt us; and the agreeable sensations of this kind invite us to those actions that are necessary to the preservation of the individual, or of the kind. *Secondly*, By the same means nature invites us to moderate bodily exercise, and admonishes us to avoid idleness and inactivity on the one hand, and excessive labour and fatigue upon the other. *Thirdly*, The moderate exercise of all our rational powers gives pleasure. *Fourthly*, Every species of beauty is beheld with pleasure, and every species of deformity with disgust; and we shall find all that we call beautiful, to be something estimable, or useful in itself, or a sign of something that is estimable or useful. *Fifthly*, The benevolent affections are all accompanied with an agreeable feeling, the malevolent with the contrary. And, *Sixthly*, The highest, the noblest and most durable pleasure is that of doing well and acting the part that becomes us; and the most bitter and painful sentiment is the anguish and remorse of a guilty conscience." These observations with regard to the economy of nature in the distribution of our painful and agreeable sensations and feelings are so well illustrated by the elegant and judicious author of *Theorie des Sentiments agreables*, that we deem it unnecessary to make any further remarks on this subject. (See Happiness and Pleasure.) A little reflection may satisfy us, that the number and variety of our sensations and feelings are prodigious. For, to omit all those which accompany our appetites, passions, and affections, our moral sentiments and sentiments of taste, even our external senses, furnish a great variety of sensations differing in kind, and almost in every kind an endless variety of degrees. Every variety we discern, with regard to taste, smell, sound, colour, heat, and cold, and in the tangible qualities of bodies, is indicated by a sensation corresponding to it.

The most general and the most important division of our sensations and feelings is into the agreeable, the disagreeable, and the indifferent. Every thing we call pleasure, happiness, or enjoyment, on the one hand; and, on the other, every thing we call misery, pain, or uneasiness, is sensation or feeling: For no man can for the present be more happy, or more miserable, than he feels himself to be. He cannot be deceived with regard to the enjoyment or suffering of the present moment.

But, besides the sensations that are agreeable or disagreeable, there is still a greater number that are indifferent. To these we give so little attention, that they have no name, and are immediately forgotten as if they had never been; it even requires attention to the operations of our minds to be convinced of their existence. For this end we may observe, that to a good ear every human voice is distinguishable from all others. Some voices are pleasant, some disagreeable; but the far greater part cannot be said to be one or the other. The same thing may be said of other sounds, and no less of tastes, smells, and colours; and if we consider, that our senses are in continual exercise while we are awake, that some sensation attends every object they present to us, and that familiar objects seldom raise any emotion pleasant or painful; we shall see reason, besides the agreeable and disagreeable, to admit a third class of sensations, that may be called indifferent. But these sensations that are indifferent are far from being useless. They serve as signs to distinguish things that differ; and the information we have concerning things external comes by these means. Thus, if a man had not a musical ear so as to receive pleasure from the harmony or melody of sounds, he would still find the sense of hearing of great utility. Though sounds gave him neither pleasure nor pain, of themselves, they would give him much useful information; and the same may be said of the sensations we have by all the other senses.

SENSIBLE NOTE, in *Music*, is that which constitutes a third major above the dominant, and a semitone beneath the tonic. *Si*, or B, is the sensible note in the tone of *ut* or C *sol* ※; or G sharp, in the tone of *la* or A.

They call it the *sensible note* on this account, that it causes to be perceived the tone or natural series of the key and the tonic itself; upon which, after the chord of the dominant, the sensible note taking the shortest road, is under a necessity of rising; which has made some authors treat this sensible note as a major dissonance, for want of observing, that dissonance, being a relation, cannot be constituted unless by two notes between which it subsists.

It is not meant that the sensible note is the seventh of the tone, because, in the minor mode, this seventh cannot be a sensible note but in ascending; for, in descending, it is at the distance of a full note from the tonic, and of a third minor from the dominant.

SENSIBILITY, is a nice and delicate perception of pleasure or pain, beauty or deformity. It is very nearly allied to taste; and, as far as it is natural, seems to depend upon the organization of the nervous system. It is capable, however, of cultivation, and is experienced in a much higher degree in civilized than in savage nations, and among persons liberally educated than among boors and illiterate mechanics. The man who has cultivated any of the fine arts has a much quicker and more exquisite perception of beauty and deformity in the execution of that art, than another of equal or even greater natural powers, who has but casually inspected its productions. He who has been long accustomed to that decorum of manners which characterizes the polite part of the world, perceives almost instantaneously the smallest deviation from it, and feels himself almost as much hurt by behaviour harmless in itself, as by the grossest rudeness; and the man who has long proceeded steadily in the paths of virtue, and often painted to himself the deformity of vice, and the miseries of which it is productive, is more quickly alarmed at any deviation from rectitude, than another who, though his life has been stained by no crime, has yet thought less upon the principles of virtue and consequences of vice.

Every thing which can be called sensibility, and is not born with man, may be resolved into association, and is to be regulated accordingly; for sensibilities may be acquired which are inimical to happiness and to the practice of virtue. The man is not to be envied who has so accustomed himself to the forms of polite address as to be hurt by the unaffected language and manners of the honest peasant, with whom he may have occasion to transact business; nor is he likely to acquire much useful knowledge who has so sedulously studied the beauties of composition as to be unable to read without disgust a book of science or of history, of which the style comes not up to his standard of perfection. That sensibility which we either have from nature, or necessarily acquire, of the miseries of others, is of the greatest use when properly regulated, as it powerfully impels us to relieve their distress; but if it by any means become so exquisite as to make us shun the sight of misery, it counteracts the end for which it was implanted in our nature, and only deprives us of happiness, while it contributes nothing to the good of others. Indeed there is reason to believe that all such extreme sensibilities are selfish affectations, employed as apologies for withholding from the miserable that relief which it is in our power to give; for there is not a fact better established in the science of human nature, than that passive perceptions grow gradually weaker by repetition, while active habits daily acquire strength.

It is of great importance to a literary man to cultivate his taste, because, it is the source of much elegant and refined pleasure, (see TASTE); but there is a degree of fastidiousness which renders that pleasure impossible to be obtained, and is the certain indication of expiring letters. It is necessary to submit to the artificial rules of politeness, for they tend to promote the peace and harmony of society, and are sometimes a useful substitute for moral virtue; but he who with respect to them has so much sensibility as to be disgusted with all whose manners are not equally polished with his own, is a very troublesome member of society. It is every man's duty to cultivate his moral sensibilities, so as to make them subservient to the purposes for which they were given to him; but if he either feel, or pretend to feel, the miseries of others to so exquisite a degree as to be unable to afford them the relief which they have a right to expect, his sensibilities are of no good tendency.

That the man of true sensibility has more pains and more pleasures than the callous wretch, is universally admitted, as well as that his enjoyments and sufferings are more exquisite in their kinds; and as no man lives for himself alone, no man will acknowledge his want of sensibility, or express a wish that his heart were callous. It is, however, a matter of some moment to distinguish real sensibilities from ridiculous affectations; those which tend to increase the sum of human happiness from such as have a contrary tendency; and to cultivate them all in such a manner as to make them answer the ends for which they were implanted in us by the beneficent Author of nature. This can be done only by watching over them as over other associations, (see METAPHYSICS, N° 98.); for excessive sensibility, as it is not the gift of nature, is the bane of human happiness. "Too much tenderness (as Rousseau well observes) proves the bitter-

Senſitive.

eſt curſe inſtead of the moſt fruitful bleſſing; vexation and diſappointment are its certain conſequences. The temperature of the air, the change of the ſeaſons, the brilliancy of the ſun, or thickneſs of the fogs, are ſo many moving ſprings to the unhappy poſſeſſor, and he becomes the wanton ſport of their arbitration."

SENSITIVE-PLANT, See MIMOSA, DIONÆA, and HEDYSARUM, BOTANY *Index*

The ſenſitive plants are well known to poſſeſs a kind of motion, by which the leaves and ſtalks are contracted and fall down on being ſlightly touched, or ſhaken with ſome degree of violence.

The contraction of the leaves and branches of the ſenſitive plant when touched, is a very ſingular phenomenon. Different hypotheſes have been formed by botaniſts in order to explain it; but we are diſpoſed to believe that theſe have generally been deduced rather from analogical reaſoning than from a collection of facts and obſervations. We ſhall therefore give an account of all the important facts which we have been able to collect upon this curious ſubject; and then draw ſuch concluſions as obviouſly reſult from them, without, however, attempting to ſupport any old, or to eſtabliſh a new, hypotheſis.

1. It is difficult to touch the leaf of a healthy ſenſitive plant ſo delicately that it will not immediately collapſe, the foliola or little leaves moving at their baſe till they come into contact, and then applying themſelves cloſe together. If the leaf be touched with a little more force, the oppoſite leaf will exhibit the ſame appearance. If a little more force be applied, the partial footſtalks bend down towards the common footſtalk from which they iſſue, making with it a more acute angle than before. If the touch be more violent ſtill, all the leaves ſituated on the ſame ſide with the one that has been touched will inſtantly collapſe, and the partial footſtalk will approach the common footſtalk to which it is attached, in the ſame manner as the partial footſtalk of the leaf approaches the ſtem or branch from which it iſſues; ſo that the whole plant, from having its branches extended, will immediately appear like a weeping birch.

2. Theſe motions of the plant are performed by means of three diſtinct and ſenſible articulations. The firſt, that of the foliola or lobes to the partial footſtalk; the ſecond, that of the partial footſtalk to the common one; the third, that of the common footſtalk to the trunk. The primary motion of all which is the cloſing of the leaf upon the partial footſtalk, which is performed in a ſimilar manner, and by a ſimilar articulation. This, however, is much leſs viſible than the others. Theſe motions are wholly independent on one another, as may be proved by experiment. It appears that if the partial footſtalks are moved, and collapſe toward the petioli, or theſe toward the trunk, the little leaves, whoſe motion is uſually primary to theſe, ſhould be affected alſo; yet experiment proves that it is poſſible to touch the footſtalks in ſuch a manner as to affect them only, and make them apply themſelves to the trunk, while the leaves feel nothing of the touch; but this cannot be, unleſs the footſtalks are ſo diſpoſed as that they can fall to the trunk, without ſuffering their leaves to touch any part of the plant in their paſſage, becauſe, if they do, they are immediately affected.

3. Winds and heavy rains make the leaves of the ſenſitive plant contract and cloſe; but no ſuch effect is produced from ſlight ſhowers.

4. At night, or when expoſed to much cold in the day, the leaves meet and cloſe in the ſame manner as when touched, folding their upper ſurfaces together, and in part over each other, like ſcales or tiles, ſo as to expoſe as little as poſſible of the upper ſurface to the air. The oppoſite ſides of the leaves (foliola) do not come cloſe together in the night, for when touched they apply themſelves cloſer together. Dr Darwin kept a ſenſitive plant in a dark place for ſome hours after daybreak; the leaves and footſtalks were collapſed as in its moſt profound ſleep; and, on expoſing it to the light, above 20 minutes paſſed before it was expanded.

5. In the month of Auguſt, a ſenſitive plant was carried in a pot out of its uſual place into a dark cave, the motion that it received in the carriage ſhut up its leaves, and they did not open till 24 hours afterwards; at this time they became moderately open, but were afterwards ſubject to no changes at night or morning, but remained three days and nights with their leaves in the ſame moderately open ſtate. At the end of this time they were brought out again into the air, and there recovered their natural periodical motions, ſhutting every night, and opening every morning, as naturally and as ſtrongly as if the plant had not been in this forced ſtate; and while in the cave, it was obſerved to be very little leſs affected with the touch than when abroad in the open air.

6. The great heats of ſummer, when there is open ſunſhine at noon, affect the plant in ſome degree like cold, cauſing it to ſhut up its leaves a little, but never in any very great degree. The plant, however, is leaſt of all affected about nine o'clock in the morning, and that is conſequently the propereſt time to make experiments on it. A branch of the ſenſitive plant cut off, and laid by, retains yet its property of ſhutting up and opening in the morning for ſome days; and it holds it longer if kept with one end in water, than if left to dry more ſuddenly.

7. The leaves only of the ſenſitive plant ſhut up in the night, not the branches; and if it be touched at this time, the branches are affected in the ſame manner as in the day, ſhutting up, or approaching to the ſtalk or trunk, in the ſame manner, and often with more force. It is of no conſequence what the ſubſtance is with which the plant is touched, it anſwers alike to all; but there may be obſerved a little ſpot, diſtinguiſhable by its paler colour in the articulations of its leaves, where the greateſt and niceſt ſenſibility is evidently placed.

8. Duhamel having obſerved, about the 15th of September, in moderate weather, the natural motion of a branch of a ſenſitive plant, remarked, that at nine in the morning it formed with the ſtem an angle of 100 degrees; at noon, 112 degrees; at three afternoon, it returned to 100; and after touching the branch, the angle was reduced to 90. Three quarters of an hour after it had mounted to 112; and, at eight at night, it deſcended again, without being touched, to 90. The day after, in finer weather, the ſame branch, at eight in the morning, made an angle of 135 degrees with the ſtem; after being touched, the angle was diminiſhed to 80; an hour after, it roſe again to 135; being touched a ſecond time, it deſcended again to 80; an hour and a half after, it had riſen to 145; and on being touched

Senſitive. touched a third time, deſcended to 135; and remained in that poſition till five o'clock in the afternoon, when being touched a fourth time it fell to 110.

9. The parts of the plants which have collapſed afterwards unfold themſelves, and return to their former expanded ſtate. The time required for that purpoſe varies, according to the vigour of the plant, the ſeaſon of the year, the hour of the day, the ſtate of the atmoſphere. Sometimes half an hour is requiſite, ſometimes only ten minutes. The order in which the parts recover themſelves varies in like manner: ſometimes it is the common footſtalk; ſometimes the rib to which the leaves are attached; and ſometimes the leaves themſelves are expanded, before the other parts have made any attempt to be reinſtated in their former poſition.

10. If, without ſhaking the other ſmaller leaves, we cut off the half of a leaf or lobe belonging to the laſt pair, at the extremity or ſummit of a wing, the leaf cut, and its antagoniſt, that is to ſay, the firſt pair, begin to approach each other; then the ſecond, and ſo on ſucceſſively, till all the leſſer leaves, or lobes of that wing, have collapſed in like manner. Frequently, after 12 or 15 ſeconds, the lobes of the other wings, which were not immediately affected by the ſtroke, ſhut; whilſt the ſtalk and its wing, beginning at the bottom, and proceeding in order to the top, gradually recover themſelves. If, inſtead of one of the leſſer extreme leaves, we cut off one belonging to the pair that is next the footſtalk, its antagoniſt ſhuts, as do the other pairs ſucceſſively, from the bottom to the top. If all the leaves of one ſide of a wing be cut off, the oppoſite leaves are not affected, but remain expanded. With ſome addreſs, it is poſſible even to cut off a branch without hurting the leaves, or making them fall. The common footſtalk of the winged leaves being cut as far as three-fourths of its diameter, all the parts which hang down collapſe, but quickly recover without appearing to have ſuffered any conſiderable violence by the ſhock. An inciſion being made into one of the principal branches to the depth of one half the diameter, the branches ſituated betwixt the ſection and the root will fall down; thoſe above the inciſion remain as before, and the leſſer leaves continue open; but this direction is ſoon deſtroyed, by cutting off one of the lobes at the extremity, as was obſerved above. Laſtly, a whole wing being cut off with precaution near its inſertion into the common footſtalk, the other wings are not affected by it, and its own lobes do not ſhut. No motion enſues from piercing the branch with a needle or other ſharp inſtrument.

11. If the end of one of the leaves be burned with the flame of a candle, or by a burning glaſs, or by touching it with hot iron, it cloſes up in a moment, and the oppoſite leaf does the ſame, and after that the whole ſeries of leaves on each ſide of the partial or little footſtalk; then the footſtalk itſelf; then the branch or common footſtalk; all do the ſame, if the burning has been in a ſufficient degree. This proves that there is a very nice communication between all the parts of the plant, by means of which the burning, which only is applied to the extremity of one leaf, diffuſes its influence through every part of the ſhrub. If a drop of aquafortis be carefully laid upon a leaf of the ſenſitive plant, ſo as not to ſhake it in the leaſt, the leaf does not begin to move till the acrid liquor corrodes the ſubſtance of it; but at that time, not only that particular leaf, but all the leaves placed on the ſame footſtalk, cloſe themſelves up. The vapour of burning ſulphur has alſo this effect on many leaves at once, according as they are more or leſs expoſed to it; but a bottle of very acrid and ſulphureous ſpirit of vitriol, placed under the branches unſtopped, produces no ſuch effect. Wetting the leaves with ſpirit of wine has been obſerved alſo to have no effect, nor the rubbing oil of almonds over them; though this laſt application deſtroys many plants.

From the preceding experiments the following concluſions may be fairly drawn: 1. The contraction of the parts of the ſenſitive plant is occaſioned by an external force, and the contraction is in proportion to the force. 2. All bodies which can exert any force affect the ſenſitive plant; ſome by the touch or by agitation, as the wind, rain, &c.; ſome by chemical influence, as heat and cold. 3. Touching or agitating the plant produces a greater effect than an inciſion or cutting off a part, or by applying heat or cold.

Attempts have been made to explain theſe curious phenomena. Dr Darwin, in the notes to his admired poem, entitled, *The Botanic Garden*, lays it down as a principle, that "the ſleep of animals conſiſts in a ſuſpenſion of voluntary motion; and as vegetables are ſubject to ſleep as well as animals, there is reaſon to conclude (ſays he) that the various action of cloſing their petals and foliage may be juſtly aſcribed to a voluntary power; for without the faculty of volition ſleep would not have been neceſſary to them." Whether this definition of ſleep when applied to animals be juſt, we ſhall not inquire; but it is evident the ſuppoſed analogy between the ſleep of animals and the ſleep of plants has led Dr Darwin to admit this aſtoniſhing concluſion, that plants have volition. As volition preſuppoſes a mind or ſoul, it were to be wiſhed that he had given us ſome information concerning the nature of a vegetable ſoul, which can think and will. We ſuſpect, however, that this vegetable ſoul will turn out to be a mere mechanical or chemical one; for it is affected by external forces uniformly in the ſame way, its volition is merely paſſive, and never makes any ſucceſsful reſiſtance againſt thoſe cauſes by which it is influenced. All this is a mere abuſe of words. The ſleep of plants is a metaphorical expreſſion, and has not the leaſt reſemblance to the ſleep of animals. Plants are ſaid to ſleep when the flowers or leaves are contracted or folded together; but we never heard that there is any ſimilar contraction in the body of an animal during ſleep.

The fibres of vegetables have been compared with the muſcles of animals, and the motions of the ſenſitive plant have been ſuppoſed the ſame with muſcular motion. Between the fibres of vegetables and the muſcles of animals, however, there is not the leaſt ſimilarity. If muſcles be cut through, ſo as to be ſeparated from the joints to which they are attached, their powers are completely deſtroyed; but this is not the caſe with vegetable fibres. The following very ingenious experiment, which was communicated to us by a reſpectable member of the Univerſity of Edinburgh, is deciſive on this ſubject. He ſelected a growing poppy at that period of its growth, before unfolding, when the head and neck are bent down almoſt double. He cut the ſtalk where it was curved half through on the under ſide, and half

through

Sentence. through at a ſmall diſtance on the upper ſide, and half through in the middle point between the two ſections, ſo that the ends of the fibres were ſeparated from the ſtalk. Notwithſtanding theſe ſeveral cuttings on the neck, the poppy raiſed its head, and aſſumed a more erect poſition. There is, therefore, a complete diſtinction between muſcular motion and the motions of a plant, for no motion can take place in the limb of an animal when the muſcles of that limb are cut.

In fine, we look upon all attempts to explain the motions of plants as abſurd, and all reaſoning from ſuppoſed analogy between animals and vegetables as the ſource of wild conjecture, and not of ſound philoſophy. We view the contraction and expanſion of the ſenſitive plant in the ſame light as we do gravitation, chemical attraction, electricity, and magnetiſm, as a ſingular fact, the circumſtances of which we may be fully acquainted with, but muſt deſpair of underſtanding its cauſe.

What has been ſaid under this article chiefly refers to the *mimoſa ſenſitiva* and *pudica*. For a full account of the motions of vegetables in general, ſee *Vegetable Motion*, under the article Motion.

SENTENCE, in *Law*, a judgement paſſed in court by the judge in ſome proceſs, either civil or criminal. See Judgement.

Sentence, in *Grammar*, denotes a period, or a ſet of words comprehending ſome perfect ſenſe or ſentiment of the mind. The buſineſs of pointing is to diſtinguiſh the ſeveral parts and members of ſentences, ſo as to render the ſenſe thereof as clear, diſtinct, and full as poſſible. See Punctuation.

In every ſentence there are two parts neceſſarily required; a noun for the ſubject, and a definite verb: whatever is found more than theſe two, affects one of them, either immediately, or by the intervention of ſome other, whereby the firſt is affected.

Again, every ſentence is either ſimple or compound: a ſimple ſentence is that conſiſting of one ſingle ſubject, and one finite verb.—A compound ſentence contains ſeveral ſubjects and finite verbs, either expreſsly or implicitly.

A ſimple ſentence needs no point or diſtinction; only a period to cloſe it: as, "A good man loves virtue for itſelf."—In ſuch a ſentence, the ſeveral adjuncts affect either the ſubject or the verb in a different manner. Thus the word *good* expreſſes the quality of the ſubject, *virtue* the object of the action, and *for itſelf* the end thereof.—Now none of theſe adjuncts can be ſeparated from the reſt of the ſentence: for if one be, why ſhould not all the reſt? and if all be, the ſentence will be minced into almoſt as many parts as there are words.

But if ſeveral adjuncts be attributed in the ſame manner either to the ſubject or the verb, the ſentence becomes compound, and is to be divided into parts.

In every compound ſentence, as many ſubjects, or as many finite verbs as there are, either expreſsly or implied, ſo many diſtinctions may there be. Thus, "My hopes, fears, joys, pains, all centre in you." And thus Cicero. *Catilina abiit, exceſſit, evaſit, erupit.*—The reaſon of which pointing is obvious; for as many ſubjects or finite verbs as there are in a ſentence, ſo many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwiſe, they are to be conceived as equal. Since, as every ſubject requires its verbs, ſo every verb requires its ſubject, wherewith it may agree: excepting, perhaps, in ſome figurative expreſſions.

Sentence, Sentiment.

SENTICOSÆ (from *ſentis*, a "briar or bramble"), the name of the 35th order in Linnæus's fragments of a natural method, conſiſting of roſe, bramble, and other plants, which reſemble them in port and external ſtructure. See Botany, *Natural Method*.

SENTIMENT, according to Lord Kames, is a term appropriated to ſuch thoughts as are prompted by paſſion. It differs from a perception; for a perception ſignifies the act by which we become conſcious of external objects. It differs from conſciouſneſs of an internal action, ſuch as thinking, ſuſpending thought, inclining, reſolving, willing, &c. And it differs from the conception of a relation among objects; a conception of that kind being termed *opinion*.

SENTIMENTS, in *Poetry*. To talk in the language of muſic, each paſſion has a certain tone, to which every ſentiment proceeding from it ought to be tuned with the greateſt accuracy: which is no eaſy work, eſpecially where ſuch harmony ought to be ſupported during the courſe of a long theatrical repreſentation. In order to reach ſuch delicacy of execution, it is neceſſary that a writer aſſume the preciſe character and paſſion of the perſonage repreſented; which requires an uncommon genius. But it is the only difficulty; for the writer, who, annihilating himſelf, can thus become another perſon, need be in no pain about the ſentiments that belong to the aſſumed character: theſe will flow without the leaſt ſtudy, or even preconception; and will frequently be as delightfully new to himſelf as to his reader. But if a lively picture even of a ſingle emotion require an effort of genius, how much greater the effort to compoſe a paſſionate dialogue with as many different tones of paſſion as there are ſpeakers? With what ductility of feeling muſt that writer be endued, who approaches perfection in ſuch a work; when it is neceſſary to aſſume different and even oppoſite characters and paſſions in the quickeſt ſucceſſion? Yet this work, difficult as it is, yields to that of compoſing a dialogue in genteel comedy, exhibiting characters without paſſion. The reaſon is, that the different tones of character are more delicate, and leſs in ſight, than thoſe of paſſion; and, accordingly, many writers, who have no genius for drawing characters, make a ſhift to repreſent, tolerably well, an ordinary paſſion in its ſimple movements. But of all works of this kind, what is truly the moſt difficult, is a characteriſtical dialogue upon any philoſophical ſubject; to interweave characters with reaſoning, by ſuiting to the character of each ſpeaker a peculiarity not only of thought but of expreſſion, requires the perfection of genius, taſte, and judgement.

How difficult dialogue-writing is, will be evident, even without reaſoning, from the miſerable compoſitions of that kind found without number in all languages. The art of mimicking any ſingularity in geſture or in voice, is a rare talent, though directed by ſight and hearing, the acuteſt and moſt lively of our external ſenſes: how much more rare muſt that talent, of imitating characters and internal emotions, tracing all their different tints, and repreſenting them in a lively manner by natural ſentiments properly expreſſed? The truth is, ſuch execution is too delicate for an ordinary genius;

Sentiments. and for that reason the bulk of writers, instead of expressing a passion as one does who feels it, content themselves with describing it in the language of a spectator. To awake passion by an internal effort merely, without any external cause, requires great sensibility; and yet that operation is necessary, not less to the writer than to the actor; because none but those who actually feel a passion can represent it to the life. The writer's part is the more complicated: he must add composition to passion: and must, in the quickest succession, adopt every different character. But a very humble flight of imagination may serve to convert a writer into a spectator, so as to figure, in some obscure manner, an action as passing in his sight and hearing. In that figured situation, being led naturally to write like a spectator, he entertains his readers with his own reflections, with cool description, and florid declamation; instead of making them eye-witnesses, as it were, to a real event, and to every movement of genuine passion. Thus most of our plays appear to be cast in the same mould; personages without character, the mere outlines of passion, a tiresome monotony, and a pompous declamatory style.

This descriptive manner of representing passion is a very cold entertainment; our sympathy is not raised by description; we must first be lulled into a dream of reality, and every thing must appear as passing in our sight. Unhappy is the player of genius who acts a part in what may be termed a *descriptive tragedy;* after assuming the very passion that is to be represented, how is he cramped in action, when he must utter, not the sentiments of the passion he feels, but a cold description in the language of a bystander? It is that imperfection, undoubtedly, in the bulk of our plays, which confines our stage almost entirely to Shakespeare, notwithstanding his many irregularities. In our late English tragedies, we sometimes find sentiments tolerably well adapted to a plain passion: but we must not in any of them expect a sentiment expressive of character: and, upon that very account, our late performances of the dramatic kind are for the most part intolerably insipid.

But it may be proper to illustrate this subject by examples. The first examples shall be of sentiments that appear the legitimate offspring of passion; to which shall be opposed what are descriptive only, and illegitimate; and in making this comparison, the instances shall be borrowed from Shakespeare and Corneille, who for genius in dramatic composition stand uppermost in the rolls of fame.

I. Shakespeare shall furnish the first example, being of sentiments dictated by a violent and perturbed passion:

Lear. ——————Filial ingratitude!
Is it not as if this mouth should tear this hand
For lifting food to't?—But I'll punish home;
No, I will weep no more.——In such a night,
To shut me out!——Pour on, I will endure.
In such a night as this! O Regan, Gonerill,
Your old kind father, whose frank heart gave all—
O! that way madness lies; let me shun that;
No more of that.——————
Kent. Good, my lord, enter here.
Lear. Prithee, go in thyself, seek thine own ease,
This tempest will not give me leave to ponder
On things would hurt me more:—but I'll go in;
In, boy, go first. You houseless poverty——
Nay, get thee in; I'll pray, and then I'll sleep——
Poor naked wretches, wheresoe'er you are,
That bide the pelting of this pitiless storm!
How shall your houseless heads, and unfed sides,
Your loop'd and window'd raggedness, defend you
From seasons such as these!——O I have ta'en
Too little care of this! take physic, Pomp;
Expose thyself to feel what wretches feel,
That thou may'st shake the superflux to them,
And show the heav'ns more just.

King Lear, act iii. sc. 5.

With regard to the French author, truth obliges us to acknowledge, that he describes in the style of a spectator, instead of expressing passion like one who feels it; which naturally betrays him into a tiresome monotony, and a pompous declamatory style. It is scarcely necessary to give examples, for he never varies from that tone. We shall, however, take two passages at a venture, in order to be confronted with those transcribed above. In the tragedy of Cinna, after the conspiracy was discovered, Æmilia, having nothing in view but racks and death to herself and her lover, receives a pardon from Augustus, attended with the brightest circumstances of magnanimity and tenderness. This is a lucky situation for representing the passions of surprise and gratitude in their different stages, which seem naturally to be what follow. These passions, raised at once to the utmost pitch, and being at first too big for utterance, must, for some moments, be expressed by violent gestures only: so soon as there is vent for words, the first expressions are broken and interrupted: at last, we ought to expect a tide of intermingled sentiments, occasioned by the fluctuation of the mind between the two passions. Æmilia is made to behave in a very different manner: with extreme coolness she describes her own situation, as if she were merely a spectator; or rather the poet takes the task off her hands:

Et je me rends, Seigneur, à ces hautes bontés:
Je recouvre la vûe auprès de leurs clartés.
Je connois mon forfait qui me sembloit justice;
Et ce que n'avoit pû la terreur du supplice,
Je sens naitre en mon ame un repentir puissant,
Et mon cœur en secret me dit, qu'il y consent.
Le ciel a résolu votre grandeur suprême;
Et pour preuve, Seigneur, je n'en veux que moi-même.
J'ose avec vanité me donner cet éclat,
Puisqu'il change mon cœur, qu'il veut changer l'état.
Ma haine va mourir, que j'ai crue immortelle;
Elle est morte, et ce cœur devient sujet fidele;
Et prenant désormais cette haine en horreur,
L'ardeur de vous servir succede à sa fureur.

Act v. sc. 3.

So much in general on the genuine sentiments of passion. We proceed to particular observations. And, first, passions seldom continue uniform any considerable time: they generally fluctuate, swelling and subsiding by turns, often in a quick succession; and the sentiments cannot be just unless they correspond to such fluctuation. Accordingly, a climax never shows better than in expressing a swelling passion: the following passages may suffice for an illustration.

Almeria.

Sentiments.

Almeria. ——— How haſt thou charm'd
The wildneſs of the waves and rocks to this;
That thus relenting they have giv'n thee back
To earth, to light and life, to love and me?
Mourning Bride, act i. ſc. 7.

I would not be the villain that thou think'ſt
For the whole ſpace that's in the tyrant's graſp,
And the rich earth to boot.
Macbeth, act iv. ſc. 4.

The following paſſage expreſſes finely the progreſs of conviction.

Let me not ſtir, nor breathe, leſt I diſſolve
That tender, lovely form, of painted air,
So like Almeria. Ha! it ſinks, it falls;
I'll catch it e'er it goes, and graſp her ſhade.
'Tis life! 'tis warm! 'tis ſhe! 'tis ſhe herſelf!
It is Almeria! 'tis, it is my wife!
Mourning Bride, act ii. ſc. 6.

In the progreſs of thought our reſolutions become more vigorous as well as our paſſions.

If ever I do yield or give conſent,
By any action, word, or thought, to wed
Another lord; may then juſt heav'n ſhow'r down, &c.
Mourning Bride, act i. ſc. 1.

And this leads to a ſecond obſervation, That the different ſtages of a paſſion, and its different directions, from birth to extinction, muſt be carefully repreſented in their order; becauſe otherwiſe the ſentiments, by being miſplaced, will appear forced and unnatural.—Reſentment, for example, when provoked by an atrocious injury, diſcharges itſelf firſt upon the author: ſentiments therefore of revenge come always firſt, and muſt in ſome meaſure be exhauſted before the perſon injured think of grieving for himſelf. In the Cid of Corneille, Don Diegue having been affronted in a cruel manner, expreſſes ſcarcely any ſentiment of revenge, but is totally occupied in contemplating the low ſituation to which he is reduced by the affront:

O rage! ô deſeſpoir! ô vieilleſſe ennemie!
N'ai-je donc tant vecu que pour cette infamie?
Et ne ſuis-je blanchi dans les travaux guerriers,
Que pour voir en un jour fletrit tant de lauriers?
Mon bras, qu'avec reſpect tout l'Eſpagne admire,
Mon bras qui tant de fois a ſauvé cet empire,
Tant de fois affermi le trône de ſon roi,
Trahit donc ma querelle, et ne fait rien pour moi!
O cruel ſouvenir de ma gloire paſſé!
Oeuvre de tant de jours en un jour effacée!
Nouvelle dignité fatale à mon bonheur!
Precipice élevé d'où tombe mon honneur!
Faut-il de votre éclat voir triompher le comte,
Et mourir ſans vengeance, ou vivre dans la honte?
Comte, ſois de mon prince à preſent gouverneur,
Ce haut rang n'admet point un homme ſans honneur;
Et ton jaloux orgueil par cet affront inſigne,
Malgré le choix du roi, m'en a ſû rendre indigne.
Et toi, de mes exploits glorieux inſtrument,
Mais d'un corps tout de glace inutile ornement,
Fer jadis tant à craindre, et qui dans cette offenſe,
M'as ſervi de parade, et non pas de defenſe,
Va, quitte deſormais le dernier des humains,
Paſſe pour me venger en de meilleures mains.
Le Cid, act i. ſc. 7.

Sentiments.

Theſe ſentiments are certainly not the firſt that are ſuggeſted by the paſſion of reſentment. As the firſt movements of reſentment are always directed to its object, the very ſame is the caſe of grief. Yet with relation to the ſudden and ſevere diſtemper that ſeized Alexander bathing in the river Cydnus, Quintus Curtius deſcribes the firſt emotions of the army as directed to themſelves, lamenting that they were left without a leader, far from home, and had ſcarce any hopes of returning in ſafety: their king's diſtreſs, which muſt naturally have been their firſt concern, occupies them but in the ſecond place according to that author. In the Aminta of Taſſo, Sylvia, upon a report of her lover's death, which ſhe believed certain, inſtead of bemoaning the loſs of her beloved, turns her thoughts upon herſelf, and wonders her heart does not break:

Ohime, ben ſon di ſaſſo,
Poi che queſta novella non m'uccide.
Act iv. ſc. 2.

In the tragedy of Jane Shore, Alicia, in the full purpoſe of deſtroying her rival, has the following reflection:

Oh Jealouſy! thou bane of pleaſing friendſhip,
Thou worſt invader of our tender boſoms;
How does thy rancour poiſon all our ſoftneſs,
And turn our gentle nature into bitterneſs!
See where ſhe comes! Once my heart's deareſt bleſſing,
Now my chang'd eyes are blaſted with her beauty,
Loathe that known face, and ſicken to behold her.
Act iii. ſc. 1.

Theſe are the reflections of a cool ſpectator. A paſſion, while it has the aſcendant, and is freely indulged, ſuggeſts not to the perſon who feels it any ſentiment to its own prejudice: reflections like the foregoing occur not readily till the paſſion has ſpent its vigour.

A perſon ſometimes is agitated at once by different paſſions; and the mind in that caſe, vibrating like a pendulum, vents itſelf in ſentiments that partake of the ſame vibration. This we give as a third obſervation:

Queen. Would I had never trod this Engliſh earth,
Or felt the flatteries that grow upon it!
Ye've angels faces, but heav'n knows your hearts.
What ſhall become of me now? wretched lady!
I am the moſt unhappy woman living.
Alas! poor wenches, where are now your fortunes?
[*To her women.*
Shipwreck'd upon a kingdom, where no pity,
No friends, no hope, no kindred, weep for me:
Almoſt no grave allow'd me.
Henry VIII. act iii. ſc. 1.

Othello. Oh devil, devil!
If that the earth could teem with woman's tears,
Each drop ſhe falls would prove a crocodile.
Out of my ſight!
Deſdemona. I will not ſtay t'offend you. [*Going.*
Lodovico. Truly, an obedient lady:
I do beſeech your lordſhip, call her back.
Oth. Miſtreſs——

Deſ.

Sentiments.

Def. My lord.

Oth. What would you with her, Sir?

Lod. Who, I, my lord?

Oth. Ay; you did wish that I would make her turn.
Sir, she can turn and turn, and yet go on;
And turn again. And she can weep, Sir, weep;
And she's obedient: as you say, obedient:
Very obedient—proceed you in your tears—
Concerning this, Sir,—oh well painted passion!—
I am commanded home—get you away,
I'll send for you anon—Sir, I obey the mandate,
And will return to Venice.——Hence, avaunt!
[*Exit* Desdemona.
Othello, act iv. sc. 6.

Æmilia. Oh! my good lord, I would speak a word with you.

Othello. Yes, 'tis Æmilia—By and by.—She's dead.
'Tis like she comes to speak of Cassio's death;
The noise was high.—Ha! no more moving?
Still as the grave. Shall she come in? wer't good?
I think she stirs again—No—what's the best?
If she come in, she'll, sure, speak to my wife:
My wife! my wife! what wife? I have no wife;
Oh insupportable! oh heavy hour!
Othello, act v. sc. 7.

A fourth observation is, That nature, which gave us passions, and made them extremely beneficial when moderate, intended undoubtedly that they should be subjected to the government of reason and conscience. It is therefore against the order of nature, that passion in any case should take the lead in contradiction to reason and conscience: such a state of mind is a sort of anarchy which every one is ashamed of and endeavours to hide or dissemble. Even love, however laudable, is attended with a conscious shame when it becomes immoderate: it is covered from the world, and disclosed only to the beloved object:

Et que l'amour souvent de remors combattu
Paroisse une foiblesse, et non une vertu.
BOILEAU, *l'Art Poet.* chant. iii. l. 101.

O, they love least that let men know they love.
Two Gentleman of Verona, act i. sc. 3.

Hence a capital rule in the representation of immoderate passions, that they ought to be hid or dissembled as much as possible. And this holds in an especial manner with respect to criminal passions: one never counsels the commission of a crime in plain terms; guilt must not appear in its native colours, even in thought; the proposal must be made by hints, and by representing the action in some favourable light. Of the propriety of sentiment upon such an occasion, Shakespeare, in the *Tempest*, has given us a beautiful example, in a speech by the usurping duke of Milan, advising Sebastian to murder his brother the king of Naples:

Antonio. ——————What might,
Worthy Sebastian,—O, what might—no more.
And yet, methinks, I see it in thy face
What thou shouldst be: the occasion speaks thee, and
My strong imagination sees a crown
Dropping upon thy head. Act ii. sc. 2.

A picture of this kind, perhaps still finer, is exhibited in *King John*, where that tyrant solicits (act iii. sc. 5.) Hubert to murder the young prince Arthur; but it is too long to be inserted here.

Sentiments

II. As things are best illustrated by their contraries, we proceed to faulty sentiments, disdaining to be indebted for examples to any but the most approved authors. The first class shall consist of sentiments that accord not with the passion; or, in other words, sentiments that the passion does not naturally suggest. In the second class shall be ranged sentiments that may belong to an ordinary passion, but unsuitable to it as tinctured by a singular character. Thoughts that properly are not sentiments, but rather descriptions, make a third. Sentiments that belong to the passion represented, but are faulty as being introduced too early or too late, make a fourth. Vicious sentiments exposed in their native dress, instead of being concealed or disguised, make a fifth. And in the last class shall be collected sentiments suited to no character nor passion, and therefore unnatural.

The *first* class contains faulty sentiments of various kinds, which we shall endeavour to distinguish from each other.

1. Of sentiments that are faulty by being above the tone of the passion, the following may serve as an example:

Othello.——————O my soul's joy!
If after every tempest come such calms,
May the winds blow till they have waken'd death:
And let the labouring bark climb hills of seas
Olympus high, and duck again as low
As hell's from heaven? *Othello*, act ii. sc. 6.

This sentiment may be suggested by violent and inflamed passion; but is not suited to the satisfaction, however great, that one feels upon escaping danger.

2. Instance of sentiments below the tone of the passion. Ptolemy, by putting Pompey to death, having incurred the displeasure of Cæsar, was in the utmost dread of being dethroned: in that agitating situation, Corneille makes him utter a speech full of cool reflection, that is in no degree expressive of the passion.

Ah! si je t'avois crû, je n'aurois pas de maitre,
Je serois dans le trône où le ciel m'a fait naître;
Mais c'est une imprudence assez commune aux rois,
D'écouter trop d'avis, et se tromper au choix.
Le Destin les aveugle au bord du précipice,
Ou si quelque lumiere en leur ame se glisse,
Cette fausse clarté dont il les eblouit,
Le plonge dans une gouffre, et puis s'evanouit.
La Mort de Pompée, act iv. sc. 1.

3. Sentiments that agree not with the tone of the passion; as where a pleasant sentiment is grafted upon a painful passion, or the contrary. In the following instances, the sentiments are too gay for a serious passion:

No happier task these faded eyes pursue;
To read and weep is all they now can do.
Eloisa to Abelard, l. 47.

Again;

Heav'n first taught letters for some wretch's aid,
Some banish'd lover, or some captive maid:

They

Sentiments.

They live, they speak, they breathe what love inspires,
Warm from the soul, and faithful to its fires;
The virgin's wish without her fears impart,
Excuse the blush, and pour out all the heart;
Speed the soft intercourse from soul to soul,
And waft a sigh from Indus to the pole.
Eloisa to Abelard, l. 51.

These thoughts are pretty: they suit Pope, but not Eloisa.

Satan, enraged by a threatening of the angel Gabriel, answers thus:

Then when I am thy captive, talk of chains,
Proud limitary cherub; but ere then
Far heavier load thyself expect to feel
From my prevailing arm, though heaven's King
Ride on thy wings, and thou with thy compeers,
Us'd to the yoke, draw'st his triumphant wheels
In progress thro' the road of heav'n *star pav'd.*
Paradise Lost, book iv.

The concluding epithet forms a grand and delightful image, which cannot be the genuine offspring of rage.

4. Sentiments too artificial for a serious passion. The first example is a speech of Percy expiring.

O, Harry, thou hast robb'd me of my growth:
I better brook the loss of brittle life,
Than those proud titles thou hast won of me:
They wound my thoughts worse than thy sword my flesh.
But thought's the slave of life, and life time's fool;
And time, that takes survey of all the world,
Must have a stop.
First Part, Henry IV. act v. sc. 9.

The sentiments of the *Mourning Bride* are for the most part no less delicate than just copies of nature: in the following exception the picture is beautiful, but too artful to be suggested by severe grief.

Almeria. O no! Time gives increase to my afflictions.
The circling hours, that gather all the woes
Which are diffus'd through the revolving year,
Come heavy laden with th' oppressive weight
To me; with me, successively, they leave
The sighs, the tears, the groans, the restless cares,
And all the damps of grief, that did retard their flight;
They shake their downy wings, and scatter all
The dire collected dews on my poor head;
Then fly with joy and swiftness from me. Act i. sc. 1.

In the same play, Almeria seeing a dead body, which she took to be Alphonso's, expresses sentiments strained and artificial, which nature suggests not to any person upon such an occasion:

Had they or hearts or eyes, that did this deed?
Could eyes endure to guide such cruel hands?
Are not my eyes guilty alike with theirs,
That thus can gaze, and yet not turn to stone?
—I do not weep! The springs of tears are dry'd,
And of a sudden I am calm, as if
All things were well; and yet my husband's murder'd!
Yes, yes, I know to mourn: I'll sluice this heart,
The source of wo, and let the torrent in.
Act v. sc. 11.

Pope's elegy to the memory of an unfortunate lady, expresses delicately the most tender concern and sorrow that one can feel for the deplorable fate of a person of worth. Such a poem, deeply serious and pathetic, rejects with disdain all fiction. Upon that account, the following passage deserves no quarter; for it is not the language of the heart, but of the imagination indulging its flights at ease, and by that means is eminently discordant with the subject. It would be a still more severe censure, if it should be ascribed to imitation, copying indiscreetly what has been said by others:

What though no weeping loves thy ashes grace,
Nor polish'd marble emulate thy face?
What though no sacred earth allow thee room,
Nor hallow'd dirge be mutter'd o'er thy tomb?
Yet shall thy grave with rising flow'rs be drest,
And the green turf lie lightly on thy breast:
There shall the morn her earliest tears bestow,
There the first roses of the year shall blow;
While angels with their silver wings o'ershade
The ground, now sacred by thy relics made.

5. Fanciful or finical sentiments. Sentiments that degenerate into point or conceit, however they may amuse in an idle hour, can never be the offspring of any serious or important passion. In the *Jerusalem* of Tasso, Tancred, after a single combat, spent with fatigue and loss of blood, falls into a swoon; in which situation, understood to be dead, he is discovered by Erminia, who was in love with him to distraction. A more happy situation cannot be imagined, to raise grief in an instant to its highest pitch; and yet, in venting her sorrow, she descends most abominably into antithesis and conceit even of the lowest kind:

E in lui versò d'inefficabil vena
Lacrime, e voce di sospiri mista.
In che misero punto hor qui me mena
Fortuna? a che veduta amara e trista?
Dopo gran tempo i' ti ritrovo à pena
Tancredi, e ti riveggio, e non son vista
Vista non son da te, benche presente
T' trovando ti perdo eternamente.
Canto xix. st. 105.

Armida's lamentation respecting her lover Rinaldo is in the same vicious taste. *Vid.* canto xx. stan. 124, 125. 126.

Queen. Give me no help in lamentation,
I am not barren to bring forth complaints:
All springs reduce their currents to mine eyes,
That I, being govern'd by the wat'ry moon,
May send forth plenteous tears to drown the world,
Ah, for my husband, for my dear lord Edward.
King Richard III. act ii. sc. 2.

Jane Shore utters her last breath in a witty conceit.

Then all is well, and I shall sleep in peace——
'Tis very dark, and I have lost you now——
Was there not something I would have bequeath'd you

But I have nothing left me to beſtow,
Nothing but one ſad ſigh. Oh mercy, Heav'n! [*Dies.*
Act v.

Guilford to Lady Jane Gray, when both were condemn'd to die:

Thou ſtand'ſt unmov'd;
Calm temper ſits upon thy beauteous brow;
Thy eyes that flow'd ſo faſt for Edward's loſs,
Gaze unconcern'd upon the ruin round thee,
As if thou had'ſt reſolv'd to brave thy fate,
And triumph in the midſt of deſolation.
Ha! ſee, it ſwells, the liquid cryſtal riſes,
It ſtarts in ſpite of thee——but I will catch it,
Nor let the earth be wet with dew ſo rich.
Lady Jane Gray, act iv. near the end.

The concluding ſentiment is altogether finical, unſuitable to the importance of the occaſion, and even to the dignity of the paſſion of love.

Corneille, in his *Examen of the Cid*, anſwering an objection, That his ſentiments are ſometimes too much refined for perſons in deep diſtreſs, obſerves, that if poets did not indulge ſentiments more ingenious or refined than are prompted by paſſion, their performances would often be low, and extreme grief would never ſuggeſt but exclamations merely. This is in plain language to aſſert, that forced thoughts are more agreeable than thoſe that are natural, and ought to be preferred.

The *ſecond* claſs is of ſentiments that may belong to an ordinary paſſion, but are not perfectly concordant with it, as tinctured by a ſingular character.

In the laſt act of that excellent comedy *The Careleſs Huſband*, Lady Eaſy, upon Sir Charles's reformation, is made to expreſs more violent and turbulent ſentiments of joy than are conſiſtent with the mildneſs of her character.

Lady Eaſy. O the ſoft treaſure! O the dear reward of long-deſiring love.—Thus! thus to have you mine, is ſomething more than happineſs; 'tis double life, and madneſs of abounding joy.

The following inſtances are deſcriptions rather than ſentiments, which compoſe a *third* claſs.

Of this deſcriptive manner of painting the paſſions, there is in the *Hippolytus* of Euripides, act v. an illuſtrious inſtance, viz. the ſpeech of Theſeus, upon hearing of his ſon's diſmal exit. In Racine's tragedy of *Eſther*, the queen hearing of the decree iſſued againſt her people, inſtead of expreſſing ſentiments ſuitable to the occaſion, turns her attention upon herſelf, and deſcribes with accuracy her own ſituation.

Juſte ciel! tout mon ſang dans mes veines ſe glace.
Act i. ſc. 3.

Again,

Aman. C'en eſt fait. Mon orgueil eſt forcé de plier.
L'inexorable Amen eſt reduit à prier.
Eſther, act iii. ſc. 5.

Athalie. Quel prodige nouveau me trouble et m'embarraſſe?
La douceur de ſa voix, ſon enfance, ſa grace,
Font inſenſiblement à mon inimitié
Succeder——Je ſerois ſenſible à la pitié?
Athalie, act ii. ſc. 7.

Titus. O de ma paſſion fureur deſeſperée!
Brutus of Voltaire, act iii. ſc. 6.

What other are the foregoing inſtances but deſcribing the paſſion another feels?

The *fourth* claſs is of ſentiments expreſſed too early or too late.

Some examples mentioned above belong to this claſs. Add the following from *Venice Preſerv'd*, act v. at the cloſe of the ſcene between Belvidera and her father Priuli. The account given by Belvidera of the danger ſhe was in, and of her huſband's threatening to murder her, ought naturally to have alarmed her relenting father, and to have made him expreſs the moſt perturbed ſentiments. Inſtead of which, he diſſolves into tenderneſs and love for his daughter, as if he had already delivered her from danger, and as if there were a perfect tranquillity:

Canſt thou forgive me all my follies paſt!
I'll henceforth be indeed a father; never,
Never more thus expoſe, but cheriſh thee,
Dear as the vital warmth that feeds my life,
Dear as thoſe eyes that weep in fondneſs o'er thee:
Peace to thy heart.

Immoral ſentiments expoſed in their native colours, inſtead of being concealed or diſguiſed, compoſe the *fifth* claſs.

The Lady Macbeth, projecting the death of the king, has the following ſoliloquy:

————The raven himſelf's not hoarſe
That croaks the fatal entrance of Duncan
Under my battlements. Come, all you ſpirits
That tend on mortal thoughts, unſex me here,
And fill me from the crown to the toe, top full
Of direſt cruelty; make thick my blood,
Stop up th' acceſs and paſſage to remorſe,
That no compunctious viſitings of nature
Shake my fell purpoſe. *Macbeth*, act i. ſc. 7.

This ſpeech is not natural. A treacherous murder was never perpetrated even by the moſt hardened miſcreant without compunction: and that the lady here muſt have been in horrible agitation, appears from her invoking the infernal ſpirits to fill her with cruelty, and to ſtop up all avenues to remorſe. But in that ſtate of mind it is a never-failing artifice of ſelf-deceit to draw the thickeſt veil over the wicked action, and to extenuate it by all the circumſtances that imagination can ſuggeſt: and if the crime cannot bear diſguiſe, the next attempt is to thruſt it out of mind altogether, and to ruſh on to action without thought. This laſt was the huſband's method.

Strange things I have in head, that will to hand;
Which muſt be acted ere they muſt be ſcann'd.
Act iii. ſc. 5.

The lady follows neither of theſe courſes, but in a deliberate manner endeavours to fortify her heart in the commiſſion of an execrable crime, without even attempting to colour it. This, we think, is not natural; we hope

hope there is no ſuch wretch to be found as is here repreſented.

The *laſt* claſs comprehends ſentiments that are unnatural, as being ſuited to no character nor paſſion. Theſe may be ſubdivided into three branches: firſt, ſentiments unſuitable to the conſtitution of man, and to the laws of his nature; ſecond, inconſiſtent ſentiments; third, ſentiments that are pure rant and extravagance.

When the fable is of human affairs, every event, every incident, and every circumſtance, ought to be natural, otherwiſe the imitation is imperfect. But an imperfect imitation is a venial fault, compared with that of running croſs to nature. In the *Hippolytus* of Euripides (act iv. ſc. 5.), Hippolytus, wiſhing for another ſelf in his own ſituation, "How much (ſays he) ſhould I be touched with his misfortune!" as if it were natural to grieve more for the misfortune of another than for one's own.

Oſmyn. Yet I behold her—yet—and now no more.
Turn your lights inward, eyes, and view my thoughts;
So ſhall you ſtill behold her—'twill not be.
O impotence of ſight! mechanic ſenſe
Which to exterior objects ow'ſt thy faculty,
Not ſeeing of election, but neceſſity.
Thus do our eyes, as do all common mirrors,
Succeſſively reflect ſucceeding images.
Nor what they would, but muſt; a ſtar or toad;
Juſt as the hand of chance adminiſters!

Mourning Bride, act ii. ſc. 8.

No man in his ſenſes, ever thought of applying his eyes to diſcover what paſſes in his mind; far leſs of blaming his eyes for not ſeeing a thought or idea. In Moliere's *l'Avare* (act iv. ſc. 7.) Harpagon, being robbed of his money, ſeizes himſelf by the arm, miſtaking it for that of the robber. And again he expreſſes himſelf as follow:

Je veux aller querir la juſtice, et faire donner la queſtion à toute ma maiſon; à ſervantes, à valets, à fils, à fille, et à moi auſſi.

This is ſo abſurd as ſcarcely to provoke a ſmile, if it be not at the author.

Of the ſecond branch the following example may ſuffice:

——————Now bid me run,
And I will ſtrive with things *impoſſible*,
Yea, get the better of them.

Julius Cæſar, act ii. ſc. 3.

Of the third branch, take the following ſamples. Lucan, talking of Pompey's ſepulchre,

—————— Romanum nomen, et omne
Imperium magno eſt tumuli modus. Obrue ſaxa
Crimine plena deûm. Si tota eſt Herculis Oete,
Et juga tota vacant Bromio Nyſeia; quare
Unus in Egypto Magno lapis? Omnia Lagi
Rura tenere poteſt, ſi nullo ceſpite nomen
Hæſerit. Erremus populi, cinerumque tuorum,
Magne, metu nullas Nili calcemus arenas.

Lib. viii. l. 793.

Thus, in Rowe's tranſlation.

Where there are ſeas, or air, or earth, or ſkies,
Where'er Rome's empire ſtretches, Pompey lies.
Far be the vile memorial then convey'd!
Nor let this ſtone the partial gods upbraid.
Shall Hercules all Oeta's heights demand,
And Nyſa's hill for Bacchus only ſtand;
While one poor pebble is the warrior's doom
That fought the cauſe of liberty and Rome?
If Fate decrees he muſt in Egypt lie,
Let the whole fertile realm his grave ſupply,
Yield the wide country to his awful ſhade,
Nor let us dare on any part to tread,
Fearful we violate the mighty dead.

The following paſſages are pure rant. Coriolanus, ſpeaking to his mother,

What is this?
Your knees to me? to your corrected ſon?
Then let the pebbles on the hungry beach
Fillop the ſtars: then let the mutinous winds
Strike the proud cedars 'gainſt the fiery ſun:
Murd'ring impoſſibility, to make
What cannot be, ſlight work.

Coriolanus, act i. ſc. 3.

Cæſar. ———Danger knows full well,
That Cæſar is more dangerous than he.
We were two lions litter'd in one day,
And I the elder and more terrible.

Julius Cæſar, act ii. ſc. 4.

Ventidius. But you, ere love miſled your wand'ring eyes,
Were ſure the chief and beſt of human race,
Fram'd in the very pride and boaſt of nature,
So perfect, that the gods who form'd you wonder'd
At their own ſkill, and cry'd, A lucky hit
Has mended our deſign. DRYDEN, *All for Love*, act i.

Not to talk of the impiety of this ſentiment, it is ludicrous inſtead of being lofty.

The famous epitaph on Raphael is not leſs abſurd than any of the foregoing paſſages:

Raphael, timuit, quo ſoſpite, vinci,
Rerum magna parens, et moriente mori.

Imitated by Pope, in his epitaph on Sir Godfrey Kneller:

Living, great Nature fear'd he might outvie
Her works; and dying, fears herſelf may die.

Such is the force of imitation; for Pope of himſelf would never have been guilty of a thought ſo extravagant.

SENTINEL, or SENTRY, in military affairs, a private ſoldier placed in ſome poſt to watch the approach of the enemy, to prevent ſurpriſes, to ſtop ſuch as would paſs without orders or diſcovering who they are. They are placed before the arms of all guards, at the tents and doors of general officers, colonels of regiments, &c.

SENTINEL Perdu, a ſoldier poſted near an enemy, or in ſome very dangerous poſt where he is in hazard of being loſt.

All ſentinels are to be vigilant on their poſts; neither are they to ſing, ſmoke tobacco, nor ſuffer any noiſe to be made near them. They are to have a watchful eye over the things committed to their charge. They are not to ſuffer any light to remain, or any fire to be made,

made, near their posts in the night-time; neither is any sentry to be relieved or removed from his post but by the corporal of the guard. They are not to suffer any one to touch or handle their arms, or in the night-time to come within ten yards of their post.

No person is to strike or abuse a sentry on his post; but when he has committed a crime, he is to be relieved, and then punished according to the rules and articles of war.

A sentinel, on his post in the night, is to know nobody but by the counter sign: when he challenges, and is answered, *Relief*, he calls out, *Stand, relief! advance, corporal!* upon which the corporal halts his men, and advances alone within a yard of the sentry's firelock (first ordering his party to rest, on which the sentry does the same), and gives him the counter-sign, taking care that no one hear it.

SEPIA, the CUTTLE-FISH, a genus of animals belonging to the class of vermes. See HELMINTHOLOGY *Index*.

The officinal cuttle affords the cuttle-bone of the shops, which was formerly used as an absorbent. The bones are frequently flung on all our shores; the animal very rarely. The conger eels, it is said, bite off their arms, or feet; but it is added they grow again, as does the lizard's tail (Plin. ix. 29.). They are preyed upon by the plaise. This fish emits (in common with the other species), when alarmed or pursued, the black liquor which the ancients supposed darkened the circumambient wave, and concealed it from the enemy.

The endanger'd cuttle thus evades his fears,
And native hoards of fluid safety bears.
A pitchy ink peculiar glands supply,
Whose shades the sharpest beam of light defy.
Pursu'd, he bids the sable fountains flow,
And, wrapt in clouds, eludes th' impending foe.
The fish retreats unseen, while self-born night,
With pious shade befriends her parent's flight.

The ancients sometimes made use of it instead of ink. Persius mentions the species in his description of the noble student.

Jam liber, et bicolor positis membrana capillis,
Inque manus chartæ, nodosque venit arundo.
Tum querimur, crassus calamo quod pendeat humor;
Nigra quod infusa vanescat sepia *lympha.*
At length, his book he spreads, his pen he takes;
His papers here in learned order lays,
And there his parchment's smoother side displays.
But oh! what crosses wait on studious men!
The *cuttle's* juice hangs clotted at our pen.
In all my life such stuff I never knew,
So gummy thick—Dilute it, it will do.
Nay, now 'tis water! DRYDEN.

This animal was esteemed a delicacy by the ancients, and is eaten even at present by the Italians. Rondeletius gives us two receipts for the dressing, which may be continued to this day. Athenæus also leaves us the method of making an antique cuttle fish sausage; and we learn from Aristotle, that those animals are in highest season when pregnant.

SEPIARIÆ, (from *sepes*, "a hedge"), the name of the 44th order of Linnæus's Fragments of a Natural Method, consisting of a beautiful collection of woody plants, some of which, from their size and elegance, are very proper furniture for hedges. See BOTANY *Index*.

SEPS, a species of LACERTA. See ERPETOLOGY *Index*.

SEPTARIÆ, in *Natural History*, an old term for a variety of iron-stone, called also *ludus Helmontii*. This mineral is of a round compressed form, and is internally divided by septa or thin partitions of lime spar or pyrites; hence the name.

SEPTAS, a genus of plants belonging to the class of *Heptandria*; and in the natural system ranged under the 13th order, *Succulentæ*. See BOTANY *Index*.

SEPTEMBER, the ninth month of the year, consisting of thirty days; it took its name as being the seventh month, reckoning from March, with which the Romans began their year.

SEPTENNIAL, any thing lasting seven years.

SEPTENNIAL Elections. Blackstone, in his Commentaries, vol. i. p. 189. says, (after observing that the utmost extent of time allowed the same parliament to sit by the stat. 6. W. and M. c. 2. was three years), "But, by the statute 1 Geo. I. st. st. 2. c. 38. (in order *professedly* to prevent the great and continued expences of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government, just then recovering from the late rebellion), this term was prolonged to seven years; and what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years enacted its own continuance for seven."

SEPTENTRIO, in *Astronomy*, a constellation, more usually called *ursa minor*.

In cosmography, the term *septentrio* denotes the same with *north*: and hence septentrional is applied to any thing belonging to the north; as *septentrional signs, parallels*, &c.

SEPTICS, are those substances which promote putrefaction, chiefly the calcareous earths, magnesia, and testaceous powders. From the many curious experiments made by Sir John Pringle to ascertain the *septic* and *antiseptic* virtues of natural bodies, it appears that there are very few substances of a truly *septic* nature. Those commonly reputed such by authors, as the alkaline and volatile salts, he found to be no wise *septic*. However, he discovered some, where it seemed least likely to find any such quality; these were chalk, common salt, and testaceous powders. He mixed twenty grains of crabs eyes, prepared with six drams of ox's gall, and an equal quantity of water. Into another phial he put an equal quantity of gall and water, but no crabs-eyes. Both these mixtures being placed in the furnace, the putrefaction began much sooner, where the powder was, than in the other phial. On making a like experiment with chalk, its *septic* virtue was found to be much greater than that of the crabs-eyes: nay, what the doctor never met with before, in a mixture of two drams of flesh, with two ounces of water and thirty grains of prepared chalk, the flesh was resolved into a perfect mucus in a few days.

To try whether the testaceous powders would also dissolve vegetable substances, the doctor mixed them with barley and water, and compared this mixture with another of barley and water alone. After a long maceration cerated by a fire, the plain water was found to ſwell the barley, and turn mucilaginous and ſour; but that with the powder kept the grain to its natural ſize, and though it ſoftened it, yet made no mucilage, and remained ſweet.

Nothing could be more unexpected, than to find ſea ſalt a haſtener of putrefaction; but the fact is thus; one dram of ſalt preſerves two drams of freſh beef in two ounces of water, above thirty hours, uncorrupted, in a heat equal to that of the human body; or, which is the ſame thing, this quantity of ſalt keeps fleſh ſweet twenty hours longer than pure water; but then half a dram of ſalt does not preſerve it above two hours longer. Twenty-five grains have little or no antiſeptic virtue, and ten, fifteen, or even twenty grains, manifeſtly both haſten and heighten the corruption. The quantity which had the moſt putrefying quality, was found to be about ten grains to the above proportion of fleſh and water.

Many inferences might be drawn from this experiment: one is, that ſince ſalt is never taken in aliment beyond the proportion of the corrupting quantities, it would appear that it is ſubſervient to digeſtion chiefly by its *ſeptic* virtue, that is, by ſoftening and reſolving meats; an action very different from what is commonly believed.

It is to be obſerved, that the above experiments were made with the ſalt kept for domeſtic uſes. See Pringle's Obſerv. on the Diſeaſes of the army, p. 348, et ſeq.

SEPTIZON, or SEPTIZONIUM, in Roman antiquity, a celebrated mauſoleum, built by Septimius Severus, in the tenth region of the city of Rome: it was ſo called from *ſeptem* and *zona*, by reaſon it conſiſted of ſeven ſtories, each of which was ſurrounded by a row of columns.

SEPTUAGESIMA, in the kalendar, denotes the third Sunday before Lent, or before Quadrageſima Sunday: ſuppoſed by ſome to take its name from its being about ſeventy days before Eaſter.

SEPTUAGINT, the name given to a Greek verſion of the books of the Old Teſtament, from its being ſuppoſed to be the work of ſeventy Jews, who are uſually called the *ſeventy interpreters*, becauſe ſeventy is a round number.

The hiſtory of this verſion is expreſsly written by Ariſtæas, an officer of the guards to Ptolemy Philadelphus, the ſubſtance of whoſe account is as follows:— Ptolemy having erected a fine library at Alexandria, which he took care to fill with the moſt curious and valuable books from all parts of the world, was informed that the Jews had one containing the laws of Moſes, and the hiſtory of that people; and being deſirous of enriching his library with a Greek tranſlation of it, applied to the high-prieſt of the Jews; and to engage him to comply with his requeſt, ſet at liberty all the Jews whom his father Ptolemy Soter had reduced to ſlavery. After ſuch a ſtep, he eaſily obtained what he deſired; Eleazar the Jewiſh high-prieſt ſent back his ambaſſadors with an exact copy of the Moſaical law, written in letters of gold, and ſix elders of each tribe, in all ſeventy-two; who were received with marks of reſpect by the king, and then conducted into the iſle of Pharos, where they were lodged in a houſe prepared for their reception, and ſupplied with every thing neceſſary. They ſet about the tranſlation without loſs of time, and finiſhed it in ſeventy-two days; and the whole being read in the preſence of the king, he admired the profound wiſdom of the laws of Moſes: and ſent back the deputies laden with preſents, for themſelves, the high-prieſt, and the temple.

Ariſtobulus, who was tutor to Ptolemy Phyſcon, Philo who lived in our Saviour's time, and was contemporary with the apoſtles, and Joſephus, ſpeak of this tranſlation as made by ſeventy two interpreters, by the care of Demetrius Phalereus in the reign of Ptolemy Philadelphus. All the Chriſtian writers, during the firſt 15 centuries of the Chriſtian era, have admitted this account of the Septuagint as an undoubted fact. But ſince the reformation, critics have boldly called it in queſtion, becauſe it was attended with circumſtances which they think inconſiſtent, or, at leaſt, improbable. Du Pin has aſked, why were ſeventy-two interpreters employed, ſince twelve would have been ſufficient? Such an objection is trifling. We may as well aſk, why did King James I. employ fifty-four tranſlators in rendering the Bible into Engliſh, ſince Du Pin thinks twelve would have been ſufficient?

1. Prideaux objects, that the Septuagint is not written in the Jewiſh, but in the Alexandrian, dialect; and could not therefore be the work of natives of Paleſtine. But theſe dialects were probably at that time the ſame, for both Jews and Alexandrians had received the Greek language from the Macedonians about 50 years before.

2. Prideaux farther contends, that all the books of the Old Teſtament could not be tranſlated at the ſame time; for they exhibit great difference of ſtyle. To this it is ſufficient to reply, that they were the work of ſeventy-two men, each of whom had ſeperate portions aſſigned them.

3. The Dean alſo urges, that Ariſtæas, Ariſtobulus, Philo, and Joſephus, all directly tell us, that the law was tranſlated without mentioning any of the other ſacred books. But nothing was more common among writers of the Jewiſh nation than to give this name to the Scriptures as a whole. In the New Teſtament, law is uſed as ſynonymous with what we call the Old Teſtament. Beſides, it is expreſsly ſaid by Ariſtobulus, in a fragment quoted by Euſebius (*Præp. Evan.* l. 1.), that the whole Sacred Scripture was rightly tranſlated through the means of Demetrius Phalereus, and by the command of Philadelphus. Joſephus indeed, ſays the learned Dean, aſſerts, in the preface to his Antiquities, that the Jewiſh interpreters did not tranſlate for Ptolemy the whole Scriptures, but the law only. Here the evidence is contradictory, and we have to determine, whether Ariſtobulus or Joſephus be moſt worthy of credit. We do not mean, however, to accuſe either of forgery, but only to inquire which had the beſt opportunities of knowing the truth. Ariſtobulus was an Alexandrian Jew, tutor to an Egyptian king, and lived within 100 years after the tranſlation was made, and certainly had acceſs to ſee it in the royal library. Joſephus was a native of Paleſtine, and lived not until 300 years or more after the tranſlation was made, and many years after it was burnt along with the whole library of Alexandria in the wars of Julius Cæſar. Suppoſing the veracity of theſe two writers equal, as we have no proof of the contrary, which of them ought we to conſider as the beſt evidence? Ari-

Septuagint.

ſtobulus ſurely. Prideaux, indeed, ſeems doubtful whether there was ever ſuch a man; and Dr Hody ſuppoſes that the Commentaries on the five books of Moſes, which bear the name of Ariſtobulus, were a forgery of the ſecond century. To prove the exiſtence of any human being, who lived 2000 years before us, and did not perform ſuch works as no mere man ever performed, is a taſk which we are not diſpoſed to undertake; and we believe it would not be leſs difficult to prove that Philo and Joſephus exiſted, than that ſuch a perſon as Ariſtobulus did not exiſt. If the writings which have paſſed under his name were a forgery of the ſecond century, it is ſurpriſing that they ſhould have impoſed upon Clemens Alexandrinus, who lived in the ſame century, and was a man of abilities, learning, and well acquainted with the writings of the ancients. Euſebius, too, in his *Præp. Evan.* quotes the Commentaries of Ariſtobulus. But, continues the learned Dean, "Clemens Alexandrinus is the firſt author that mentions them. Now, had any ſuch commentaries exiſted in the time of Philo and Joſephus, they would ſurely have mentioned them. But is the circumſtance of its not being quoted by every ſucceeding author a ſufficient reaſon to diſprove the authenticity of any book? Neither Philo nor Joſephus undertook to give a liſt of preceding authors, and it was by no means the uniform practice of theſe times always to name the authors from whom they derived their information."

4. Prideaux farther contends, that the ſum which Ptolemy is ſaid to have given to the interpreters is too great to be credible. If his computation were juſt, it certainly would be ſo. He makes it 2,000,000l. ſterling, but other writers * reduce it to 85,421l. and ſome to 56,947l.; neither of which is a ſum ſo very extraordinary in ſo great and magnificent a prince as Philadelphus, who ſpent, according to a paſſage in Athenæus (lib. v.), not leſs than 10,000 talents on the furniture of one tent; which is ſix times more than what was ſpent in the whole of the embaſſy and tranſlation, which amounted only to 1552 talents.

* Blair's Lectures on the Canon.

5. Prideaux ſays, "that what convicts the whole ſtory of Ariſteas of falſity is, that he makes Demetrius Phalereus to be the chief actor in it, and a great favourite of the king; whereas Philadelphus, as ſoon as his father was dead, caſt him into priſon, where he ſoon after died." But it may be replied, that Philadelphus reigned two years jointly with his father Lagus, and it is not ſaid by Hermippus that Demetrius was out of favour with Philadelphus during his father's life. Now, if the Septuagint was tranſlated in the beginning of the reign of Philadelphus, as Euſebius and Jerome think, the difficulty will be removed. Demetrius might have been librarian during the reign of Philadelphus, and yet impriſoned on the death of Lagus. Indeed, as the cauſe of Philadelphus's diſpleaſure was the advice which Demetrius gave to his father, to prefer the ſons of Arſinoë before the ſon of Bernice, he could ſcarcely ſhow it till his father's death. The Septuagint tranſlation might therefore be begun while Philadelphus reigned jointly with his father, but not be finiſhed till after his father's death.

Stillingfleet's Origines Sacræ.

6. Beſides the objections which have been conſidered, there is only one that deſerves notice. The ancient Chriſtians not only differ from one another concerning the time in which Ariſtobulus lived, but even contradict themſelves in different parts of their works†. Sometimes they tell us, he dedicated his book to Ptolemy Philometer, at other times they ſay, it was addreſſed to Philadelphus and his father. Sometimes they make him the ſame perſon who is mentioned in 2 Maccabees, chap 1. and ſometimes one of the 72 interpreters 152 years before. It is difficult to explain how authors fall into ſuch inconſiſtencies, but it is probably occaſioned by their quoting from memory. This was certainly the practice of almoſt all the early Chriſtian writers, and ſometimes of the apoſtles themſelves. Miſtakes were therefore inevitable. Joſephus has varied in the circumſtances of the ſame event, in his antiquities and wars of the Jews, probably from the ſame cauſe; but we do not hence conclude, that every circumſtance of ſuch a relation is entirely falſe. In the account of the Marquis of Argyle's death in the reign of Charles II. we have a very remarkable contradiction. Lord Clarendon relates, that he was condemned to be hanged, which was performed the ſame day: on the contrary, Burnet, Woodrow, Heath, Echard, concur in ſtating, that he was beheaded; and that he was condemned upon the Saturday and executed upon the Monday †. Was any reader of Engliſh hiſtory ever ſceptic enough to raiſe from hence a queſtion, whether the Marquis of Argyle was executed or not? Yet this ought to be left in uncertainty according to the way of reaſoning in which the facts reſpecting the tranſlation of the Septuagint is attempted to be diſproved.

Prideaux's Connections. vol. ii. b. i.

† Biogra. Britan.

Such are the objections which the learned and ingenious Prideaux has raiſed againſt the common account of the Septuagint tranſlation, and ſuch are the anſwers which may be given to them. We have choſen to ſupport that opinion which is ſanctioned by hiſtorical evidence, in preference to the conjectures of modern critics however ingenious; being perſuaded, that there are many things recorded in hiſtory, which, though perfectly true, yet, from our imperfect knowledge of the concomitant circumſtances, may, at a diſtant period, ſeem liable to objections. To thoſe who require poſitive evidence, it may be ſtated thus. Ariſtæas, Ariſtobulus, Philo, and Joſephus, aſſure us, that the law was tranſlated. Taking the law in the moſt reſtricted ſenſe, we have at leaſt ſufficient authority to aſſert, that the Pentateuch was rendered into Greek under Ptolemy Philadelphus. Ariſtobulus affirms, that the whole Scriptures were tranſlated by the ſeventy-two. Joſephus confines their labours to the books of Moſes. He therefore who cannot determine to which of the two the greateſt reſpect is due, may ſuſpend his opinion. It is certain, however, that many of the other books were tranſlated before the age of our Saviour; for they are quoted both by him and his apoſtles: and, perhaps, by a minute examination of ancient authors, in the ſame way that Dr Lardner has examined the Chriſtian fathers to prove the antiquity of the New Teſtament, the preciſe period in which the whole books of the Septuagint were compoſed might, with conſiderable accuracy, be aſcertained.

For 400 years this tranſlation was in high eſtimation with the Jews. It was read in their ſynagogues in preference to the Hebrew; not only in thoſe places where Greek was the common language, but in many ſynagogues of Jeruſalem and Judea. But when they ſaw that it was equally valued by the Chriſtians, they be-

Septuagint. came jealous of it, and at length, in the fecond century, Aquila, an apoftate Chriftian, attempted to fubftitute another Greek tranflation in its place. In this work he was careful to give the ancient prophecies concerning the Meffiah a different turn from the Septuagint, that they might not be applicable to Chrift. In the fame defign he was followed by Symmachus and Theodotion, who alfo, as St Jerome informs us, wrote out of hatred to Chriftianity.

In the mean time, the Septuagint, from the ignorance, boldnefs, and careleffnefs of tranfcribers, became full of errors. To correct thefe, Origen publifhed a new edition in the beginning of the third century, in which he placed the tranflations of Aquila, Symmachus, and Theodotion. This edition was called *Tetrapla*, the tranflations being arranged oppofite to one another in four columns. He alfo added one column, containing the Hebrew text in Hebrew letters, and another exhibiting it in Greek. In a fecond edition he publifhed two additional Greek verfions; one of which was found at Nicopolis, and the other at Jericho; this was called the *Hexapla*. By comparing fo many tranflations, Origen endeavoured to form a correct copy of the Scriptures. Where they all agreed, he confidered them right. The paffages which he found in the LXX, but not in the Hebrew text, he marked with an obelifk: what he found in the Hebrew, but not in the LXX, he marked with an afterifk. St Jerome fays, that the additions which Origen made to the LXX, and marked with an afterifk, were taken from Theodotion. From this valuable work of Origen the verfion of the LXX was tranfcribed in a feparate volume, with the afterifks and obelifks for the ufe of the churches; and from this circumftance the great work itfelf was neglected and loft.

About the year 300 two new editions of the LXX were publifhed; the one by Hefychius an Egyptian bifhop, and the other by Lucian a prefbyter of Antioch. But as thefe authors did not mark with any note of diftinction the alterations which they had made, their edition does not poffefs the advantages of Origen's.

The beft edition of the LXX is that of Dr Grabe, which was publifhed in the beginning of the prefent century. He had accefs to two MSS, nearly of equal antiquity, the one found in the Vatican library at Rome, the other in the royal library at St James's. which was prefented to Charles I. by Cyril, patriarch of Alexandria, and hence is commonly called the *Alexandrian MS.* Anxious to difcover which of thefe was according to the edition of Origen, Dr Grabe collected the fragments of the Hexapla, and found they agreed with the Alexandrian MS. but not with the Vatican where it differed with the other. Hence he concluded that the Alexandrian MS. was taken from the edition of Origen. By comparing the quotations from fcripture in the works of Athanafius and St Cyril (who were patriarchs of Alexandria at the time St Jerome fays Hefychius's edition of the LXX was there ufed) with the Vatican MS. he found they agreed fo well that he juftly inferred that that MS. was taken from the edition of Hefychius.

This verfion was in ufe to the time of our bleffed Saviour, and is that out of which moft of the citations in the New Teftament, from the Old, are taken. It was alfo the ordinary and canonical tranflation made ufe of by the Chriftian church in the earlieft ages; and it ftill fubfifts in the churches both of the eaft and weft. Septuagint ‖ Sepulchre.

Thofe who defire a more particular account of the Septuagint tranflations may confult Hody *de Bibliorum Textibus*, Prideaux's Connections, Owen's Inquiry into the Septuagint Verfion, Blair's Lectures on the Canon, and Michaelis's Introduction to the New Teftament, laft edition.

SEPTUAGINT Chronology, the chronology which is formed from the dates and periods of time mentioned in the Septuagint tranflation of the Old Teftament. It reckons 1500 years more from the creation to Abraham than the Hebrew bible. Dr Kennicot, in the differtation prefixed to his Hebrew bible, has fhown it to be very probable that the chronology of the Hebrew fcriptures, fince the period juft mentioned, was corrupted by the Jews, between the years 175 and 200, and that the chronology of the Septuagint is more agreeable to truth. It is a fact, that during the fecond and third centuries the Hebrew fcriptures were almoft entirely in the hands of the Jews, while the Septuagint was confined to the Chriftians. The Jews had therefore a very favourable opportunity for this corruption. The following is the reafon which is given by oriental writers: It being a very ancient tradition, that the Meffiah was to come in the fixth chiliad, becaufe he was to come in the laft days (founded on a myftical application of the fix days creation), the contrivance was *to fhorten the age of the world from about* 5500 *to* 3760; *and thence to prove that Jefus could not be the Meffiah.* Dr Kennicot adds, that fome Hebrew copies having the larger chronology were extant till the time of Eufebius, and fome till the year 700.

SEPTUM, in *Anatomy*, an inclofure or partition; a term applied to feveral parts of the body, which ferve to feparate one part from another; as, *feptum narium*, or partition between the noftrils, &c.

SEPULCHRAL, fomething belonging to fepulchres or tombs: thus a fepulchral column is a column erected over a tomb, with an infcription on its fhaft; and fepulchral lamps, thofe faid to have been found burning in the tombs of feveral martyrs and others. See LAMP.

SEPULCHRE, a tomb or place deftined for the interment of the dead. This term is chiefly ufed in fpeaking of the burying-places of the ancients, thofe of the moderns being ufually called *tombs*.

Sepulchres were held facred and inviolable; and the care taken of them has always been held a religious duty, grounded on the fear of God, and the belief of the foul's immortality. Thofe who have fearched or violated them have been thought odious by all nations, and were always feverely punifhed.

The Egyptians called fepulchres *eternal houfes*, in contradiftinction to their ordinary houfes or palaces, which they called *inns*, on account of their fhort ftay in the one in comparifon of their long abode in the other. See TOMB.

Regular Canons of St SEPULCHRE, a religious order, formerly inftituted at Jerufalem, in honour of the holy fepulchre, or the tomb of Jefus Chrift.

Many of thefe canons were brought from the Holy Land into Europe, particularly into France, by Louis the Younger; into Poland, by Jaxa, a Polifh gentleman; and into Flanders, by the counts thereof; many alfo also came into England. This order was, however, suppressed by Pope Innocent VIII. who gave its revenues and effects to that of our Lady of Bethlehem: which also becoming extinct, they were bestowed on the knights of St John of Jerusalem. But the suppression did not take effect in Poland, where they still subsist, as also in several provinces of Germany. These canons follow the rule of St Augustine.

Knights of the Holy SEPULCHRE, a military order, established in Palestine about the year 1114.

The knights of this order in Flanders chose Philip II. king of Spain, for their master, in 1558, and afterwards his son; but the grand-master of the order of Malta prevailed on the last to resign; and when afterwards the duke of Nevers assumed the same quality in France, the same grand-master, by his interest and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta.

SEQUANI, a people anciently forming a part of Gallia Celtica, but annexed to Belgica by Augustus, separated from the Helvetii by Mount Jura, with the Rhine on the east (Strabo), bordering on the Ædui and Segustiano to the south, and Lingones to the west (Tacitus). Now Franche Comte.

SEQUESTRATION, in *Common Law*, is setting aside the thing in controversy from the possession of both the parties that contend for it. In which sense it is either voluntary, as when done by the consent of the parties; or necessary, as where it is done by the judge, of his own authority, whether the parties will or not.

SEQUESTRATION, in the *Civil Law*, is the act of the ordinary, disposing of the goods and chattels of one deceased, whose estate no man will meddle with.

A widow is also said to sequester, when she disclaims having any thing to do with the estate of her deceased husband.

Among the Romanists, in questions of marriage, where the wife complains of impotency in the husband, she is to be sequestered into a convent, or into the hands of matrons, till the process be determined.

SEQUESTRATION is also used for the act of gathering the fruits of a benefice void, to the use of the next incumbent.

Sometimes a benefice is kept under sequestration for many years, when it is of so small value, that no clergyman fit to serve the cure will be at the charge of taking it by institution; in which case the sequestration is committed either to the curate alone, or to the curate and church-wardens jointly. Sometimes the profits of a living in controversy, either by the consent of the parties, or the judge's authority, are sequestered and placed for safety in a third hand, till the suit is determined, a minister being appointed by the judge to serve the cure, and allowed a certain salary out of the profits. Sometimes the profits of a living are sequestered for neglect of duty, for dilapidations, or for satisfying the debts of the incumbent.

SEQUESTRATION, in chancery, is a commission usually directed to seven persons therein named, empowering them to seize the defendant's personal estate, and the profits of his real, and to detain them, subject to the order of the court. It issues on the return of the serjeant at arms, wherein it is certified, that the defendant had secreted himself.

Sequestrations were first introduced by Sir Nicholas Bacon, lord keeper in the reign of Queen Elizabeth; before which the court found some difficulty in enforcing its process and decrees; and they do not seem to be in the nature of process to bring in the defendant, but only intended to enforce the performance of the court's decree.

A sequestration is also made, in London, upon an action of debt; the course of proceeding in which case is this: The action being entered, the officer goes to the defendant's shop or warehouse, when no person is there, and takes a padlock, and hangs it on the door, uttering these words: "I do sequester this warehouse, and the goods and merchandise therein, of the defendant in this action, to the use of the plaintiff," &c. after which he sets on his seal, and makes a return of the sequestration in the compter; and four days being passed after the return made, the plaintiff may. at the next court, have judgment to open the shop or warehouse, and to have the goods appraised by two freemen, who are to be sworn at the next court held for that compter; and then the serjeant puts his hand to the bill of appraisement, and the court grants judgment thereon; but yet the defendant may put in bail before satisfaction, and by that means dissolve the sequestration; and after satisfaction, may put in bail to disprove the debt, &c.

In the time of the civil wars, sequestration was used for a seizing of the estates of delinquents for the use of the commonwealth.

SEQUESTRATION, in *Scots Law*. See LAW *Index*.

SEQUIN, a gold coin, struck at Venice, and in several parts of the Grand Signior's dominions. In Turkey, it is called *dahob*, or piece of gold, and according to Volney is in value about 6s. 3d. sterling. It varies, however, considerably in its value in different countries. At Venice it is equal to about 9s. 2d. sterling.

The Venetian sequins are in great request in Syria, from the fineness of their standard, and the practice they have of employing them for women's trinkets. The fashion of these trinkets does not require much art; the piece of gold is simply pierced, in order to suspend it by a chain, likewise of gold, which flows upon the breast. The more sequins that are attached to this chain, and the greater the number of these chains, the more is a woman thought to be ornamented. This is the favourite luxury, and the emulation of all ranks. Even the female peasants, for want of gold, wear piastres or smaller pieces; but the women of a certain rank disdain silver; they will accept of nothing but sequins of Venice, or large Spanish pieces, and crusadoes. Some of them wear 260 or 300, as well lying flat, as strung one on another, and hung near the forehead, at the edge of the head dress. It is a real load: but they do not think they can pay too dearly for the satisfaction of exhibiting this treasure at the public bath, before a crowd of rivals, to awaken whose jealousy constitutes their chief pleasure. The effect of this luxury on commerce, is the withdrawing considerable sums from circulation, which remain dead; besides, that when any of these pieces return into common use, having lost their

Seraglio. their weight by being pierced, it becomes neceſſary to weigh them. The practice of weighing money is general in Syria, Egypt, and all Turkey. No piece, however effaced, is refuſed there; the merchant draws out his ſcales and weighs it, as in the days of Abraham, when he purchaſed his ſepulchre. In conſiderable payments, an agent of exchange is ſent for, who counts paras by thouſands, rejects a great many pieces of falſe money, and weighs all the ſequins, either ſeparately or together.

SERAGLIO, formed from the Perſian word *ſeraw*, or Turkiſh word *ſarai*, which ſignifies a houſe, and is commonly uſed to expreſs the houſe or palace of a prince. In this ſenſe it is frequently uſed at Conſtantinople; the houſes of foreign ambaſſadors are called *ſeraglios*. But it is commonly uſed by way of eminence for the palace of the grand ſignior at Conſtantinople, where he keeps his court, and where his concubines are lodged, and where the youth are trained up for the chief poſts of the empire.

It is a triangle about three Italian miles round, wholly within the city, at the end of the promontory Chryſoceras, now called the *Seraglio Point*. The buildings run back to the top of the hill, and from thence are gardens that reach to the edge of the ſea. It is incloſed with a very high and ſtrong wall, upon which there are ſeveral watch towers: and it has many gates, ſome of which open towards the ſea ſide, and the reſt into the city; but the chief gate is one of the latter, which is conſtantly guarded by a company of capoochees, or porters; and in the night it is well guarded towards the ſea. The outward appearance is not very beautiful, the architecture being irregular, conſiſting of ſeparate edifices in the form of pavilions and domes.

The ladies of the ſeraglio are a collection of beautiful young women, chiefly ſent as preſents from the provinces and the Greek iſlands, moſt of them the children of Chriſtian parents. The brave prince Heraclius hath for ſome years paſt aboliſhed the infamous tribute of children of both ſexes, which Georgia formerly paid every year to the Porte. The number of women in the harem depends on the taſte of the reigning monarch or ſultan. Selim had 2000, Achmet had but 300, and his ſucceſſor had nearly 1600. On their admiſſion they are committed to the care of old ladies, taught ſewing and embroidery, muſic, dancing, and other accompliſhments, and furniſhed with the richeſt clothes and ornaments. They all ſleep in ſeparate beds, and between every fifth there is a preceptreſs. Their chief governeſs is called *Katon Kiaga*, or governeſs of the noble young ladies. There is not one ſervant among them, for they are obliged to wait on one another by rotation; the laſt that is entered ſerves her who preceded her and herſelf. Theſe ladies are ſcarcely ever ſuffered to go abroad, except when the grand ſignior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are incloſed with lattices and linen curtains; and when they go by land they are put into cloſe chariots, and ſignals are made at certain diſtances, to give notice that none approach the roads through which they march. The boats of the harem, which carry the grand ſignior's wives, are manned with 24 rowers, and have white covered tilts, ſhut alternately by Venetian blinds. Among the emperor's attendants are a number of mutes, who act and converſe by ſigns with great quickneſs, and ſome dwarfs, who are exhibited for the diverſion of his Majeſty. Seraglio.

When he permits the women to walk in the gardens of the ſeraglio, all people are ordered to retire, and on every ſide there is a guard of black eunuchs, with ſabres in their hands, while others go their rounds in order to hinder any perſon from ſeeing them. If, unfortunately, any one is found in the garden, even through ignorance or inadvertence, he is undoubtedly killed, and his head brought to the feet of the grand ſignior, who gives a great reward to the guard for their vigilance. Sometimes the grand ſignior paſſes into the gardens to amuſe himſelf when the women are there; and it is then that they make uſe of their utmoſt efforts, by dancing, ſinging, ſeducing geſtures, and amorous blandiſhments, to enſnare the affections of the monarch. It is not permitted that the monarch ſhould take a virgin to his bed, except during the ſolemn feſtivals, and on occaſion of ſome extraordinary rejoicings, or the arrival of ſome good news. Upon ſuch occaſions, if the ſultan chooſe a new companion to his bed, he enters into the apartment of the women, who are ranged in files by the governeſſes, to whom he ſpeaks, and intimates the perſon he likes beſt: the ceremony of the handkerchief, which the grand ſignior is ſaid to throw to the girl that he elects, is an idle tale, without any foundation. As ſoon as the grand ſignior has choſen the girl that he has deſtined to be the partner of his bed, all the others follow her to the bath, waſhing and perfuming her, and dreſſing her ſuperbly, conducting her ſinging, dancing, and rejoicing, to the bed chamber of the grand ſignior, who is generally, on ſuch an occaſion, already in bed. Scarcely has the new-elected favourite entered the chamber, introduced by the grand eunuch who is upon guard, than ſhe kneels down, and when the ſultan calls her, ſhe creeps into bed to him by the foot of the bed, if the ſultan does not order her, by eſpecial grace, to approach by the ſide: after a certain time, upon a ſignal given by the ſultan, the governeſs of the girls, with all her ſuite, enters the apartment, and takes her back again, conducting her with the ſame ceremony to the women's apartments; and if by good fortune ſhe becomes pregnant, and is delivered of a boy, ſhe is called *aſaki ſultaneſs*, that is to ſay, ſultaneſs-mother; for the firſt ſon ſhe has the honour to be crowned, and ſhe has the liberty of forming her court. Eunuchs are alſo aſſigned for her guard, and for her particular ſervice. No other ladies, though delivered of boys, are either crowned or maintained with ſuch coſtly diſtinction as the firſt; however, they have their ſervice apart, and handſome appointments. After the death of the ſultan, the mothers of the male children are ſhut up in the old ſeraglio, from whence they can never come out any more, unleſs any of their ſons aſcend the throne. Baron de Tott informs us, that the female ſlave who becomes the mother of a ſultan, and lives long enough to ſee her ſon mount the throne, is the only woman who at that period alone acquires the diſtinction of *ſultana-mother*; ſhe is till then in the interior of her priſon with her ſon. The title of *bache kadun*, principal woman, is the firſt dignity of the grand ſignior's harem; and ſhe has a larger allowance

Seraglio. allowance than thoſe who have the title of ſecond, third, and fourth woman, which are the four free women the Koran allows.

This is a deſcription of the grand ſignior's ſeraglio: we ſhall now add an account of the ſeraglio or *harem*, as it is often called, of the emperor of Morocco, from the very intereſting tour of Mr Lempriere. This gentleman being a ſurgeon by profeſſion, was admitted into the harem to preſcribe for ſome of the ladies who were indiſpoſed, and was therefore enabled to give a particular account of this female priſon, and, what is ſtill more curious, of the manners and behaviour of its inhabitants.

The harem forms a part of the palace. The apartments, which are all on the ground floor, are ſquare, very lofty, and four of them incloſe a ſpacious ſquare court, into which they open by means of large folding doors. In the centre of theſe courts, which are floored with blue and white chequered tiling, is a fountain, ſupplied by pipes from a large reſervoir on the outſide of the palace, which ſerves for the frequent ablutions recommended by the Mahometan religion, as well as for other purpoſes. The whole of the harem conſiſts of about twelve of theſe ſquare courts, communicating with each other by narrow paſſages, which afford a free acceſs from one part of it to another, and of which all the women are allowed to avail themſelves.

The apartments are ornamented on the outſide with beautiful carved wood. In the inſide moſt of the rooms are hung with rich damaſk of various colours; the floors are covered with beautiful carpets, and there are matreſſes diſpoſed at different diſtances, for the purpoſes of ſitting and ſleeping.

Beſides theſe, the apartments are furniſhed at each extremity with an elegant European mahogany bedſtead, hung with damaſk, having on it ſeveral mattreſſes placed one over the other, which are covered with various coloured ſilks; but theſe beds are merely placed there to ornament the room. In all the apartments, without exception, the ceiling is wood, carved and painted. The principal ornaments in ſome were large and valuable looking-glaſſes, hung on different parts of the walls. In others, clocks and watches of different ſizes, in glaſs caſes, were diſpoſed in the ſame manner.

The ſultana Lalla Batoom and another favourite were indulged with a whole ſquare to themſelves; but the concubines were only each allowed a ſingle room.

Each female had a ſeparate daily allowance from the emperor, proportioned to the eſtimation in which they were held by him. The late emperor's allowance was very trifling: Lalla Douyaw, the favourite ſultana, had very little more than half-a-crown Engliſh a-day, and the others leſs in proportion. It muſt be allowed, that the emperor made them occaſional preſents of money, dreſs, and trinkets; but this could never be ſufficient to ſupport the number of domeſtics and other expences they muſt incur. Their greateſt dependence therefore was on the preſents they received from thoſe Europeans and Moors who viſited the court, and who employed their influence in obtaining ſome particular favour from the emperor. This was the moſt ſucceſsful mode that could be adopted. When Mr Lempriere was at Morocco, a Jew, deſirous of obtaining a very advantageous favour from the emperor, for which he had been a long time unſucceſsfully ſoliciting, ſent to all the principal ladies of the harem preſents of pearls to a very large amount; the conſequence was, that they all went in a body to the emperor, and immediately obtained the wiſhed-for conceſſion. Seraglio.

The ladies ſeparately furniſh their own rooms, hire their own domeſtics, and, in fact, do what they pleaſe in the harem, but are not permitted to go out without an expreſs order from the emperor, who very ſeldom grants them that favour, except when they are to be removed from one palace to another. In that caſe, a party of ſoldiers is diſpatched a little diſtance before them, to diſperſe the male paſſengers in particular, and to prevent the poſſibility of their being ſeen. This previous ſtep being taken, a piece of linen cloth is tied round the lower part of the face, and afterwards theſe miſerable females cover themſelves entirely with their haicks, and either mount mules, which they ride like men, or, what is more uſual, are put into a ſquare carriage or litter, conſtructed for this purpoſe, which by its lattice-work allows them to ſee without being ſeen. In this manner they ſet off, under the charge of a guard of black eunuchs. This journey, and ſometimes a walk within the bounds of the palace, with which they are, however, ſeldom indulged, is the only exerciſe they are permitted to take.

The late emperor's harem conſiſted of between 60 and 100 females, beſides their domeſtics and ſlaves, which were very numerous. Many of the concubines were Mooriſh women, who had been preſented to the emperor, as the Moors conſider it an honour to have their daughters in the harem; ſeveral were European ſlaves, who had either been made captives, or purchaſed by the emperor; and ſome were Negroes.

In this group the Europeans, or their deſcendants, had by far the greateſt claim to the character of handſome. There was one in particular, who was a native of Spain, and taken into the harem at about the ſame age as Lalla Douyaw, who was indeed a perfect beauty. Nor was this lady quite ſingular in that reſpect, for many others were almoſt equally handſome.

The eunuchs, who have the entire charge of the women, and who in fact live always among them, are the children of Negro ſlaves. They are generally either very ſhort and fat, or elſe tall, deformed, and lame. Their voices have that particular tone which is obſervable in youths who are juſt arriving at manhood; and their perſons altogether afford a diſguſting image of weakneſs and effeminacy.

The ſame gentleman gives us a very curious account of the manners and ignorance of theſe immured females, from his own obſervation, when viſiting the prince's harem. "Attended by an eunuch (ſays he), after paſſing the gate of the harem, which is always locked, and under the care of a guard of eunuchs, we entered a narrow and dark paſſage, which ſoon brought us to the court, into which the women's chambers open. We here ſaw numbers of both black and white women and children; ſome concubines, ſome ſlaves, and others hired domeſtics.

"Upon their obſerving the unuſual figure of an European, the whole multitude in a body ſurrounded me, and expreſſed the utmoſt aſtoniſhment at my dreſs and appearance. Some ſtood motionleſs, with their hands lifted up, their eyes fixed, and their mouths open, in the

Seraglio.

the uſual attitude of wonder and ſurpriſe. Some burſt into immoderate fits of laughter; while others again came up, and with uncommon attention eyed me from head to foot. The parts of my dreſs which ſeemed moſt to attract their notice were my buckles, buttons, and ſtockings; for neither men nor women in this country wear any thing of the kind. With reſpect to the club of my hair, they ſeemed utterly at a loſs in what view to conſider it; but the powder which I wore they conceived to be employed for the purpoſe of deſtroying vermin. Moſt of the children, when they ſaw me, ran away in the moſt perfect conſternation; and on the whole, I appeared as ſingular an animal, and I dare ſay had the honour of exciting as much curioſity and attention, as a lion or man-tiger juſt imported from abroad, and introduced into a country town in England on a market-day. Every time I viſited the harem, I was ſurrounded and laughed at by this curious mob, who, on my entering the gate, followed me cloſe to the very chamber to which I was proceeding, and on my return univerſally eſcorted me out.

"The greateſt part of the women were uncommonly fat and unwieldy; had black and full eyes, round faces, with ſmall noſes. They were of different complexions; ſome very fair, ſome ſallow, and others again perfect Negroes.

"One of my new patients being ready to receive me, I was deſired to walk into her room; where, to my great ſurpriſe, I ſaw nothing but a curtain drawn quite acroſs the apartment, ſimilar to that of a theatre which ſeparates the ſtage from the audience. A female domeſtic brought a very low ſtool, placed it near the curtain, and told me I was to ſit down there, and feel her miſtreſs's pulſe.

"The lady, who had by this time ſummoned up courage to ſpeak, introduced her hand from the bottom of the curtain, and deſired me to inform her of all her complaints, which ſhe conceived I might perfectly do by merely feeling the pulſe. It was in vain to aſk her where her pain was ſeated, whether in her ſtomach, head, or back; the only anſwer I could procure was a requeſt to feel the pulſe of the other hand, and then point out the ſeat of the diſeaſe, and the nature of the pain.

"Having neither ſatisfied my curioſity by exhibiting her face, nor made me acquainted with the nature of her complaint, I was under the neceſſity of informing her in poſitive terms, that to underſtand the diſeaſe it was abſolutely neceſſary to ſee the tongue as well as to feel the pulſe; and that without it I could do nothing for her. My eloquence, or rather that of my Jewiſh interpreter, was, however, for a long time exerted in vain; and I am perſuaded ſhe would have diſmiſſed me without any further inquiry, had not her invention ſupplied her with a happy expedient to remove her embarraſſment. She contrived at laſt to cut a hole through the curtain, through which ſhe extruded her tongue, and thus complied with my injunction as far as it was neceſſary in a medical view, but moſt effectually diſappointed my curioſity.

"I was afterwards ordered to look at another of the prince's wives, who was affected with a ſcrophulous ſwelling in her neck. This lady was, in the ſame manner as the other, at firſt excluded from my ſight; but as ſhe was obliged to ſhow me her complaint, I had an opportunity of ſeeing her face, and obſerved it to be very handſome."

Seraglio || Serapis.

It is curious to obſerve the ſtrange and childiſh notions of perſons who have been wholly ſecluded from the world. All the ladies of the harem expected that our author ſhould have inſtantly diſcovered their complaints upon feeling the pulſe, and that he could cure every diſeaſe inſtantaneouſly. He found them proud and vain of their perſons, and extremely ignorant. "Among many ridiculous queſtions, they aſked my interpreter (ſays Mr Lempriere) if I could read and write; upon being anſwered in the affirmative, they expreſſed the utmoſt ſurpriſe and admiration at the abilities of the Chriſtians. There was not one among them who could do either; theſe rudiments of learning are indeed only the lot of a few of their men, who on that account are named *Talbs*, or explainers of the Mahometan law."

It is melancholy to reflect on the ſituation of theſe unfortunate women. Being conſidered as the mere inſtruments of pleaſure, no attention is paid to the improvement of their minds. They have no employment to occupy their time. Their needle-work is performed by Jeweſſes; their food is dreſſed, and their chambers taken care of, by ſlaves and domeſtics. They have no amuſement but a rude and barbarous kind of melancholy muſic, without melody, variety, or taſte; and converſation with one another, which muſt indeed be very confined, uniform, and inanimate, as they never ſee a new object. Excluded from the enjoyment of freſh air and exerciſe, ſo neceſſary for the ſupport of health and life; deprived of all ſociety but that of their fellow ſufferers, a ſociety to which moſt of them would prefer ſolitude itſelf; they are only to be conſidered as the moſt abject of ſlaves—ſlaves to the vices and caprice of a licentious tyrant, who exacts even from his wives themſelves a degree of ſubmiſſion and reſpect which borders upon idolatry, and which God and nature never meant ſhould be paid to a mortal.

SERAI, a building on the high-road, or in large cities in India, erected for the accommodation of travellers.

SERAPH, or SERAPHIM, ſpirits of the higheſt rank in the hierarchy of angels; who are thus called from their being ſuppoſed to be moſt inflamed with divine love, by their nearer and more immediate attendance at the throne of God, and to communicate their fervour to the remoter and inferior orders. Seraphim is the Hebrew plural of ſeraph. See ANGEL.

SERAPHIC, burning or inflamed with love or zeal, like a ſeraphim: thus St Bonaventure is called the *ſeraphic doctor*, from his abundant zeal and fervour.

SERAPIAS, a genus of plants belonging to the claſs of gynandria; and in the natural ſyſtem arranged under the ſeventh order *Orchideæ*. See BOTANY *Index*.

SERAPION, a phyſician of Alexandria. He and Philinus of the iſle of Cos were both ſcholars of Herophilus, and were founders of the empiric ſect; which happened about 287 B. C.

SERAPIS, in *Mythology*, an Egyptian deity, who was worſhipped under various names and attributes, as, the tutelary god of Egypt in general, and as the patron of ſeveral of their principal cities. Tacitus informs us, that he was worſhipped as a kind of univerſal deity that repreſented Eſculapius, Oſiris, Jupiter, and Pluto; and he he was sometimes taken for Jupiter Ammon, the Sun, and Neptune: and the honours that were rendered to him at Alexandria were more solemn and extraordinary than those of any other place.

Plutarch and Clemens of Alexandria, as well as Tacitus *, inform us, that while the first Ptolemy was employed in fortifying Alexandria with walls, adorning it with temples and stately buildings, there appeared to him in his sleep a young man of extraordinary beauty, of a stature more than human, admonishing him to dispatch into Pontus some of his most trusty friends to bring from thence his statue: he assured him, that the city and kingdom which possessed it should prove happy, glorious, and powerful. The young man having thus spoken, disappeared, mounting up into heaven in a blaze of fire.

* Tac. Hist. lib. iv. cap. 3. Plut. de Iside et Osiride. Clem. Alex in Protrep.

Ptolemy discovered his vision to the priests; but finding them ignorant of Pontus, he had recourse to an Athenian, who informed him that near Sinope, a city of Pontus, there was a temple much resorted to by the natives, which was consecrated to Pluto, where he had a statue, near which stood that of a woman. Ptolemy, neglecting the injunctions of the apparition, it again appeared to him in a menacing attitude; and the king immediately dispatched ambassadors to the Serapian monarch, loaded with presents. The king of Sinope consented; but his subjects opposed the removal of the statue. The god, however, of his own accord, as we are informed, conveyed himself to the ambassador's ship, and in three days landed in Alexandria. The statue of Serapis was erected in one of the suburbs of the city, where a magnificent temple was afterwards reared.

The statue of Serapis, according to Macrobius, was of a human form, with a basket or bushel on his head, signifying plenty; his right hand leaned on the head of a serpent, whose body was wound round a figure with three heads, of a dog, a lion, and a wolf; in his left hand he held a measure of a cubit length, as it were to take the height of the waters of the Nile. The figure of Serapis is found on many ancient medals.

The famous temple of Serapis at Alexandria was destroyed by order of Theodosius; and the celebrated statue of this deity was broken in pieces, and its limbs carried first in triumph by the Christians through the city, and then thrown into a fierce fire, kindled for that purpose in the amphitheatre. As the Egyptians ascribed the overflowing of the Nile, to which was owing the fertility of their country, to the benign influence of their god Serapis, they concluded, that now he was destroyed, the river would no longer overflow, and that a general famine would ensue; but when they observed, on the contrary, that the Nile swelled to a greater height than had been known in the memory of man, and thereby produced an immense plenty of all kinds of provisions, many of the pagans renouncing the worship of idols, adored the God of the Christians.

SERENA GUTTA, the same as *amaurosis*. See MEDICINE, N° 360.

SERENADE, a kind of concert given in the night by a lover to his mistress, under her window. These sometimes only consist of instrumental music, but at other times voices are added: the music and songs composed for these occasions are also called *serenades*.

SERENE, a title of honour given to several princes and to the principal magistrates of republics. The king of Britain, the republic and doge of Venice, and the children of the king of Spain, are called *most serene*; and when the pope or the sacred college write to the emperor, to kings, or to the doge, they give them no other title. In like manner, the emperor gives no other title to any king, except to the king of France.

SERENUS, SAMMONICUS, a celebrated physician in the reigns of the emperors Severus and Caracalla, in and about the year 200. He wrote several treatises on history and the works of nature; but there is only one of them extant, which is a very indifferent poem on the Remedies of Diseases. He was murdered at a festival by the order of Caracalla. He had a library that contained 62,000 volumes, which Quintus Serenus Sammonicus his son gave to Gordian the Younger, to whom he was preceptor.

SERES (Ptolemy); a people of the Farther Asia; bounded on the west by Scythia extra Imaum; on the north and east, by Terra Incognita; and on the south, by India extra Gangem. According to these limits, their country answers nearly to Cathoy or North China. Other authors vary greatly in placing them, though the generality agree in placing them far to the east. Mela places them between the Indi and Scythæ; and perhaps beyond the Indi, if we distinguish the Sinæ from them. The ancients commend them for their cotton manufactures, different from the produce of the bombyces or silk-worms, called *seres* by the Greeks; whence *serica*, "silk."

SERGE, a woollen quilted stuff, manufactured on a loom with four treddles, after the manner of rateens, and other stuffs that have the whale. The goodness of serges is known by the quilting, as that of cloths by the spinning. Of serges there are various kinds, denominated either from the different qualities thereof, or from the places where they are wrought. The most considerable is the London serge, now highly valued abroad, particularly in France, where a manufacture is carried on with considerable success, under the title of *serge façon de Londres*.

The method of making the London serge we shall now describe: For wool, the longest is chosen for the warp, and the shortest for the woof. Before either kind is used, it is first scoured, by putting it in a copper of liquor, somewhat more than lukewarm, composed of three parts of fair water and one of urine. After having stayed long enough therein for the liquor to dissolve, and take off the grease, &c. it is stirred briskly about with a wooden peel; taken out of the liquor, drained, and washed in a running water, dried in the shade, beaten with sticks on a wooden rack to drive out the coarser dust and filth, and then picked clean with the hands. Thus far prepared, it is greased with oil of olives, and the longest part, destined for the warp, is combed with large combs, heated in a little furnace for the purpose. To clear off the oil again, the wool is put in a liquor composed of hot water, with soap melted therein: whence being taken out, wrung, and dried, it is spun on the wheel.

As to the shorter wool, intended for the woof, it is only carded on the knee with small cards, and then spun on the wheel, without being scoured of its oil. It must be remarked, that the thread for the warp is always to be spun much finer, and better twisted than that of the woof. The wool both for the warp and

Serge, Sergeant. the woof being ſpun, and the thread divided into ſkains, that of the woof is put on ſpools (unleſs it have been ſpun upon them) fit for the cavity or eye of the ſhuttle; and that for the warp is wound on a kind of wooden bobbins to fit it for warping. When warped, it is ſtiffened with a kind of ſize, whereof that made of the ſhreds of parchment is held the beſt; and when dry is put on the loom.

When mounted on the loom, the workman raiſing and lowering the threads (which are paſſed through a reed), by means of four treddles placed underneath the loom, which he makes to act tranſverſely, equally, and alternately, one after another, with his feet, in proportion as the threads are raiſed and lowered, throws the ſhuttle acroſs from one ſide to the other; and each time that the ſhuttle is thrown, and the thread of the woof is croſſed between thoſe of the warp, ſtrikes it with the frame to which the reed is faſtened, through thoſe teeth the threads of the warp paſs; and this ſtroke he repeats twice or thrice, or even more, till he judges the croſſing of the ſerge ſufficiently cloſe: thus he proceeds till the warp is all filled with woof.

The ſerge now taken off the loom is carried to the fuller, who ſcours it in the trough of his mill with a kind of fat earth, called *fuller's earth*, firſt purged of all ſtones and filth. After three or four hours ſcouring, the fuller's earth is waſhed out in fair water, brought by little and little into the trough, out of which it is taken when all the earth is cleared; then, with a kind of iron pincers or plyers, they pull off all the knots, ends, ſtraws, &c. ſticking out on the ſurface on either ſide; and then returning it into the fulling trough, where it is worked with water ſomewhat more than lukewarm, with ſoap diſſolved therein for near two hours: it is then waſhed out till ſuch time as the water becomes quite clear, and there be no ſigns of ſoap left; then it is taken out of the trough, the knots, &c. again pulled off, and then put on the tenter to dry, taking care as faſt as it dries to ſtretch it out both in length and breadth till it be brought to its juſt dimenſions. When well dried, it is taken off the tenter, and dyed, ſhorn, and preſſed.

SERGEANT, or SERJEANT *at Law*, or *of the Coif*, is the higheſt degree taken at the common law, as that of Doctor is of the civil law; and as theſe are ſuppoſed to be the moſt learned and experienced in the practice of the courts, there is one court appointed for them to plead in by themſelves, which is the common pleas, where the common law of England is moſt ſtrictly obſerved: but they are not reſtricted from pleading in any other court, where the judges, who cannot have that honour till they have taken the degree of ſerjeant at law, call them *brothers*.

SERGEANT at Arms, or *Mace*, an officer appointed to attend the perſon of the king; to arreſt traitors, and ſuch perſons of quality as offend; and to attend the lord high ſteward, when ſitting in judgement on a traitor.

Of theſe, by ſtatute 13 Richard II. cap. 6. there are not to be above 30 in the realm. There are now nine at court at 100l. per annum ſalary each; they are called the *king's ſergeants at arms*, to diſtinguiſh them from others: they are created with great ceremony, the perſon kneeling before the king, his majeſty lays the mace on his right ſhoulder, and ſays, *Riſe up, ſergeant at arms, and eſquire for ever*. They have, beſides, a patent for the office, which they hold for life.

Sergeant ‖ Series. They have their attendance in the preſence-chamber, where the band of gentlemen-penſioners wait, and, receiving the king at the door, they carry the maces before him to the chapel door, whilſt the band of penſioners ſtand foremoſt, and make a lane for the king, as they alſo do when the king goes to the houſe of lords.

There are four other ſergeants at arms, created in the ſame manner; one, who attends the lord chancellor; a ſecond, the lord treaſurer; a third, the ſpeaker of the houſe of commons; and a fourth, the lord mayor of London on ſolemn occaſions.

They have a conſiderable ſhare of the fees of honour, and travelling charges allowed them when in waiting, viz. five ſhillings per day when the court is within ten miles of London, and ten ſhillings when twenty miles from London. The places are in the lord chamberlain's gift.

There are alſo ſergeants of the mace of an inferior kind, who attend the mayor or other head officer of a corporation.

Common SERGEANT, an officer in the city of London, who attends the lord mayor and court of aldermen on court days, and is in council with them on all occaſions, within and without the precincts or liberties of the city. He is to take care of orphans eſtates, either by taking account of them, or to ſign their indentures, before their paſſing the lord mayor and court of aldermen: and he was likewiſe to let and manage the orphan eſtates, according to his judgement to their beſt advantage. See RECORDER.

SERGEANT, in *War*, is an uncommiſſioned officer in a company of foot or troop of dragoons, armed with an halbert, and appointed to ſee diſcipline obſerved, to teach the ſoldiers the exerciſe of their arms, to order, ſtraiten, and form their ranks, files, &c. He receives the orders from the adjutant, which he communicates to his officers. Each company generally has two ſergeants.

SERGEANTY (*Serjeantia*), ſignifies, in law, a ſervice that cannot be due by a tenant to any lord but the king; and this is either *grand ſergeanty*, or *petit*. The firſt is a tenure by which the one holds his lands of the king by ſuch ſervices as he ought to do in perſon to the king at his coronation; and may alſo concern matters military, or ſervices of honour in peace; as to be the king's butler, carver, &c. *Petit ſergeanty* is where a man holds lands of the king to furniſh him yearly with ſome ſmall thing towards his wars; and in effect payable as rent. Though all tenures are turned into *ſoccage* by the 12 Car. II. cap. 24. yet the honorary ſervices of grand ſergeanty ſtill remain, being therein excepted. See *KNIGHT-Service*.

SERIES, in general, denotes a continual ſucceſſion of things in the ſame order, and having the ſame relation or connection with each other: in this ſenſe we ſay, a ſeries of emperors, kings, biſhops, &c.

In natural hiſtory, a ſeries is uſed for an order or ſubdiviſion of ſome claſs of natural bodies; comprehending all ſuch as are diſtinguiſhed from the other bodies of that claſs, by certain characters which they poſſeſs in common, and which the reſt of the bodies of that claſs have not.

(1.) SERIES, in *Arithmetic* or *Algebra*, a rank or progreffion of quantities which fucceed one another according to fome determinate law. For example, the numbers

$$3, 5, 7, 9, 11, 13, 15, \&c.$$

conftitute a feries, the law of which is that each term exceeds that before it by a given number, viz. 2. Again, the numbers

$$3, 6, 12, 24, 48, 96, 192, \&c.$$

conftitute a feries of a different kind, each term being the product of the term before it, and the given number 2.

(2.) As the law according to which the terms of a feries are formed may be infinitely varied, there may be innumerable kinds of feries; we fhall enumerate a few of the moft common.

1. *Arithmetical Series.* The general form of a feries of this kind is

$$a, a+d, a+2d, a+3d, a+4d, \&c.$$

and its law is that the difference between any two adjacent terms is the fame quantity, viz. d. The firft of the two preceding examples is a feries of this nature.

2. *Geometrical Series.* Its general form is

$$a, ar, ar^2, ar^3, ar^4, \&c.$$

In this kind of feries each term is the product of that which precedes it and a conftant number r, which is called the common ratio of the terms. The fecond of the above examples is a particular cafe of a geometrical feries.

3. *Harmonic Series* is that in which the firft of any three of its confecutive terms is to the third, as the difference between the firft and fecond to the difference between the fecond and third: hence we readily find that putting a and b for its two firft terms, its general form will be

$$a, b, \frac{ab}{2a-b}, \frac{ab}{3a-2b}, \frac{ab}{4a-3b}, \&c.$$

If we fuppofe $a=1$ and $b=\frac{1}{2}$, we get

$$1, \tfrac{1}{2}, \tfrac{1}{3}, \tfrac{1}{4}, \tfrac{1}{5}, \tfrac{1}{6}, \&c.$$

as a particular example of a harmonic feries.

4. *Recurring Series.* Let its terms be denoted by

$$A, B, C, D, E, F, \&c.$$

Then, we fhall form a recurring feries, if m and n being put for given quantities, we take

$$C=mA+nB, \qquad E=mC+nD,$$
$$D=mB+nC, \qquad F=mD+nE.$$

For example, let us fuppofe $A=1$, $B=2x$, $m=4x^2$, $n=3x$; then $C=10x^2$, $D=38x^3$, $E=154x^4$, $F=614x^5$, fo that the firft fix terms of the feries are

$$1, 2x, 10x^2, 38x^3, 154x^4, 614x^5.$$

We have here fuppofed each term to be formed from the two which come immediately before it; but the name *recurring feries* is given to every one in which the terms are formed in like manner from fome affigned number of the terms which precede that fought. Thus, putting as before A, B, C, D, &c. for the terms of the feries, and m, n, p, q for given quantities, we fhall have another recurring feries, if we fuppofe them fo related that

Series.

$$mA+nB+pC+qD=0,$$
$$mB+nC+pD+qE=0,$$
$$mC+nD+pE+qF=0,$$

The two feries of quantities fin. a, fin. $2a$, fin. $3a$, &c. and cof. a, cof. $2a$, cof. $3a$, &c. are both recurring, as is manifeft from the law which connects the quantities one with another. (See ALGEBRA, §. 358.).

(3.) As in general it is the fum of the terms of a feries which is the object of inveftigation, it is ufual to connect them by the fign + or —, and to apply the name *feries* to the expreffion thus formed. Accordingly

$$1+3+5+7+9\cdots+\left\{1+2(n-1)\right\}$$

(where n denotes the number of terms) is called an arithmetical feries; and in like manner

$$1+\tfrac{1}{2}+\tfrac{1}{4}+\tfrac{1}{8}\cdots+\frac{1}{2^{n-1}}$$

is a geometrical feries.

(4.) A feries may either confift of a definite number of terms, or their number may be fuppofed greater than any that can be affigned, and in this cafe the feries is faid to be *infinite*. The number of terms of a feries may be infinite, and yet their fum finite. This is true; for example, of the feries

$$\tfrac{1}{2}+\tfrac{1}{4}+\tfrac{1}{8}+\tfrac{1}{16}+\&c.$$

which is equivalent to unity, or 1.

(5.) We have already treated of feveral branches of the doctrine of feries in the articles ALGEBRA, FLUXIONS and LOGARITHMS; and in particular we have given four different methods for expanding a quantity into a feries, viz.

1. By *Divifion* or *Evolution.* (See ALGEBRA, § 78, and § 260.).

2. By *the Method of Indeterminate Coefficients.* (ALGEBRA, § 261.).

3. By *the Binomial Theorem.* (ALGEBRA, § 263—§ 269.).

4. By *Taylor's Theorem.* (FLUXIONS, § 66—§ 72.).

We fhall here treat briefly of another branch of the theory, namely, how to find the fum of any propofed number of terms of certain feries, or the fum of their terms continued *ad infinitum*, when that fum is finite.

(6.) There is a great analogy between the terms of a feries and the ordinates of a curve which are fuppofed to ftand upon the axis at equal diftances from one another, the firft ordinate reckoned from the extremity of the axes being analogous to the firft term of the feries, the fecond ordinate to the fecond term, and fo on. From this analogy it follows immediately, that like as the nature of a curve is indicated by an equation expreffing the value of an indefinite ordinate in terms of its correfponding abfciffa, fo alfo the nature of a feries may be fhown by an equation which fhall exprefs the relation between any term; and the number that denotes the place or order of that term in the feries. In conformity

conformity to this method, putting the symbols $T_{(1)}$, $T_{(2)}$, $T_{(3)}$, &c. to denote the terms of any series whatever, we may express it generally thus.

$$T_{(1)}, + T_{(2)}, + T_{(3)}, \cdots + T_{(v)}$$

where the characters (1), (2), are meant to denote the place or order of the terms to which they are joined, (the first term being supposed to have the place 1, the second term the place 2, and so on) and (v) is put for any indefinite number.

The nature of the arithmetical series

$$a+(a+d)+(a+2d)+(a+3d)+, \text{ \&c.}$$

will be defined by the equation

$$T_{(v)} = a+(v-1)d,$$

and, in like manner, the nature of the geometrical series

$$a+ar+ar^2+ar^3+, \text{ \&c.}$$

will be expressed by the equation

$$T_{(v)} = ar^{v-1}.$$

(7.) As the expression for the value of the indefinite term $T_{(v)}$ becomes identical with all the terms of the series in succession, by substituting the numbers 1, 2, 3, &c. one after another for v, that expression is called the *general term* of the series. In the series

$$a+b+\frac{ab}{2a-b}+\frac{ab}{3a-2b}+\frac{ab}{4a-3b}+, \text{ \&c.}$$

the general term is evidently $\dfrac{ab}{(v-1)a-(v-2)b}$.

(8.) We shall now investigate the sum of any number of terms of such series as have their general terms expressed by any one of the following algebraic functions

$$v, \ \frac{v(v+1)}{1\cdot 2}, \ \frac{v(v+1)(v+2)}{1\cdot 2\cdot 3}, \ \frac{v(v+1)(v+2)(v+3)}{1\cdot 2\cdot 3}, \text{ \&c.}$$

PROBLEM I. It is proposed to find the sum of n terms of the series of which the general term is the first function.

By putting 1, 2, 3, &c. to n successively for v, it appears that the series to be summed is

$$1+2+3+4\cdots+n.$$

Now, as $v=\dfrac{v(v+1)}{2}-\dfrac{(v-1)v}{2}$, we have, by putting in this formula 1, 2, 3, $\cdots$ to n successively for v,

$$1=\frac{1\cdot 2}{2}-0,$$
$$2=\frac{2\cdot 3}{2}-\frac{1\cdot 2}{2},$$
$$3=\frac{3\cdot 4}{2}-\frac{2\cdot 3}{2},$$
$$4=\frac{4\cdot 5}{2}-\frac{3\cdot 4}{2},$$
$$\cdots\cdots$$
$$n-1=\frac{(n-1)n}{2}-\frac{(n-2)(n-1)}{2},$$
$$n=\frac{n(n+1)}{2}-\frac{(n-1)n}{2}.$$

Let the sum of the quantities on each side of the sign $=$ be now taken; then, observing that each of the fractions on the right hand side, with the exception of $\dfrac{n(n+1)}{1\cdot 2}$, occurs twice, once with the sign $+$, and again with the sign $-$, by which it happens that their aggregate is $=0$, it is evident that we have

$$1+2+3+4\cdots+n=\frac{n(n+1)}{1\cdot 2}.$$

PROB. II. It is proposed to sum n terms of the series having for its general term the second function

$$\frac{v(v+1)}{1\cdot 2}.$$

This series, by substituting 1, 2, 3, &c. successively for v, is found to be

$$\frac{1\cdot 2}{1\cdot 2}+\frac{2\cdot 3}{1\cdot 2}+\frac{3\cdot 4}{1\cdot 2}\cdots+\frac{n(n+1)}{1\cdot 2}.$$

We now, following the mode of proceeding employed in last problem, put the expression $\dfrac{v(v+1)}{1\cdot 2}$ under this form,

$$\frac{v(v+1)(v+2)}{1\cdot 2\cdot 3}-\frac{(v-1)v(v+1)}{1\cdot 2\cdot 3},$$

to which it is evidently equivalent, and, substituting 1, 2, 3, &c. successively for v, find

$$\frac{1\cdot 2}{1\cdot 2}=\frac{1\cdot 2\cdot 3}{1\cdot 2\cdot 3}-0,$$
$$\frac{2\cdot 3}{1\cdot 2}=\frac{2\cdot 3\cdot 4}{1\cdot 2\cdot 3}-\frac{1\cdot 2\cdot 3}{1\cdot 2\cdot 3},$$
$$\frac{3\cdot 4}{1\cdot 2}=\frac{3\cdot 4\cdot 5}{1\cdot 2\cdot 3}-\frac{2\cdot 3\cdot 4}{1\cdot 2\cdot 3},$$
$$\frac{4\cdot 5}{1\cdot 2}=\frac{4\cdot 5\cdot 6}{1\cdot 2\cdot 3}-\frac{3\cdot 4\cdot 5}{1\cdot 2\cdot 3},$$
$$\cdots\cdots$$
$$\frac{n(n+1)}{1\cdot 2}=\frac{n(n+1)(n+2)}{1\cdot 2\cdot 3}-\frac{(n-1)n(n+1)}{1\cdot 2\cdot 3}.$$

In this problem, as in the former, it appears that each quantity on the right side of the equations, except $\dfrac{n(n+1)(n+2)}{1\cdot 2\cdot 3}$, occurs twice, and with contrary signs; therefore, taking the aggregate of the terms on each side, we have

$$\frac{1\cdot 2}{1\cdot 2}+\frac{2\cdot 3}{1\cdot 2}+\frac{3\cdot 4}{1\cdot 2}+\frac{4\cdot 5}{1\cdot 2}\cdots+\frac{n(n+1)}{1\cdot 2}$$
$$=\frac{n(n+1)(n+2)}{1\cdot 2\cdot 3}.$$

(9.) It will be obvious, by a little attention to the solutions of these two problems, that in each the terms of the series to be summed are the differences betwixt the adjacent

Series. adjacent terms of another ſeries, namely, that which has for its general term the function next in order to the general term of the ſeries under conſideration; that is, the terms of the ſeries whoſe general term is v, are the differences betwixt thoſe of the ſeries having $\frac{v(v+1)}{1\cdot 2}$ for its general terms; and, again, the terms of this laſt are the differences of the terms of the ſeries having $\frac{v(v+1)(v+2)}{1\cdot 2\cdot 3}$ for its general term. Now as the ſum of the differences of any ſeries of quantities whatever which begins with o muſt neceſſarily be the laſt term of that ſeries *, it follows, that the ſum of all the terms of each of the ſeries we have conſidered muſt be equal to the laſt term of the next following ſeries; and this term is neceſſarily the expreſſion formed by ſubſtituting n for v in its general term, that is, the ſum of the ſeries $1+2+3\cdots+n$, which has v for its general term, is $\frac{n(n+1)}{1\cdot 2}$; and the ſum of the ſeries

$$\frac{1\cdot 2}{1\cdot 2}+\frac{2\cdot 3}{1\cdot 2}+\frac{3\cdot 4}{1\cdot 2}\cdots++\frac{n(n+1)}{1\cdot 2}$$
$$\text{is } \frac{n(n+1)(n+2)}{1\cdot 2\cdot 3}.$$

The next ſeries which has $\frac{v(v+1)(v+2)}{1\cdot 2\cdot 3}$ for its general term, as well as all that ſucceed, will be found to have the very ſame property, as may be proved as follows. Let p denote any term of the ſeries of natural numbers 1, 2, 3, &c. Then, becauſe

$$1=\frac{v+p}{p+1}-\frac{v-1}{p+1},$$

if we multiply theſe equals by the product of all the factors v, $\frac{v+1}{2}$, $\frac{v+2}{3}$, &c. to $\frac{v+p-1}{p}$, we get

$$\frac{v(v+1)(v+2)\cdots(v+p-1)}{1\cdot 2\cdot 3\cdots p}$$
$$=\begin{cases}\frac{v(v+1)(v+2)\cdots(v+p)}{1\cdot 2\cdot 3\cdots(p+1)}\\ -\frac{(v-1)v(v+1)\cdots(v+p-1)}{1\cdot 2\cdot 3\cdots(p+1)}.\end{cases}$$

Now, if in this identical equation we ſubſtitute the numbers 1, 2, 3, &c. to n ſucceſſively for v, the reſults obtained from its firſt member

$$\frac{v(v+1)(v+2)\cdots(v+p-1)}{1\cdot 2\cdot 3\cdots p}$$

will be a ſeries having this function for its general term, and the terms of which will evidently be the difference between the terms of another ſeries having the firſt part of the ſecond member of the equation, viz.

$$\frac{v(v+1)(v+2)\cdots(v+p)}{1\cdot 2\cdot 3\cdots(p+1)},$$

for its general term: Hence it will happen, as in the two foregoing problems, that the ſum of all the terms of the former ſeries will be equal to the laſt term of the latter; which concluſion may be expreſſed in the form of a theorem, as follows: Series.

THEOREM. *The ſum of* n *terms of a ſeries having for its general term the function,*

$$\frac{v(v+1)(v+2)\cdots(v+p-1)}{1\cdot 2\cdot 3\cdots p}$$

is equal to

$$\frac{n(n+1)(n+2)\cdots(n+p)}{1\cdot 2\cdot 3\cdots(p+1)}.$$

Or, ſetting aſide the denominators of the terms, we may expreſs the theorem thus: *The ſum of* n *terms of a ſeries, having for its general term the expreſſion*

$$v(v+1)(v+2)\cdots(v+p-1),$$

is equal to

$$\frac{n(n+1)(n+2)\cdots(n+p)}{p+1}.$$

We ſhall here give a few particular caſes of this laſt general formula.

I. $1+2+3+4\cdots+n=\frac{n(n+1)}{2}$.

II. $1\cdot 2+2\cdot 3+3\cdot 4+4\cdot 5\cdots+n(n+1)$
$=\frac{n(n+1)(n+2)}{3}$.

III. $1\cdot 2\cdot 3+2\cdot 3\cdot 4+3\cdot 4\cdot 5\cdots+n(n+1)(n+2)$
$=\frac{n(n+1)(n+2)(n+3)}{4}$.

(10.) By means of the above general theorem we may find the ſum of any number of terms of a ſeries compoſed of the powers of the terms of an arithmetical progreſſion, the general term of which will, in the ſimpleſt caſe, be v^p, p being a given number. The manner of doing this will appear from the following problems.

PROB. III. It is propoſed to find the ſum of n terms of the ſeries of ſquares $1+4+9+16+25+$ &c. or $1^2+2^2+3^2+4^2+5^2+$ &c.

The general term of this ſeries being v^2, we put it under this form, $v(v+1)-v$; hence we get by ſubſtituting 1, 2, 3, &c. for v,

$$\begin{aligned}1^2&=1\cdot 2-1,\\ 2^2&=2\cdot 3-2,\\ 3^2&=3\cdot 4-3,\\ 4^2&=4\cdot 5-4,\\ &\cdots\\ n^2&=n(n+1)-n.\end{aligned}$$

Therefore adding, we find

$$1^2+2^2+3^2+4^2\cdots+n^2$$
$$=\begin{cases}1\cdot 2+2\cdot 3+3\cdot 4+4\cdot 5\cdots+n(n+1)\\ -(1+2+3+4\cdots+n).\end{cases}$$

But

* For example, let the quantities be o, a, b, c, d; then it is manifeſt that $(a-o)+(b-a)+(c-b)+(d-c)=d$.

But by the general theorem (9.)

$$1\cdot 2+2\cdot 3+3\cdot 4\cdots+n(n+1)=\frac{n(n+1)(n+2)}{3},$$

and, $$1+2+3+4\cdots+n=\frac{n(n+1)}{2};$$

therefore $$1^2+2^2+3^2+4^2\cdots+n^2$$
$$=\frac{n(n+1)(n+2)}{3}-\frac{n(n+1)}{2}$$
$$=\frac{n(n+1)(2n+1)}{6}.$$

We might have arrived at the fame conclufion by confidering that fince v^2, the general term of the feries, is equivalent to $v(v+1)-v$, the feries muft be the difference between two others, one having $v(v+1)$ and the other v for its general term; for the fake of perfpicuity, however, we have put down the terms of all the three feries.

PROB. IV. It is propofed to find the fum of n terms of the feries

$$1^3+2^3+3^3+4^3+5^3+\ \&c.$$

The general term in this cafe is v^3; now to transform this function, fo as to deduce the fum of the feries from the general theorem, we affume

$$v^3=v(v+1)(v+2)+A\,v(v+1)+B\,v,$$

where A and B denote quantities which are to have fuch values as fhall render the two fides of the equation identical whatever be the value of v; taking now the product of the factors, we have

$$v^3=v^3+(A+3)v^2+(A+B+2)v,$$

Therefore, by the theory of indeterminate coefficients, (ALGEBRA, § 261.)

$$A+3=0,\ A+B+2=0:$$

Hence we find $A=-3$, $B=-A-2=1$; thus it appears that v being any number whatever,

$$v^3=v(v+1)(v+2)-3\,v(v+1)+v.$$

Now, let S denote the fum of n terms of the feries under confideration, which has v^3 for its general term, and put P, Q, R for the like fums of the three feries, whofe general terms are the functions $v(v+1)(v+2)$, $v(v+1)$ and v refpectively; then, it is evident that $S=P-3Q+R$. But by the theorem, (9.)

$$P=\frac{n(n+1)(n+2)(n+3)}{4},$$
$$Q=\frac{n(n+1)(n+2)}{3},$$
$$R=\frac{n(n+1)}{2},$$

therefore, $$S=\frac{n(n+1)(n+2)(n+3)}{4}$$
$$-n(n+1)(n+2)+\frac{n(n+1)}{2},$$

and by proper reduction, S, or

$$1^3+2^3+3^3+4^3\cdots+n^3=\frac{n^2(n+1)^2}{4}.$$

Corollary. We have found (PROB. I.) that

$$1+2+3+4\cdots+n=\frac{n(n+1)}{2},$$

therefore, comparing this with the refult juft now obtained, it is evident that

$$(1+2+3+4\cdots+n)^2=1^3+2^3+3^3+4^3\cdots+n^3;$$

this is a very curious and elegant property of numbers.

(11.) It is manifeft that by the mode of proceeding employed in laft problem we may inveftigate the fum of n terms of the feries

$$1^m+2^m+3^m+4^m+\ \&c.$$

m being any whole pofitive number whatever: and indeed in the very fame way we may find the fum of any number of terms of a feries, whofe general term is

$$a+b\,v+c\,v^2+d\,v^3+\ \&c.$$

where a and b, &c. denote given numbers; namely, by transforming it into a function of the form

$$A+B\,v+C\,v(v+1)+D\,v(v+1)(v+2)+\ \&c.$$

where A, B, and C, &c. denote conftant quantities. Our limits, however, will not allow us to go into particulars.

(12.) The next clafs of feries we fhall confider, comprehends fuch as may be formed by the fucceffive fubftitution of a, $a+1$, $a+2$, &c. (a being put for any given quantity whatever) in the feries of functions

$$\frac{1}{v(v+1)},\ \frac{1}{v(v+1)(v+2)},\ \frac{1}{v(v+1)(v+2)(v+3)},\ \&c.$$

We fhall begin with the firft of thefe.

PROB. V. It is propofed to find the fum of n terms of the feries

$$\frac{1}{a(a+1)}+\frac{1}{(a+1)(a+2)}+\frac{1}{(a+2)(a+3)}+\ \&c.$$

which is formed by fubftituting a, $a+1$, $a+2$, &c. fucceffively for v in the general term $\frac{1}{v(v+1)}$.

Whatever be the value of v, we have

$$\frac{1}{v(v+1)}=\frac{1}{v}-\frac{1}{v+1},$$

therefore, proceeding as in the foregoing problems, we get

$$\frac{1}{a(a+1)}=\frac{1}{a}-\frac{1}{a+1},$$
$$\frac{1}{(a+1)(a+2)}=\frac{1}{a+1}-\frac{1}{a+2},$$
$$\frac{1}{(a+2)(a+3)}=\frac{1}{a+2}-\frac{1}{a+3},$$
$$\cdots\cdots$$
$$\frac{1}{(a+n-2)(a+n-1)}=\frac{1}{a+n-2}-\frac{1}{a+n-1},$$
$$\frac{1}{(a+n-1)(a+n)}=\frac{1}{a+n-1}-\frac{1}{a+n}.$$

Here it is evident that the terms of the feries to be fummed

fummed are the differences betwixt every two adjoining terms of this other feries.

$$\frac{1}{a}+\frac{1}{a+1}+\frac{1}{a+2}+\frac{1}{a+3}\cdots+\frac{1}{a+n};$$

Hence it immediately follows, that the fum of all the terms of the former is the difference between the two extreme terms of the latter; that is

$$\frac{1}{a(a+1)}+\frac{1}{(a+1)(a+2)}\cdots+\frac{1}{(a+n-1)(a+n)}$$
$$=\frac{1}{a}-\frac{1}{a+n}.$$

If we fuppofe the feries to be continued *ad infinitum*, then, as n will be indefinitely great, and $\frac{1}{a+n}$ indefinitely fmall, the fum will be fimply $\frac{1}{a}$; or in other words, the fraction $\frac{1}{a}$ is a limit to the fum of the feries.

PROB. VI. Let it be required to find the fum of n terms of this feries.

$$\frac{1}{a(a+1)(a+2)}+\frac{1}{(a+1)(a+2)(a+3)}+$$
$$\frac{1}{(a+2)(a+3)(a+4)}+, \text{\&c.}$$

the general term in this cafe being $\frac{1}{v(v+1)(v+2)}$.

Becaufe $\frac{2}{v(v+2)}=\frac{1}{v}-\frac{1}{v+2}$, therefore, multiplying by $\frac{1}{2(v+1)}$, we have

$$\frac{1}{v(v+1)(v+2)}=\frac{1}{2}\left\{\frac{1}{v(v+1)}-\frac{1}{(v+1)(v+2)}\right\},$$

and hence, by fubftituting a, $a+1$, $a+2$, &c. fucceffively for v,

$$\frac{1}{a(a+1)(a+2)}=\frac{1}{2}\left\{\frac{1}{a(a+1)}-\frac{1}{(a+1)(a+2)}\right\}.$$
$$\frac{1}{(a+1)(a+2)(a+3)}=\frac{1}{2}\left\{\frac{1}{(a+1)(a+2)}-\frac{1}{(a+2)(a+3)}\right\}.$$
$$\frac{1}{(a+2)(a+3)(a+4)}=\frac{1}{2}\left\{\frac{1}{(a+2)(a+3)}-\frac{1}{(a+3)(a+4)}\right\}$$
$$\cdots\cdots$$
$$\frac{1}{(a+n-1)(a+n)(a+n+1)}$$
$$=\frac{1}{2}\left\{\frac{1}{(a+n-1)(a+n)}-\frac{1}{(a+n)(a+n+1)}\right\}.$$

Hence it appears that the terms of the feries to be fummed are the halves of the differences of the terms of the feries

$$\frac{1}{a(a+1)}+\frac{1}{(a+1)(a+2)}+\frac{1}{(a+2)(a+3)}\cdots$$
$$+\frac{1}{(a+n)(a+n+1)};$$

confequently, the fum of all the terms of the former is half the difference between the extreme terms of the latter, or is $=$

$$\frac{1}{2}\left\{\frac{1}{a(a+1)}-\frac{1}{(a+n)(a+n+1)}\right\}.$$

(13.) From thefe two particular cafes it is eafy to fee how we may fum the feries when the general term is

$$\frac{1}{v(v+1)(v+2)\ldots(v+p)},$$

p being any whole number whatever: for fince

$$\frac{p}{v(v+p)}=\frac{1}{v}-\frac{1}{v+p},$$

therefore, multiplying the denominaters by all the factors which are intermediate between v and $v+p$,

we have

$$\frac{p}{v(v+1)(v+2)\ldots(v+p)}=$$
$$\frac{1}{v(v+1)(v+2)\ldots(v+p-1)}-$$
$$\frac{1}{(v+1)(v+2)(v+3)\ldots(v+p)}.$$

Now the latter fide of this equation is a general expreffion for the difference between any two adjacent terms of a feries whofe general term is

$$\frac{1}{v(v+1)(v+2)\ldots(v+p-1)},$$

therefore the difference between the firft and laft terms of this feries muft be the fum of the feries whofe general term is the function on the other fide of the equation, viz.

$$\frac{p}{v(v+1)(v+2)\ldots(v+p)}.$$

Hence we have the following very general theorem.

THEOREM. *Let* a *denote any number whatever, and let* 1, 2, 3 . . . p *be a feries of numbers, each of which exceeds that before it by unity; the fum of* n *terms of a feries formed by fubftituting the numbers* a, a+1, a+2, &c. *to* a+n−1 *fucceffively for* v *in the function*

$$\frac{1}{v(v+1)(v+2)\ldots(v+p)}$$

is equal to

$$p\left\{\frac{1}{a(a+1)(a+2)\ldots(a+p-1)}-\frac{1}{(a+n)(a+n+1)(a+n+2)\ldots(a+n+p-1)}\right.$$

COROLLARY.

COROLLARY. *The same series continued ad infinitum is equal to*

$$\frac{1}{p}\,\frac{1}{a(a+1)(a+2)\cdots(a+p-1)}.$$

(14.) We shall now give a few examples of the application of this theorem.

Example 1. Required the sum of n terms of the series

$$\frac{1}{2\cdot 3\cdot 4\cdot 5}+\frac{1}{3\cdot 4\cdot 5\cdot 6}+\frac{1}{4\cdot 5\cdot 6\cdot 7}+\text{, \&c.}$$

The terms of this series are evidently produced by the successive substitution of the numbers 2, 3, 4, 5, &c. for v in the function

$$\frac{1}{v(v+1)(v+2)(v+3)};$$

therefore, comparing this expression with the general formula, we have $a=2$, $p=3$, and the sum required

$$=\tfrac{1}{3}\left\{\frac{1}{2\cdot 3\cdot 4}-\frac{1}{(2+n)(3+n)(4+n)}\right\}.$$

Ex. 2. Required the sum of the series

$$\frac{1}{1\cdot 4\cdot 7}+\frac{1}{4\cdot 7\cdot 10}+\frac{1}{7\cdot 10\cdot 13}+\frac{1}{10\cdot 13\cdot 16}+\text{, \&c.}$$

continued *ad infinitum*.

By a little attention it will appear that its terms are produced by the substitution of the numbers $\frac{1}{3}$, $1\frac{1}{3}$, $2\frac{1}{3}$, &c. successively for v in the function

$$\frac{1}{3v(3v+3)(3v+6)}=\frac{1}{27v(v+1)(v+2)}:$$

In this case then $a=\frac{1}{3}$, $p=2$, therefore the sum is

$$\frac{1}{2}\times\frac{1}{27}\,\frac{1}{\frac{1}{3}\times 1\frac{1}{3}}=\frac{1}{24}.$$

(15.) When the function from which the series is derived has not the very form required in the theorem, it may be brought to that form by employing suitable transformations, as in the two following examples.

Ex. 3. It is proposed to find the sum of the series

$$\frac{1}{1.4}+\frac{1}{2.5}+\frac{1}{3.6}+\frac{1}{4.7}+\text{, \&c.}$$

continued *ad infinitum*.

This series is evidently formed by the substitution of the numbers 1, 2, 3, &c. successively for v in the function $\frac{1}{v(v+3)}$. This expression, however, does not in its present form agree with the general formula, because the factors $v+1$, $v+2$ are wanting; therefore to transform it, we multiply its numerator and denominator by $(v+1)(v+2)$, and it becomes

$$\frac{(v+1)(v+2)}{v(v+1)(v+2)(v+3)};$$

we next assume its numerator

$$(v+1)(v+2)=A(v+2)(v+3)+B(v+3)+C,$$

and by multiplying get

$$v^2+3v+2=Av^2+(5A+B)v+(6A+3B+C);$$

therefore, that v may be indeterminate, we must make

$$A=1,\ 5A+B=3,\ 6A+3B+C=2,$$

from which equations we get $A=1$, $B=3-5A=-2$, $C=2-6A-3B=2$, so that

$$\frac{1}{v(v+3)}=\frac{(v+2)(v+3)-2(v+3)+2}{v(v+1)(v+2)(v+3)}$$
$$=\frac{1}{v(v+1)}-\frac{2}{v(v+1)(v+2)}$$
$$+\frac{2}{v(v+1)(v+2)(v+3)}.$$

Thus it appears that the proposed series is resolvable into three others, the general terms of which all agree with the theorem. Now the sum of the infinite series whose general term is $\frac{1}{v(v+1)}$ appears by the theorem to be $\frac{1}{a}$, or 1, because $a=1$, and the sum of the infinite series whose general term is $\frac{-2}{v(v+1)(v+2)}$, is in like manner found to be $\frac{-2}{2}+\frac{1}{1\cdot 2}=\frac{-1}{2}$; and lastly, the infinite series whose general term is $\frac{2}{v(v+1)(v+2)(v+3)}$ is $\frac{2}{3}\,\frac{1}{1\cdot 2\cdot 3}=\frac{1}{9}$; therefore, collecting these into one, the sum of the proposed series is $1-\frac{1}{2}+\frac{1}{9}=\frac{11}{18}$, the answer.

Ex. 4. Required the sum of the infinite series.

$$\frac{1}{2\cdot 3\cdot 4}+\frac{2}{3\cdot 4\cdot 5}+\frac{3}{4\cdot 5\cdot 6}+\frac{4}{5\cdot 6\cdot 7}+\text{, \&c.}$$

The terms of this series are evidently formed by the substitution of the numbers 2, 3, 4, successively in the function

$$\frac{v-1}{v(v+1)(v+2)}.$$

Now $v-1=v+2-3$; therefore,

$$\frac{v-1}{v(v+1)(v+2)}=\frac{1}{v(v+1)}-\frac{3}{v(v+1)(v+2)},$$

thus it appears that the proposed series is reducible to two others, one having its terms produced by the substitution of 2, 3, &c. for v in the function $\frac{1}{v(v+1)}$, and the other by a like substitution in the function $\frac{-3}{v(v+1)(v+2)}$. Now, by our theorem, the sum of the first of these is $\frac{1}{2}$, and that of the second is $\frac{-3}{2}$

$\frac{1}{2\cdot 3}$

Series.

$\frac{1}{2 \cdot 3} = -\frac{1}{4}$, therefore the fum of the propofed feries is $\frac{1}{2} - \frac{1}{4} = \frac{1}{4}$.

From thefe examples it is fufficiently evident how the theorem is to be applied in other cafes; and it appears alfo that by means of it we can fum any feries whatever whofe general term is of the form

$$\frac{A}{v(1+v)} + \frac{B}{v(1+v)(v+1)} + \frac{C}{v(v+1)(v+2)(v+3)} +, \text{ \&c.}$$

or admits of being reduced to that form.

(16.) It deferves to be remarked that the feries

$$\frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} +, \text{ \&c.}$$

which is of a very fimple form, and in appearance of the fame nature as thofe we have fummed, does not however admit of being treated in the fame manner; and indeed, if it be continued *ad infinitum*, its fum is infinite, that is, it exceeds any number which can be affigned. The truth of this affertion will be evident if we can fhew that a certain definite number of its terms, beginning with any propofed term, can always be found, the fum of which fhall exceed an unit or 1; for this being the cafe, as we can go on continually in affigning fuch fets of terms, we can conceive as many to be taken as there are units in any propofed number however great; and therefore their fum, and much more the fum of all the terms of the feries from its beginning to the end of the laft fets of terms will exceed that number. Now that this can always be done may be proved as follows:

Let the term of the feries from which we are to reckon be $\frac{1}{a}$, then, if the thing be poffible, and if n be the requifite number of terms, we muft have

$$\frac{1}{a} + \frac{1}{a+1} + \frac{1}{a+2} + \frac{1}{a+3} \cdots + \frac{1}{a+n-1} > 1.$$

Now becaufe

$$a\left(1+\frac{1}{a}\right)^2 = a+2+\frac{1}{a},$$

$$a\left(1+\frac{1}{a}\right)^3 = a+3+\frac{3}{a}+\frac{1}{a^2},$$

and in general,

$$a\left(1+\frac{1}{a}\right)^p = a+p+\frac{p \cdot p-1}{1 \cdot 2}\frac{1}{a} +, \text{ \&c.}$$

therefore, p being any whole number,

$a\left(1+\frac{1}{a}\right)^p > a+p$, and confequently

$$\frac{1}{a+p} > \frac{1}{a\left(1+\frac{1}{a}\right)^p};$$

hence it follows that the feries

$$\frac{1}{a} + \frac{1}{a+1} + \frac{1}{a+2} \cdots + \frac{1}{a+n-1}$$

will be greater than the other feries

$$\frac{1}{a} + \frac{1}{a\left(1+\frac{1}{a}\right)} + \frac{1}{a\left(1+\frac{1}{a}\right)^2} + \frac{1}{a\left(1+\frac{1}{a}\right)^3} \cdots + \frac{1}{a\left(1+\frac{1}{a}\right)^{n-1}}.$$

Now this laft being evidently a geometrical feries, of which the common ratio is $\frac{1}{1+\frac{1}{a}}$, its fum is

$$1+\frac{1}{a} - \frac{1}{\left(1+\frac{1}{a}\right)^{n-1}};$$

therefore, the fum of the feries

$$\frac{1}{a} + \frac{1}{a+1} + \frac{1}{a+2} + \frac{1}{a+3} \cdots + \frac{1}{a+n-1}$$

will always be greater than this expreffion; but if we fuppofe n fo great that the quantity $\left(1+\frac{1}{a}\right)^{n-1}$ is equal to, or exceeds a, which is evidently always poffible, then the above expreffion for the fum of the geometrical feries will be equal to 1, or will exceed 1; therefore, the fame number of terms of the feries $\frac{1}{a} + \frac{1}{a+1} + \frac{1}{a+2} + \frac{1}{a+3} +$, &c. will always exceed 1; now this is the property of the feries we propofed to demonftrate.

When $a = \left(1+\frac{1}{a}\right)^{n-1}$, then $a^2 = a\left(1+\frac{1}{a}\right)^{n-1}$, but this quantity is greater than $a+n-1$ the denominator of the laft term of the feries

$$\frac{1}{a} + \frac{1}{a+1} + \frac{1}{a+2} + \frac{1}{a+3} \cdots + \frac{1}{a+n-1},$$

the fum of which, we have proved, will upon that hypothefis exceed unity; much more then will the fum exceed unity if we fuppofe the feries continued until the denominator of its laft term be equal to, or greater than a^2.

Hence, beginning with the term $\frac{1}{2}$, it appears that

$$\tfrac{1}{2} + \tfrac{1}{3} + \frac{1}{4=2^2} > 1,$$

$$\tfrac{1}{5} + \tfrac{1}{6} \cdots + \frac{1}{25=5^2} > 1,$$

$$\tfrac{1}{26} + \tfrac{1}{27} \cdots + \frac{1}{676=26^2} > 1,$$

$$\tfrac{1}{677} + \tfrac{1}{678} \cdots + \frac{1}{458329=677^2} > 1,$$

&c.

Although the fum of the feries we have been confidering is infinite, yet it evidently increafes very flowly; indeed it is a limit to all fuch as have a finite fum; for every

every infinite feries, the terms of which decreafe fafter than the reciprocals of an arithmetical progreffion, is always finite.

(17.) We have already explained what is meant by a *recurring feries*, (2.) we fhall now treat briefly, firft, of their origin, next of the way in which they may be fummed, and laftly, of the manner of determining the *general term* of any particular feries.

The feries which is produced by the developement of a rational algebraic fraction has always the property which conftitutes the characteriftic of the clafs called *Recurring*, (2.) and on the other hand, any feries having that property being propofed, an algebraic fraction may be found by the expanfion of which the feries fhall be produced.

The fraction $\frac{1+2x}{1-x-x^2}$, for example, by dividing the numerator by the denominator is converted into the infinite feries.

$$1+3x+4x^2+7x^3+11x^4+18x^5+, \&c.$$

which is of fuch a nature that if T, T′, T″, denote any three of its fucceeding terms, their relation to one another is expreffed by the equation

$$T''=T x^2+T' x.$$

If we employ algebraic divifion to convert the fraction into a feries, the law of its terms will not appear fo readily as if we ufe the method of indeterminate coefficients. By this method we affume the fraction

$$=A+Bx+Cx^2+Dx^3+Ex^4, +\&c.$$

and hence, multiplying by the denominator, and bringing all the terms to one fide, as explained in ALGEBRA, § 261, we have

$$\left.\begin{matrix}A+B\\-1-A\\-2\end{matrix}\right\} x \left.\begin{matrix}+C\\-B\\-A\end{matrix}\right\} x^2 \left.\begin{matrix}+D\\-C\\-B\end{matrix}\right\} x^3+\ \&c. =0,$$

and hence,

$$\begin{array}{ll} A-1=0, & C-B-A=0, \\ B-A-2=0, & D-C-B=0, \\ & \&c. \end{array}$$

From thefe equations it appears that the law of the feries is fuch as we have affigned.

The equation expreffing the relation which fubfifts among a certain number of fucceeding terms of a recurring feries, is called its *fcale of Relation*. The fame name is alfo fometimes given to the equation expreffing the connection of the coefficients of the terms. Thus the fcale of relation of the foregoing feries is either

$$T''=T x+T' x^2,$$

where T, T′, and T″ denote any three fucceeding terms of the feries, or it is

$$R=P+Q,$$

where P, Q and R denote their numeral coefficients.

(18.) We come next to fhew how the fum of any propofed number of terms of a recurring feries may be found. Let the feries continued to n terms be

$$T_{(1)}+T_{(2)}+T_{(3)} \cdots +T_{(n-2)}+T_{(n-1)}+T_{(n)},$$

where the characters $T_{(1)}$, $T_{(2)}$, &c. denote the fucceffive terms, and the numbers (1), (2), &c. their order or place; and as whatever number of terms is contained in the fcale, the manner of fumming the feries is the fame, we fhall in what follows, for the fake of brevity, fuppofe that it confifts of three, in which cafe it may be expreffed thus,

$$p\,T_{(n-2)}+q\,T_{(n-1)}+r\,T_{(n)}=0,$$

where p, q, r denote certain given quantities.

The fcale of relation affords the following feries of equations,

$$\begin{array}{l} p\,T_{(1)}+q\,T_{(2)}+r\,T_{(3)}=0, \\ p\,T_{(2)}+q\,T_{(3)}+r\,T_{(4)}=0, \\ p\,T_{(3)}+q\,T_{(4)}+r\,T_{(5)}=0, \\ \cdots\cdots\cdots \\ p\,T_{(n-2)}+q\,T_{(n-1)}+r\,T_{(n)}=0. \end{array}$$

Taking now the fum of thefe equations, we get

$$\left.\begin{array}{l} p(T_{(1)}+T_{(2)}+T_{(3)} \cdots +T_{(n-2)}) \\ +q(T_{(2)}+T_{(3)}+T_{(4)} \cdots +T_{(n-1)}) \\ +r(T_{(3)}+T_{(4)}+T_{(5)} \cdots +T_{(n)}) \end{array}\right\}=0.$$

But, putting s for the fum of n terms of the feries, this equation may manifeftly be expreffed thus,

$$\left.\begin{array}{l} p\,(s-T_{(n)}-T_{(n-1)}) \\ +q\,(s-T_{(1)}-T_{(n)}) \\ +r\,(s-T_{(1)}-T_{(2)}) \end{array}\right\}=0.$$

Hence, after reduction, we find $s=$

$$\frac{p(T_{(n-1)}+T_{(n)})+q(T_{(1)}+T_{(n)})+r(T_{(1)}+T_{(2)})}{p+q+r},$$

From which it appears that in this cafe the fum depends only on the two firft and the two laft terms of the feries.

EXAMPLE. It is propofed to find from this formula the fum of n terms of the feries

$$1+2x+3x^2+4x^3+5x^4+\ \&c.$$

its fcale of relation being

$$x^2\,T_{(n-2)}-2x\,T_{(n-1)}+T_{(n)}=0.$$

Here $p=x^2$, $q=-2x$, $r=1$, therefore, obferving that the laft two terms of the feries muft be $(n-1)x^{n-2}$ and $n x^{n-1}$, we have, after fubftituting and reducing,

$$s=\frac{1-(n+1)x^n+n x^{n+1}}{1-2x+x^2}.$$

This formula will not apply in the cafe of $x=1$, becaufe then the numerator and denominator are each $=0$: but in fuch cafes as this we may find the value of the function which expreffes the fum by what is delivered at § 90, FLUXIONS.

(19.) The procefs by which we have determined the value of n terms of the feries $T_{(1)}+T_{(2)}+T_{(3)}+$ &c. will alfo apply to the finding the rational fraction from which the feries may be deduced, which is alfo the fum of the feries continued *ad infinitum*. For in this cafe the equation from which we have deduced the fum being

$$\left.\begin{array}{l} p\,(T_{(1)}+T_{(2)}+T_{(3)}+\ \&c.) \\ +q\,(T_{(2)}+T_{(3)}+T_{(4)}+\ \&c.) \\ +r\,(T_{(3)}+T_{(4)}+T_{(5)}+\ \&c.) \end{array}\right\}=0,$$

Series.

that is,

$$ps+q(s-T_{(1)})+r(s-T_{(1)}-T_{(2)})=0,$$

we have

$$s=\frac{(q+r)T_{(1)}+rT_{(2)}}{p+q+r}.$$

For example, let it be required to find the fraction, which being developed produces the feries

$$1+2x+3x^2+4x^3+, \&c.$$

the fcale of relation of which is

$$x^2T_{(n-2)}-2xT_{(n-1)}+T_{(n)}+0.$$

Here $p=x^2$, $q=-2x$, $r=1$, $T_{(1)}=1$, $T_{(2)}=2x$; therefore, fubftituting in the formula, we get

$$\frac{1}{1-2x+x^2}=\frac{1}{(1-x)^2}$$

for the fraction required, or for the fum of the feries continued *ad infinitum*.

(20.) We come now to the laft branch of the theory of recurring feries which we propofed to confider, namely, how to find in any cafe the *general term*.

We fhall begin with the moft fimple, and fuppofe the fraction to be $\frac{a}{1-px}$, which being expounded into a feries by divifion, is

$$a+apx+ap^2x^2+ap^3x^3+, \&c.$$

here it is immediately manifeft that the general term is $ap^{n-1}x^{n-1}$.

Next let us fuppofe the fraction to be $\frac{a+bx}{1-\alpha x-\beta x^2}$. Let the two roots of the quadratic equation $1-\alpha x-\beta x^2=0$ be $x=\frac{1}{p}$, $x=\frac{1}{q}$, fo that $1-px=0$, and $1-qx=0$; therefore, $1-\alpha x-\beta x^2=(1-px)(1-qx)$, thus, we have

$$\frac{a+bx}{1-\alpha x-\beta x^2}=\frac{a+bx}{(1-px)(1-qx)}.$$

Let us affume this expreffion equal to

$$\frac{P}{1-px}+\frac{Q}{1-qx},$$

where P and Q denote quantities which are to be independent of x, then, reducing to a common denominator, we have

$$\frac{a+bx}{(1-px)(1-qx)}=\frac{P+Q-(qP+pQ)x}{(1-px)(1-qx)}.$$

Hence, that x may remain indeterminate, we muft make

$$P+Q=a,\ qP+pQ=-b,$$

and from thefe equations we get

$$P=\frac{ap+b}{p-q},\ Q=-\frac{aq+b}{p-q}.$$

Now, by the operation of divifion, we find

$$\frac{P}{1-px}=P+Ppx+Pp^2x^2+, \&c.$$

$$\frac{Q}{1-qx}=Q+Qqx+Qq^2x^2+, \&c.$$

therefore, fince $\frac{a+bx}{1-\alpha x-\beta x^2}=\frac{P}{1-px}+\frac{Q}{1-qx}$, it follows that the developement of the fraction $\frac{a+bx}{1-\alpha x-\beta x^2}$ which proceeds according to the powers of x, is

$$(P+Q)Pp+Qq)x+(Pp^2+Qq^2)x^2$$
$$+(Pp^3+Qq^3)x^3+, \&c.$$

And here it is evident that the general term is $(Pp^{n-1}+Qq^{n-1})x^{n-1}$.

Let us take as a particular example the fraction $\frac{1-x}{1-x-2x^2}$, which, when expanded into a feries, becomes

$$1+0x+2x^2+2x^3+6x^4+10x^5$$
$$+22x^6+42x^7+86x^8+, \&c.$$

Here, from the equation $1-x-2x^2=0$, we get $x=\frac{1}{2}$ and $x=-1$, fo that $1-2x$ and $1+x$ are divifors of the function $1-x-2x^2$, that is, $1-x-2x^2=(1+x)(1-2x)$; hence $p=-1$, $q=2$, and fince $a=1$, $b=-1$; therefore $P=\frac{2}{3}$, $Q=\frac{1}{3}$, and the general term $(Pp^{n-1}+Qq^{n-1})x^{n-1}$ becomes by fubftituting

$$\left\{\frac{2}{3}(-1)^{n-1}+\frac{1}{3}2^{n-1}\right\}x^{n-1}=\frac{2^{n-1}\pm 2}{3}x^{n-1},$$

where the fign $+$ is to be taken when n is an odd number; but the fign $-$ when n is even.

Sometimes the values of p and q will come out imaginary quantities; thefe, however, will be found always to deftroy one another when fubftituted in the general term.

Let us next fuppofe the fraction which produces a recurring feries to be

$$\frac{a+bx+cx^2}{1-\alpha x-\beta x^2-\gamma x^3}.$$

Let $x=\frac{1}{p}$, $x=\frac{1}{q}$, $x=\frac{1}{r}$ be the three roots of the cubic equation $1-\alpha x-\beta x^2-\gamma x^3=0$, then the denominator of the fraction will be the product of the three factors

$$1-px,\ 1-qx,\ 1-rx.$$

We muft now affume the fraction equal to the expreffion

$$\frac{P}{1-px}+\frac{Q}{1-qx}+\frac{R}{1-rx};$$

in which P, Q, R denote quantities which are independent of x.

The three terms of this expreffion are next to be reduced to a common denominator and collected into one, and the coefficients of the powers of x in the numerator of the refult are to be put equal to the like powers of x in the propofed fraction, we fhall then have

P+

$$P+Q+R=a,$$
$$(q+r)P+(p+r)Q+(p+q)R=-b,$$
$$q\,r\,P+p\,r\,Q+p\,q\,R=c,$$

and by these equations the values of P, Q, R may be found.

Let $\frac{P}{1-px}$, $\frac{Q}{1-qx}$, $\frac{R}{1-rx}$ be now resolved into series by division; then, adding the like powers of x in each we have

$$(P+Q+R)+(Pp+Qq+Rr)x+(Pp^2+Qq^2+Rr^2)x^2+,\ \&c.$$

for the series which is the developement of the fraction

$$\frac{a+bx+cx^2}{1-\alpha x-\beta x^2-\gamma x^3}$$

and here the general term is evidently

$$(Pp^{n-1}+Qq^{n-1}+Rr^{n-1})x^{n-1};$$

and in the very same manner may the general term be found in every case in which the denominator of the fraction admits of being resolved into unequal factors.

(21.) Let us now suppose the fraction to have the form $\frac{a+bx}{(1-px)^2}$, the denominator being the product of two equal factors; this fraction cannot be decomposed into other fractions, the denominators of which are the simple factors of its denominator. We may, however, transform it into two, which shall have their numerators constant quantities by proceeding as follows: Assume the numerator $a+bx=P+Q(1-px)$, then, that x may remain indeterminate, we must have $P+Q=a$, $-pQ=b$, therefore

$$Q=-\frac{b}{p},\ P=a+\frac{b}{p}.$$

The assumption of $a+bx=P+Q(1-px)$ gives us therefore

$$\frac{a+bx}{(1-px)^2}=\frac{P}{(1-px)^2}+\frac{Q}{1-px}.$$

Now, putting the first term of the latter side of this equation under the form $P(1-px)^{-2}$, it is resolved by the binomial theorem into the series

$$P(1+2px+3p^2x^2+4p^3x^3+,\ \&c.);$$

the other fraction $\frac{Q}{1-px}$ being expanded into a series is

$$Q+Qpx+Qp^2x^2+,\ \&c.$$

Therefore, the complete developement of $\frac{a+bx}{(1-px)^2}$ is

$$P+Q+(2P+Q)px+(3P+Q)p^2x^2+,\ \&c.$$

and here the general term is manifestly $(nP+Q)p^{n-1}x^{n-1}$, or, substituting for P and Q their values,

$$\left\{npa+(n-1)b\right\}p^{n-2}x^{n-1}.$$

(22.) In general, whatever be the form of the fraction from which a recurring series is derived, to determine the general term we must decompose the fraction into others which may be as simple as possible; and provided it be rational, and the highest power of x in the numerator at least one degree less than the highest power in the denominator, it may be always decomposed into others having one or other of these two forms

$$\frac{P}{1-px},\ \frac{Q}{(1-qx)^n},$$

in which expressions P, Q, p, and q, denote quantities independent of x. Each partial fraction gives a recurring series, the general term of which will be sufficiently obvious; and as the series belonging to the original fraction, is the sum of these series, so also its general term will be the sum of all their general terms.

We have now treated of some of the more general methods of summing series which admit of being explained by the common principles of algebra; but the subject is of great extent, and to treat of it so as to give a tolerable notion of its various branches, would require more room than could with propriety be spared on such a work as ours.

(23). The fluxionary calculus affords a method, almost the only general one we possess, of summing series. The general principles upon which it is applied may be stated briefly as follows. Since the fluent of any fluxion containing one variable quantity may always be expressed by a series, on the contrary every series may be regarded as the expression of a fluent: when any series then is proposed, we must endeavour to find the fluxional expression of which that series is the fluent; and as we can always find the fluent of a fluxion, at least by approximation, within given limits; we may thence determine, if not the exact, at least the approximate value of any infinite series. We shall now shew how this principle may be applied in some particular cases.

Problem I. It is proposed to find the sum of n terms of the series

$$x+2x^2+3x^3+4x^4\cdots+nx^n.$$

Let the sum be denoted by s. Then, multiplying all the terms by $\frac{\dot{x}}{x}$ we have

$$\frac{s\dot{x}}{x}=\dot{x}+2x\dot{x}+3x^2\dot{x}+4x^3\dot{x}\cdots+nx^{n-1}\dot{x}$$

Let the fluent of both sides be now taken, and the result is

$$\int\frac{s\dot{x}}{x}=x+x^2+x^3+x^4\cdots+x^n.$$

Now the series on the right-hand side of this equation is a geometrical progression, the sum of which is known to be $\frac{x-x^{n+1}}{1-x}$, (Algebra, § 106). Therefore,

$$\int\frac{s\dot{x}}{x}=\frac{x-x^{n+1}}{1-x},$$

and

and, taking the fluxions,

$$\frac{\dot{s}x}{x}=\frac{\dot{x}-(n+1)x^n\dot{x}+nx^{n+1}\dot{x}}{(1-x)^2}.$$

Hence we find

$$s=\frac{x-(n+1)x^{n+1}+nx^{n+2}}{(1-x)^2}.$$

This result agrees with that formerly found (17.) of this article.

Problem II. It is proposed to sum the infinite series

$$1-\frac{1}{3}+\frac{1}{5}-\frac{1}{7}+\frac{1}{9}-\frac{1}{11}+, \text{ \&c.}$$

We may consider this series as a particular case of the more general series,

$$x-\frac{x^3}{3}+\frac{x^5}{5}-\frac{x^7}{7}+, \text{ \&c.}$$

namely, that in which $x=1$. Putting therefore the sum $=s$, and taking the fluxions, we have

$$\dot{s}=\dot{x}(1-x^2+x^4-x^6+, \text{ \&c.}).$$

Now the series in the parenthesis is obviously the developement of the rational fraction $\frac{1}{1+x^2}$ therefore, $\dot{s}=\frac{\dot{x}}{1+x^2}$, and taking the fluent $s=$ arc (tan. $=x$) $+c$, radius being unity. (Fluxions § 60.) Now when $x=0$, all the terms of the series vanish, so that in this case $s=0$; and as when $x=0$, arc. (tan. $=x$)$=0$; therefore c, the constant quantity added to complete the fluent is 0, and we have simply $s=$ arc. (tan. $=x$), and when $x=1$, then $s=\frac{1}{2}$ a quadrant $=.7853982$.

Problem III. Required the sum of the infinite series

$$\frac{x}{1\cdot 2}+\frac{x^2}{2\cdot 3}+\frac{x^3}{3\cdot 4}+\frac{x^4}{4\cdot 5}+, \text{ \&c.}$$

Putting s for the sum, and taking the fluxions, we get

$$\dot{s}=\frac{\dot{x}}{x^2}\left(\frac{x^2}{2}+\frac{x^3}{3}+\frac{x^4}{4}+\frac{x^5}{5}+, \text{ \&c.}\right)$$

Now the series in the parenthesis is evidently equal to $-x-$ Nap. log. $(1-x)$. (see Logarithms, page 76. column 1.); therefore

$$\dot{s}=-\frac{\dot{x}}{x}-\frac{\dot{x}}{x^2}\times \text{Nap. log. } (1-x).$$

To find the fluent, let us put v for the function $\frac{1}{x}$ log. $(1-x)$, then, taking its fluxion we have

$$\dot{v}=-\frac{\dot{x}}{x^2}\times\log.(1-x)-\frac{\dot{x}}{x(1-x)},$$

and $-\frac{\dot{x}}{x^2}\times\log.(1-x)=\dot{v}+\frac{\dot{x}}{x(1-x)}$,

therefore, substituting, we get

$$\dot{s}=\dot{v}+\frac{\dot{x}}{x(1-x)}-\frac{\dot{x}}{x}$$

$$=\dot{v}+\frac{\dot{x}}{1-x};$$

and taking the fluents,

$$s=v-\log.(1-x)+c$$
$$=\frac{\log.(1-x)}{x}-\log.(1-x)+c.$$

To determine the constant quantity c, let us take $x=0$, then, in this case all the terms of the series vanish so that $s=0$, also log. $(1-x)=$ log. $1=0$; and since in general $\frac{\log.(1-x)}{x}=\frac{1}{x}\left(-x-\frac{x^2}{2}-\frac{x^3}{3}\right.$ $\left.-, \text{ \&c.}\right)=-1-\frac{x}{2}-\frac{x^2}{3}-$, &c. when $x=0$, then $\frac{\log.(1-x)}{x}=-1$: therefore $0=-1+c$, and $c=1$; hence it appears that

$$s=\frac{\log.(1-x)}{x}-\log.(1-x)+1$$
$$=\frac{(1-x)\log.(1-x)}{x}+1.$$

Example, Let $x=\frac{1}{2}$, then our formula gives

$$\frac{1}{1\cdot 2\cdot 2}+\frac{1}{2\cdot 3\cdot 2^2}+\frac{1}{3\cdot 4\cdot 2^3}+\frac{1}{4\cdot 5\cdot 2^4}+, \text{ \&c.}$$
$=1-$ Nap. log. $2=.3068528$.

Problem IV. Let the series to be summed be

$$1+\frac{m}{n}x+\frac{m+1}{n+1}x^2+\frac{m+2}{n+2}x^3+, \text{ \&c.}$$

Putting s for this series let all its terms be multiplied by x^{n-1} so that the exponent of x in each may be identical with its denominater, the result is

$$sx^{n-1}=x^{n-1}+\frac{m}{n}x^n+\frac{m+1}{n+1}x^{n+1}+\frac{m+2}{n+2}x^{n+2}+, \text{ \&c.}$$

and hence taking the fluxions

$$\dot{s}x^{n-1}+(n-1)s\dot{x}x^{n-2}=(n-1)\dot{x}x^{n-2}+m\dot{x}x^{n-1}$$
$$+(m+1)\dot{x}x^n+(m+2)\dot{x}x^{n+1}+, \text{ \&c.}$$

Let both sides of this equation be now multiplied by x^{m-n}, and it becomes

$$\dot{s}x^{m-1}+(n-1)s\dot{x}x^{m-2}=(n-1)\dot{x}x^{m-2}+m\dot{x}x^{m-1}$$
$$+(m+1)\dot{x}x^m+(m+2)\dot{x}x^{m+1}+, \text{ \&c.}$$

Putting now the single character $\dot{p}$ for the fluxional expression which forms the first member of this equation, we get by taking the fluents of both sides,

$$p=\frac{n-1}{m-1}x^{m-1}+x^m+x^{m+1}+x^{m+2}+, \text{ \&c.}$$
$$=\frac{n-1}{m-1}x^{m-1}+x^m(1+x+x^2+x^3+, \text{ \&c}),$$

but the series in the parenthesis is the developement of $\frac{1}{1-x}$, therefore

$$p=\frac{n-1}{m-1}x^{m-1}+\frac{x^m}{1-x};$$

taking

Series.

taking now the fluxions, and substituting instead of $\dot{p}$ the expression it was put to represent, we get

$$\dot{s}x^{n-1}+(n-1)s\dot{x}x^{n-2}$$
$$=(n-1)\dot{x}x^{n-2}+\frac{m\dot{x}x^{n-1}}{1-x}+\frac{\dot{x}x^{n}}{(1-x)^2},$$

and this, after reduction, becomes

$$\dot{s}+\frac{n-1}{x}s\dot{x}=\frac{(n-1)\dot{x}}{x}+\frac{m\dot{x}}{1-x}+\frac{x\dot{x}}{(1-x)^2}.$$

This fluxional equation being of the first degree, and first order, its primitive equation may be found (from the general formula given in FLUXIONS, § 182.) to be

$$s=\frac{1}{x^{n-1}}\times\int\left\{(n-1)\dot{x}x^{n-2}+\frac{m\dot{x}x^{n-1}}{1-x}+\frac{\dot{x}x^{n}}{(1-x)^2}\right\};$$

and this again, by remarking that $\int(n-1)\dot{x}x^{n-2}=x^{n-1}$,

and that

$$\int\frac{m\dot{x}x^{n-1}}{1-x}=\frac{mx^{n}}{n(1-x)}-\int\frac{m\dot{x}x^{n}}{n(1-x)^2},$$

may be reduced to

$$s=1+\frac{mx}{n(1-x)}+\frac{n-m}{nx^{n-1}}\int\frac{x^{n}\dot{x}}{(1-x)^2}.$$

The remaining fluent $\int\frac{x^{n}\dot{x}}{(1-x)^2}$ may be found by § 109. FLUXIONS, and it must be so taken, that after being multiplied by $\frac{n-m}{nx^{n-1}}$, it shall vanish when $x=0$; for then this hypothesis will make the whole function which expresses the value of s vanish, except its first term 1, as it ought to do.

Example. Let us suppose $n=2$, then,

$$\int\frac{x^2\dot{x}}{(1-x)^2}=x+\frac{x}{1-x}+2\log.(1-x),$$

and

$$\frac{2-m}{2x}\int\frac{x^2\dot{x}}{(1-x)^2}=\frac{(2-m)x}{2(1-x)}$$
$$+\frac{2-m}{x}\log.(1-x),$$

the fluent being here taken as directed. In this case then, after collecting the terms, we get s, or

$$1+\frac{m}{2}x+\frac{m+1}{3}x^2+\frac{m+2}{4}x^3+, \&c.$$
$$=\frac{1}{1-x}+\frac{(2-m)}{x}\log.(1-x).$$

(24.) There is a branch of the doctrine of series which is of considerable importance in pure mathematics as well as in many physical inquiries, and in the science of astronomy; it is called the *Interpolation* of series.

To interpolate a series is to interpose among its terms others which shall be subject to the same law, or which shall be formed in the same manner as the original terms of the series; or in other words, it is to find the value of one or more terms by means of others which are given, and which may be either at equal or unequal intervals from one another, the places of the given terms as well as of those sought being supposed known.

It is easy to see that this problem may be applied to the construction of logarithmic tables; for we may regard the logarithms of the natural numbers 1, 2, 3, 4, &c. *ad infinitum* as the terms of a particular series of which the numbers themselves are then the indices. Having given the logarithms of some numbers we may by interpolating deduce from them the logarithms of others.

Again, in astronomy we may consider the numbers which express the successive observed positions of a celestial body as the terms of a series, their indices being the intervals of time between the observations, and some assumed epoch, and the problem we are considering will enable us to determine the position at any instant different from the times of actual observation, provided the intervals between the observations be small, and the instant for which the position is sought not very remote from those at which the observations were made.

(25.) With a view to illustrate the nature of the problem to be resolved, let us consider some particular case, as for example the arithmetical series

$$a,\ a+d,\ a+2d,\ a+3d,\ a+4d,\ \&c.$$

Let t and t' be two given terms of the series, which are at any distance from one another, and let n and n' be their indices, or numbers which denote their places in the series. Also let y be any term whatever and x its index. Then by the nature of an arithmetical series,

$$t=a+(n-1)d,\ t'=a+(n'-1)d,$$
$$y=a+(x-1)d,$$

Now, as there are here three equations, each involving the quantities a and d, we may eliminate both these quantities by the common rules, (ALGEBRA, Sect. VII.) and this being done, we get

$$(x-n')(t'-t)=(n'-n)(y-t');$$

and hence we find this expression,

$$y=\frac{x-n'}{n-n'}t+\frac{x-n}{n'-n}t',$$

which is a general formula for interpolating any arithmetical series, and it is observable, that it is entirely independent both of the first term and common difference.

Example. The 7th term of an arithmetical series is 15, and the 12th term is 25: It is required to find the 10th term.

Here $n=7,\ n'=12,\ x=10;$

$t=15,\ t'=25,\ y$ is sought.

Therefore by the formula,

$$y=\frac{2}{5}\times15+\frac{3}{5}\times25=21, \text{ the answer.}$$

(26.) The mode of investigation by which we have found a formula for the interpolation of an arithmetical series will apply also to others, if the law according to which the terms are formed be known; in general, however, the law of a series to be interpolated is either not

Series. Plate ccclxxvii.

not known, or it is not taken into account, and we only consider the absolute magnitudes of certain terms, and the numbers expressing their places in the series. To resolve the problem generally with these *data*, it is usual to proceed as follows: Let a straight line, AB, and a point A in it, be assumed as given in position, and let there be taken the segments AD, AD′, AD″, AD‴, &c. proportional to the numbers denoting the places of the terms of a series reckoned from any term assumed as a fixed origin, and at the points D, D′, D″ let there be erected perpendiculars proportional to the terms themselves. Let us now suppose a curve to pass through C, C′, C″, C‴, &c. then, if it be so chosen that its curvature may vary gradually in its progress from point to point, without any very abrupt changes of inflection, and moreover, if the terms (which we may suppose to be either at equal or unequal distances) are pretty near to one another, it is easy to conceive, that if AP be taken equal to the number expressing the place of a term between C″D″, C‴D‴ any two others, the term itself will, if not exactly, at least be nearly expressed by PQ, the ordinate to the curve.

As an infinite variety of curves may be found that shall pass through the same given points; in this respect the problem is unlimited; it is, however, convenient to assume such as are simple and tractable. The parabolic class possess these properties, and accordingly they are commonly employed.

Let us then express the ordinates CD, C′D′, C″D″, C‴D‴, &c. which are the given terms of the series by

$$t,\ t',\ t'',\ t''',\ \&c.$$

and the abscissæ AD, AD′, AD″, AD‴, or the numbers denoting the order of the terms by

$$n,\ n',\ n'',\ n''',\ \&c.$$

Put y for PQ, a term to be interpolated, and x for AP its place. Then, considering x and y as indefinite co-ordinates, a parabolic curve that shall pass through the points C, C′, C″, C‴, &c. will have for its equation

$$y = A + Bx + Cx^2 + Dx^3, +, \&c.$$

the number of terms on the right-hand side being supposed equal to that of the given points, and A, B, C, &c. being put to denote constant quantities. To determine these we must consider that when $x=n$, then $y=t$, and that when $x=n'$, then $y=t'$ and so on, therefore, substituting the successive corresponding values of x and y we get

$$\begin{aligned}
t &= A + Bn + Cn^2 + Dn^3 +, \&c.\\
t' &= A + Bn' + Cn'^2 + Dn'^3 +, \&c.\\
t'' &= A + Bn'' + Cn''^2 + Dn''^3 +, \&c.\\
t''' &= A + Bn''' + Cn'''^2 + Dn'''^3 +, \&c.\\
&\&c. \qquad \&c.
\end{aligned}$$

this series of equations must be continued until their number be the same as that of the coefficient, A, B, C, D, &c. If we now consider t, t', t'', &c. and n, n', n'', &c. as known, and A, B, C, &c. as unknown quantities, we may determine these last by eliminating them one after another from the above equations, as is taught in ALGEBRA, Sect. XVII. And the values of A, B, C, &c. being thus determined and substituted in the general equation, we shall have a general expression for y in terms of x the number denoting its place and known quantities; and this is in substance the solution originally given of the problem by Sir Isaac Newton, who proposed it in the third book of his *Principia* with a view to its application in astronomy.

A celebrated foreign mathematician (Lagrange) has, in the *Cahiers de l'Ecole Normale*, given a different form to the expression for y. He has observed that since, when x becomes n, n', n'', n''', &c. successively, then y becomes t, t', t'', t''', &c. It follows that the expression for y must have this form.

$$y = \alpha t + \beta t' + \gamma t'' + \delta t''' +, \&c.$$

where the quantities α, β, γ, &c. must be such functions of x, that if we put $x=n$, then $\alpha=1$ and $\beta=0$, $\gamma=0$, &c. and if we put $x=n'$, then $\alpha=0$, $\beta=1$; $\gamma=0$, &c. and again, if we make $x=n''$, then $x=0$, $\beta=0$, $\gamma=1$, &c. and so on. Hence it is easy to conclude that the values of α, β, γ, &c. must have the form

$$\begin{aligned}
\alpha &= \frac{(x-n')(x-n'')(x-n''')}{(n-n')(n-n'')(n-n''')}, \&c.\\
\beta &= \frac{(x-n)(x-n'')(x-n''')}{(n'-n)(n'-n'')(n'-n''')}, \&c.\\
\gamma &= \frac{(x-n)(x-n')(x-n''')}{(n''-n)(n''-n')(n''-n''')}, \&c.\\
\delta &= \frac{(x-n)(x-n')(x-n'')}{(n'''-n)(n'''-n')(n'''-n'')}, \&c.\\
&\&c.
\end{aligned}$$

and here the number of factors in the numerator and denominator must be each equal to the number of given points in the curve. This formula would be found to be identical with that which may be obtained by the method indicated in last article, if we were to take the actual product of the factors and arrange the whole expression according to powers of x. It possesses however one advantage over the other, viz. that of admitting of the application of logarithms.

We shall now shew the application of this formula.

Ex. 1. Having given the logarithms of 101, 102, 104, and 105, it is required to find the logarithm of 103.

In this case we may reckon the terms of the series forward from the first given term, viz. log. 101, so that we have

$$\begin{aligned}
t &= \text{log. } 101 = 2.0043214, & n&=0,\\
t' &= \text{log. } 102 = 2.0086002, & n'&=1,\\
y &= \text{log. } 103 = \text{term sought}, & x&=2,\\
t'' &= \text{log. } 104 = 2.0170333, & n''&=3,\\
t''' &= \text{log. } 105 = 2.0211893, & n'''&=4.
\end{aligned}$$

Substituting now in the general formula we get

$$\alpha = \frac{1\times-1\times-2}{-1\times-3\times-4} = -\frac{1}{6}, \quad \gamma = \frac{2\times1\times-2}{3\times2\times-1} = \frac{2}{3},$$

$$\beta = \frac{2\times-1\times-2}{1\times-2\times-3} = \frac{2}{3}, \quad \delta = \frac{2\times1\times-1}{4\times3\times1} = -\frac{1}{6},$$

$$\begin{aligned}
\text{Therefore } y &= -\frac{t}{6} + \frac{2t'}{3} + \frac{2t''}{3} - \frac{t'''}{6}\\
&= \tfrac{2}{3}(t'+t'') - \tfrac{1}{6}(t+t''')\\
&= 2.0128372 \text{ the answer.}
\end{aligned}$$

Ex.

Ex. 2. Given a comet's diſtance from the ſun on the following days at 12 at night, to find its diſtance December 20th.

December 12.	diſtance 301,	Dec. 24.	diſtance 715,
21.	620,	26.	772.

Here we ſhall eſtimate the places of the terms from the time of the firſt poſition, viz. December 12. Therefore

$$\begin{array}{ll} t = 301, & n = 0, \\ y \text{ is ſought}, & x = 8, \\ t' = 620, & n' = 9, \\ t'' = 715, & n'' = 12, \\ t''' = 772, & n''' = 14. \end{array}$$

In this caſe the general formula gives us

$$\alpha = \frac{1}{63},\ \beta = \frac{6}{45},\ \gamma = -\frac{2}{3},\ \delta = \frac{8}{35},$$

therefore

$$y = \frac{t}{63} + \frac{64t'}{45} - \frac{2t''}{3} + \frac{8t'''}{35}.$$
$$= 586.3 \text{ the anſwer.}$$

We ſhall conclude this article with a brief enumeration of the beſt works on the ſubject which we have been treating of.

SERINGAPATAM, the capital of Myſore, formerly the dominions of Tippoo Sultan, is ſituated in an iſland of the Cavery river, about 290 or 300 miles from Madras, and in N. Lat. 12° 32′ and E. Long. 96° 47′, about four miles in length, by one and a half in breadth, acroſs the middle, where it is likewiſe higheſt, whence it gradually falls and narrows towards the extremities. The weſt end of the iſland, on which there is a fort of conſiderable ſtrength, ſlopes more, eſpecially towards the north; and the ground riſing on the oppoſite ſide of the river commands a diſtinct view of every part of the fort. The fort and outworks occupy about a mile of the weſt end of the iſland, and are diſtinguiſhed by magnificent buildings, and ancient Hindoo pagodas, contraſted with the more lofty and ſplendid monuments lately raiſed in honour of the Mahometan faith. The great garden, called the *Laul Baug*, covers about as much of the eaſt end of the iſland as the fort and outworks do of the weſt; and the whole intermediate ſpace, except a ſmall incloſure on the north bank near the fort, was, before the laſt war, filled with houſes, and formed an extenſive ſuburb, of which the greateſt part was deſtroyed by Tippoo to make room for batteries to defend the iſland when attacked by the combined forces of Earl Cornwallis and the Mahratta chiefs in February 1792. This ſuburb, or town of modern ſtructure, is about half a mile ſquare, divided into regular croſs ſtreets, all wide, and ſhaded on each ſide by trees. It is ſurrounded by a ſtrong mud wall, contains many good houſes, and ſeems to have been preſerved by the Sultan for the accommodation of merchants, and for the convenience of troops ſtationed on that part of the iſland for its defence. A little to the eaſtward of the town is the entrance to the great garden, which was laid out in regular ſhady walks of large cypreſs trees, and abounding with fruit-trees, flowers, and vegetables of every deſcription. It poſſeſſed all the beauty and elegance of a country retirement, and was dignified by the mauſoleum of Hyder, and a ſuperb new palace built by his ſon. This noble garden was devoted to deſtruction; and the trees which had ſhaded their proud maſter, and contributed to his pleaſures, were formed into the means of protecting his enemies in ſubverting his empire. "Before that event, ſo glorious to the arms of England, this inſulated metropolis (ſays Major Dirom) muſt have been the richeſt, moſt convenient, and beautiful ſpot poſſeſſed in the preſent age by any native prince in India; but when the allies left it, the Sultan's fort and city only remained in repair amidſt all the wrecks of his former grandeur, the iſland preſenting nothing but the appearance of wretched barrenneſs. Tippoo is a man of talents, enterpriſe, and great wealth; but, in the opinion of our author, the remaining years of his ill-fated life will be unequal to renew the beauties of his terreſtrial paradiſe." This prediction was more than verified in the fate of Tippoo; for he loſt his life in bravely defending his capital, which was taken by aſſault in 1799 by the Britiſh troops under General Baird. See INDIA, N° 183.

SERINGHAM, an iſland of Indoſtan, formed about ſix miles north-weſt of Trinchinopoly by the river Cavery, which divides itſelf into two branches: that to the northward takes the name of *Coleroon*, but the ſouthern branch preſerves its old name the *Cavery*. Each of theſe rivers, after a courſe of about 90 miles, empty themſelves into the ſea; the Coleroon at Devicottah, and the Cavery near Tranquebar, at about 20 miles diſtance from one another. In this iſland, facing Trinchinopoly, ſtood a famous pagoda ſurrounded by ſeven ſquare walls of ſtone, 25 feet high and four feet thick. The ſpace between the outward and ſecond walls meaſured 310 feet, and ſo proportionably of the reſt. Each incloſure had four large gates, with a high tower; which were placed, one in the middle of each ſide of the incloſure, and oppoſite to the four cardinal points. The outward wall was about four miles in circumference, and its gateway to the ſouth was ornamented with pillars, ſome of which were ſingle ſtones 33 feet in length and five in diameter; while thoſe that formed the roof were ſtill larger; and in the inmoſt incloſure were the chapels.—About half a mile to the eaſt was another large pagoda called *Jumbikiſtna*, which had but one incloſure.

The pagoda of Seringham was held in great veneration, from a belief that it contained the identical image of of the god Wiftnou worfhipped by Brama; and pilgrims came here from all parts of India with offerings of money to procure abfolution. A large part of the revenue of the ifland was allotted for the maintenance of the Bramins who inhabited the pagoda; and thefe, with their families, formerly amounted to no fewer than 40,000 perfons, all maintained by the fuperftitious liberality of the adjacent country.

SERIOLA, a genus of plants belonging to the clafs fyngenefia, and in the natural fyftem ranged under the 49th order, *Compofitæ*. See BOTANY *Index*.

SERIPHIUM, a genus of plants belonging to the clafs fyngenefia. See BOTANY *Index*.

SERIPHUS, in *Ancient Geography*, one of the Cyclades or iflands in the Ægean fea, called *Saxum Seriphium* by Tacitus, as if all a rock; one of the ufual places of banifhment among the Romans. The people, *Seriphii*; who, together with the Siphnii, joined Greece againft Xerxes, were almoft the only iflanders who refufed to give him earth and water in token of fubmiffion, (Herodotus). *Seriphia Rana*, a proverbial faying concerning a perfon who can neither fing nor fay; frogs in this ifland being faid to be dumb, (Pliny).

SERMON, a difcourfe delivered in public, for the purpofe of religious inftruction and improvement.

Funeral SERMON. See *FUNERAL Orations*.

SERON OF ALMONDS, is the quantity of two hundred weight; of anife feed, it is from three to four hundred; of Caftile foap, from two hundred and a half to three hundred and three quarters.

SEROSITY, in *Medicine*, the watery part of the blood.

SERPENS, in *Aftronomy*, a conftellation in the northern hemifphere, called more particularly *Serpens Ophiuchi*. The ftars in the conftellation Serpens, in Ptolemy's catalogue, are 18; in Tycho's, 13; in Hevelius's, 22; and in the Britannic catalogue, 64.

SERPENS Biceps, or *Double-headed Snake*; a monfter of the ferpent kind, of which fome individuals are defcribed by naturalifts.

SERPENTES, *Serpents*, in the Linnæan fyftem of zoology, an order of animals belonging to the clafs of *amphibia*. See OPHIOLOGY.

The ferpent has been always confidered the enemy of man; and it has hitherto continued to terrify and annoy him, notwithftanding all the arts which have been practifed to deftroy it. Formidable in itfelf, it deters the invader from the purfuit; and from its figure, capable of finding fhelter in a little fpace, it is not eafily difcovered by thofe who would venture to encounter it. Thus poffeffed at once of potent arms, and inacceffible or fecure retreats, it baffles all the arts of man, though ever fo earneftly bent upon its deftruction. For this reafon, there is fcarcely a country in the world that does not ftill give birth to this poifonous brood, that feems formed to quell human pride, and reprefs the boafts of fecurity. Mankind have driven the lion, the tiger, and the wolf, from their vicinity; but the fnake and the viper ftill defy their power.

Their numbers, however, are thinned by human affiduity; and it is poffible fome of the kinds are wholly deftroyed. In none of the countries of Europe are they fufficiently numerous to be truly terrible. The various malignity that has been afcribed to European ferpents of old is now utterly unknown; there are not above three or four kinds that are dangerous, and their poifon operates in all in the fame manner. The drowfy death, the ftarting of the blood from every pore, the infatiable and burning thirft, the melting down the folid mafs of the whole form into one heap of putrefaction, faid to be occafioned by the bites of African ferpents, are horrors with which we are entirely unacquainted, and are perhaps only the creatures of fancy.

But though we have thus reduced thefe dangers, having been incapable of wholly removing them, in other parts of the world they ftill rage with all their ancient malignity. In the warm countries that lie within the tropics, as well as in the cold regions of the north, where the inhabitants are few, the ferpents propagate in equal proportion. But of all countries thofe regions have them in the greateft abundance where the fields are unpeopled and fertile, and where the climate fupplies warmth and humidity. All along the fwampy banks of the river Niger or Oroonoko, where the fun is hot, the forefts thick, and the men but few, the ferpents cling among the branches of the trees in infinite numbers, and carry on an unceafing war againft all other animals in their vicinity. Travellers have affured us, that they have often feen large fnakes twining round the trunk of a tall tree, encompaffing it like a wreath, and thus rifing and defcending at pleafure.—We are not, therefore, to reject as wholly fabulous the accounts left us by the ancients of the terrible devaftations committed by a fingle ferpent. It is probable, in early times, when the arts were little known, and mankind were but thinly fcattered over the earth, that ferpents, continuing undifturbed poffeffors of the foreft, grew to an amazing magnitude; and every other tribe of animals fell before them. It then might have happened, that ferpents reigned the tyrants of a diftrict for centuries together. To animals of this kind, grown by time and rapacity to 100 or 150 feet in length, the lion, the tiger, and even the elephant itfelf, were but feeble opponents. That horrible fœtor, which even the commoneft and the moft harmlefs fnakes are ftill found to diffufe, might, in thefe larger ones, become too powerful for any living being to withftand; and while they preyed without diftinction, they might thus alfo have poifoned the atmofphere around them. In this manner, having for ages lived in the hidden and unpeopled foreft, and finding, as their appetites were more powerful, the quantity of their prey decreafing, it is poffible they might venture boldly from their retreats into the more cultivated parts of the country, and carry confternation among mankind, as they had before defolation among the lower ranks of nature. We have many hiftories of antiquity, prefenting us fuch a picture, and exhibiting a whole nation finking under the ravages of a fingle ferpent. At that time man had not learned the art of uniting the efforts of many to effect one great purpofe. Oppofing multitudes only added new victims to the general calamity, and increafed mutual embarraffment and terror. The animal was therefore to be fingly oppofed by him who had the greateft ftrength, the beft armour, and the moft undaunted courage. In fuch an encounter, hundreds muft have fallen; till one, more lucky than the reft, by a fortunate blow, or by taking the monfter in its torpid interval, and furcharged with fpoil, might kill, and thus rid his country

country of the deſtroyer. Such was the original occupation of heroes; and thoſe who firſt obtained that name, from their deſtroying the ravagers of the earth, gained it much more deſervedly than their ſucceſſors, who acquired their reputation only for their ſkill in deſtroying each other. But as we deſcend into more enlightened antiquity, we find theſe animals leſs formidable, as being attacked in a more ſucceſsful manner. We are told, that while Regulus led his army along the banks of the river Bagrada in Africa, an enormous ſerpent diſputed his paſſage over. We are aſſured by Pliny, that it was 120 feet long, and that it had deſtroyed many of the army. At laſt, however, the battering engines were brought out againſt it; and theſe aſſailing it at a diſtance, it was ſoon deſtroyed. Its ſpoils were carried to Rome, and the general was decreed an ovation for his ſucceſs. There are, perhaps, few facts better aſcertained in hiſtory than this: an ovation was a remarkable honour; and was given only for ſome ſignal exploit that did not deſerve a triumph: no hiſtorian would offer to invent that part of the ſtory at leaſt, without being ſubject to the moſt ſhameful detection. The ſkin was kept for ſeveral years after in the Capitol; and Pliny ſays he ſaw it there. At preſent, indeed, ſuch ravages from ſerpents are ſcarcely ſeen in any part of the world; not but that, in Africa and America, ſome of them are powerful enough to brave the aſſaults of men to this day.

> *—Nequeunt expleri corda tuendo*
> *Terribiles oculos, vultum villoſaque ſetis*
> *Pectora.—* VIRGIL.

We have given a place to the preceding remarks, not ſo much for their accuracy as to ſhow what were formerly the ſentiments of mankind concerning this tribe of animals.

SERPENT, a muſical inſtrument, ſerving as a baſs to the cornet, or *ſmall ſhawm*, to ſuſtain a chorus of ſingers in a large edifice. It has its name *ſerpent* from its figure, as conſiſting of ſeveral folds or wreaths, which ſerve to reduce its length, which would otherwiſe be ſix or ſeven feet.

It is uſually covered with leather, and conſiſts of three parts, a mouth-piece, a neck, and a tail. It has ſix holes, by means whereof it takes in the compaſs of two octaves.

Merſennus, who has particularly deſcribed this inſtrument, mentions ſome peculiar properties of it, e. gr. that the ſound of it is ſtrong enough to drown 20 robuſt voices, being animated merely by the breath of a boy, and yet the ſound of it may be attempered to the ſoftneſs of the ſweeteſt voice. Another peculiarity of this inſtrument is, that great as the diſtance between the third and fourth hole appears, yet whether the third hole be open or ſhut, the difference is but a tone.

SERPENT, in *Mythology*, was a very common ſymbol of the ſun, and he is repreſented biting his tail, and with his body formed into a circle, in order to indicate the ordinary courſe of this luminary, and under this form it was an emblem of time and eternity. The ſerpent was alſo the ſymbol of medicine, and of the gods which preſided over it, as of Apollo and Æſculapius: and this animal was the object of very ancient and general worſhip, under various appellations and characters. In moſt of the ancient rites we find ſome alluſion to the ſerpent, under the ſeveral titles of Ob, Ops, Python, &c. This idolatry is alluded to by Moſes, (Lev. xx. 27.). The woman at Endor who had a familiar ſpirit is called Oub, or Ob, and it is interpreted Pythoniſſa. The place where ſhe reſided, ſays the learned Mr Bryant, ſeems to have been named from the worſhip then inſtituted; for Endor is compounded of *En-ador*, and ſignifies *fons Pythonis*, "the fountain of light, the oracle of the god Ador, which oracle was probably founded by the Canaanites, and had never been totally ſuppreſſed. His pillar was alſo called *Abbadir*, or *Abadir*, compounded of *ab* and *adir*, and meaning the ſerpent deity Addir, the ſame as Adorus.

In the orgies of Bacchus, the perſons who partook of the ceremony uſed to carry ſerpents in their hands, and with horrid ſcreams call upon Eva! Eva! Eva, being, according to the writer juſt mentioned, the ſame as epha, or opha, which the Greeks rendered *ophis*, and by it denoted a ſerpent. Theſe ceremonies and this ſymbolic worſhip began among the Magi, who were the ſons of Chus; and by them they were propagated in various parts. Wherever the Amonians founded any places of worſhip, and introduced their rites, there was generally ſome ſtory of a ſerpent. There was a legend about a ſerpent at Colchis, at Thebes, and at Delphi; and likewiſe in other places. The Greeks called Apollo himſelf Python, which is the ſame as Opis, Oupis, and Oub.

In Egypt there was a ſerpent named Thermuthis, which was looked upon as very ſacred; and the natives are ſaid to have made uſe of it as a royal tiara, with which they ornamented the ſtatues of Iſis. The kings of Egypt wore high bonnets, terminating in a round ball, and ſurrounded with figures of aſps; and the prieſts likewiſe had the repreſentation of ſerpents upon their bonnets.

Abadon, or Abaddon, mentioned in the Revelations xx. 2. is ſuppoſed by Mr Bryant to have been the name of the Ophite god, with whoſe worſhip the world had been ſo long infected. This worſhip began among the people of Chaldea, who built the city of Ophis upon the Tigris, and were greatly addicted to divination, and to the worſhip of the ſerpent. From Chaldea the worſhip paſſed into Egypt, where the ſerpent deity was called Canoph, Can-eph, and C'neph. It had alſo the name of Ob or Oub, and was the ſame as the Baſiliſcus or royal ſerpent, the ſame as the Thermuthis, and made uſe of by way of ornament to the ſtatues of their gods. The chief deity of Egypt is ſaid to have been Vulcan, who was ſtyled Opas. He was the ſame as Oſiris, the Sun, and hence was often called Ob-el, or Pytho-ſol, and there were pillars ſacred to him, with curious hieroglyphical inſcriptions bearing the ſame name; whence among the Greeks, who copied from the Egyptians, every thing gradually tapering to a point was ſtyled obelos, or obeliſcus.

As the worſhip of the ſerpent began among the ſons of Chus, Mr Bryant conjectures, that from thence they were denominated Ethiopians and Aithiopians, from Ath-ope or Ath-opes, the god whom they worſhipped, and not from their complexion; the Ethiopes brought theſe rites into Greece, and called the iſland where they firſt eſtabliſhed them, *Ellopia, Solis Serpentis inſula*, the ſame with *Eubœa*, or *Oubaia*, i. e. "the ſerpent iſland."

The same learned writer discovers traces of the serpent worship among the Hyperboreans, at Rhodes, named Ophiusa, in Phrygia, and upon the Hellespont, in the island Cyprus, in Crete, among the Athenians, in the name of Cecrops, among the natives of Thebes in Bœotia, among the Lacedemonians, in Italy, in Syria, &c. and in the names of many places, as well as of the people where the Ophites settled. One of the most early heresies introduced into the Christian church was that of the Ophitæ. Bryant's Analysis of Ancient Mythology, vol. i. p. 43, &c. p. 473, &c.

SERPENT Stones. See *CORNU Ammonis*, and *SNAKE-Stones.*

Sea-SERPENT. See *SEA Serpent.*

SERPENTARIA, SNAKE ROOT; a species of ARISTOLOCHIA. See BOTANY and MATERIA MEDICA *Index*.

SERPENTARIUS, in *Astronomy*, a constellation of the northern hemisphere, called also Ophiuchus, and anciently Æsculapius. The stars in the constellation Serpentarius, in Ptolemy's catalogue, are 29; in Tycho's 15; in Hevelius's 40; in the Britannic catalogue they are 74.

SERPENTINE, in general, denotes any thing that resembles a serpent; hence the worm or pipe of a still, twisted in a spiral manner, is termed a *serpentine worm.*

SERPENTINE Stone, a species of mineral belonging to the magnesian genus. See MINERALOGY *Index*.

SERPENTINE *verses*, are such as begin and end with the same word. As,

Ambo florentes ætatibus, Arcades ambo.

SERPENTINE, in the *Manege.* A horse is said to have a serpentine tongue, if it is always frisking and moving, and sometimes passing over the bit, instead of keeping in the void space, called the liberty of the tongue.

SERPICULA, a genus of plants belonging to the class monœcia. See BOTANY *Index*.

SERPIGO, in *Surgery*, a kind of herpes, popularly called a *tetter* or ringworm. See SURGERY.

SERPULA, a genus belonging to the class of vermes and to the order of testacea. See CONCHOLOGY *Index*.

SERRANUS, JOANNES, or John de Serres, a learned French Protestant, was born about the middle of the 16th century. He acquired the Greek and Latin languages at Lausanne, and devoted himself to the study of the philosophy of Aristotle and Plato. On his return to France he studied divinity. He began to distinguish himself in 1572 by his writings, but was obliged to forsake his country after the dreadful massacre of St Bartholomew. He became minister of Nismes in 1582, but was never regarded as a very zealous Calvinist: he has even been suspected, though without reason, of having actually abjured the Protestant religion. He was one of the four clergymen whom Henry IV. consulted about the Romish religion, and who returned for answer, *that Catholics might be saved.* He wrote afterwards a treatise in order to reconcile the two communions, entitled *De fide Catholica, sive de principiis religionis Christianæ, communi omnium Christianorum consensu, semper et ubique ratis.* This work was disliked by the Catholics, and received with such indignation by the Calvinists of Geneva, that many writers have affirmed that they poisoned the author. It is certain at least that he died at Geneva in 1598, at the age of 50. His principal works are, 1. A Latin translation of Plato, published by Henry Stephens, which owes much of its reputation to the elegance of the Greek copy which accompanies it. 2. A Treatise on the Immortality of the Soul. 3. *De statu religionis et reipublicæ in Francia.* 4. *Memoire de la 3me guerre civile et derniers troubles de France sous Charles IX. &c.* 5. *Inventaire general de l'Histoire de France, illustré par la conference de l'Eglise et de l'Empire, &c.* 6. *Recueil de chose memorable avenue en France sous Henri II. Français II. Charles IX. Henri III.* These three historical treatises have been justly accused of partiality and passion; faults which it is next to impossible for a contemporary writer to avoid, especially if he bore any part in the transactions which he describes. His style is exceedingly incorrect and inelegant; his mistakes too and misstatements of facts are very numerous.

SERRATED, in general, something indented or notched in the manner of a saw; a term much used in the description of the leaves of plants. See BOTANY *Index*.

SERRATULA, SAW-WORT, a genus of plants belonging to the syngenesia class, and in the natural system ranged under the 49th order, *Compositæ*. See BOTANY *Index*.

SERRATUS, in *Anatomy*, a name given to several muscles, from their resemblance to a saw. See ANATOMY, *Table of the Muscles*.

SERRISHTEHDAR, in Bengal, keeper of records or accounts.

SERTORIUS, QUINTUS, an eminent Roman general; (see SPAIN), under the history of which his exploits are related.

SERTULARIA, a genus belonging to the class of vermes, and to the order of zoophyta. See HELMINTHOLOGY *Index*.

SERVAL, MOUNTAIN CAT. See FELIS, MAMMALIA *Index*.

SERVANDONI, JOHN NICOLAS, a celebrated architect, was born at Florence in 1695. He rendered himself famous by his exquisite taste in architecture, and by his genius for decorations, fetes, and building. He was employed and rewarded by most of the princes in Europe. He was honoured in Portugal with the order of Christ: In France he was architect and painter to the king, and member of the different academies established for the advancement of these arts. He received the same titles from the kings of Britain, Spain, Poland, and from the duke of Wirtemberg. Notwithstanding these advantages, his want of economy was so great, that he left nothing behind him. He died at Paris in 1766. Paris is indebted to him for many of its ornaments. He made decorations for the theatres of London and Dresden. The French king's theatre, called *la salle des Machines*, was under his management for some time. He was permitted to exhibit some shows consisting of simple decorations: Some of these were astonishingly sublime; his "Descent of Æneas into Hell" in particular, and his "Enchanted Forest," are well known. He built and embellished a theatre at Chambor for Marefchal Saxe; and furnished the plan and the model of the theatre royal at Dresden. His genius for fetes was remarkable; he had the management of a great number in Paris, and even in London. He conducted one

Servandoni, Servant.

one at Lisbon given an account of a victory gained by the duke of Cumberland. He was employed frequently by the king of Portugal, to whom he presented several elegant plans and models. The prince of Wales, too, father to the present king, engaged him in his service; but the death of that prince prevented the execution of the designs which had been projected. He presided at the magnificent *fete* given at Vienna on account of the marriage of the archduke Joseph and the Infanta of Parma. But it would be endless to attempt an enumeration of all his performances and exhibitions.

SERVANT, a term of relation, signifying a person who owes and pays obedience for a certain time to another in quality of a master.

As to the several sorts of servants: It was observed, under the article LIBERTY, that pure and proper slavery does not, nay cannot, subsist in Britain: such we mean whereby an absolute and unlimited power is given to the master over the life and fortune of the slave. And indeed it is repugnant to reason, and the principles of natural law, that such a state should subsist anywhere. See SLAVERY.

The law of England therefore abhors, and will not endure, the existence of slavery within this nation: so that when an attempt was made to introduce it, by statute 1 Edw. VI. c. 3. which ordained, that all idle vagabonds should be made slaves, and fed upon bread, water, or small drink, and refuse-meat; should wear a ring of iron round their necks, arms, or legs; and should be compelled, by beating, chaining, or otherwise, to perform the work assigned them, were it ever so vile; the spirit of the nation could not brook this condition, even in the most abandoned rogues; and therefore this statute was repealed in two years afterwards. And now it is laid down, that a slave or negro, the instant he lands in Britain, becomes a freeman; that is, the law will protect him in the enjoyment of his person and his property. Yet, with regard to any right which the master may have lawfully acquired to the perpetual service of John or Thomas, this will remain exactly in the same state as before: for this is no more than the same state of subjection for life which every apprentice submits to for the space of seven years, or sometimes for a longer term. Hence, too, it follows, that the infamous and unchristian practice of withholding baptism from negro-servants, lest they should thereby gain their liberty, is totally without foundation, as well as without excuse. The law of England acts upon general and extensive principles: it gives liberty, rightly understood, that is, protection, to a Jew, a Turk, or a Heathen, as well as to those who profess the true religion of Christ; and it will not dissolve a civil obligation between master and servant, on account of the alteration of faith in either of the parties; but the slave is entitled to the same protection in England before as after baptism; and, whatever service the Heathen negro owed of right to his American master, by general, not by local law, the same (whatever it be) is he bound to render when brought to England and made a Christian.

1. The first sort of servants, therefore, acknowledged by the laws of England, are *menial servants*; so called from being *intra mœnia*, or domestics. The contract between them and their masters arises upon the hiring. If the hiring be general, without any particular time limited, the law construes it to be a hiring for a year; upon a principle of natural equity, that the servant shall serve and the master maintain him, throughout all the revolutions of the respective seasons; as well when there is work to be done, as when there is not: but the contract may be made for any larger or smaller term. All single men between 12 years old and 60, and married ones under 30 years of age, and all single women between 12 and 40, not having any visible livelihood, are compellable by two justices to go out to service in husbandry or certain specific trades, for the promotion of honest industry; and no master can put away his servant, or servant leave his master, after being so retained, either before or at the end of his term, without a quarter's warning; unless upon reasonable cause, to be allowed by a justice of the peace; but they may part by consent, or make a special bargain.

2. Another species of servants are called *apprentices*, (from *apprendre*, to learn); and are usually bound for a term of years, by deed indented or indentures, to serve their masters, and be maintained and instructed by them. This is usually done to persons of trade, in order to learn their art and mystery; and sometimes very large sums are given with them as a premium for such their instruction: but it may be done to husbandmen, nay, to gentlemen and others. And children of poor persons may be apprenticed out by the overseers, with consent of two justices, till 24 years of age, to such persons as are thought fitting; who are also compellable to take them: and it is held, that gentlemen of fortune, and clergymen, are equally liable with others to such compulsion: for which purposes our statutes have made the indentures obligatory, even though such parish-apprentice be a minor. Apprentices to trades may be discharged on reasonable cause, either at the request of themselves or masters, at the quarter-sessions, or by one justice, with appeal to the sessions; who may, by the equity of the statute, if they think it reasonable, direct restitution of a rateable share of the money given with the apprentice: and parish-apprentices may be discharged in the same manner by two justices. But if an apprentice, with whom less than 10 pounds hath been given, runs away from his master, he is compellable to serve out his time of absence, or make satisfaction for the same, at any time within seven years after the expiration of his original contract. See APPRENTICE and APPRENTICESHIP.

3. A third species of servants are *labourers*, who are only hired by the day or the week, and do not live *intra mœnia*, as part of the family; concerning whom the statutes before cited have made many very good regulations; 1. Directing that all persons who have no visible effects may be compelled to work; 2. Defining how long they must continue at work in summer and in winter: 3. Punishing such as leave or desert their work: 4. Empowering the justices at sessions, or the sheriff of the county, to settle their wages: and, 5. Inflicting penalties on such as either give or exact more wages than are so settled.

4. There is yet a fourth species of servants, if they may be so called, being rather in a superior, a ministerial, capacity; such as *stewards*, *factors*, and *bailiffs*; whom, however, the law considers as servants *pro tempore*, with regard to such of their acts as affect their master's or employer's property.

As to the manner in which this relation affects the master, the servant himself, or third parties, see the article *MASTER and Servant*.

For the condition of servants by the law of Scotland, see LAW.

SERVETISTS, a name given to the modern Antitrinitarians, from their being supposed to be the followers of Michael Servetus; who, in the year 1553, was burnt at Geneva, together with his books.

SERVETUS, MICHAEL, a learned Spanish physician, was born at Villaneuva, in Arragon, in 1509. He was sent to the university of Toulouse to study the civil law. The Reformation, which had awakened the most polished nations of Europe, directed the attention of thinking men to the errors of the Romish church and to the study of the Scriptures. Among the rest Servetus applied to this study. From the love of novelty, or the love of truth, he carried his inquiries far beyond the other reformers, and not only renounced the false opinions of the Roman Catholics, but went so far as to question the doctrine of the Trinity. Accordingly, after spending two or three years at Toulouse, he determined to go into Germany to propagate his new opinions, where he could do it with most safety. At Basil he had some conferences with Oecolampadius. He went next to Strasburg to visit Bucer and Capito, two eminent reformers of that town. From Strasburg he went to Hugenau, where he printed a book, intitled *De Trinitatis Erroribus*, in 1531. The ensuing year he published two other treatises on the same subject: in an advertisement to which, he informs the reader that it was not his intention to retract any of his former sentiments, but only to state them in a more distinct and accurate manner. To these two publications he had the courage to put his name, not suspecting that in age when liberty of opinion was granted, the exercise of that liberty would be attended with danger. After publishing these books, he left Germany, probably finding his doctrines not so cordially received as he expected. He went first to Basil, and thence to Lyons, where he lived two or three years. He then removed to Paris, where he studied medicine under Sylvius, Fernelius, and other professors, and obtained the degree of master of arts and doctor of medicine. His love of controversy involved him in a serious dispute with the physicians of Paris; and he wrote an Apology, which was suppressed by an edict of the Parliament. The misunderstanding which this dispute produced with his colleagues, and the chagrin which so unfavourable a termination occasioned, made him leave Paris in disgust. He settled two or three years in Lyons, and engaged with the Frellons, eminent printers of that age, as a corrector to their press. At Lyons he met with Pierre Palmier, the archbishop of Vienne, with whom he had been acquainted at Paris. That prelate, who was a great encourager of learned men, pressed him to accompany him to Vienne, offering him at the same time an apartment in his palace. Servetus accepted the offer, and might have lived a tranquil and happy life at Vienne, if he could have confined his attention to medicine and literature. But the love of controversy, and an eagerness to establish his opinions, always possessed him. At this time Calvin was at the head of the reformed church at Geneva. With Servetus he had been acquainted at Paris, and had there opposed his opinions. For 16 years Calvin kept up a correspondence with him, endeavouring to reclaim him from his errors. Servetus had read the works of Calvin, but did not think they merited the high eulogies of the reformers, nor were they sufficient to convince him of his errors. He continued, however, to consult him; and for this purpose sent from Lyons to Geneva three questions, which respected the divinity of Jesus Christ, regeneration, and the necessity of baptism. To these Calvin returned a civil answer. Servetus treated the answer with contempt, and Calvin replied with warmth. From reasoning he had recourse to abusive language; and this produced a polemical hatred, the most implacable disposition in the world. Calvin having obtained some of Servetus's papers, by means, it is said, not very honourable, sent them to Vienne along with the private letters which he had received in the course of their correspondence. The consequence was, that Servetus was arrested; but having escaped from prison, he resolved to retire to Naples, where he hoped to practise medicine with the same reputation which he had so long enjoyed at Vienne. He imprudently took his route through Geneva, though he could not but know that Calvin was his mortal enemy. Calvin informed the magistrates of his arrival; Servetus was apprehended, and appointed to stand trial for heresy and blasphemy. It was a law at Geneva, that every accuser should surrender himself a prisoner, that if the charge should be found false, the accuser should suffer the punishment in which he meant to involve the accused. Calvin not choosing to go to prison himself, sent one of his domestics to present the impeachment against Servetus. The articles brought against him were collected from his writings with great care; an employment which took up three days. One of these articles was, "that Servetus had denied that Judæa was a beautiful, rich, and fertile country; and affirmed, on the authority of travellers, that it was poor, barren, and disagreeable." He was also charged with "corrupting the Latin Bible, which he was employed to correct at Lyons, by introducing impertinent, trifling, whimsical, and impious notes of his own through every page." But the main article, which was certainly fatal to him, was, "that in the person of Mr Calvin, minister of the word of God in the church of Geneva, he had defamed the doctrine that is preached, uttering all imaginable injurious, blasphemous words against it."

Calvin visited Servetus in prison, and had frequent conferences with him: but finding that, in opposition to all the arguments he could employ, the prisoner remained inflexible in his opinions, he left him to his fate. Before sentence was passed, the magistrates of Geneva consulted the ministers of Bale, of Bern, and Zurich; and, as another account informs us, the magistrates of the Protestant Cantons of Swizzerland. And to enable them to form a judgment of the criminality of Servetus, they transmitted the writings of Calvin, with his answers. The general opinion was, that Servetus ought to be condemned to death for blasphemy. He was accordingly sentenced to be burnt alive on the 27th of October 1553. As he continued alive in the midst of the flames more than two hours, it is said, finding his torment thus protracted, he exclaimed, "Unhappy wretch that I am! Will the flames be insufficient to terminate my misery! What then! Will the hundred pieces of gold, and the rich collar which they took from me, Servetus, Service.

me, not purchafe wood enough to confume me more quickly !" "Though the fentence of death was paffed againft Servetus by the magiftrates of Geneva, with the approbation of a great number of the magiftrates and minifters of Switzerland, yet it is the opinion of moft hiftorians that this dreadful fentence was impofed at the inftigation of Calvin. This act of feverity for holding a fpeculative opinion, however erroneous and abfurd, has left a ftain on the character of this illuftrious reformer, which will attend the name of Calvin as long as hiftory fhall preferve it from oblivion. The addrefs and art which he ufed in apprehending Servetus, his inhumanity to him during his trial, his diffimulation and malevolence after his condemnation, prove that he was as much influenced by perfonal hatred as by a defire to fupport the intereft of religion, though probably, during the trial, Calvin believed he was performing a very pious action. This intolerant fpirit of Calvin and the magiftrates of Geneva gave the Roman Catholics a favourable opportunity to accufe the Proteftants of inconfiftency in their principles, which they did not fail to embrace. "How could the magiftrates (fays the author of the *Dictionnaire des Herefies*), who acknowledged no infallible interpretation of the Scriptures, condemn Servetus to death becaufe he explained them differently from Calvin; fince every man has the privilege to expound the Scripture, according to his own judgment, without having recourfe to the church? It is a great injuftice to condemn a man becaufe he will not fubmit to the judgment of an enthufiaft, who may be wrong as well as himfelf."

Servetus was a man of great acutenefs and learning, and well verfed in the arts and fciences. In his own profeffion his genius exerted itfelf with fuccefs. In his tract intitled *Chriftianifmi Reftitutio*, publifhed in 1553, he remarks, that the whole mafs of blood paffes through the lungs by the pulmonary artery and vein, in oppofition to the opinion which was then univerfally entertained, that the blood paffes through the partition which divides the two ventricles. This was an important ftep towards the difcovery of the circulation of the blood.

His works confift of Controverfial Writings concerning the Trinity; an edition of Pagninus's Verfion of the Bible, with a preface and notes, publifhed under the name of Michael Villanevanus; an Apology to the Phyficians of Paris; and a book intitled *Ratio Syruporum*. Mofheim has written in Latin a Hiftory of the Herefy and Misfortunes of Servetus, which was publifhed at Helmftadt, in 4to, in 1728. From the curious details which it gives it is extremely interefting.

SERVIA, a province of Turkey in Europe, bounded on the north by the rivers Danube and Save, which feparate it from Hungary; on the eaft, by Bulgaria; on the weft, by Bofnia: and on the fouth, by Albania and Macedonia. It is about 190 miles in length from eaft to weft; 95 in breadth from north to fouth; and is divided into four fangiacates. Two of thefe were ceded to the Chriftians in 1718, who united them into one. This continued till 1739, when the Turks were victorious; and then they were abandoned to the Turks by the treaty of Belgrade. Belgrade is the capital town.

SERVICE, in *Law*, is a duty which a tenant, on account of his fee, owes to his lord.

There are many divifions of fervices; as, 1. Into perfonal, where fomething is to be done by the tenant in perfon, as homage and fealty. 2. Real, fuch as wards, marriages, &c. 3. Accidental, including heriots, reliefs, and the like. 4. Entire, where, on the alienation of any part of the lands by a tenant, the fervices become multiplied. 5. Frank-fervice, which was performed by freemen, who were not obliged to perform any bafe fervice, but only to find a man and horfe to attend the lord into the army or to court. 6. Knight's fervice, by which lands were anciently held of the king, on paying homage, fervice in war, &c.

As in every free and well regulated fociety there muft be a diverfity of ranks, there muft be a great number of perfons employed in fervice, both in agriculture and domeftic affairs. In this country, fervice is a contract into which the fervant voluntarily enters; and the mafter's authority extends no farther than to the performance of that fpecies of labour for which the agreement was made.

"The treatment of fervants (fays that refpectable moralift Mr Paley), as to diet, difcipline, and accommodation, the kind and quantity of work to be required of them, the intermiffion, liberty, and indulgence to be allowed them, muft be determined in a great meafure by cuftom; for where the contract involves fo many particulars, the contracting parties expref a few perhaps of the principal, and by mutual underftanding refer the reft to the known cuftom of the country in like cafes.

Paley's Moral and Political Philofophy, p. 139.

"A fervant is not bound to obey the unlawful commands of his mafter; to minifter, for inftance, to his unlawful pleafures; or to affift him in unlawful practices in his profeffion; as in fmuggling or adulterating the articles which he deals in. For the fervant is bound by nothing but his own promife; and the obligation of a promife extends not to things unlawful.

"For the fame reafon, the mafter's authority does not juftify the fervant in doing wrong; for the fervant's own promife, upon which that authority is founded, would be none.

"Clerks and apprentices ought to be employed entirely in the profeffion or trade which they are intended to learn. Inftruction is their wages; and to deprive them of the opportunities of inftruction, by taking up their time with occupations foreign to their bufinefs, is to defraud them of their wages.

"The mafter is refponfible for what a fervant does in the ordinary courfe of his employment; for it is done under a general authority committed to him, which is in juftice equivalent to a fpecific direction. Thus, if I pay money to a banker's clerk, the banker is accountable: but not if I had paid it to his butler or his footman, whofe bufinefs it is not to receive money. Upon the fame principle, if I once fend a fervant to take up goods upon credit, whatever goods he afterwards takes up at the fame fhop, fo long as he continues in my fervice, are juftly chargeable to my account.

"The law of this country goes great lengths in intending a kind of concurrence in the mafter, fo as to charge him with the confequences of his fervants conduct. If an innkeeper's fervant rob his guefts, the innkeeper muft make reftitution; if a farrier's fervant lame your horfe, the farrier muft anfwer for the damage;

Service. mage; and still farther, if your coachman or carter drive over a passenger in the road, the passenger may recover from you a satisfaction for the hurt he suffers. But these determinations stand, I think, rather upon the authority of the law, than any principle of natural justice."

There is a grievance which has long and justly been complained of, the giving of good characters to bad servants. This is perhaps owing to carelessness, to a desire of getting rid of a bad servant, or to mistaken compassion. But such carelessness is inexcusable. When a man gives his sanction to the character of a bad servant, he ought to reflect on the nature and consequences of what he is doing. He is giving his name to a falsehood; he is deceiving the honest man who confides in his veracity; and he is deliberately giving a knave an opportunity of cheating an honest man. To endeavour to get quit of a bad servant in this way, is surely not less criminal than concealing the faults and disadvantages of an estate which is advertised for sale, and ascribing to it advantages which it does not possess. In this case, we know the sale would be reduced, and the advertiser disgraced. Many masters give characters to servants out of compassion; but it is to this mistaken compassion that the disorderly behaviour of servants is perhaps principally owing: for if the punishment of dishonesty be only a change of place (which may be a reward instead of a punishment), it ceases to be a servant's interest to be true to his trust.

We have said above that a master's authority over his servant extends no farther than the terms of contract; by which we meant, that a master could give no unreasonable orders to his servant, or such as was inconsistent with the terms of contract. But the relation between a master and servant is certainly closer than the mere terms of a contract: it is a moral as well as a legal relation. A master of a family ought to superintend the morals of his servants, and to restrain them from vices. This he may do by his example, by his influence, and authority. Indeed every man possessed of authority is guilty of criminal negligence if he does not exert his authority for promoting virtue in his inferiors; and no authority is so well adapted for this purpose as that of masters of families, because none operates with an influence so immediate and constant. It is wonderful how much good a nobleman or gentleman of fortune can do to his domestics by attending to their morals; and every master may be a blessing to individuals and to society, by exerting prudently that influence which his situation gives him over the conduct of his servant.

Choral SERVICE, in church-history, denotes that part of religious worship which consists in chanting and singing. The advocates for the high antiquity of singing, as a part of church-music, urge the authority of St Paul in its favour (Ephes. chap. v. ver. 19. and Colos. chap. iii. ver. 16.). On the authority of which passages it is asserted, that songs and hymns were, from the establishment of the church, sung in the assemblies of the faithful; and it appears from undoubted testimony, that singing, which was practised as a sacred rite among the Egyptians and Hebrews, at a very early period, and which likewise constituted a considerable part of the religious ceremonies of the Greeks and Romans, made a part of the religious worship of Christians, not only before churches were built, and their religion established by law, but from the first profession of Christianity. However, the era from whence others have dated the introduction of music into the service of the church, is that period during which Leontius governed the church of Antioch, *i. e.* between the year of Christ 347 and 356. See ANTIPHONY.

From Antioch the practice soon spread through the other churches of the East; and in a few ages after its first introduction into divine service, it not only received the sanction of public authority, but those were forbid to join in it who were ignorant of music. A canon to this purpose was made by the council of Laodicea, which was held about the year 372; and Zonanas informs us, that these canonical singers were reckoned a part of the clergy. Singing was introduced into the western churches by St Ambrose about the year 374, who was the institutor of the Ambrosian chant established at Milan about the year 386; and Eusebius (lib. ii. cap. 17.) tells us, that a regular choir, and method of singing the service, were first established, and hymns used, in the church at Antioch, during the reign of Constantine, and that St Ambrose, who had long resided there, had his melodies thence. This was about 230 years afterwards amended by Pope Gregory the Great, who established the Gregorian chant; a plain, unisonous kind of melody, which he thought consistent with the gravity and dignity of the service to which it was to be applied. This prevails in the Roman church even at this day: it is known in Italy by the name of *canto fermo;* in France by that of *plain chant;* and in Germany and most other countries by that of the *cantus Gregorianus*. Although no satisfactory account has been given of the specific difference between the Ambrosian and Gregorian chants, yet all writers on this subject agree in saying, that St Ambrose only used the four authentic modes, and that the four plagal were afterwards added by St Gregory. Each of these had the same final, or key-note, as its relative authentic; from which there is no other difference, than that the melodies in the four authentic or principal modes are generally confined within the compass of the eight notes above the key-note, and those in the four plagal or relative modes, within the compass of eight notes below the fifth of the key. See MODE

Ecclesiastical writers seem unanimous in allowing that Pope Gregory, who began his pontificate in 590, collected the musical fragments of such ancient psalms and hymns as the first fathers of the church had approved and recommended to the first Christians; and that he selected, methodized, and arranged them in the order which was long continued at Rome, and soon adopted by the chief part of the western church. Gregory is also said to have banished from the church the *canto figurato*, as too light and dissolute; and it is added, that his own chant was called *canto fermo*, from its gravity and simplicity.

It has been long a received opinion, that the ecclesiastical tones were taken from the reformed modes of Ptolemy; but Dr Burney observes, that it is difficult to discover any connection between them, except in their names; for their number, upon examination, is not the same: those of Ptolemy being seven, the ecclesiastical eight; and indeed the Greek names given to the

Service. the ecclesiastical modes do not agree with those of Ptolemy in the single instance of key, but with those of higher antiquity. From the time of Gregory to that of Guido, there was no other distinction of keys than that of authentic and plagal; nor were any semitones used but those from E to F, B to C, and occasionally A to B *b*.

With respect to the music of the primitive church, it may be observed, that though it consisted in the singing of psalms and hymns, yet it was performed in many different ways; sometimes the psalms were sung by one person alone, whilst the rest attended in silence; sometimes they were sung by the whole assembly; sometimes alternately, the congregation being divided into separate choirs; and sometimes by one person, who repeated the first part of the verse, the rest joining in the close of it. Of the four different methods of singing now recited, the second and third were properly distinguished by the names of *symphony* and *antiphony;* and the latter was sometimes called *responsaria*, in which women were allowed to join. St Ignatius, who, according to Socrates (lib. vi. cap. 8.), conversed with the apostles, is generally supposed to have been the first who suggested to the primitive Christians in the East the method of singing hymns and psalms alternately, or in dialogues; and the custom soon prevailed in every place where Christianity was established; though Theodoret in his history (lib. ii. cap. 24.) tells us, that this manner of singing was first practised at Antioch. It likewise appears, that almost from the time when music was first introduced into the service of the church, it was of two kinds, and consisted in a gentle inflection of the voice, which they termed plain song, and a more elaborate and artificial kind of music, adapted to the hymns and solemn offices contained in its ritual; and this distinction has been maintained even to the present day.

Although we find a very early distinction made between the manner of singing the hymns and chanting the psalms, it is, however, the opinion of the learned Martini, that the music of the first five or six ages of the church consisted chiefly in a plain and simple chant of unisons and octaves, of which many fragments are still remaining in the *canto fermo* of the Romish missals. For with respect to music in parts, as it does not appear, in these early ages, that either the Greeks or Romans were in possession of harmony or counterpoint, which has been generally ascribed to Guido, a monk of Arezzo in Tuscany, about the year 1022, though others have traced the origin of it to the eighth century, it is in vain to seek it in the church. The choral music, which had its rise in the church of Antioch, and from thence spread through Greece, Italy, France, Spain, and Germany, was brought into Britain by the singers who accompanied Austin the monk, when be came over, in the year 596, charged with a commission to convert the inhabitants of this country to Christianity. Bede tells us, that when Austin and the companions of his mission had their first audience of King Ethelbert, in the isle of Thanet, they approached him in procession, singing litanies; and that afterwards, when they entered the city of Canterbury, they sung a litany, and at the end of it Allelujah. But though this was the first time the Anglo-Saxons had heard the Gregorian chant, yet Bede likewise tells us, that our British ancestors had been instructed in the rites and ceremonies of the Gallican church by St Germanus, and heard him sing Allelujah many years before the arrival of St Austin. In 680, John, præcentor of St Peter's in Rome, was sent over by Pope Agatho to instruct the monks of Weremouth in the art of singing; and he was prevailed upon to open schools for teaching music in other places in Northumberland. Benedict Biscop, the preceptor of Bede, Adrian the monk, and many others, contributed to disseminate the knowledge of the Roman chant. At length the successors of St Gregory, and of Austin his missionary, having established a school for ecclesiastical music at Canterbury, the rest of the island was furnished with masters from that seminary. The choral service was first introduced in the cathedral church of Canterbury; and till the arrival of Theodore, and his settlement in that see, the practice of it seems to have been confined to the churches of Kent; but after that, it spread over the whole kingdom; and we meet with records of very ample endowments for the support of this part of public worship. This mode of religious worship prevailed in all the European churches till the time of the Reformation: the first deviation from it is that which followed the Reformation by Luther, who, being himself a lover of music, formed a liturgy, which was a musical service, contained in a work entitled *Psalmodia*, h. e. *Cantica sacra Veteris Ecclesiæ selecta*, printed at Norimberg in 1553, and at Wittemberg in 1561. But Calvin, in his establishment of a church at Geneva, reduced the whole of divine service to prayer, preaching, and singing; the latter of which he restrained. He excluded the offices of the antiphon, hymn, and motet, of the Romish service, with that artificial and elaborate music to which they were sung; and adopted only that plain metrical psalmody, which is now in general use among the reformed churches, and in the parochial churches of our own country. For this purpose he made use of Marot's version of the Psalms, and employed a musician to set them to easy tunes only of one part. In 1553, he divided the Psalms into pauses or small portions, and appointed them to be sung in churches. Soon after they were bound up with the Geneva catechism; from which time the Catholics, who had been accustomed to sing them, were forbid the use of them, under a severe penalty. Soon after the Reformation commenced in England, complaints were made by many of the dignified clergy and others of the intricacy and difficulty of the church-music of those times: in consequence of which it was once proposed, that organs and curious singing should be removed from our churches. Latimer, in his diocese of Worcester, went still farther, and issued injunctions to the prior and convent of St Mary, forbidding in their service all manner of singing. In the reign of Edward VI. a commission was granted to eight bishops, eight divines, eight civilians, and eight common lawyers, to compile a body of such ecclesiastical laws as should in future be observed throughout the realm. The result of this compilation was a work first published in 1571 by Fox the martyrologist, and afterwards in 1640, under the title of *Reformatio Legum Ecclesiasticarum.* These 32 commissioners, instead of reprobating church-music, merely condemned figurative and operose music, or that kind of singing which abounded with fugues, responsive passages, and a commixture of various and intricate proportions; which, whether extemporary or written, is by musicians termed *descant*. However,

ever, notwithstanding the objections against choral music, and the practice of some of the reformed churches, the compilers of the English liturgy in 1548, and the king himself, determined to retain musical service. Accordingly the statute 2 & 3 Edw. VI. cap. 1. though it contains no formal obligation on the clergy, or others, to use or join in either vocal or instrumental music in the common prayer, does clearly recognise the practice of singing; and in less than two years after the compiling of King Edward's liturgy, a formula was composed, which continues, with scarce any variation, to be the rule for choral service even at this day. The author of this work was John Marbecke, or Marbeike; and it was printed by Richard Grafton, in 1550 under the title of the Book of Common Prayer, noted. Queen Mary laboured to re-establish the Romish choral service; but the accession of Elizabeth was followed by the act of uniformity; in consequence of which, and of the queen's injunctions, the Book of Common Prayer, noted by Marbecke, was considered as the general formula of choral service. In 1560, another musical service, with some additions and improvements, was printed by John Day; and in 1565, another collection of offices, with musical notes. Many objections were urged by Cartwright and other Puritans against the form and manner of cathedral service, to which Hooker replied in his Ecclesiastical Polity. In 1664, the statutes of Edward VI. and Elizabeth, for uniformity in the Common Prayer, were repealed; and the Directory for Public Worship, which allows only of the singing of psalms, established. But upon the restoration of Charles II. choral service was again revived, and has since uniformly continued. See on this subject Hawkins's History of Music, vol. i. p. 404. vol. ii. p. 264. vol. iii. p. 58—468, &c. vol. iv. p. 44—347.

SERVICE-Tree. See SORBUS, BOTANY *Index*.

SERVITES, a religious order in the church of Rome, founded about the year 1233, by seven Florentine merchants, who, with the approbation of the bishop of Florence, renounced the world, and lived together in a religious community on Mount Senar, two leagues from that city.

SERVITOR, in the university of Oxford, a student who attends on another for his maintenance and learning. See SIZAR.

SERVITUDE, the condition of a servant, or rather slave.

Under the declension of the Roman empire, a new kind of servitude was introduced, different from that of the ancient Romans: it consisted in leaving the lands of subjugated nations to the first owners, upon condition of certain rents, and servile offices, to be paid in acknowledgement. Hence the names of *servi censiti, ascriptitii*, and *addicti glebæ*; some whereof were taxable at the reasonable discretion of the lord; others at a certain rate agreed on; and others were mainmortable, who, having no legitimate children, could not make a will to above the value of five pence, the lord being heir of all the rest; and others were prohibited marrying, or going to live out of the lordship. Most of these services existed lately in France; but they were long ago abolished in England. Such, however, was the original of our tenures, &c. See SLAVE.

SERVITUDE, in *Scots Law*. See LAW, Part III. Sect. ix.

SERVIUS, MAURUS HONORATUS, a celebrated grammarian and critic of antiquity, who flourished about the time of Arcadius and Honorius; now chiefly known by his Commentaries on Virgil. There is also extant a piece of Servius upon the feet of verses and the quantity of syllables, called *Centimetrum*.

SERUM, a thin, transparent, saltish liquor, which makes a considerable part of the mass of blood. See ANATOMY and CHEMISTRY *Index*.

SESAMOIDEA OSSA, certain small bones some what resembling the seeds of sesamum, whence their name. They are placed at the under part of the bones of the last joints of the fingers and toes.

SESAMUM, OILY GRAIN; a genus of plants belonging to the class didynamia; and in the natural system ranging under the 20th order, *Luridæ*. See BOTANY *Index*.

SESELI, MEADOW SAXIFRAGE; a genus of plants belonging to the class pentandria; and in the natural system ranging under the 45th order, *Umbellatæ*. See BOTANY *Index*.

SESOSTRIS, king of Egypt. See EGYPT, p. 591.

SESQUI, a Latin particle, signifying a whole and a half; which, joined with *altera, terza, quarta*, &c. is much used in the Italian music to express a kind of ratios, particularly several species of triples.

SESQUI-Alterate, in *Geometry* and *Arithmetic*, is a ratio between two lines, two numbers, or the like, where one of them contains the other once, with the addition of a half.

Thus 6 and 9 are in a sesqui-alterate ratio; since 9 contains 6 once, and 3, which is half of 6, over; and 20 and 30 are in the same; as 30 contains 20, and half 20 or 10.

SESQUI-Duplicate ratio, is when of two terms the greater contains the less twice, and half the less remains; as 15 and 6; 50 and 20.

SESQUI-Tertional proportion, is when any number or quantity contains another once and one third.

SESSILE, among botanists. See BOTANY.

SESSION, in general, denotes each sitting or assembly of a council, &c.

SESSION of Parliament, is the season or space from its meeting to its prorogation. See PARLIAMENT.

Kirk-SESSION, the name of a petty ecclesiastical court in Scotland. See *KIRK-Session*.

SESSIONS for weights and measures. In London, four justices from among the mayor, recorder, and aldermen (of whom the mayor and recorder is to be one), may hold a session to inquire into the offences of selling by false weights and measures, contrary to the statutes; and to receive indictments, punish offenders, &c. Char. King Charles I.

Court of SESSION. See LAW, Part III. Sect ii.

Court of Quarter-SESSIONS, an English court that must be held in every county once in every quarter of a year; which, by statute 2 Henry V. c. 4. is appointed to be in the first week after Michaelmas-day, the first week after the epiphany, the first week after the close of Easter, and in the week after the translation of St Thomas the martyr, or the 7th of July. It is held before two or more justices of the peace, one of which must be of the quorum. The jurisdiction of this court, by 34 Edward III. c. 1. extends to the trying and determining all felonies and trespasses whatsoever: though they seldom,

dom, if ever, try any greater offence than fmall felonies within the benefit of clergy; their commiffion providing, that if any cafe of difficulty arifes, they fhall not proceed to judgement, but in the prefence of one of the juftices of the courts of king's bench or common-pleas, or one of the judges of affize: and therefore murders, and other capital felonies, are ufually remitted for a more folemn trial to the affizes. They cannot alfo try any new-created offence, without exprefs power given them by the ftatute which creates it. But there are many offences and particular matters which, by particular ftatutes, belong properly to this jurifdiction, and ought to be profecuted in this court; as, the fmaller mifdemeanors againft the public or commonwealth, not amounting to felony; and efpecially offences relating to the game, highways, alehoufes, baftard children, the fettlement and provifion for the poor, vagrants, fervants wages, and Popifh recufants. Some of thefe are proceeded upon by indictment: others in a fummary way, by motion, and order thereupon; which order may for the moft part, unlefs guarded againft by particular ftatutes, be removed into the court of king's-bench by writ of *certiorari facias*, and be there either quafhed or confirmed. The records or rolls of the feffions are committed to the cuftody of a fpecial officer, denominated *cuftos rotulorum*, who is always a juftice of the quorum; and among them of the quorum (faith Lambard) a man for the moft part efpecially picked out, either for wifdom, countenance, or credit. The nomination of the *cuftos rotulorum* (who is the principal officer in the county, as the lord-lieutenant is chief in military command) is by the king's fign manual: and to him the nomination of the clerk of the peace belongs; which office he is exprefsly forbidden to fell for money.

In moft corporation-towns there are quarter-feffions kept before juftices of their own, within their refpective limits; which have exactly the fame authority as the general quarter-feffions of the county, except in a very few inftances; one of the moft confiderable of which is the matter of appeals from orders of removal of the poor, which, though they be from the orders of corporation-juftices, muft be to the feffions of the county, by ftatute 8 and 9 William III. c. 30. In both corporations and counties at large, there is fometimes kept a fpecial or petty feffion, by a few juftices, for difpatching fmaller bufinefs in the neighbourhood between the times of the general feffions; as for licenfing alehoufes, paffing the account of parifh-officers, and the like.

SESTERCE, SESTERTIUS, a filver coin, in ufe among the ancient Romans, called alfo fimply *nummus*, and fometimes *nummus feftertius*. The feftertius was the fourth part of the denarius, and originally contained two affes and a half. It was at firft denoted by LLS; the two L's fignifying two libræ, and the S half. But the librarii, afterwards converting the two L's into an H, expreffed the feftertius by HS. The word *feftertius* was firft introduced by way of abbreviation for *femiftertius*, which fignifies two, and a half of a third, or, literally, only half a third; for in expreffing half a third, it was underftood that there were two before.

Some authors make two kinds of fefterces; the lefs called *feftertius*, in the mafculine gender; and the great one, called *feftertium*, in the neuter: the firft, that we have already defcribed; the latter containing a thoufand of the other. Others will have any fuch diftinction of great and little fefterces unknown to the Romans: *feftertius*, fay they, was an adjective, and fignified *as feftertius*, or two affes and a half; and when ufed in the plural, as in *quinquaginta feftertium*, or *feftertia*, it was only by way of abbreviation, and there was always underftood *centena, millia*, &c.

This matter has been accurately ftated by Mr Raper, in the following manner. The fubftantive to which feftertius referred is either *as*, or *pondus*; and *feftertius as* is two affes and a half; *feftertium pondus*, two pondera and a half, or two hundred and fifty denarii. When the denarius paffed for ten affes, the feftertius of two affes and a half was a quarter of it; and the Romans continued to keep their accounts in thefe fefterces long after the denarius paffed for fixteen affes; till, growing rich, they found it more convenient to reckon by quarters of the denarius, which they called *nummi*, and ufed the words *nummus* and *feftertius* indifferently, as fynonymous terms, and fometimes both together, as *feftertius nummus*; in which cafe the word *feftertius*, having loft its original fignification, was ufed as a fubftantive; for *feftertius nummus* was not two nummi and a half, but a fingle nummus of four affes. They called any fum under two thoufand fefterces fo many *feftertii* in the mafculine gender; two thoufand fefterces they called *duo* or *bina feftertia*, in the neuter; fo many quarters making five hundred denarii, which was twice the feftertium; and they faid *dena, vicena*, &c. *feftertia*, till the fum amounted to a thoufand feftertia, which was a million of fefterces. But, to avoid ambiguity, they did not ufe the neuter *feftertium* in the fingular number, when the whole fum amounted to no more than a thoufand fefterces, or one feftertium. They called a million of fefterces *decies nummûm*, or *decies feftertiûm*, for *decies centena millia nummorum*, or *feftertiorum* (in the mafculine gender), omitting *centena millia* for the fake of brevity. They likewife called the fame fum *decies feftertium* (in the neuter gender) for *decies centies feftertium*, omitting *centies* for the fame reafon; or fimply *decies*, omitting *centena millia feftertiûm*, or *centies feftertium*; and with the numeral adverbs *decies, vicies, centies, millies*, and the like, either *centena millia* or *centies* was always underftood. Thefe were their moft ufual forms of expreffion; though for *bina, dena, vicena feftertia*, they frequently faid *bina, dena, vicena millia nummûm*. If the confular denarius contained 60 troy grains of fine filver, it was worth fomewhat more than eight-pence farthing and a half fterling; and the as, of 16 to the denarius, a little more than a half-penny. To reduce the ancient fefterces of two affes and a half, when the denarius paffed for 16, to pounds fterling, multiply the given number by 5454, and cut off fix figures on the right hand for decimals. To reduce *nummi feftertii*, or quarters of the denarius, to pounds fterling; if the given fum be confular money, multiply it by 8727, and cut off fix figures on the right hand for decimals; but for imperial money diminifh the faid product by one-eighth of itfelf. Phil. Tranf. vol. lxi. part ii. art. 48.

To be qualified for a Roman knight, an eftate of 400,000 *fefterces* was required; and for a fenator, of 800,000.

Authors alfo mention a copper *fefterce*, worth about one-third of a penny Englifh.

SESTERCE, or *feftertius*, was alfo ufed by the ancients for a thing containing two wholes and an half of another, as *as* was taken for any whole or integer.

SESTOS, a noted fortrefs of European Turkey, fituated at the entrance of the Hellefpont or Dardanelles, 24 miles fouth-weft of Gallipoli. This place is famous for the loves of HERO and LEANDER, fung by the poet Mufæus.

SESUVIUM, a genus of plants belonging to the clafs icofandria. See BOTANY *Index*.

SET, or SETS, a term ufed by the farmers and gardeners to exprefs the young plants of the white thorn and other fhrubs, with which they ufe to raife their quick or quick-fet hedges. The white thorn is the beft of all trees for this purpofe; and, under proper regulations, its fets feldom fail of anfwering the farmer's utmoft expectations.

SET-off, in *Law*, is an act whereby the defendant acknowledges the juftice of the plaintiff's demand on the one hand; but, on the other, fets up a demand of his own, to counterbalance that of the plaintiff, either in the whole, or in part: as, if the plaintiff fues for 10l. due on a note of hand, the defendant may fet off 9l. due to himfelf for merchandife fold to the plaintiff; and, in cafe he pleads fuch fet-off, muft pay the remaining balance into court. This anfwers very nearly to the *compenfatio* or ftoppage of the civil law, and depends upon the ftatutes 2 Geo. II. cap. 22. and 8 Geo. II. cap. 24.

SETACEOUS WORM, in *Natural Hiftory*, a name given by Dr Lifter to that long and flender waterworm, which fo much refembles a horfe-hair, that it has been fuppofed by the vulgar to be an animated hair of that creature. Thefe creatures, fuppofed to be living hairs, are a peculiar fort of infects, which are bred and nourifhed within the bodies of other infects, as the worms of the ichneumon flies are in the bodies of the caterpillars.

Aldrovand defcribes the creature, and tells us it was unknown to the ancients; but called *feta aquatica*, and *vermis fetarius*, by the moderns, either from its figure refembling that of a hair, or from the fuppofition of its once having been the hair of fome animal. We generally fuppofe it, in the imaginary ftate of the hair, to have belonged to a horfe; but the Germans fay it was once the hair of a calf, and call it by a name fignifying *vitulus aquaticus*, or the "water calf."

Albertus, an author much reverenced by the common people, has declared that this animal is generated of a hair; and adds, that any hair thrown into ftanding water, will, in a very little time, obtain life and motion. Other authors have diffented from this opinion, and fuppofed them generated of the fibrous roots of waterplants; and others, of the parts of grafshoppers fallen into the water. This laft opinion is rejected by Aldrovand as the moft improbable of all. Standing and foul waters are moft plentifully ftored with them; but they are fometimes found in the cleareft and pureft fprings, and fometimes out of the water, on the leaves of trees and plants, as on the fruit-trees in our gardens, and the elms in hedges. They are from three to five inches long, of the thicknefs of a large hair; and are brown upon the back, and white under the belly, and the tail is white on every part.

SETH, the third fon of Adam, the father of Enos, was born 3874 B. C. and lived 912 years.

SETHIANS, in church hiftory, Chriftian heretics; fo called becaufe they paid divine worfhip to Seth, whom they looked upon to be Jefus Chrift the fon of God, but who was made by a third divinity, and fubftituted in the room of the two families of Abel and Cain, which had been deftroyed by the deluge. Thefe heretics appeared in Egypt in the fecond century; and as they were addicted to all forts of debauchery, they did not want followers; and continued in Egypt above 200 years.

SETIMO, a town of Italy, in the province of Piedmont, fituated on the river Po, eight miles north of Turin.

SETON, in *Surgery*, a few horfe hairs, fmall threads, or large packthread, drawn through the fkin, chiefly the neck, by means of a large needle or probe, with a view to reftore or preferve health.

Experience fhews that fetons are ufeful in catarrhs, inflammations, and other diforders, and particularly thofe of the eyes; to thefe may be added fevere headachs, with ftupor, drowfinefs, epilepfies, and even apoplexy itfelf. See SURGERY.

SETTEE, in fea-language, a veffel very common in the Mediterranean with one deck and a very long and fharp prow. They carry fome two mafts, fome three, without top-mafts. They have generally two mafts, equipped with triangular fails, commonly called *lateen fails*. The leaft of them are of 60 tons burden. They ferve to tranfport cannon and provifions for fhips of war and the like. Thefe veffels are peculiar to the Mediterranean fea, and are ufually navigated by Italians, Greeks, or Mahometans.

SETTING, in *Aftronomy*, the withdrawing of a ftar or planet, or its finking below the horizon. Aftronomers and poets make three different kinds of fetting of the ftars, viz. the COSMICAL, ACRONYCAL, and HELIACAL. See thefe articles.

SETTING, in the fea language. To fet the land or the fun by the compafs, is to obferve how the land bears on any point of the compafs, or on what point of the compafs the fun is. Alfo when two fhips fail in fight of one another, to mark on what point the chafed bears, is termed *fetting the chace by the compafs*.

SETTING, among fportfmen, a term ufed to exprefs the manner of taking partridges by means of a dog peculiarly trained to that purpofe. See SHOOTING.

ACT OF SETTLEMENT, in Britifh hiftory, a name given to the ftatute 12 and 13 Will. III. cap. 2. whereby the crown was limited to his prefent majefty's illuftrious houfe; and fome new provifions were added, at the fame fortunate era, for better fecuring our religion, laws, and liberties: which the ftatute declares to be the birthright of the people of England, according to the ancient doctrine of the common law.

SEVEN STARS, a common denomination given to the clufter of ftars in the neck of the fign Taurus, the bull; properly called the *Pleiades*. They are fo called from their number feven, which appear to the naked eye, though fome eyes can difcover only fix of them; but by the aid of telefcopes there appears to be a great multitude of them.

SEVENTH, in *Mufic*, an interval called by the Greeks *heptachordon*. See INTERVAL.

SEVERANCE, in *Law*, the fingling or fevering two or more that join or are joined in the fame writ or action.

Severance ‖ Severn.

tion. As if two join in a writ, *de libertate probanda*, and the one be afterwards nonsuited; here severance is permitted, so as notwithstanding the nonsuit of the one, the other may severally proceed.

There is also severance of the tenants in assize; when one, two, or more disseisees appear upon the writ, and not the other. And severance in debt, where two executors are named plaintiffs, and the one refuses to prosecute. We also meet with severance of summons, severance in attaints, &c. An estate in joint tenancy may be severed and destroyed by destroying any of its unities. 1. That of time, which respects only the original commencement of the joint estate, cannot indeed (being now part) be affected by any subsequent transaction. But, 2. The joint-tenants estate may be destroyed without any alienation, by merely disuniting their possession. 3. The jointure may be destroyed, by destroying the unity of title. And, 4. By destroying the unity of interest.

SEVERIA, a province of the Russian empire, with the title of a duchy, bounded on the north by Smolensko and Muscovy, on the east by Vorotinsbi and the country of the Cossacks, on the south by the same, and on the west by Zernegovia. It is a country overrun with woods, and on the south part is a forest of great length. Novogrodec, or Novogorod, is the capital town.

St SEVERINA, a town of Italy, in the kingdom of Naples, and in Lower Calabria, with an archbishop's see. It is very well fortified, and seated on a craggy rock, on the river Neeto; in E. Long. 17. 14. N. Lat. 39. 15.

SEVERINO, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a bishop's see. It has fine vineyards, and is seated between two hills on the river Petenza, in E. Long. 13. 6. N. Lat. 43. 16.

SEVERN, a river of England which rises near Plimlimmon Hill in Montgomeryshire, and before it enters Shropshire receives about 30 streams, and passes down to Laudring, where it receives the Morda, that flows from Oswestry. When it arrives at Monford, it receives the river Mon, passing on to Shrewsbury, which it almost surrounds, then to Bridgeworth; afterwards it runs through the skirts of Staffordshire, enters Worcestershire, and passes by Worcester; then it runs to Tewkesbury, where it joins the Avon, and from thence to Gloucester, keeping a north-westerly course, till it falls into the Bristol Channel. It begins to be navigable for boats at Welchpool, in Montgomeryshire, and takes in several other rivers in its course, besides those already mentioned, and *is the second in England*. By the late inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Derwent, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. A canal from Stroud-Water, a branch of the Severn, to join the Thames, was projected and executed for the purpose of conveying a tunnel 16 feet high and 16 feet wide, under Sapperton Hill and Hayley-Wood (very high ground), for two miles and a quarter in length, through a very hard rock, which was lined and arched with brick. This stupendous undertaking was completed, and boats passed through it the

Lucombe's English Gazetteer.

21st of May 1789. By this opening, a communication is made between the river Severn at Framiload and the Thames near Lechlade, and will be continued over the Thames near Inglesham, into deep water in the Thames below St John-Bridge, and so to Oxford, &c. and London, for conveyance of coals, goods, &c. It is now navigable from the Severn to Themsford, by way of Stroud, Cirencester, Cricklade, &c. being filled with water for that purpose near 40 miles.

Severn, Severus.

SEVERUS, Cornelius, an ancient Latin poet of the Augustan age; whose *Ætna*, together with a fragment *De morte Ciceronis*, were published, with notes and a prose interpretation, by Le Clerc, 12mo, Amsterdam, 1703. They were before inserted among the *Catalecta Virgilii* published by Scaliger; whose notes, with others, Le Clerc has received among his own.

Severus, *Septimus*, a Roman emperor, who has been so much admired for his military talents, that some have called him the most warlike of the Roman emperors. As a monarch he was cruel, and it has been observed that he never did an act of humanity or forgave a fault. In his diet he was temperate, and he always showed himself an open enemy to pomp and splendor. He loved the appellation of a man of letters, and he even composed an history of his own reign, which some have praised for its correctness and veracity. However cruel Severus may appear in his punishments and in his revenge, many have endeavoured to exculpate him, and observed that there was need of severity in an empire where the morals were so corrupted, and where no less than 3000 persons were accused of adultery during the space of 17 years. Of him, as of Augustus, some were disposed to say, that it would have been better for the world if he had never been born, or had never died. See Rome, N° 372.

Severus's Wall, in British topography, the fourth and last barrier erected by the Romans against the incursions of the North Britons. See the articles Adrian, and *Antoninus's Wall*.

We learn from several hints in the Roman historians, that the country between the walls of Hadrian and Antoninus continued to be a scene of perpetual war and subject of contention between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimius Severus in Britain, A.D. 206. This last emperor having subdued the Mæatæ, and repulsed the Caledonians, determined to erect a stronger and more impenetrable barrier than any of the former, against their future incursions.

Though neither Dio nor Herodian make any mention of a wall built by Severus in Britain for the protection of the Roman province, yet we have abundant evidence from other writers of equal authority, that he really built such a wall. "He fortified Britain (says Spartian) with a wall drawn cross the island from sea to sea; which is the greatest glory of his reign. After the wall was finished, he retired to the next station (York), not only a conqueror, but the founder of an eternal peace." To the same purpose, Aurelius Victor and Orosius, to say nothing of Eutropius and Cassiodorus: "Having repelled the enemy in Britain, he fortified the country, which was suited to that purpose, with a wall drawn cross the island from sea to sea."—"Severus drew a great ditch, and built a strong wall, fortified

fortified with several turrets, from sea to sea, to protect that part of the island which he had recovered from the yet unconquered nations." As the residence of the emperor Severus in Britain was not quite four years, it is probable that the two last of them were employed in building this wall; according to which account, it was begun A. D. 209, and finished A. D. 211.

This wall of Severus was built nearly on the same tract with Hadrian's rampart, at the distance only of a few paces north. The length of this wall, from Cousin's house near the mouth of the river Tyne on the east, to Boulness on the Solway frith on the west, hath been found, from two actual mensurations, to be a little more than 68 English miles, and a little less than 74 Roman miles. To the north of the wall was a broad and deep ditch, the original dimensions of which cannot now be ascertained, only it seems to have been larger than that of Hadrian. The wall itself, which stood on the south brink of the ditch, was built of freestone, and where the foundation was not good, it is built on piles of oak; the interstices between the two faces of this wall is filled with broad thin stones, placed not perpendicularly, but obliquely on their edges; the running mortar or cement was then poured upon them, which, by its great strength and tenacity, bound the whole together, and made it firm as a rock. But though these materials are sufficiently known, it is not easy to guess where they were procured, for many parts of the wall are at a great distance from any quarry of freestone; and, though stone of another kind was within reach, yet it does not appear to have been anywhere used. The height of this wall was 12 feet besides the parapet, and its breadth 8 feet, according to Bede, who lived only at a small distance from the east end of it, and in whose time it was in many places almost quite entire. Such was the wall erected by the command and under the direction of the emperor Severus in the north of England; and, considering the length, breadth, height, and solidity, it was certainly a work of great magnificence and prodigious labour. But the wall itself was but a part, and not the most extraordinary part, of this work. The great number and different kinds of fortresses which were built along the line of it for its defence, and the military ways with which it was attended, are still more worthy of our admiration, and come now to be described.

The fortresses which were erected along the line of Severus's wall for its defence, were of three different kinds, and three different degrees of strength; and were called by three different Latin words, which may be translated *stations*, *castles*, and *turrets*. Of each of these in their order.

The *stationes*, stations, were so called from their stability and the stated residence of garrisons. They were also called *castra*, which hath been converted into *chesters*, a name which many of them still bear. These were by far the largest, strongest, and most magnificent of the fortresses which were built upon the wall, and were designed for the head-quarters of the cohorts of troops which were placed there in garrison, and from whence detachments were sent into the adjoining castles and turrets. These stations, as appears from the vestiges of them which are still visible, were not all exactly of the same figure nor of the same dimensions; some of them being exactly squares, and others oblong, and some of them a little larger than others. These variations were no doubt occasioned by the difference of situation and other circumstances. The stations were fortified with deep ditches and strong walls, the wall itself coinciding with and forming the north wall of each station. Within the stations were lodgings for the officers and soldiers in garrison; the smallest of them being sufficient to contain a cohort, or 600 men. Without the walls of each station was a town, inhabited by labourers, artificers, and others, both Romans and Britons, who chose to dwell under the protection of these fortresses. The number of the stations upon the wall was exactly 18; and if they had been placed at equal distances, the interval between every two of them would have been four miles and a few paces: but the intervention of rivers, marshes, and mountains; the conveniency of situations for strength, prospect, and water; and many other circumstances to us unknown, determined them to place these stations at unequal distances. The situation which was always chosen by the Romans, both here and everywhere else in Britain where they could obtain it, was the gentle declivity of a hill, near a river, and facing the meridian sun. Such was the situation of the far greatest part of the stations on this wall. In general, we may observe, that the stations stood thickest near the two ends and in the middle, probably because the danger of invasion was greatest in these places. But the reader will form a clearer idea of the number of these stations, their Latin and English names, their situation and distance from one another, by inspecting the following table, than we can give him with equal brevity in any other way. The first column contains the number of the station, reckoning from east to west; the second contains its Latin, and the third its English name; and the three last its distance from the next station to the west of it, in miles, furlongs, and chains.

N°	Latin Name.	English Name.	M.	F.	C.

The *castella*, or castles, were the second kind of fortifications which were built along the line of this wall for its defence. These castles were neither so large nor strong

Severus. ſtrong as the ſtations, but much more numerous, being no fewer than 81. The ſhape and dimenſions of the caſtles, as appears from the foundations of many of them which are ſtill viſible, were exact ſquares of 66 feet every way. They were fortified on every ſide with thick and lofty walls, but without any ditch, except on the north ſide; on which the wall itſelf, raiſed much above its uſual height, with the ditch attending it, formed the fortification. The caſtles were ſituated in the intervals between the ſtations, at the diſtance of about ſeven furlongs from each other; though particular circumſtances ſometimes occaſioned a little variation. In theſe caſtles, guards were conſtantly kept by a competent number of men detached from the neareſt ſtations.

The *turres*, or turrets, were the third and laſt kind of fortifications on the wall. Theſe were ſtill much ſmaller than the caſtles, and formed only a ſquare of about 12 feet, ſtanding out of the wall on its ſouth ſide. Being ſo ſmall, they are more entirely ruined than the ſtations and caſtles, which makes it difficult to diſcover their exact number. They ſtood in the intervals between the caſtles; and from the faint veſtiges of a few of them, it is conjectured that there were four of them between every two caſtles, at the diſtance of about 300 yards from one another. According to this conjecture, the number of the turrets amounted to 324. They were deſigned for watch-towers and places for ſentinels, who, being within hearing of one another, could convey an alarm or piece of intelligence to all parts of the wall in a very little time.

Such were the ſtations, caſtles, and turrets, on the wall of Severus; and a very conſiderable body of troops was conſtantly quartered in them for its defence. The uſual complement allowed for this ſervice was as follows:

1. Twelve cohorts of foot, conſiſting of 600 men each, - - -	7200
2. One cohort of mariners in the ſtation at Boulneſs, - - - - -	600
3. One detachment of Moors, probably equal to a cohort, - - -	600
4. Four alæ or wings of horſe, conſiſting, at the loweſt computation, of 400 each, -	1600
	10,000

For the conveniency of marching theſe troops from one part of the wall to another, with the greater eaſe and expedition, on any ſervice, it was attended with two military ways, paved with ſquare ſtones, in the moſt ſolid and beautiful manner. One of theſe ways was ſmaller, and the other larger. The ſmaller military way run cloſe along the ſouth ſide of the wall, from turret to turret, and caſtle to caſtle, for the uſe of the ſoldiers in relieving their guards and centinels, and ſuch ſervices. The larger way did not keep ſo near the wall, nor touch at the turrets or caſtles, but purſued the moſt direct courſe from one ſtation to another, and was deſigned for the conveniency of marching larger bodies of troops.

It is to be regretted, that we cannot gratify the reader's curioſity, by informing him by what particular bodies of Roman troops the ſeveral parts of this great work were executed; as we were enabled to do with regard to the wall of Antoninus Pius from inſcriptions. For though it is probable that there were ſtones with inſcriptions of the ſame kind, mentioning the ſeveral bodies of troops, and the quantity of work performed by each of them, originally inſerted in the face of this wall, yet none of them are now to be found. There have indeed been diſcovered, in or near the ruins of this wall, a great number of ſmall ſquare ſtones, with very ſhort, and generally imperfect, inſcriptions upon them; mentioning particular legions, cohorts, and centuries; but without directly aſſerting that they had built any part of the wall, or naming any number of paces. Of theſe inſcriptions, the reader may ſee no fewer than twenty-nine among the Northumberland and Cumberland inſcriptions in Mr Horſley's Britannia Romana. As the ſtones on which theſe inſcriptions are cut are of the ſame ſhape and ſize with the other facing-ſtones of this wall, it is almoſt certain that they have been originally placed in the face of it. It is equally certain, from the uniformity of theſe inſcriptions, that they were all intended to intimate ſome one thing, and nothing ſo probable as that the adjacent wall was built by the troops mentioned in them. This was, perhaps, ſo well underſtood, that it was not thought neceſſary to be expreſſed; and the diſtance of theſe inſcriptions from one another ſhowed the quantity of work performed. If this was really the caſe, we know in general, that this great work was executed by the ſecond and ſixth legions, theſe being the only legions mentioned in theſe inſcriptions. Now, if this prodigious wall, with all its appendages of ditches, ſtations, caſtles, turrets, and military ways, was executed in the ſpace of two years by two legions only, which, when moſt complete, made no more than 12,000 men, how greatly muſt we admire the ſkill, the induſtry, and excellent diſcipline of the Roman ſoldiers, who were not only the valiant guardians of the empire in times of war, but its moſt active and uſeful members in times of peace?

This wall of Severus, and its fortreſſes, proved an impenetrable barrier to the Roman territories for near 200 years. But about the beginning of the 5th century, the Roman empire being aſſaulted on all ſides, and the bulk of their forces withdrawn from Britain, the Mæatæ and Caledonians, now called *Scots* and *Picts*, became more daring; and ſome of them breaking through the wall, and others ſailing round the ends of it, they carried their ravages into the very heart of Provincial Britain. Theſe invaders were indeed ſeveral times repulſed after this by the Roman legions ſent to the relief of the Britons. The laſt of theſe legions, under the command of Gallio of Ravenna, having, with the aſſiſtance of the Britons, thoroughly repaired the breaches of Severus's wall and its fortreſſes, and exhorted the Britons to make a brave defence, took their final farewell of Britain. It ſoon appeared, that the ſtrongeſt walls and ramparts are no ſecurity to an undiſciplined and daſtardly rabble, as the unhappy Britons then were. The Scots and Picts met with little reſiſtance in breaking through the wall, while the towns and caſtles were tamely abandoned to their deſtructive rage. In many places they levelled it with the ground, that it might prove no obſtruction to their future inroads.—From this time no attempts were ever made to repair this noble work. Its beauty and grandeur procured it no reſpect in the dark and taſteleſs ages which ſucceeded. It became

Sevigné. came the common quarry for more than a thousand years, out of which all the towns and villages around were built; and is now so entirely ruined, that the penetrating eyes of the most poring and patient antiquarian can hardly trace its vanishing foundations.

SEVIGNE', Marie de Rabutin, Marquise de, a French lady, was born in 1626. When only a year old she lost her father, who was killed in the descent of the English on the isle of Rhé, where he commanded a company of volunteers. In 1644 she married the marquis of Sevigné, who was slain in a duel by the chevalier d'Albret, in 1651. She had by him a son and a daughter, to the education of whom she afterwards religiously devoted herself. Her daughter was married in 1669 to the count of Grignan, who conducted her to Provence. Madame de Sevigné consoled herself by writing frequent letters to her daughter. She fell at last the victim to her maternal tenderness. In one of her visits to Grignan, she fatigued herself so much during the sickness of her daughter, that she was seized with a fever, which carried her off on the 14th of January 1696. We have two portraits of Madame de Sevigné; the one by the compte de Bussi, the other by Madame de la Fayette. The first exhibits her defects; the second her excellencies. Bussi describes her as a lively gay coquette, a lover of flattery, fond of titles, honour, and distinction: M. de la Fayette as a woman of wit and good sense, as possessed of a noble soul, formed for dispensing benefits, incapable of debasing herself by avarice, and blessed with a generous, obliging, and faithful heart. Both these portraits are in some measure just. That she was vain-glorious, appears evident from her own letters, which, on the other hand, exhibit undoubted proofs of her virtue and goodness of heart.

This illustrious lady was acquainted with all the wits of her age. It is said that she decided the famous dispute between Perrault and Boileau concerning the preference of the ancients to the moderns, thus, "The ancients are the finest, and we are the prettiest." She left behind her a most valuable collection of letters, the best edition of which is that of 1775, in 8 vols 12mo. "These letters (says Voltaire) are filled with anecdotes, written with freedom, and in a natural and animated style; are an excellent criticism on studied letters of wit, and still more on those fictitious letters which aim at the epistolary style, by a recital of false sentiments and feigned adventures to an imaginary correspondent." It were to be wished that a proper selection had been made of these letters. It is difficult to read eight volumes of letters, which, though inimitably written, present frequent repetitions, and are often filled with trifles. What makes them in general perhaps so interesting is, that they are in part historical. They may be looked on as a relation of the manners, the ton, the genius, the fashions, the etiquette, which reigned in the court of Louis XIV. They contain many curious anecdotes nowhere else to be found: But these excellencies would be still more striking, were they sometimes stripped of that multitude of domestic affairs and minute incidents which ought naturally to have died with the mother and the daughter. A volume entitled *Sevigniana* was published at Paris in 1756, which is nothing more than a collection of the fine sentiments, literary and historical anecdotes, and moral apophthegms, scattered throughout these letters.

Siecle de Louis XIV. tom. ii.

Seville.

SEVILLE, a large and populous city of Spain, stands on the banks of the Guadalquiver, in the midst of a rich, and to the eye a boundless, plain; in W. Long. 5° 5′, N. Lat. 37° 20′. This city is supposed to have been founded by the Phœnicians, who gave it the name of *Hispalis*. When it fell under the power of the Romans, it was called *Julia*; and at last, after a variety of corruptions, was called *Sebilla* or *Sevilla*; both of which names are retained by the Spaniards. The Romans embellished it with many magnificent edifices; of which scarce any vestige now remains. The Gothic kings for some time made it their residence: but in process of time they removed their court to Toledo; and Seville was taken by storm soon after the victory obtained at Xeres over the Gothic king Rodrigo.—In 1027, Seville became an independent monarchy; but was conquered 70 years afterwards by Yusef Almoravides, an African prince. At last it was taken by Ferdinand III. after a year's siege; and 300,000 Moors were then obliged to leave the place. Notwithstanding this prodigious emigration, Seville continued to be a great and populous city, and soon after it was enlarged and adorned with many magnificent buildings, the chief of which is the cathedral. Seville arrived at its utmost pitch of grandeur a little after the discovery of America, the reason of which was, that all the valuable productions of the West Indies were carried thither. Its court was then the most splendid in Europe; but in the course of a few years all this grandeur disappeared, owing to the impediments in navigating the Guadalquiver. The superior excellence of the port of Cadiz induced government to order the galeons to be stationed there in time to come.

Seville is of a circular form, and is surrounded by a wall about five miles and a half in circumference, containing 176 towers. The ditch in many places is filled up. The streets of Seville are crooked and dirty, and most of them so narrow that two carriages can scarcely pass one another abreast.

Seville is said to contain 80,268 souls, and is divided into 30 parishes. It has 84 convents, with 24 hospitals.

Of the public edifices of this city the cathedral is the most magnificent. Its dimensions are 420 feet in length, 263 in breadth within the walls, and 126 feet in height. It has nine doors, 80 altars, at which 500 masses are daily celebrated, and 80 windows of painted glass, each of which cost 1000 ducats. At one angle stands a tower of Moorish workmanship 350 feet high. On the top of it is the giralda, or large brazen image, which, with its palm branch, weighs near one ton and a half, yet turns as a weather-cock with the slightest variation of the wind. The whole work is brick and mortar. The passage to the top is an inclined plane, which winds about in the inside in the manner of a spiral staircase, so easy of ascent that a horse might trot from the bottom to the top; at the same time it is so wide that two horsemen may ride abreast. What appears very unaccountable, the solid masonry in the upper half is just as thick again as that in the lower, though on the outside the tower is all the way of the same dimensions. In the opinion of Mr Swinburne, this cathedral is inferior to York-

Townsend's Travels, vol. ii.

Seville. York minster. Its treasures are inestimable; one altar with all its ornaments is solid silver; of the same metal are the images of St Isidore and St Leander, which are as large as the life; and a tabernacle for the host more than four yards high, adorned with 48 columns. Before the choir of the cathedral is the tomb of the celebrated Christopher Columbus, the discoverer of America. His monument consists of one stone only, on which these words are inscribed, *A Castella y Arragon otro mundo dio Colon;* that is, "To Castile and Arragon Columbus gave another world:" an inscription simple and expressive, the justness of which will be acknowledged by those who have read the adventures of this illustrious but unfortunate man. The cathedral was begun by Don Sancho the Brave, about the close of the 13th century, and finished by John II. about an hundred years after. To the cathedral belongs a library of 20,000 volumes, collected by Hernando the son of Columbus; but, to the disgrace of the Spaniards, it has scarcely received any addition since the death of the founder. The organ in this cathedral is a very ingenious piece of mechanism †. "I was much pleased (says Mr Townsend in his interesting travels) with the construction of a new organ, containing 5300 pipes, with 110 stops, which latter, as the builder told me, is 50 more than are in the famous one of Haerlem; yet, so ample are the bellows, that when stretched they supply the full organ 15 minutes. The mode of filling them with air is singular; for, instead of working with his hands, a man walks backwards and forwards along an inclined plane of about 15 feet in length, which is balanced in the middle on its axis; under each end is a pair of bellows, of about six feet by three and a half. These communicate with five other pairs united by a bar; and the latter are so contrived, that when they are in danger of being overstrained, a valve is lifted up, and gives them relief. Passing 10 times along the inclined plane fills all these vessels."

Bourgoanne's Travels, vol. ii.

† Vol. ii. p. 318.

The Canos de Carmone, or great aqueduct of Seville, is reckoned by the historians of this city one of the most wonderful works of antiquity. Mr Swinburne, however, remarks, that it is ugly, crooked, the arches unequal, and the architecture neglected. The conduit is so leaky, that a rivulet is formed by the waste water. Nevertheless, it still conveys to the city an ample supply of water sufficient to turn several mills, and to give almost every house in town the benefit of it.

Swinburne's Travels, p. 283.

Many of the convents are remarkable for the beauty of their architecture; but in Seville the eye covets only pictures, of which there is a wonderful profusion. Among these are the works of the famous painter Murillo, with many others universally admired.

The convent of the Franciscans contains 15 cloisters, with apartments for 200 monks, though, when Mr Townsend visited them, they amounted only to 140. The annual expenditure of these, who are all fed on charity, is about 4000l. sterling. "In the principal cloister (says the same intelligent traveller), which is entirely inclosed by a multitude of little chapels, are represented, in 14 pictures, each called a *station*, all the sufferings of the Redeemer. These are so arranged as to mark given distances by walking round the cloister from the first to the second, and so in order to the rest. Over them is mentioned the number of steps taken by our Lord between the several incidents of his passion in his way to Calvary; and these precisely are the paces measured for the penitents in their progress from one station to another. Over one is the following inscription: 'This station consists of 1087 steps. Here the blessed Redeemer fell a second time under the weight of his cross, and here is to be gained the indulgence of seven years and forty quarantines. Mental prayer, the Paternoster, and the Ave Maria.' This may serve as an example for the rest."

Townsend's Travels, vol. ii. p. 326.

The principal manufacture of Seville is snuff. Mr Townsend, who paid particular attention to it, informs us, that the building in which it is carried on is elegant and simple in its form, and is about 600 feet by 480, and not less than 60 feet in height, with four regular fronts, inclosing 28 quadrangles. It cost 37,000,000 of reals, or about 370,000l. At present (1787), no more than 1700 workmen are employed, and 100 horses or mules; but formerly 3000 men were engaged, and near 400 horses. This falling off is attributed by Mr Swinburne to a practice which the directors followed, of adulterating the tobacco with the red earth of Almazarron. When Mr Townsend visited this manufacture, they had changed their system. From the year 1780, he informs us, the annual sale of tobacco from Brazil has been 1,500,000 pounds, purchased from the Portuguese at three reals a pound; and of snuff from the produce of their own colonies 1,600,000 pounds, beside *cigars* (A) to a very considerable amount. They have lying by them more than 5,000,000 pounds of snuff unsold; but as it will not suffer by age, they are not uneasy at this accumulation. Besides the peculiar kind of snuff with which Spain was accustomed to supply the market, they have lately introduced the manufacture of rappee. In this branch alone are employed 220 persons, old and young, with 16 mules.

"All the workmen (continues Mr Townsend) deposit their cloaks at the door; and when they go out are so strictly examined, that they have little chance of being able to conceal tobacco; yet they sometimes venture to hide it about their persons. An officer and a guard is always attending to take delinquents into custody; and that they may prevent resistance, no workman is permitted to enter with a knife. Were it not for this precaution, the consequence of a detection might be fatal. The whole business is conducted by a director, with a salary of 40,000 reals a-year, and 54 superior officers, assisted by as many subordinate to them. For grinding their snuff, they have 40 mills, each consisting of a stone roller, moved by a large horse or mule, with the traces fastened to a beam of eight feet in length, in the angle of 45 degrees, consequently losing precisely half his force."

Before Mr Townsend left Seville, according to his usual practice, which was truly laudable, he enquired into the prices of labour and provisions. As a piece of curious

(A) These are little rolls of tobacco which the Spaniards smoke without a pipe.

Sewer.

curious and useful information, and as an example to other travellers, we present them to our readers. They are as follows :

Day-labourers	$4\frac{1}{2}$ reals, about	L. 0	0	$10\frac{1}{4}$	
Carpenters from 7 to 11 ——					
Joiners, if good workmen,	24 —— or	0	4	9	
Weavers, if good workmen, 15 reals, about		0	3	0	
Bread, for 3 lb. of 16 oz. 16 quartos, or		0	0	$4\frac{1}{2}$	
—— sometimes 28 quartos, or		0	0	$7\frac{7}{8}$	
Beef, 30 quartos for 32 oz. per lb. about		0	0	$4\frac{1}{2}$	
Mutton, 38 do. do.		0	0	$5\frac{1}{3}\frac{1}{2}$	
Kid, 24 do.		0	0	$3\frac{3}{8}$	
Pork from 36 to 42 quartos, do.	or	0	0	$5\frac{1}{16}$	
	to	0	0	$5\frac{9}{11}$	

The price of wheat has at different periods been very remarkable. In 1652, it sold at the rate of 15s. $3\frac{1}{2}$d. the bushel ; and in 1657, it fell so low as 1s. $4\frac{1}{2}$d. per bushel, reckoning the fanega at $109\frac{1}{2}$ lb. and the bushel at 70.

SEVUM MINERALE, mineral tallow ; a substance somewhat resembling tallow, found on the sea-coasts of Finland in the year 1736. It burns with a blue flame, and smell of grease, leaving a black viscid matter which cannot easily be consumed. It is extremely light ; being only of the specific gravity of 0.770 ; whereas tallow is not less than 0.969. It is partly soluble in highly rectified spirit of wine ; but entirely so in expressed oils when boiling. It is met with in some of the rocky parts of Persia, but there it appears to be mixed with petrolæum. Dr Herman of Strasburg mentions a spring in the neighbourhood of that city which contains a substance of this sort diffused through it, separating, and capable of being collected on ebullition.—A fat mineral matter resembling butter or tallow has lately been extracted from peat in Lancashire. See PEAT.

SEWAURY, a Hindoo word used in Bengal, and signifying the train of attendants that accompany a nabob or great man.

SEWER, *in the Household*, an officer who arranged on the table the dishes of a king or nobleman.

SEWER is also a passage or gutter made to carry water into the sea or a river, whereby to preserve the land, &c. from inundations and other annoyances.

Court of Commissioners of SEWERS in England, a temporary tribunal, erected by virtue of a commission under the great seal ; which formerly used to be granted *pro re nata* at the pleasure of the crown, but now at the discretion and nomination of the lord chancellor, lord treasurer, and chief justices, pursuant to the statute 23 Hen. VIII. c. 5. Their jurisdiction is to overlook the repair of sea-banks and sea-walls, and the cleansing of rivers, public streams, ditches, and other conduits, whereby any waters are carried off ; and is confined to such county or particular district as the commission shall expressly name. The commissioners are a court of record, and may fine and imprison for contempts ; and in the execution of their duty may proceed by jury, or upon their own view, and may take order for the removal of any annoyances, or the safeguard and conservation of the sewers within their commission, either according to the laws and customs of Romney-marsh, or otherwise at their own discretion. They may also assess such rates or scots upon the owners of lands within their district as they shall judge necessary : and if any person refuses to pay them, the commissioners may levy the same by distress of his goods and chattels ; or they may, by statute 23 Hen. VIII. c. 5. sell his freehold lands (and by the 7 Ann. c. 10. his copyhold also), in order to pay such scots or assessments. But their conduct is under the controul of the court of King's-bench, which will prevent or punish any illegal or tyrannical proceedings. And yet in the reign of King James I. (8th Nov. 1616.), the privy-council took upon them to order, that no action or complaint should be prosecuted against the commissioners unless before that board ; and committed several to prison who had brought such actions at common law, till they should release the same : and one of the reasons for discharging Sir Edward Coke from his office of lord chief-justice, was for countenancing those legal proceedings. The pretence for these arbitrary measures was no other than the tyrant's plea of the *necessity* of unlimited powers in works of evident utility to the public, " the supreme reason above all reasons, which is the salvation of the king's lands and people." But now it is clearly held, that this (as well as all other inferior jurisdiction) is subject to the discretionary coercion of his majesty's court of King's-bench.

Ferguson's Roman History.

Common SEWERS, in Rome, were executed at a great expence. It was proposed that they should be of sufficient dimensions to admit a waggon loaded with hay. When these common sewers came to be obstructed, or out of repair, under the republic, the censors contracted to pay a thousand talents, or about 193,000l. for clearing and repairing them. They were again in disrepair at the accession of Augustus Cæsar, and the reinstating them is mentioned among the great works of Agrippa. He is said to have turned the course of seven rivers into these subterraneous passages, to have made them navigable, and to have actually passed in barges under the streets and buildings of Rome. These works are still supposed to remain ; but as they exceed the power and resources of the present city to keep them in repair, they are quite concealed, except at one or two places. They were in the midst of the Roman greatness, and still are, reckoned among the wonders of the world ; and yet they are said to have been works of the elder Tarquin, a prince whose territory did not extend, in any direction, above 16 miles ; and, on this supposition, they must have been made to accommodate a city that was calculated chiefly for the reception of cattle, herdsmen, and banditti. Rude nations sometimes execute works of great magnificence, as fortresses and temples, for the purposes of war and superstition ; but seldom palaces, and still more seldom works of mere convenience and cleanliness, in which for the most part they are long defective. It is not unreasonable, therefore, to question the authority of tradition in respect to this singular monument of antiquity, which so greatly exceeds what the best accommodated city of modern Europe could undertake for its own conveniency. And as those works are still entire, and may continue so for thousands of years, it may be suspected that they were even prior to the settlement of Romulus, and may have been the remains of a more ancient city, on the ruins of which the followers of Romulus settled, as the Arabs now hut or encamp.

Sewers, Sex.

ers the ruins of Palmyra and Balbeck. Livy owns, that the common ſewers were not accommodated to the plan of Rome, as it was laid out in his time; they were carried in directions acroſs the ſtreets, and paſſed under buildings of the greateſt antiquity. This derangement indeed he imputes to the haſty rebuilding of the city after its deſtruction by the Gauls; but haſte, it is probable, would have determined the people to build on their old foundations, or at leaſt not to change them ſo much as to croſs the direction of former ſtreets.

SEX, the property by which any animal is male or female.

Lavater has drawn the following characteriſtic diſtinctions between the male and female of the human ſpecies.

"The primary matter of which women are conſtituted appears to be more flexible, irritable, and elaſtic, than that of man. They are formed to maternal mildneſs and affection; all their organs are tender, yielding, eaſily wounded, ſenſible, and receptible. Among a thouſand females there is ſcarcely one without the generic feminine ſigns; the flexible, the circular, and the irritable.

"They are the counterpart of man, taken out of man, to be ſubject to man; to comfort him like angels, and to lighten his cares. 'She ſhall be ſaved in childbearing, if they continue in faith, and charity, and holineſs, with ſobriety" (1 Tim. ii. 15.). This tenderneſs, this ſenſibility, this light texture of their fibres and organs, this volatility of feeling, render them ſo eaſy to conduct and to tempt; ſo ready of ſubmiſſion to the enterpriſe and power of the man; but more powerful through the aid of their charms than man with all his ſtrength. The man was not firſt tempted, but the woman, afterward the man by the woman. And, not only eaſy to be tempted, ſhe is capable of being formed to the pureſt, nobleſt, moſt ſeraphic virtue; to every thing which can deſerve praiſe or affection. Highly ſenſible of purity, beauty, and ſymmetry, ſhe does not always take time to reflect on internal life, internal death, internal corruption. 'The woman ſaw that the tree was good for food, and that it was pleaſant to the eyes, and a tree to be deſired to make one wiſe, and ſhe took of the fruit thereof.' (Gen. iii. 6.).

"The female thinks not profoundly; profound thought is the power of the man. Women feel more. Senſibility is the power of woman. They often rule more effectually, more ſovereignly, than man. They rule with tender looks, tears, and ſighs: but not with paſſion and threats: for if, or when, they ſo rule, they are no longer women, but abortions. They are capable of the ſweeteſt ſenſibility, the moſt profound emotion, the utmoſt humility, and the exceſs of enthuſiaſm. In their countenance are the ſigns of ſanctity and inviolability, which every feeling man honours, and the effects of which are often miraculous. Therefore, by the irritability of their nerves, their incapacity for deep inquiry and firm deciſion, they may eaſily from their extreme ſenſibility become the moſt irreclaimable, the moſt rapturous enthuſiaſts. Their love, ſtrong and rooted as it is, is very changeable; their hatred almoſt incurable, and only to be effaced by continued and artful flattery. Men are moſt profound; women are more ſublime.

"Men more embrace the whole; women remark individually, and take more delight in ſelecting the minutiæ which form the whole. Man hears the burſting thunder, views the deſtructive bolt with ſerene aſpect, and ſtands erect amidſt the fearful majeſty of the ſtreaming clouds. Woman trembles at the lightning, and the voice of diſtant thunder; and ſhrinks into herſelf or ſinks into the arms of man. Man receives a ray of light ſingle, woman delights to view it through a priſm in all its dazzling colours. She contemplates the rainbow as the promiſe of peace; he extends his inquiring eye over the whole horizon. Woman laughs, man ſmiles; woman weeps, man remains ſilent. Woman is in anguiſh when man weeps, and in deſpair when man is in anguiſh; yet has ſhe often more faith than man. Man without religion, is a diſeaſed creature, who would perſuade himſelf he is well, and needs not a phyſician; but woman without religion, is raging and monſtrous. A woman with a beard is not ſo diſguſting as a woman who acts the freethinker; her ſex is formed to piety and religion; to them Chriſt firſt appeared; but he was obliged to prevent them from too ardently, and too haſtily, embracing him: 'Touch me not.' They are prompt to receive and ſeize novelty, and become its enthuſiaſts. The whole world is forgotten in the emotion cauſed by the preſence and proximity of him they love. They ſink into the moſt incurable melancholy, as they alſo riſe to the moſt enraptured heights.

"Male ſenſation is more imagination, female more heart. When communicative, they are more communicative than man; when ſecret, more ſecret. In general they are more patient, long-ſuffering, credulous, benevolent, and modeſt. Woman is not a foundation on which to build. She is the gold, ſilver, precious ſtones, wood, hay, ſtubble (1 Cor. iii. 12.); the materials for building on the male foundation. She is the leaven, or more expreſſively the oil to the vinegar of man: the ſecond part of the book of man.

"Man ſingly is but half man; at leaſt but half human; a king without a kingdom. Woman, who feels properly what ſhe is, whether ſtill or in motion, reſts upon the man; nor is man what he may and ought to be, but in conjunction with woman; therefore, 'it is not good that man ſhould be alone, but that he ſhould leave father and mother, and cleave to his wife, and they two ſhall be one fleſh."

They differ alſo in their exterior form and appearance.

"Man is the moſt firm; woman the moſt flexible. Man is the ſtraighteſt; woman the moſt bending. Man ſtands ſtedfaſt: woman gently retreats. Man ſurveys and obſerves; woman glances and feels. Man is ſerious; woman is gay. Man is the talleſt and broadeſt; woman the ſmalleſt and weakeſt. Man is rough and hard; woman ſmooth and ſoft. Man is brown; woman is fair. Man is wrinkly; woman is not. The hair of man is more ſtrong and ſhort; of woman more long and pliant. The eyebrows of man are compreſſed; of woman leſs frowning. Man has moſt convex lines; woman moſt concave. Man has moſt ſtraight lines, woman moſt curved. The countenance of man taken in profile is more ſeldom perpendicular than that of the woman. Man is moſt angular; woman moſt round."

In determining the comparative merit of the two ſexes, it is no derogation from female excellency that it differs in kind from that which diſtinguiſhes the male part of our ſpecies: and if, in general, it ſhould be found (wh… upon an impartial inquiry will moſt certainly be found) that women fill up their appointed circle of action with greater regularity than men, the claim of preference cannot juſtly be decided in our favour. In the prudential and economical parts of life, it is undeniable that they riſe far above us: and if true fortitude of mind is beſt diſcovered by a cheerful reſignation to the meaſures of Providence, we ſhall not find reaſon, perhaps, to claim that moſt ſingular of the human virtues as our peculiar privilege. There are numbers of the other ſex who, from the natural delicacy of their conſtitution, paſs through one continued ſcene of ſuffering from their cradles to their graves, with a firmneſs of reſolution that would deſerve ſo many ſtatues to be erected to their memories, if heroiſm were not eſteemed more by the ſplendor than the merit of actions.

But whatever real difference there may be between the moral or intellectual powers of the male and female mind, Nature does not ſeem to have marked the diſtinction ſo ſtrongly as our vanity is willing to imagine; and after all, perhaps, education will be found to conſtitute the principal ſuperiority. It muſt be acknowledged, at leaſt, that in this article we have every advantage over the ſofter ſex that art and induſtry can poſſibly ſecure to us. The moſt animating examples of Greece and Rome are ſet before us, as early as we are capable of any obſervation; and the nobleſt compoſitions of the ancients are given into our hands almoſt as ſoon as we have ſtrength to hold them; while the employments of the other ſex, at the ſame period of life, are generally the reverſe of every thing that can open and enlarge their minds, or fill them with juſt and rational notions. The truth of it is, female education is ſo much worſe than none, as it is better to leave the mind to its natural and uninſtructed ſuggeſtions, than to lead it into falſe purſuits, and contract its views, by turning them upon the loweſt and moſt trifling objects. We ſeem, indeed, by the manner in which we ſuffer the youth of that ſex to be trained, to conſider women agreeably to the opinion of certain Mahometan doctors, and treat them as if we believed they had no ſouls: why elſe are they

> Bred only, and completed to the taſte
> Of luſtful appetence, to ſing, to dance,
> To dreſs, and troul the tongue, and roll the eye.
>
> MILTON.

This ſtrange neglect of cultivating the female mind can hardly be allowed as good policy, when it is conſidered how much the intereſt of ſociety is concerned in the rectitude of their underſtandings. That ſeaſon of every man's life which is moſt ſuſceptible of the ſtrongeſt impreſſions, is neceſſarily under female direction; as there are few inſtances, perhaps, in which that ſex is not one of the ſecret ſprings which regulates the moſt important movements of private or public tranſactions. What Cato obſerves of his countrymen is in one reſpect true of every nation under the ſun: "The Romans (ſaid he) govern the world, but it is the women that govern the Romans."

If it be true then (as true beyond all peradventure it is) that female influence is thus extenſive, nothing certainly can be of more importance than to give it a proper tendency, by the aſſiſtance of a well-directed education. Far are we from recommending any attempts to render women learned; yet ſurely it is neceſſary they ſhould be raiſed above ignorance. Such a general tincture of the moſt uſeful ſciences as may ſerve to free the mind from vulgar prejudices, and give it a reliſh for the rational exerciſe of its powers, might very juſtly enter into a plan of female erudition. That ſex might be taught to turn the courſe of their reflections into a proper and advantageous channel, without any danger of rendering them too elevated for the feminine duties of life. In a word, they ought to be conſidered as deſigned by Providence for uſe as well as ſhow, and trained up, not only as women, but as rational creatures.

Sex, ‖ Sextius.

SEX of Bees. See BEE.

SEX of Plants. See BOTANY *Index*.

SEXAGENARY, ſomething relating to the number ſixty: thus ſexagenary or ſexageſimal arithmetic is a method of computation proceeding by ſixties; ſuch is that uſed in the diviſion of a degree into ſixty minutes, of the minute into ſixty ſeconds, of the ſecond into ſixty thirds, &c. Alſo ſexagenary tables are tables of proportional parts, ſhowing the product of two ſexagenaries that are to be multiplied, or the quotient of the two that are to be divided.

SEXAGESIMA, the ſecond Sunday before Lent, or the next to Shrove-Sunday; ſo called as being about the 60th day before Eaſter.

SEXAGESIMALS, or *SEXAGESIMAL Fractions*, fractions whoſe denominators proceed in a ſexagecuple ratio; that is, a prime, or the firſt minute $=\frac{1}{60}$; a ſecond $=\frac{1}{3600}$; a third $=\frac{1}{216000}$. Anciently, there were no other than ſexageſimals uſed in aſtronomy; and they are ſtill retained in many caſes, though decimal arithmetic begins to grow in uſe now in aſtronomical calculations. In theſe fractions, which ſome call *aſtronomical fractions*, the denominator being always 60, or a multiple thereof, is uſually omitted, and the numerator only written down: thus $4^{\circ}, 59', 32'', 50''', 16''''$, is to be read, 4 degrees, 59 minutes, 32 ſeconds, 50 thirds, 16 fourths, &c.

SEXTANS, SEXTANT, a ſixth part of certain things. The Romans having divided their *as* into 12 ounces or unciæ, the ſixth part of that, or two ounces, was the ſextans.—*Sextans* was alſo a meaſure which contained two ounces of liquor, or two cyathi.

SEXTANS, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere, made by Hevelius out of unformed ſtars. In Hevelius's catalogue it contains 11, but in the Britannic catalogue 41 ſtars.

SEXTANT, in *Mathematics*, denotes the ſixth part of a circle, or an arch comprehending 60 degrees.

The word *ſextant* is more particularly uſed for an aſtronomical inſtrument made like a quadrant, excepting that its limb only comprehends 60 degrees. The uſe and application of the ſextant is the ſame with that of the quadrant. See QUADRANT; and NAVIGATION, p. 699, &c.

SEXTILE, SEXTILIS, the poſition or aſpect of two planets when at 60 degrees diſtance, or at the diſtance of two ſigns from one another. It is marked thus (*). See ASPECT.

SEXTIUS, QUINTUS, a Pythagorean philoſopher, flouriſhed in the time of Auguſtus. He ſeemed formed to riſe in the republic; but he ſhrunk from civil honours, and declined accepting the rank of ſenator when it was offered him by Julius Cæſar, that he might have time

time to apply to philosophy. It appears that he wished to establish a school at Rome, and that his tenets, though chiefly drawn from the doctrines of Pythagoras, in some particulars resembled those of the Stoics.

He soon found himself involved in many difficulties. His laws were tinctured with great severity; and in an early period of this establishment, he found his mind so harassed, and the harshness of the doctrines which he wished to establish so repulsive to his feelings, that he had nearly worked himself up to such an height of desperation as to resolve on putting a period to his existence.

Of the school of Sextius were Fabianus, Sotion, Flavianus, Crassitius, and Celsus. Of his works only a few fragments remain; and whether any of them formed a part of the work which Seneca admired so much, cannot now be determined. Some of his maxims are valuable. He recommended an examination of the actions of the day to his scholars when they retired to rest; he taught, that the road to heaven *(ad astra)* was by frugality, temperance, and fortitude. He used to recommend holding a looking glass before persons disordered with passion. He enjoined his scholars to abstain from animal food.

SEXTON, a church-officer, thus called by corruption of the Latin *sacrista*, or Saxon *segerstone*, which denotes the same. His office is to take care of the vessels, vestments, &c. belonging to the church; and to attend the minister, church-warden, &c. at church. He is usually chosen by the parson only. Sextons, as well as parish-clerks, are regarded by the common law as persons who have freehold in their offices; and, therefore, though they may be punished, yet they cannot be deprived, by ecclesiastical censures.

The office of sexton in the pope's chapel is appropriated to the order of the hermits of St Augustine. He is generally a bishop, though sometimes the pope only gives a bishopric, *in partibus*, to him on whom he confers the post. He takes the title of *Prefect of the Pope's Sacristy*, and has the keeping the vessels of gold and silver, the relics, &c. When the pope says mass, the sexton always takes the bread and wine first. If it be in private he says mass, his holiness, of two wafers, gives him one to eat; and, if in public, the cardinal, who assists the pope in quality of deacon, of three wafers, gives him one to eat. When the pope is desperately sick, he administers to him the sacrament of extreme unction, &c. and enters the conclave in quality of first conclavist.

The office of a sexton in Sweden is sometimes singular. During M. Outhier's stay at Stockholm in 1736 he visited the church of St Clara, and during divine service he observed a sexton going about with a long rod, waking those persons who had fallen asleep.

SEXTUPLE, in *Music*, denotes a mixed sort of triple, which is beaten in double time.

SEXTUS EMPIRICUS, a famous Pyrrhonian philosopher, lived in the second century, under the reign of Antoninus the Debonair. He was a physician of the sect of the Empirics, and is said to have been one of the preceptors of Antoninus the philosopher. There are still extant his Pyrrhonian Institutions, and a large work against the mathematicians, &c. The best edition of Sextus Empiricus is that of Fabricius in Greek and Latin, printed at Leipsic in 1718, folio.

SEXUALISTÆ, among botanical writers, those who have established the classes of plants upon the differences of the sexes and parts of fructification in plants, according to the modern method; as Linnæus, &c.

SEZAWUL, a Hindoo word, used in Bengal to express an officer employed at a monthly salary to collect the revenues.

SFORZA, JAMES, was the founder of the illustrious house of Sforza, which acted so conspicuous a part in Italy during the 15th and 16th centuries, which gave six dukes to Milan, and contracted alliances with almost every sovereign in Europe. James Sforza was born on the 28th of May 1369, at Catignola, a small town in Italy, lying between Imola and Faenza. His father was a day labourer, or, according to Commines, a shoemaker. A company of soldiers happening one day to pass through Catignola, he was seized with the desire of accompanying them to the wars. "I will go (said he to himself), and dart my hatchet against that tree, and if it stick fast in the wood, I will immediately become a soldier." The hatchet accordingly stuck fast, and our adventurer enlisted; and because, says the Abbé de Choisi, he had thrown the axe with all his force, he assumed the name of Sforza; for his true name was Giacomuzzo, or James Attendulo. He rose rapidly in the army, and soon became commander of 7000 men. He defended the cause of Jane II. queen of Naples for many years, and was made constable of her kingdom. He was created Count of Catignola by Pope John XXII. by way of paying a debt of 14000 ducats which the church of Rome owed him. His exploits became every day more illustrious: He obliged Alphonso king of Arragon to raise the siege of Naples; and reduced several places that had revolted in Abruzzo and Le Labour; but while in pursuit of his enemies he was unfortunately drowned in the river Aterno on the 3d January 1424, at the age of 54 years. His heroic qualities, and the continual wars in which he was engaged, did not prevent him from forming an attachment to the fair sex. In his youth he fell in love with a woman called *Lucia Trezana*, whom he married after she had born him several children. He married afterwards Antoinette Salembini, who brought him several excellent estates; she bore him Bosio Sforza, compte of Santa-Flor, a warrior and governor of Orvietta for Pope Martin V. His third wife was Catharine Alopo, sister of Rodolpho, grand chamberlain to the sovereign of Naples. His last wife, for he was four times married, was Mary Marzana, daughter to the duke of Sessa. She bore him Charles Sforza, who was general of the order of Augustines, and archbishop of Milan.

SFORZA, *Francis*, the son of James Sforza by Lucia Trezana, was born in 1401, and trained up by his father to the profession of arms. At the age of 23 he defeated the troops of Braccio, who disputed with him the passage of the Aterno. In this action his father was drowned, and Francis, though illegitimate, succeeded him. He fought successfully against the Spaniards, and contributed a great deal both towards raising the siege of Naples, and to the victory which was gained over the troops of Braccio near Aquila in 1425, where that general was killed. After the death of Queen Jane, in 1435, he espoused the interests of the duke of Anjou, to whom she had left her crown, and by his courage and abilities ably supported that unfortunate

Florentine prince. He made himself master of several places in Ancona, from which he was driven by Pope Eugenius IV. who detested and excommunicated him; but he soon re-established his affairs by a victory. His reputation was now so great, that the pope, the Venetians, and the Florentines, chose him for their general against the duke of Milan. Sforza had already conducted Venetian armies against that prince, though he had espoused his daughter. The duke dying in 1447, the inhabitants of Milan invited Sforza, his son-in-law, to lead them against that duke. But, after some exertions in their favour, he turned his arms against themselves, laid siege to Milan, and obliged them to receive him as duke, notwithstanding the rights of Charles duke of Orleans, the son of Valentine of Milan. In 1464, Louis XI. who hated Orleans, gave up to Sforza the rights which the crown of France had over Genoa, and even put into his hands Savona, a town belonging to that republic. The duke of Milan soon after made himself master of Genoa. He died in 1466, with the reputation of a man who was willing to sell his blood to the best purchaser, and who was not too scrupulous an observer of his word. His second wife was Blanche Marie, natural daughter of Philip Marie duke of Milan. She bore him Galeas Marie, and Ludovic Marie, dukes of Milan, Philip Marie count of Pavia, Sforza Marie duke of Bari, Ascagne Marie bishop of Pavia and Cremona, and a cardinal. He was taken prisoner by the troops of Louis XII. and confined for some time in the tower of Bourges. He was a cunning man, and deceived Cardinal d'Amboise when that prelate aspired at the papacy. His daughters were Hyppolita, married to Alphonso of Arragon, afterwards king of Naples; and Elizabeth, married to William marquis of Montferrat. He had besides several natural children.

SHACK, in ancient customs, a liberty of winter-pasturage. In the counties of Norfolk and Suffolk, the lord of the manor has shack, i. e. a liberty of feeding his sheep at pleasure in his tenants lands during the six winter months. In Norfolk, shack also extends to the common for hogs, in all men's grounds, from the end of harvest till seed-time. Whence to go *a-shack*, is to feed at large.

SHACKLES, aboard a ship, are those oblong iron rings, bigger at one end than at the other, with which the ports are shut fast, by thrusting the wooden bar of the port through them. There is also a sort of shackles to lift the hatches up with, of a like figure, but smaller. They are fastened at the corners of the hatches.

SHAD, a species of CLUPEA. See ICHTHYOLOGY *Index*.

SHADDOCK, a species of CITRUS, the fruit of which is of a very large size, and of a very grateful taste. In the West Indies it is eaten after dinner to give a zest to the wine.

SHADOW, in *Optics*, a privation or diminution of light, by the interposition of an opaque body; or it is a plane where the light is either altogether obstructed, or greatly weakened, by the interposition of some opaque body between it and the luminary.

SHADOW, in *Painting*, an imitation of a real shadow, effected by gradually heightening and darkening the colours of such figures as by their dispositions cannot receive any direct rays from the luminary that is supposed to enlighten the piece.

SHADOW, in *Perspective*, the appearance of an opaque body, and a luminous one, whose rays diverge (e. g. a candle, lamp, &c.), being given; to find the just appearance of the shadow, according to the laws of perspective. The method is this: From the luminous body, which is here considered as a point, let fall a perpendicular to the perspective plane or table; i. e. find the appearance of a point upon which a perpendicular, drawn from the middle of the luminary, falls on the perspective plane; and from the several angles, or raised points of the body, let fall perpendiculars to the plane. These points, whereon the perpendiculars fall, connect by right lines, with the point upon which the perpendicular let fall from the luminary falls; and continue the lines to the side opposite to the luminary. Lastly, through the raised points draw lines through the centre of the luminary, intersecting the former; the points of intersection are the terms or bounds of the shadow.

SHADOWS, COLOURED, a curious phenomenon in optics, which was observed by Professor Scherffer of Vienna, and afterwards by Count Rumford, who made the discovery while prosecuting his experiments on light.

"Desirous," says the count, "of comparing the intensity of the light of a clear blue sky by day with that of a common wax candle, I darkened my room, and letting the day-light from the north, coming through a hole near the top of the window-shutter, fall at an angle of about 70° upon a sheet of very fine white paper, I placed a burning wax candle in such a position that its rays fell upon the same paper, and, as near as I could guess, in the line of reflection of the rays of day-light from without; when, interposing a cylinder of wood, about half an inch in diameter, before the centre of the paper, and at the distance of about 2 inches from its surface, I was much surprised to find that the two shadows projected by the cylinder upon the paper, instead of being merely shades without colour, as I expected; the one of them, that which, corresponding with the beam of day light, was illuminated by the candle, was yellow; while the other, corresponding to the light of the candle, and consequently illuminated by the light of the heavens, was of the most beautiful blue that it is possible to imagine. This appearance, which was not only unexpected, but was really in itself in the highest degree striking and beautiful, I found upon repeated trials, and after varying the experiment in every way I could think of, to be so perfectly permanent, that it is absolutely impossible to produce two shadows at the same time, from the same body, the one answering to a beam of day-light, and the other to the light of a candle or lamp, without those shadows being coloured, the one yellow, and the other blue.

"If the candle be brought nearer to the paper, the blue shadow will become of a deeper hue, and the yellow shadow will gradually grow fainter; but if it be removed farther off, the yellow shade will become of a deeper colour, and the blue shade will become fainter; and the candle remaining stationary in the same place, the same varieties in the strength of the tints of the coloured shades may be produced merely by opening the window shutter a little more or less, and rendering the illumination of the paper, by the light from without, stronger or weaker. By either of these means, the coloured shadows may be made to pass through all the gradations of shade from the deepest to the lightest, and

vice

Shadows || Shafras.

vice versa; and it is not a little amusing to see shadows thus glowing with all the brilliancy of the purest and most intense prismatic colours, then passing suddenly through all the varieties of shade, preserving in all the most perfect purity of tint, growing stronger and fainter, and vanishing and returning, at command *."

* Phil. Transf. 1794.

The count is clearly of opinion, that the causes of the colours of these shadows arise from the different qualities of the light by which they are illuminated; but he does not think it so evident how they are produced. Perhaps it may be said, however, that all the phenomena of coloured shadows which the count enumerates may be accounted for by the theory of Professor Scheffer.

SHADWELL, Thomas, descended of an ancient family in Staffordshire, was born in 1640, and educated at Caius college, Cambridge. He then was placed in the Middle Temple to study the laws; where having spent some time, he travelled abroad. Upon his return home, he became acquainted with the most celebrated persons of wit in that age. He applied himself chiefly to dramatic writing, in which he had great success; and upon the revolution was made poet laureat and historiographer to King William and Queen Mary, in the room of Mr Dryden. These employments he enjoyed till his death, which happened in 1692. Beside his dramatic writings, he composed several other pieces of poetry; the chief of which are his congratulatory poem on the prince of Orange's coming to England; another on Queen Mary; his translation of Juvenal's 10th satire, &c. Mr Dryden treats him with great contempt, in his satire called *Mac-Flecno*. The best judges of that age, however, gave their testimony in favour of his comedies; which have in them fine strokes of humour; the characters are often original, strongly marked, and well sustained. An edition of his works, with some account of his life and writings prefixed, was published in 1720, in 4 vols 8vo.

SHAFRAS, or Suffras, Gregory Savarof, an Armenian merchant, remarkable only as the person who sold the large and celebrated diamond which is now set in the imperial sceptre of Russia. Shah Nadir, an Indian prince, had two principal diamonds in his throne, one of them denominated the *Sun of the Sea*, and the other the *Moon of the Mountain*. When that prince was assassinated, many precious ornaments belonging to the crown were pillaged, and privately disposed of by the soldiers who shared the plunder. See Diamond, under Mineralogy, where the account given of this diamond is somewhat different.

Shafras, who was called *Millionshik* at Astracan, then had his residence at Bassora, with two of his brothers. A chief of the Avganians one day applied to him, and proposed to sell the diamond already mentioned for a very moderate sum, probably the Moon of the Mountain, together with a very large emerald, a ruby of considerable size, and other precious stones of less value. Shafras was astonished at the offer; and giving out that he had not a sufficient sum to purchase them, he requested time to consult with his brothers on the subject. The vender did not again make his appearance, probably from [illegible]. Shafras, with the approbation of his brothers, went directly in search of the [illegible]ger with the jewels, but by that time he had left Bassora. Shafras, however, accidentally met him at [illegible], and [illegible] 895[illegible]

Shafras || Shaftsbury

for all his jewels. Shafras and his brothers being well aware that the most profound secrecy was absolutely necessary, resolved to remain at Bassora.

At the expiration of 12 years, Shafras set off with the largest of the jewels, directing his route through Sham and Constantinople, and afterwards through Hungary and Silesia to the city of Amsterdam by land, where he publicly offered them for sale.

It is reported that the British government was among the bidders. The Russian court sent for the large diamond, with an offer to reimburse all reasonable expences, if the price could not be agreed on. When the diamond arrived, Count Panin, the Russian minister, made the following offer to Shafras. Besides the patent of hereditary nobility, which the vender demanded, he was to receive an annual pension of 6000 rubles during life, 500,000 rubles in cash (112,500l. Sterling), one-fifth of which was to be payable on demand, and the remainder by instalments in the course of ten years. He also claimed the order of nobility for his brothers, persisting so obstinately in his demands, that the diamond was returned.

Shafras was now very much perplexed. He had involved himself in expences, was forced to pay interest for considerable sums of borrowed money, and the law no prospect of selling the jewel to advantage. The negociation was recommenced with Russia by Count Gregory Grigorievitch Orlof, afterwards created a prince of the empire; and the diamond was purchased for 450,000 rubles (105,250l.) ready money, together with a grant of Russian nobility. We are informed that 120,000 rubles (27,000l.), fell to the share of the negociators, for commission, interest, and similar expences. Shafras settled at Astracan; and his riches, which by inheritance devolved to his daughters, have been in a great measure dissipated by the extravagance of his sons-in law.

SHAFT *of a* Column, in *Building*, is the body thereof between the base and capital; so called from its straightness. See Architecture.

Shaft, in mining, is the pit or hollow entrance into the mine. In the tin mines, after this is sunk about a fathom, they leave a little, long, square place, which is called a *shamble*.

Shafts are sunk some ten, some twenty fathoms deep into the earth, more or less. Of these shafts, there is the landing or working shaft, where they bring up the work or ore to the surface; but if it be worked by a horse engine or whim, it is called a *whim shaft*: and when the water is drawn out of the mine, it is indifferently named an *engine-shaft*, or the *rod shaft*. See Mine.

Shaft. See Trochilus, Ornithology *Index*.

SHAFTESBURY, a town of Dorsetshire in England, in W. Long. 2. 20. N. Lat. 51. 0. It stands on a high hill, and is built in the form of a bow. It enjoys a fine wholesome air, and has a fine prospect. It is a good thoroughfare, is governed by a mayor, and sends two members to parliament. This town is supposed to have been built in the 8th century, and to have been enlarged by King Alfred; and had 12 churches, besides a Benedictine monastery, in the time of the Saxons, but has now only three. St Edward the martyr was buried here. It had three mints before the [illegible], and, in the reign of Henry VIII. was the [illegible]

large

fragan bishop. It was incorporated by Queen Elizabeth and Charles II. and is governed by a mayor, recorder, twelve aldermen, bailiffs, and a common-council. It contains about 320 houses, many of which are of free-stone. Water is so scarce, that it used to be supplied from Motcomb; but it was obtained more commodiously in 1718, by means of engines, which raised the water above 300 feet perpendicular, and conveyed it to a large cistern in the middle of the town, from the distance of two miles. Yet even this is laid aside, and they have dug several pits, in which they preserve the rain-water; and the poor get their living to this day by fetching it in pails or on horses. It gives the title of earl to the noble family of Cooper.

SHAFTESBURY, *Earl of*. See COOPER.

SHAG. See PELICANUS, ORNITHOLOGY *Index*.

SHAGREEN, or CHAGREEN, in *Commerce*, a kind of grained leather prepared of the skin of a species of SQUALUS, and much used in covering cases, books, &c.

The best is that brought from Constantinople, of a brownish colour; the white is the worst. It is extremely hard; yet, when steeped in water, it becomes very soft and pliable; whence it is of great use among case-makers. It takes any colour that is given it, red, green, yellow, or black. It is frequently counterfeited by morocco, formed like shagreen; but this last is distinguished by its peeling off, which the first does not.

The following is the method of preparing shagreen, as it is described by Professor Pallas.

" All kinds of horses or asses skins, which have been dressed in such a manner as to appear grained, are, by the Tartars, called *sauwer*, by the Persians *sogre*, and by the Turks *sogri*, from which the Europeans have made *shagreen* or *chagrin*. The Tartars who reside at Astracan, with a few of the Armenians of that city, are the only people in the Russian empire acquainted with the art of making shagreen. Those who follow this occupation not only gain considerable profit by the sale of their production to the Tartars of Cuban, Astracan, and Casan, who ornament with it their Turkey leather boots, slippers, and other articles made of leather, but they derive considerable advantage from the great sale of horses hides, which have undergone no other process than that of being scraped clean, and of which several thousands are annually exported, at the rate of from 75 to 85 roubles per hundred, to Persia, where there is a scarcity of such hides, and from which the greater part of the shagreen manufactured in that country is prepared. The hind part only of the hide, however, which is cut out in the form of a crescent about a Russian ell and a half in length across the loins, and a short ell in breadth along the back, can properly be employed for shagreen. The remaining part, as is proved by experience, is improper for that purpose, and is therefore rejected.

" The preparation of the skins, after being cut into the above form, is as follows:—They are deposited in a tub filled with pure water, and suffered to remain there for several days, till they are thoroughly soaked, and the hair has dropped off. They are then taken from the tub, one by one, extended on boards placed in an oblique direction against a wall, the corners of them, which reach beyond the edges of the board, being made fast, and the hair with the epidermis is then scraped off with a blunt iron scraper called *urak*. The skins thus cleaned are again put in pure water to soak. When all the skins have undergone this part of the process, they are taken from the water a second time, spread out one after the other as before, and the flesh side is scraped with the same kind of instrument. They are carefully cleaned also on the hair side, so that nothing remains but the pure fibrous tissue, which serves for making parchment, consisting of coats of white medullary fibres, and which has a resemblance to a swine's bladder softened in water.

" After this preparation, the workmen take a certain kind of frames called *pälzi*, made of a straight and a semicircular piece of wood, having nearly the same form as the skins. On these the skins are extended in as smooth and even a manner as possible by means of cords; and during the operation of extending them, they are several times besprinkled with water, that no part of them may be dry, and occasion an unequal tension. After they have been all extended on the frames, they are again moistened, and carried into the house, where the frames are deposited close to each other on the floor with the flesh side of the skin next the ground. The upper side is then thickly bestrewed with the black exceedingly smooth and hard seeds of a kind of goose foot (*chenopodium album*), which the Tartars call *alabuta*, and which grows in abundance, to about the height of a man, near the gardens and farms on the south side of the Volga; and that they may make a strong impression on the skins, a piece of felt is spread over them, and the seeds are trod down with the feet, by which means they are deeply imprinted into the soft skins. The frames, without shaking the seeds, are then carried out into the open air, and placed in a reclining position against a wall to dry, the side covered with the seeds being next the wall, in order that it may be sheltered from the sun. In this state the skins must be left several days to dry in the sun, until no appearance of moisture is observed in them, when they are fit to be taken from the frames. When the impressed seeds are beat off from the hair side, it appears full of indentations or inequalities, and has acquired that impression which is to produce the grain of the shagreen, after the skins have been subjected to the last smoothing or scraping, and have been dipped in a ley, which will be mentioned hereafter, before they receive the dye.

" The operation of smoothing is performed on an inclined bench or board, which is furnished with an iron hook, and is covered with thick felt of sheep's wool, on which the dry skin may gently rest. The skin is suspended in the middle of the bench or board to its iron hook, by means of one of the holes made in the edge of the skin for extending it in its frame as before mentioned; and a cord, having at its extremity a stone or a weight, is attached to each end of the skin, to keep it in its position while under the hands of the workman. It is then subjected to the operation of smoothing and scraping by means of two different instruments. The first used for this purpose, called by the Tartars *tokar*, is a piece of sharp iron bent like a hook, with which the surface of the shagreen is pretty closely scraped to remove all the projecting inequalities. This

Shagreen. This operation, on account of the corneous hardneſs of the dry ſkin, is attended with ſome difficulty; and great caution is at the ſame time required that too much of the impreſſion of the *alabuta* ſeed be not deſtroyed, which might be the caſe if the iron were kept too ſharp. As the iron, however, is pretty blunt, which occaſions inequalities on the ſhagreen, this inconvenience muſt afterwards be remedied by means of a ſharp ſcraping iron or *urak*, by which the ſurface acquires a perfect uniformity, and only faint impreſſions of the *alabuta* ſeed then remain, and ſuch as the workman wiſhes. After all theſe operations, the ſhagreen is again put into water, partly to make it pliable, and partly to raiſe the grain. As the ſeeds occaſion indentations on the ſurface of the ſkin, the intermediate ſpaces, by the operations of ſmoothing and ſcraping, loſe ſome part of their projecting ſubſtance; but the points which have been depreſſed, and which have loſt none of their ſubſtance, now ſwell up above the ſcraped parts, and thus form the grain of the ſhagreen. To produce this effect, the ſkins are left to ſoak in water for 24 hours; after which they are immerſed ſeveral times in a ſtrong warm ley, obtained, by boiling, from a ſtrong alkaline earth named *ſchora*, which is found in great abundance in the neighbourhood of Aſtracan. When the ſkins have been taken from this ley, they are piled up, while warm, on each other, and ſuffered to remain in that ſtate ſeveral hours; by which means they ſwell, and become ſoft. They are then left 24 hours in a moderately ſtrong pickle of common ſalt, which renders them exceedingly white and beautiful, and fit for receiving any colour. The colour moſt uſual for theſe ſkins is a ſea-green; but old experienced workmen can dye them blue, red, or black, and even make white ſhagreen.

" For the green colour nothing is neceſſary but filings of copper and ſal ammoniac. Sal ammoniac is diſſolved in water till the water is completely ſaturated; and the ſhagreen ſkins, ſtill moiſt, after being taken from the pickle, are waſhed over with the ſolution on the ungrained fleſh ſide, and when well moiſtened a thick layer of copper filings is ſtrewed over them: the ſkins are then folded double, ſo that the ſide covered with the filings is innermoſt. Each ſkin is then rolled up in a piece of felt; the rolls are all ranged together in proper order, and they are preſſed down in an uniform manner by ſome heavy bodies placed over them, under which they remain 24 hours. During that period, the ſolution of ſal ammoniac diſſolves a quantity of the cupreous particles ſufficient to penetrate the ſkin, and to give it a ſea-green colour. If the firſt application be not ſufficient, the proceſs is repeated in the ſame manner; after which the ſkins are ſpread out and dried.

" For the blue dye, indigo is uſed. About two pounds of it, reduced to a fine powder, are put into a kettle; cold water is poured over it, and the mixture is ſtirred round till the colour begins to be diſſolved. Five pounds of pounded *alakar*, which is a kind of barilla or crude ſoda, prepared by the Armenians and Calmucs, is then diſſolved in it, with two pounds of lime and a pound of pure honey, and the whole is kept ſeveral days in the ſun, and during that time frequently ſtirred round. The ſkins intended to be dyed blue muſt be moiſtened only in the natrous ley *ſchora*, but not in the ſalt brine. When ſtill moiſt, they are folded up and ſewed together at the edge, the fleſh ſide being innermoſt, and the ſhagreened hair ſide outwards; after which they are dipped three times in the remains of an exhauſted kettle of the ſame dye, the ſuperfluous dye being each time expreſſed; and after this proceſs they are dipped in the freſh dye prepared as above, which muſt not be expreſſed. The ſkins are then hung up in the ſhade to dry; after which they are cleaned and paired at the edges.

" For black ſhagreen, gall nuts and vitriol are employed in the following manner:—The ſkins, moiſt from the pickle, are thickly beſtrewed with finely pulverized gall nuts. They are then folded together, and laid over each other for 24 hours. A new ley, of bitter ſaline earth or *ſckora*, is in the mean time prepared, and poured hot into ſmall troughs. In this ley each ſkin is ſeveral times dipped; after which they are again beſtrewed with pounded gall-nuts, and placed in heaps for a certain period, that the galls may thoroughly penetrate them, and they are dried and beat, to free them from the duſt of the galls. When this is done, they are rubbed over, on the ſhagreen ſide, with melted ſheep's tallow, and expoſed a little in the ſun, that they may imbibe the greaſe. The ſhagreen makers are accuſtomed alſo to roll up each ſkin ſeparately, and to preſs or ſqueeze it with their hands againſt ſome hard ſubſtance, in order to promote the abſorption of the tallow. The ſuperfluous particles are removed by means of a blunt wooden ſcraper (*urac*); and when this proceſs is finiſhed, and the ſkins have lain ſome time, a ſufficient quantity of vitriol of iron is diſſolved in water, with which the ſhagreen is moiſtened on both ſides, and by this operation it acquires a beautiful black dye. It is then dreſſed at the edges, and in other places where there are any blemiſhes.

" To obtain white ſhagreen, the ſkins muſt firſt be moiſtened on the ſhagreen ſide with a ſtrong ſolution of alum. When the ſkin has imbibed this liquor, it is daubed over on both ſides with a paſte made of flour, which is ſuffered to dry. The paſte is then waſhed off with alum water, and the ſkin is placed in the ſun till it is completely dry. As ſoon as it is dry, it is gently beſmeared with pure melted ſheep's tallow, which it is ſuffered to imbibe in the ſun; and to promote the effect, it is preſſed and worked with the hands. The ſkins are then faſtened in ſucceſſion to the before-mentioned bench, where warm water is poured over them, and the ſuperfluous fat is ſcraped off with a blunt wooden inſtrument. In the laſt operation the warm water is of great ſervice. In this manner ſhagreen perfectly white is obtained, and nothing remains but to pare the edges and dreſs it.

" But this white ſhagreen is not intended ſo much for remaining in that ſtate, as for receiving a dark red dye; becauſe, by the above previous proceſs, the colour becomes much more perfect. The ſkins deſtined for a red colour muſt not be immerſed firſt in ley of bitter ſalt earth (*ſchora*), and then in pickle, but after they have been whitened, muſt be left to ſoak in the pickle for 24 hours. The dye is prepared from cochineal, which the Tartars call *kirmitz*. About a pound of the dried herb *tſchagann*, which grows in great abundance in the neighbourhood of Aſtracan, and is a kind of of soda plant or kali (*salsola ericoides*) (A), is boiled a full hour in a kettle containing about four common pailfuls of water; by which means the water acquires a greenish colour. The herb is then taken out, and about half a pound of pounded cochineal is put into the kettle, and the liquor is left to boil a full hour, care being taken to stir it that it may not run over. About 15 or 20 drams of a substance which the dyers call *lüter* (orchilla) is added, and when the liquor has been boiled for some time longer, the kettle is removed from the fire. The skins taken from the pickle are then placed over each other in troughs, and the dye-liquor is poured over them four different times, and rubbed into them with the hands, that the colour may be equally imbibed and diffused. The liquor each time is expressed; after which they are fit for being dried. Skins prepared in this manner are sold at a much dearer rate than any of the other kinds."

SHAIK properly signifies an old man. In the east it is used to denote a lord or chief, a man of eminence and property. See SCHIECHS.

SHAKE, in singing. See TRILL.

SHAKESPEARE or SHAKSPEARE, *William*, the prince of dramatic writers, was born at Stratford upon Avon in Warwickshire, on the 23d of April 1564. From the register of that town, it appears that a plague broke out there on the 30th of June following, which raged with great violence; but fortunately it did not reach the house in which this infant prodigy lay. His father, John Shakespeare, enjoyed a small patrimonial estate, and was a considerable dealer in wool; his mother was the daughter and heir of Robert Arden of Wellingcote. Our illustrious poet being designed for the business of his father, received no better education than the instructions which the free-school of Stratford could afford. After applying some time to the study of Latin, he was called home to assist his father, who seems by some accident to have been reduced in his circumstances. Before arriving at the age of 19, he married the daughter of Mr Hathaway, a substantial yeoman in the neighbourhood of Stratford. This lady was eight years older than her husband. Having the misfortune to fall into bad company, he was seduced into some profligate actions, which drew on him a criminal prosecution, and at length forced him to take refuge in the capital. In concert with his associates, he broke into a park belonging to Sir Thomas Lucy of Charlecote, and carried off some of his deer. Every admirer of Shakespeare will regret that such a blemish should have stained his character; but, perhaps, if any thing can extenuate his guilt, we might ascribe it to the opinions of the age, which, perhaps, as was formerly the case in Scotland, might not distinguish the killing of deer by any mark of disgrace, or any charge of criminality. One thing at least is certain, that Shakespeare himself thought that the prosecution which Sir Thomas raised against him was carried on with too great severity; an opinion which he could not have entertained had this action been at that time viewed in the same criminal light as it is at present. Shakespeare testified his resentment against Sir Thomas, by writing a satirical ballad, which exasperated him so much, that the process was carried on with redoubled violence; and the young poet, in order to avoid the punishment of the law, was obliged to make his escape. This ballad would be considered as a curious relick, on account of its being the first production of Shakespeare; it would also be interesting to peruse a poem which could irritate the baronet to so high a degree. Tradition has preserved the first stanza:

A parliamente member, a justice of peace,
At home a poor scare-crow, at London an asse.
If lowsie is Lucy, as some volke miscalle it,
Then Lucy is lowsie whatever befall it:
He thinks himself greate,
Yet an asse in his state,
We allowe by his ears, but with asses to mate.
If Lucy is lowsie, as some volke miscalle it,
Sing lowsie Lucy whatever befall it.

If the rest of the ballad was of a piece with this stanza, it might assist us to form some opinion of the irritability of the baronet, but will enable us to form no idea of the opening genius of Shakespeare.

Thus expelled from his native village, he repaired to London, where he was glad to accept a subordinate office in the theatre. It has been said that he was first engaged, while the play was acting, in holding the horses of those who rode to the theatre; but this story rests on a slender foundation. As his name is found printed among those of the other players before some old plays, it is probable that he was some time employed as an actor; but we are not informed what characters he played; we are only told, that the part which he acted best was that of the Ghost in Hamlet; and that he appeared in the character of Adam in *As you like it*. If the names of the actors prefixed to Ben Jonson's play of *Every Man in his Humour* were arranged in the same order as the persons represented, which is very probable, Shakespeare played the part of Old Knowell. We have reason therefore to suppose, as far as we can argue from these few facts, that he generally represented old men. See Malone's Chronology, in his edition of Shakespeare.

But though he was not qualified to shine as an actor, he was now in the situation which could most effectually rouse those latent sparks of genius which afterwards burst forth with so resplendent a flame. Being well acquainted with the mechanical business of the theatre and the taste of the times; possessed of a knowledge of the characters of men resembling intuition, an imagination that ranged at large through nature, selecting the grand, the sublime, and the beautiful; a judicious caution, that disposed him to prefer those plots which had already been found to please; an uncommon fluency

(A) The beautiful red Turkey leather is dyed with cochineal prepared in the same manner. Professor Gmelin junior, in the second part of his Travels through Russia, explains the herb *tschagann* by *artemisia annua*, having doubtless been deceived by the appearance the plant acquires after it has been dried. Besides, this *artemisia* is found only in the middle of Siberia, and never on the west side of the Irtisch.

Shakespeare.

fluency and force of expression; he was qualified at once to eclipse all who had gone before him.

Notwithstanding the unrivalled genius of Shakespeare, most of his plots were the invention of others; which, however, he certainly much improved, if he did not entirely new-model. We are assured, that prior to the theatrical compositions of Shakespeare, dramatic pieces were written on the following subjects, viz. King John, King Richard II. and III. King Henry IV. and V. King Henry VIII. King Lear, Antony and Cleopatra, Measure for Measure, the Merchant of Venice, the Taming of a Shrew, and the Comedy of Errors.

Among his patrons, the earl of Southampton is particularly honoured by him, in the dedication of two poems, Venus and Adonis, and Lucrece; in the latter especially, he expressed himself in such terms as gives countenance to what is related of that patron's distinguished generosity to him. In the beginning of King James I.'s reign (if not sooner) he was one of the principal managers of the playhouse, and continued in it several years afterwards; till, having acquired such a fortune as satisfied his moderate wishes and views in life, he quitted the stage, and all other business, and passed the remainder of his time in an honourable ease, at his native town of Stratford, where he lived in a handsome house of his own purchasing, to which he gave the name of *New Place;* and he had the good fortune to save it from the flames in the dreadful fire that consumed the greatest part of the town in 1614.

In the beginning of the year 1616, he made his will, wherein he testified his respect to his quondam partners in the theatre: he appointed his youngest daughter, jointly with her husband, his executors, and bequeathed to them the best part of his estate, which they came into the possession of not long after. He died on the 23d of April following, being the 53d year of his age; and was interred among his ancestors on the north side of the chancel, in the great church of Stratford, where there is a handsome monument erected for him, inscribed with the following elegiac distich in Latin:

Judicio Pylium, genio Socratem, arte Maronem,
Terra tegit, Populus mæret, Olympus habet.

In the year 1740, another very noble one was raised to his memory, at the public expence, in Westminster abbey; an ample contribution for this purpose being made upon exhibiting his tragedy of Julius Cæsar, at the theatre-royal in Drury-Lane, April 28th 1738.

Nor must we omit mentioning another testimony of the veneration paid to his manes by the public in general, which is, that a mulberry-tree planted upon his estate by the hands of this revered bard, was cut down not many years ago; and the wood being converted to several domestic uses, was all eagerly bought at a high price, and each single piece treasured up by its purchaser as a precious memorial of the planter.

The character of Shakespeare as a dramatic writer has been often drawn, but perhaps never with more accuracy than by the pen of Dr Johnson: "Shakespeare (says he) is above all writers, at least above all modern writers, the poet of nature; the poet that holds up to his readers a faithful mirror of manners and of life. His characters are not modified by the customs of particular places, unpractised by the rest of the world; by the peculiarities of studies or professions, which can operate but upon small numbers; or by the accidents of transient fashions or temporary opinions: they are the genuine progeny of common humanity, such as the world will always supply, and observation will always find. His persons act and speak by the influence of those general passions and principles by which all minds are agitated, and the whole system of life is continued in motion. In the writings of other poets, a character is too often an individual; in those of Shakespeare, it is commonly a species.

"It is from this wide extension of design that so much instruction is derived. It is this which fills the plays of Shakespeare with practical axioms and domestic wisdom. It was said of Euripides, that every verse was a precept; and it may be said of Shakespeare, that from his works may be collected a system of civil and economical prudence. Yet his real power is not shown in the splendor of particular passages, but by the progress of his fable, and the tenor of his dialogue; and he that tries to recommend him by select quotations, will succeed like the pedant in Hierocles, who, when he offered his house to sale, carried a brick in his pocket as a specimen.

"Upon every other stage the universal agent is love, by whose power all good and evil is distributed, and every action quickened or retarded. But love is only one of many passions; and as it has no great influence upon the sum of life, it has little operation in the dramas of a poet who caught his ideas from the living world, and exhibited only what he saw before him. He knew that any other passion, as it was regular or exorbitant, was a cause of happiness or calamity.

"Characters thus ample and general were not easily discriminated and preserved; yet perhaps no poet ever kept his personages more distinct from each other.

"Other dramatists can only gain attention by hyperbolical or aggravated characters, by fabulous and unexampled excellence or depravity, as the writers of barbarous romances invigorated the reader by a giant and a dwarf; and he that should form his expectations of human affairs from the play, or from the tale, would be equally deceived. Shakespeare has no heroes, his scenes are occupied only by men, who act and speak as the reader thinks that he should himself have spoken or acted on the same occasion: Even where the agency is supernatural, the dialogue is level with life. Other writers disguise the most natural passions and most frequent incidents; so that he who contemplates them in the book will not know them in the world: Shakespeare approximates the remote, and familiarizes the wonderful; the event which he represents will not happen, but if it were possible, its effects would probably be such as he has assigned; and it may be said, that he has not only shown human nature as it acts in real exigencies, but as it would be found in trials to which it cannot be exposed.

"This therefore is the praise of Shakespeare, that his drama is the mirror of life; that he who has mazed his imagination, in following the phantoms which other writers raise up before him, may here be cured of his delirious ecstasies, by reading human sentiments in human language: by scenes from which a hermit may esti-

Shakespeare. mate the transactions of the world, and a confessor predict the progress of the passions."

The learning of Shakespeare has frequently been a subject of inquiry. That he possessed much classical knowledge does not appear, yet he was certainly acquainted with the Latin poets, particularly with Terence, as Colman has justly remarked, which appears from his using the word *thrasonical*. Nor was he unacquainted with French and Italian. We are indeed told, that the passages in which these languages occur might be impertinent additions of the players; but is it probable, that any of the players so far surpassed Shakespeare?

That much knowledge is scattered over his works is very justly observed by Pope; but it is often such knowledge as books did not supply. "There is, however, proof enough (says Dr Johnson) that he was a very diligent reader; nor was our language then so indigent of books, but that he might very liberally indulge his curiosity without excursion into foreign literature. Many of the Roman authors were translated, and some of the Greek; the Reformation had filled the kingdom with theological learning; most of the topics of human disquisition had found English writers; and poetry had been cultivated, not only with diligence, but success. This was a stock of knowledge sufficient for a mind so capable of appropriating and improving it."

The works of Shakespeare consist of 35 dramatic pieces. The following is the chronological order which Mr Malone has endeavoured to establish, after a minute investigation, in which he has in general been successful:

1. First Part of King Henry VI. -	1589
2. Second Part of King Henry VI. -	1591
3. Third Part of King Henry VI. -	1591
4. A Midsummer Night's Dream -	1592
5. Comedy of Errors - -	1593
6. Taming of the Shrew - -	1594
7. Love's Labour Lost - -	1594
8. Two Gentlemen of Verona -	1595
9. Romeo and Juliet - -	1595
10. Hamlet - -	1596
11. King John - -	1596
12. King Richard II. - -	1597
13. King Richard III. - -	1597
14. First Part of King Henry IV. -	1597
15. Second Part of King Henry IV. -	1598
16. The Merchant of Venice - -	1598
17. All's Well that Ends Well -	1598
18. King Henry V. - -	1599
19. Much Ado about Nothing -	1600
20. As you like it - -	1600
21. Merry Wives of Windsor -	1601
22. King Henry VIII. - -	1601
23. Troilus and Cressida - -	1602
24. Measure for Measure - -	1603
25. The Winter's Tale - -	1604
26. King Lear - -	1605
27. Cymbelline - - -	1605
28. Macbeth - - -	1606
29. Julius Cæsar - -	1607
30. Antony and Cleopatra - -	1608
31. Timon of Athens - -	1609
32. Coriolanus - -	1610
33. Othello - -	1611
34. The Tempest - -	1612
35. Twelfth Night - -	1614

The first three of these, Mr Malone thinks, there is very strong reason to believe are not the original productions of Shakespeare; but that he probably altered them, and added some new scenes.

In the first folio edition in 1623, these plays were entitled "Mr William Shakespeare's Comedies, Histories, and Tragedies." They have been published by various editors. The first folio edition by Isaac Jaggard and Edward Blount; the second, folio, 1632, by Thomas Cotes for Robert Allot; the third, 1664, for P. C.; the fourth, 1685, for H. Herringman, E. Brewster, and R. Bentley. Rowe published an 8vo edition in 1709, in 7 vols, and a 12mo edition in 1714, in 9 vols; for which he received 36l. 10s. Pope published a 4to edition in 1725, in 6 vols, and a 12mo in 1728, in 10 vols; for which he was paid 217l. 12s. Theobald gave a new edition in 8vo in 1733, in 7 vols, another in 12mo in 1740, in 8 vols; and received for his labour 652l. 10s. Sir Thomas Hanmer published an edition in 1744, in 6 vols 4to. Dr Warburton's 8vo edition came out in 1747, in 8 vols; for which he was paid 560l. The editions published since that time, are Dr Johnson's in 1765, in 8 vols 8vo. Stevens's in 1766, in 4 vols 8vo. Capell's in 1768, in 10 vols, crown 8vo; for this the author was paid 300l. A second edition of Hanmer's in 1771, 6 vols. Johnson's and Stevens's in 1773, in 10 vols 8vo; a second edition in 1778; a third by Reed in 1785; and Malone's crown 8vo edition in 1789, in 10 vols.

The most authentic of the old editions is that of 1623. "At last (says Dr Johnson) an edition was undertaken by Rowe; not because a poet was to be published by a poet, for Rowe seems to have thought very little on correction or explanation, but that our author's works might appear like those of his fraternity, with the appendages of a life and recommendatory preface. Rowe has been clamorously blamed for not performing what he did not undertake; and it is time that justice be done him, by confessing, that though he seems to have had no thought of corruption beyond the printer's errors, yet he has made many emendations, if they were not made before, which his successors have received without acknowledgment, and which, if they had produced them, would have filled pages with censures of the stupidity by which the faults were committed, with displays of the absurdities which they involved, with ostentatious expositions of the new reading, and self-congratulations on the happiness of discovering it."

The nation had been for many years content enough with Mr Rowe's performance, when Mr Pope made them acquainted with the true state of Shakespeare's text, showed that it was extremely corrupt, and gave reason to hope that there were means of reforming it. Mr Pope's edition, however, he observes, fell below his own expectations; and he was so much offended, when he was found to have left any thing for others to do, that he passed the latter part of his life in a state of hostility with verbal criticism.

The only task, in the opinion of Mr Malone, for which Pope was eminently and indisputably qualified, was

was to mark the faults and beauties of his author.—When he undertook the office of a commentator, every anomaly of language, and every expression that was currently in use, were considered as errors or corruptions, and the text was altered or amended, as it was called, at pleasure. Pope is openly charged with being one of the great corrupters of Shakespeare's text.

Pope was succeeded by Theobald, who collated the ancient copies, and rectified many errors. He was, however, a man of narrow comprehension and of little learning, and what is worse, in his reports of copies and editions, he is not to be trusted without examination. From the liberties taken by Pope, the edition of Theobald was justly preferred, because he professed to adhere to the ancient copies more strictly, and illustrated a few passages by extracts from the writers of our poet's age. Still, however, he was a considerable innovator; and while a few arbitrary changes made by Pope were detected, innumerable sophistications were silently adopted.

Sir Thomas Hanmer, who comes next, was a man of critical abilities, and of extensive learning. His corrections are commonly just, but sometimes capricious. He is censurable, too, for receiving without examination almost all the innovations of Pope.

The original and predominant error of Warburton's commentary, is acquiescence in his first thoughts; that precipitation which is produced by consciousness of quick discernment; and that confidence which presumes to do, by surveying the surface, what labour only can perform, by penetrating to the bottom. His notes exhibit sometimes perverse interpretations, and sometimes improbable conjectures; he at one time gives the author more profundity of meaning than the sentence admits, and at another discovers absurdities where the sense is plain to every other reader. But his emendations are likewise often happy and just; and his interpretation of obscure passages learned and sagacious.

It has indeed been said by his defenders, that his great object was to display his own learning; and certainly, in spite of the clamour raised against him for substituting his own chimerical conceits instead of the genuine text of Shakespeare, his work increased his reputation. But as it is of little value as a commentary on Shakespeare, since Warburton is now gone, his work will probably soon sink into oblivion.

In 1765 Dr Johnson's edition, which had long been impatiently expected, was given to the public. His vigorous and comprehensive understanding threw more light on his author than all his predecessors had done. The character which he gave of each play is generally just. His refutation of the false glosses of Theobald and Warburton, and his numerous explications of involved and difficult passages, entitle him to the gratitude of every admirer of Shakespeare.

The last editor is Mr Malone, who was eight years employed in preparing his edition. By collating the most authentic copies, he has been careful to purify the text. He has been so industrious, in order to discover the meaning of the author, that he has ransacked many volumes, and trusts that, besides his additional illustrations, not a single valuable explication of any obscure passage in these plays has ever appeared, which he has not inserted in his edition. He rejects Titus Andronicus, as well as the three plays formerly mentioned, as not being the authentic productions of Shakespeare. To the whole he has added an appendix, and a copious glossary.—Of this work a less expensive edition has been published in 7 vols 12mo, in which the general introductory observations prefixed to the different plays are preserved, and the numerous notes abridged.

This judicious commentator has certainly done more for the elucidation and correction of Shakespeare than all who came before him, and has followed with indefatigable patience the only road which a commentator of Shakespeare ought to observe.

Within 50 years after our poet's death, Dryden says that he was become "a little obsolete;" and in the beginning of the 18th century Lord Shaftesbury complains of his rude unpolished style, and his antiquated phrase and wit. These complaints were owing to the great revolution which the English language has undergone, and to the want of an enlightened commentator. These complaints are now removed, for an enlightened commentator has been found in Mr Malone.

We have only farther to add, that in the year 1790 a copious index to the remarkable passages and words in the plays of Shakespeare was published by the Reverend Mr Ayscough; a gentleman to whom the literary world is much indebted for several very valuable keys of knowledge. In fine, the admirers of Shakespeare are now, by the labours of several eminent men, furnished with every help that can enable them to understand the sense and to taste the beauties of this illustrious poet.

SHAKLES. See SHACKLES.

SHALE, in MINERALOGY, a kind of SCHISTUS, of a black colour and slaty structure, or a clay hardened into a stony consistence, and so much impregnated with bitumen that it becomes somewhat like a coal. The acid emitted from shale, during its calcination, uniting itself to the argillaceous earth of the shale, forms alum. About 120 tons of calcined shale will make one ton of alum. The shale, after being calcined, is steeped in water, by which means the alum, which is formed during the calcination of the shale, is dissolved: this dissolved alum undergoes various operations before it is formed into the alum of the shops. Watson's Chemical Essays, vol. ii. p. 315. See ALUM, CHEMISTRY *Index*.

This kind of slate forms large strata in Derbyshire; and that which lies near the surface of the earth is of a softer and more shivery texture than that which lies deeper. It is also found in large strata, generally above the coal, in most coal counties of this kingdom.

SHALLOP, SHALLOOP, or SLOOP, is a small light vessel, with only a small main-mast and fore-mast, and lug-sails, to haul up, and let down, on occasion.—Shallops are commonly good sailers, and are therefore often used as tenders upon men of war.

SHALLOT, or ESCHALOT. See ALLIUM, BOTANY and GARDENING *Index*.

SHAMANS are wizards or conjurers, in high repute among several idolatrous nations inhabiting different parts of Russia. By their enchantments they pretend to cure diseases, to divert misfortunes, and to foretel futurity. They are great observers of dreams, by the interpretation of which they judge of their good or bad fortune. They pretend likewise to chiromancy, and to foretel a man's good or ill success by the lines of his

his hand. By these and such like means they have a very great ascendancy over the understandings, and a great influence on the conduct, of those people.

SHAMBLES, among miners, a sort of niches or landing places, left at such distances in the adits of the mines, that the shovel-men may conveniently throw up the ore from shamble to shamble, till it comes to the top of the mine.

SHAMOIS, CHAMOIS, or SHAMMY, a kind of leather, either dressed in oil or tanned, much esteemed for its softness, pliancy, &c. It is prepared from the skin of the chamois, or shamois, a kind of rupicapra, or wild goat, called also isard, inhabiting the mountains of Dauphiny, Savoy, Piedmont, and the Pyrenees. Besides the softness and warmth of the leather, it has the faculty of bearing soap without damage; which renders it very useful on many accounts.

In France, &c. some wear the skin raw, without any preparation. Shammy leather is used for the purifying of mercury, which is done by passing it through the pores of this skin, which are very close. The true chamois leather is counterfeited with common goat, kid, and even with sheep skins, the practice of which makes a particular profession, called by the French *chamoisure*. The last, though the least esteemed, is yet so popular, and such vast quantities of it are prepared, especially about Orleans, Marseilles, and Tholouse, that it may be proper to give the method of preparation.

Manner of shamoising, or of preparing sheep, goat, or kid skins in oil, in imitation of shammy.—The skins, being washed, drained, and smeared over with quicklime on the fleshy side, are folded in two lengthwise, the wool outwards, and laid in heaps, and so left to ferment eight days, or, if they had been left to dry after flaying, then fifteen days.

Then they are washed out, drained, and half dried; laid on a wooden leg, or horse, the wool stripped off with a round staff for that purpose, and laid in a weak pit, the lime whereof had been used before, and has lost the greatest part of its force.

After 24 hours they are taken out, and left to drain 24 more; they are then put in another stronger pit. This done, they are taken out, drained, and put in again, by turns; which begins to dispose them to take oil; and this practice they continue for six weeks in summer, or three months in winter: at the end whereof they are washed out, laid on the wooden leg, and the surface of the skin on the wool side peeled off, to render them the softer; then made into parcels, steeped a night in the river, in winter more, stretched six or seven over one another on the wooden leg, and the knife passed strongly on the flesh side, to take off any thing superfluous, and render the skin smooth. Then they are steeped, as before, in the river, and the same operation is repeated on the wool side; they are then thrown into a tub of water, with bran in it, which is brewed among the skins till the greatest part sticks to them, and then separated into distinct tubs, till they swell, and rise of themselves above the water. By this means the remains of the lime are cleared out; they are then wrung out, hung up to dry on ropes, and sent to the mill, with the quantity of oil necessary to scour them: the best oil is that of stock-fish. Here they are first thrown in bundles into the river for 12 hours, then laid in the mill-trough, and fulled without oil till they be well softened; then oiled with the hand, one by one, and thus formed into parcels of four skins each; which are milled and dried on cords a second time; then a third; and then oiled again, and dried. This process is repeated as often as necessity requires; when done, if there be any moisture remaining, they are dried in a stove, and made up into parcels wrapped up in wool; after some time they are opened to the air, but wrapped up again as before, till such time as the oil seems to have lost all its force, which it ordinarily does in 24 hours. The skins are then returned from the mill to the chamoiser to be scoured; which is done by putting them in a lixivium of wood-ashes, working and beating them in it with poles, and leaving them to steep till the ley hath had its effect; then they are wrung out, steeped in another lixivium, wrung again; and this is repeated till all the grease and oil be purged out. When this is done, they are half dried, and passed over a sharp-edged iron instrument, placed perpendicular in a block, which opens, softens, and makes them gentle. Lastly, they are thoroughly dried, and passed over the same instrument again; which finishes the preparation, and leaves them in form of shammy.

Kid and goat skins are shamoised in the same manner as those of sheep, excepting that the hair is taken off without the use of any lime; and that when brought from the mill they undergo a particular preparation called *ramalling*, the most delicate and difficult of all the others. It consists in this, that, as soon as brought from the mill, they are steeped in a fit lixivium, taken out, stretched on a round wooden leg, and the hair is scraped off with the knife; this makes them smooth, and in working to cast a kind of fine knap. The difficulty is in scraping them evenly.

SHANK, or *SHANK-Painter*, in a ship, is a short chain fastened under the foremast shrouds, by a bolt, to the ship's sides, having at the other end a rope fastened to it. On this shank-painter the whole weight of the aft part of the anchor rests, when it lies by the ship's side. The rope, by which it is hauled up, is made fast about a timber head.

SHANK, in the manege, that part of a horse's fore leg which lies between the knee and the fetlock.

SHANKER, or CHANCRE, in *Medicine*, a malignant ulcer, usually occasioned by some venereal disorder. See MEDICINE, N° 350.

SHANNON, the largest river in Ireland, and one of the finest in the British dominions, not only on account of its rolling 200 miles, but also of its great depth in most places, and the gentleness of its current, by which it might be made exceedingly serviceable to the improvement of the country, the communication of its inhabitants, and consequently the promoting of inland trade, through the greatest part of its long course. But the peculiar prerogative of the Shannon is its situation, running from north to south, and separating the province of Connaught from Leinster and Munster, and of consequence dividing the greatest part of Ireland into what lies on the east and that on the west of the river; watering in its passage the valuable county of Leitrim, the plentiful shire of Roscommon, the fruitful county of Galway, and the pleasant county of Clare; the small but fine shire of Longford, the King's county, and fertile county of Meath in Leinster, the populous county of Tipperary, the spacious shire of Limerick,

rick, and the rough but pleasant county of Kerry in Munster; visiting 10 counties in its passage, and having on its banks the following remarkable places, viz. Leitrim, Jamestown, Lanesborough, Athlone, Clonfert, Killaloe, and Limerick; at 20 leagues below the latter it spreads gradually several miles in extent, so that some have considered its expansion as a lake. It at last joins its waters to the sea, being navigable all that way for the largest vessels.

SHANSCRIT, the language of the Bramins of Hindostan. See Philology, sect. v.

SHARE *of a Plough*, that part which cuts the ground; the extremity forwards being covered with a sharp-pointed iron, called the *point of the share*, and the end of the wood behind the *tail of the share*.

SHARK. See Squalus, Ichthyology *Index*.

SHARON, a name common to three cantons of Palestine. The first lay between Mount Tabor and the sea of Tiberias; the second between the city of Cæsarea of Palestine, and Joppa; and the third lay beyond Jordan. To give an idea of perfect beauty, Isaiah said, the glory of Lebanon and the beauty of Carmel must be joined to the abundance of Sharon. (Isaiah xxxiii. 9. xxxi. 2.). The plains of Sharon are of vast extent; and, when surveyed by the Abbé Mariti a few years ago, they were sown with cucumbers; and he informs us, that such a number is annually produced, as not only to supply the whole neighbourhood, but also all the coasts of Cyprus and the city of Damietta. In the middle of the plain, between Arsus and Lydda, rises a small mountain, upon the ridge of which there is a small village called Sharon, from the name of the ancient city whose king was conquered by Joshua.

SHARP, James, archbishop of St Andrew's, was born of a good family in Banffshire in 1618. He devoted himself very early to the church, and was educated for that purpose in the university of Aberdeen. When the solemn league and covenant was framed in 1638, the learned men in that seminary, and young Sharp in particular, declared themselves decidedly against it. To avoid the insults and indignities to which he was subjected in consequence of this conduct, he retired to England, where he contracted an acquaintance with some of the most celebrated divines in that country.

At the commencement of the civil wars he returned to Scotland. During his journey thither, he accidentally met with Lord Oxenford, who was so charmed with his conversation, that he invited him to his house. While he resided with that nobleman, he became known to the earl of Rothes, who procured him a professorship at St Andrew's. By the interest of the earl of Crawford he was soon after appointed minister of Crail; where he conducted himself, it is said, in an exemplary manner.

Sharp had always inclined to the cause of royalty, and had for some time kept up a correspondence with his exiled prince. After the death of the protector he began to declare himself more openly, and seems to have enjoyed a great share of the confidence of Monk, who was at that time planning the restoration of Charles II. When that general marched to London, the presbyterians sent Sharp to attend him in order to support their interests. At the request of General Monk and the chief presbyterians in Scotland, Mr Sharp was sent over to the king at Breda to procure from him, if possible, the establishment of presbyterianism. On his return, he assured his friends that "he had found the king very affectionate to Scotland, and resolved not to wrong the settled government of the church: but he apprehended they were mistaken who went about to establish the presbyterian government."

Charles was soon after restored without any terms. All the laws passed in Scotland since the year 1633 were repealed; the king and his ministers resolved at all hazards to restore prelacy. Mr Sharp, who had been commissioned by the Scotch presbyterians to manage their interests with the king, was prevailed upon to abandon the party; and, as a reward for his compliance, he was made archbishop of St Andrew's. This conduct rendered him very odious in Scotland; he was accused of treachery and perfidy, and reproached by his old friends as a traitor and renegado. The absurd and wanton cruelties which were afterwards committed, and which were imputed in a great measure to the archbishop, rendered him still more detested. Nor is it probable that these accusations were without foundation: the very circumstance of his having been formerly of the presbyterian party would induce him, after forsaking them, to treat them with severity. Besides, it is certain, that when after the rout at Pentland-hills he received an order from the king to stop the executions, he kept it for some time before he produced it to council.

There was one Mitchell a preacher, and a desperate fanatic, who had formed the design of taking vengeance for these cruelties by assassinating the archbishop. He fired a pistol at him as he was sitting in his coach; but the bishop of Orkney, lifting up his hand at the moment, intercepted the ball. Though this happened in the midst of Edinburgh, the primate was so much detested, that nobody stopped the assassin; who, having walked leisurely home, and thrown off his disguise, returned, and mixed unsuspected with the crowd. Some years after, the archbishop observing a man eyeing him with keenness, suspected that he was the assassin, and ordered him to be brought before him. It was Mitchell. Two loaded pistols were found in his pocket. The primate offered him a pardon if he would confess the crime; the man complied; but Sharp, regardless of his promise, conducted him to the council. The council also gave him a solemn promise of pardon if he would confess his guilt, and discover his accomplices. They were much disappointed to hear that only one man was privy to his purpose, who was since dead. Mitchell was then brought before a court of justice, and ordered to make a third confession, which he refused. He was imprisoned for several years, and then tried. His own confession was urged against him. It was in vain for him to plead the illegality of that evidence, and to appeal to the promise of pardon previously given. The council took an oath that they had given no such promise; and Mitchell was condemned. Lauderdale, who at that time governed Scotland, would have pardoned him, but the primate insisted on his excution; observing, that if assassins were permitted to go unpunished, his life must be continually in danger. Mitchell was accordingly executed.

Sharp had a servant, one Carmichael, who by his cruelty had rendered himself particularly odious to the zealots. Nine men formed the resolution of waylaying him in Magus-moor, about three miles from St Andrew's.

Sharp. drew's. While they were waiting for this man, the primate himſelf appeared with very few attendants. This they looked upon as a declaration of heaven in their favour; and calling out, "the Lord has delivered him into our hands," they ran up to the carriage. They fired at him without effect; a circumſtance which was afterwards imputed to magic. They then diſpatched him with their ſwords, regardleſs of the tears and intreaties of his daughter, who accompanied him (A).

Thus fell Archbiſhop Sharp, whoſe memory is even at preſent deteſted by the common people of Scotland. His abilities were certainly good, and in the early part of his life he appears with honour and dignity. But his conduct afterwards was too cruel and inſincere to merit approbation. His treatment of Mitchell was mean and vindictive. How far he contributed to the meaſures adopted againſt the preſbyterians is not certain. They were equally cruel and impolitic; nor did their effects ceaſe with the meaſures themſelves. The unheard-of cruelties exerciſed by the miniſters of Cha. II. againſt the adherents of the covenant, raiſed ſuch a flame of enthuſiaſm and bigotry as is not yet entirely extinguiſhed.

Sharp, *Dr John*, archbiſhop of York, was deſcended from the Sharps of Little Norton, a family of Bradford Dale in Yorkſhire; and was ſon of an eminent tradeſman of Bradford, where he was born in 1644. He was educated at Cambridge, and in 1667 entered into orders. That ſame year he became domeſtic chaplain to Sir Heneage Finch, then attorney-general. In 1672 he was collated to the archdeaconry of Berkſhire. In 1675 he was inſtalled a prebendary in the cathedral church of Norwich; and the year following was inſtituted into the rectory of St Bartholomew near the Royal Exchange, London. In 1681 he was, by the intereſt of his patron Sir Heneage Finch, then lord high chancellor of England, made dean of Norwich; but in 1686 was ſuſpended for taking occaſion, in ſome of his ſermons, to vindicate the doctrine of the church of England in oppoſition to Popery. In 1688 he was ſworn chaplain to King James II. being then probably reſtored after his ſuſpenſion for it is certain that he was chaplain to King Charles II. and attended as a court chaplain at the coronation of King James II. In 1689 he was declared dean of Canterbury; but never could be perſuaded to fill up any of the vacancies made by the deprived biſhops. Upon the death of Dr Lamplugh, he was promoted to the ſee of York. In 1702 he preached the ſermon at the coronation of Queen Anne; and the ſame year was ſworn of the privy-council, and made lord almoner to her majeſty. He died at Bath in 1713; and was interred in the cathedral of York, where a monument is erected to his memory.—His ſermons, which were collected after his death and publiſhed in 7 vols 8vo, are juſtly admired. Sharp.

Sharp, *Abraham*, an eminent Engliſh mathematician, and aſtronomer, was born at Little Horton, near Bradford, in the year 1651. He was put apprentice to a merchant at Mancheſter; but ſo ſtrongly was he inclined to the ſtudy of mathematics, that he ſoon found his ſituation both irkſome and diſagreeable. By the mutual conſent, therefore, of his maſter and himſelf, he quitted the buſineſs of a merchant. He then removed to Liverpool, where he wholly devoted himſelf to mathematical ſtudies, and where, for a ſubſiſtence, he taught writing and accounts.

Soon after this a merchant from London, in whoſe houſe the celebrated Mr Flamſteed then lodged, engaged Mr Sharp to be his book-keeper. With this eminent aſtronomer he ſoon contracted an intimate friendſhip, and by his recommendation he obtained a more profitable employment in the dock-yard of Chatham, where he continued till his friend and patron called him to his aſſiſtance. Mr Sharp was chiefly employed in the conſtruction of the mural arch, which he finiſhed in the courſe of 14 months ſo entirely to the ſatisfaction of Mr Flamſteed, that he ſpoke of him in terms of the higheſt praiſe. In the opinion of Mr Smeaton, this was the firſt good inſtrument of the kind, and Mr Sharp the firſt artiſt who cut delicate diviſions on aſtronomical inſtruments. When this inſtrument was conſtructed, Mr Sharp was but 25, and Mr Flamſteed 30 years of age. Mr Sharp aſſiſted his friend in making a catalogue of nearly 3000 fixed ſtars, with their longitudes and magnitudes, their right aſcenſions and polar diſtances, with the variations of the ſame while they change their longitude by one degree.

But from the fatigue of conſtantly obſerving the ſtars by night, in a cold thin air, added to a weakly conſtitution, his health was much impaired; for the recovery of which he requeſted leave to retire to his houſe at Horton, where, as ſoon as he felt himſelf recovering, he began to fit up an obſervatory of his own, and the teleſcopes he made uſe of were all of his own conſtruction, and the lenſes ground and adjuſted with his own hands.

It was about this time that he aſſiſted Mr Flamſteed in calculating moſt of the tables in the ſecond volume of his *Hiſtoria Cœleſtis*, as appears by their letters, to be ſeen in the hands of Mr Sharp's friends at Horton. The mathematician, ſays Dr Hutton, meets with ſomething extraordinary in Sharp's elaborate treatiſe of *Geometry Improved;* by a large and accurate table of ſegments of circles, its conſtruction and various uſes in the ſolution of ſeveral difficult problems, with compendious tables for finding a true proportional part; and their uſe in theſe or any other tables exemplified in making logarithms,

(A) Such is the account given by all our hiſtorians of the murder of Archbiſhop Sharp; and that he fell by the hands of fanatics, whom he perſecuted, is certain. A tradition, however, has been preſerved in different families deſcended from him, which may be mentioned, and is in itſelf certainly not incredible. The primate, it ſeems, who, when miniſter of Crail, was peculiarly ſevere in puniſhing the ſin of fornication, had, in the plenitude of his archiepiſcopal authority, taken notice of a criminal amour carried on between a nobleman high in office and a lady of ſome faſhion who lived within his dioceſe. This interference was in that licentious age deemed very impertinent; and the archbiſhop's deſcendants believe that the proud peer inſtigated the deluded rabble to murder their anceſtor.

logarithms, or their natural numbers, to 60 places of figures; there being a table of them for all primes to 1100, true to 61 figures. His concise treatise of Polyedra, or solid bodies of many bases, both of the regular ones and others; to which are added, 12 new ones, with various methods of forming them, and their exact dimensions in surds or species, and in numbers; illustrated with a variety of copper-plates, neatly engraved by his own hands. Indeed, few of the mathematical instrument makers could exceed him in exactly graduating or neatly engraving mathematical or astronomical instruments. He possessed a remarkably clear head for contriving, and an extraordinary hand for executing any thing, not only in mechanics, but likewise in drawing, writing, and making the most beautiful figures in all his calculations and constructions.

The quadrature of the circle was undertaken by him for his own amusement, in the year 1699, deduced from two different series, by which the truth of it was proved to 72 places of figures, as may be seen in Sherwin's Tables of Logarithms. In the same book may likewise be seen his ingenious improvements on the making of logarithms, and the constructing of the natural sines, tangents, and secants.

Mr Sharp kept up a correspondence with most of the eminent mathematicians and astronomers of his time, as Flamsteed, Newton, Halley, Wallis, Hodgson, &c. the answers to whose letters are all written on the backs or empty spaces, of the letters he received, in a short hand of his own invention. Being one of the most accurate and indefatigable computers whoever existed; he was many years the common resource for Flamsteed, Sir Jonas Moor, Halley, and others, in all sorts of troublesome and delicate calculations.

Mr Sharp was never married, and spent his time as a hermit. He was of a middle stature, very thin, of a weakly constitution; but remarkably feeble during the last 3 or 4 years before his death, which happened on the 18th of July 1742, in the 91st year of his age.

He was very irregular as to his meals, and uncommonly sparing in his diet, which he frequently took in the following manner. A little square hole, resembling a window, formed a communication between the room where he usually studied, and another where a servant could enter; and before this hole he had contrived a sliding board. It often happened, that the breakfast, dinner, and supper, have remained untouched, when the servant has gone to remove what was left,—so deeply was he engaged in calculations.

SHARP, in *Music*. See INTERVAL.

SHASTAH, the same as SHASTER.

SHASTER, SHASTAH, or BEDANG, the name of a sacred book, in high estimation among the idolaters of Hindostan, containing all the dogmas of the religion of the bramins, and all the ceremonies of their worship; and serving as a commentary on the VEDAM.

The term *Shaster* denotes "science" or "system"; and is applied to other works of astronomy and philosophy, which have no relation to the religion of the Indians. None but the bramins and rajahs of India are allowed to read the Vedam; the priests of the Banians, called *Shuderers*, may read the Shaster; and the people, in general, are allowed to read only the Paran or Pouran, which is a commentary on the Shaster.

The Shaster is divided into three parts: the first containing the moral law of the Indians; the second, the rites and ceremonies of their religion; and the third, the distribution of the people into tribes or classes, with the duties pertaining to each class.

The principal precepts of morality, contained in the first part of the Shaster, are the following: that no animal be killed, because the Indians attribute souls to brute animals as well as to mankind; that they neither hear nor speak evil, nor drink wine, nor eat flesh, nor touch any thing that is unclean; that they observe the feasts, prayers, and washings, which their law prescribes; that they tell no lies, nor be guilty of deceit in trade; that they neither oppress nor offer violence to one another; that they celebrate the solemn feasts and fasts, and appropriate certain hours of ordinary sleep to cultivate a disposition for prayer; and that they do not steal or defraud one another.

The ceremonies, contained in the second part of the Shaster, are such as these: that they wash often in the rivers, hereby obtaining the pardon of their sins; that they mark their forehead with red, in token of their relation to the Deity; that they present offerings and prayers under certain trees, set apart for this purpose; that they pray in the temples, make oblations to their pagodas or idols, sing hymns, and make processions, &c.; that they make pilgrimages to distant rivers, and especially to the Ganges, there to wash themselves and make offerings; that they make vows to particular saints, according to their respective departments; that they render homage to the Deity at the first sight of the sun; that they pay their respect to the sun and moon, which are the two eyes of the Deity; and that they treat with particular veneration those animals that are deemed more pure than others; as the cow, buffalo, &c.; because the souls of men have transmigrated into these animals.

The third part of the Shaster records the distribution of the people into four classes: the first being that of the bramins or priests, appointed to instruct the people; the second, that of the kutteris or nobles, who are the magistrates; the third, that of the shudderis or merchants; and the fourth, that of the mechanics. Each person is required to remain in the class in which he was born, and to pursue the occupation assigned to him by the Shaster. According to the bramins, the Shaster was imparted by God himself to Brahma, and by him to the bramins; who communicated the contents of it to the people.

Modern writers have given us very different accounts of the antiquity and importance of the Shaster. Mr Holwell, who had made considerable progress in the translation of this book, apprehends, that the mythology as well as the cosmogony of the Egyptians, Greeks, and Romans, was borrowed from the doctrines of the bramins, contained in it, even to the copying of their exteriors of worship, and the distribution of their idols, though grossly mutilated and adulterated. With respect to the Vedam and Shaster, or scriptures of the Gentoos, this writer informs us, that *Vedam*, in the Malabar language, signifies the same as *Shaster* in the Shanscrit; and that the first book is followed by the Gentoos of the Malabar and Coromandel coasts, and also of the island of Ceylon. The Shaster is followed by the Gentoos of the provinces of Bengal, and by all the Gentoos

Gentoos of the rest of India, commonly called *India Proper*, along the course of the rivers Ganges and Jumna to the Indus. Both these books (he says) contain the institutes of their respective religion and worship, as well as the history of their ancient rajahs and princes, often couched under allegory and fable. Their antiquity is contended for by the partisans of each; but he thinks, that the similitude of their names, idols, and great part of their worship, leaves little room to doubt, nay plainly evinces, that both these scriptures were originally one. He adds, if we compare the great purity and chaste manners of the Shaster with the great absurdities and impurities of the Vedam, we need not hesitate to pronounce the latter a corruption of the former.

With regard to the high original of these scriptures, the account of the bramins is as follows. Brahma (that is, "Mighty Spirit"), about 4866 years ago, assumed the form of man and the government of Indostan. He translated the divine law (designed for the restoration of mankind, who had offended in a pre-existent state, and who are now in their last scene of probation, to the dignity from which they were degraded) out of the language of angels into the well known Shanscrit language, and called his translation the *Chartah Bhade Shastah of Birmah*, or *the Six Scriptures of Divine Words of the Mighty Spirit*. He appointed the bramins, deriving their name from him, to preach the word of God; and the doctrines of the Shaster were accordingly preached in their original purity 1000 years. About this time there was published a paraphrase on the Chartah Bhade; and about 500 years afterwards, a second exposition, called the *Aughtorrah Bhade Shasta*, or *Eighteen Books of Divine Words*, written in a character compounded of the common Indostan and the Shanscrit. This innovation produced a schism among the Gentoos; on which occasion, it is said, those of Coromandel and Malabar formed a scripture of their own, which they pretended to be founded on the Chartah Bhade of Bramah, and called it *the Vedam of Birmah*, or *Divine Words of the Mighty Spirit*. The original Chartah Bhade was thrown aside, and at length wholly unknown, except to a few families; who can still read and expound it in the Shanscrit character. With the establishment of the Aughtorrah Bhade, and Vedam, which, according to the Gentoo account, is 3366 years ago, their polytheism commenced; and the principles of religion became so obscure, and their ceremonies so numerous, that every head of a family was obliged to keep a bramin as a guide both in faith and practice. Mr Holwell is of opinion, that the Chartah Bhade, or Original Scriptures, are not copied from any other system of theology, promulgated to or obtruded upon mankind. The Gentoos do not attribute them to Zoroaster; and Mr Holwell supposes, that both Zoroaster and Pythagoras visited Indostan, not to instruct, but to be instructed.

From the account of Mr Dow, we learn, that the books which contain the religion and philosophy of the Hindoos are distinguished by the name of *Bedas*; that they are four in number, and like the sacred writings of other nations, said to be penned by the Divinity. Beda, he says, in the Shanscrit language, literally signifies *science*; and these books treat not only of religion and moral duties, but of every branch of philosophic knowledge. The bramins maintain, that the Bedas are the divine laws, which Brimha, at the creation of the world, delivered for the instruction of mankind; but they affirm, that their meaning was perverted in the first age by the ignorance and wickedness of some princes, whom they represent as evil spirits, who then haunted the earth.

The first credible account we have of the Bedas is, that about the commencement of the Cal Jug, of which era the year 1768 was the 4886th year, they were written, or rather collected, by a great philosopher and reputed prophet, called *Beäss Muni*, or *Beäss the Inspired*.

The Hindoos (says Mr Dow) are divided into two great religious sects: the followers of the doctrine of Bedang, which is the original Shaster, or commentary upon the Bedas; and those who adhere to the principles of the Neadirsen. The original Shaster is called *Bedang*, and is a commentary upon the Bedas. This book, he says, is erroneously called in Europe the *Vedam*. It is ascribed to Beäss Muni, and is said to have been revised some years after by one Serrider Swami, since which it has been reckoned sacred, and not subject to any farther alterations.

Almost all the Hindoos of the Decan, and those of the Malabar and Coromandel coasts, are of this sect. The followers of the Bedang Shaster do not allow that any physical evil exists; they maintain that God created all things perfectly good; but that man, being a free agent, may be guilty of moral evil, which may be injurious to himself, but can be of no detriment to the general system of nature. God, they say, being perfectly benevolent, never punished the wicked otherwise than by the pain and affliction which are the natural consequences of evil actions; and hell, therefore, is no other than a consciousness of evil.

The Neadirsen Shaster is said to have been written by a philosopher called *Goutam*, near four thousand years ago. The bramins, from Mr Dow's account of their sacred books, appear to believe invariably in the unity, eternity, omniscience, and omnipotence of God; and the polytheism of which they have been accused is no more than a symbolical worship of the divine attributes, which they divide into three classes. Under the name of *Brimha*, they worship the wisdom and creative power of God; under the appellation of *Bishen*, his providential and preserving quality; and under that of *Shibah*, that attribute which tends to destroy.

As few of our readers may have an opportunity of perusing the Shaster, we shall, by way of specimen, subjoin a passage from it, which, though it contains some metaphysical mysteries concerning the creation, yet discovers views of God so enlightened that they would not disgrace more refined nations. The passage which we shall quote is the first chapter of the Shaster, which is a dialogue between Brimha the Wisdom of the Divinity, and Narud or Reason, who is represented as the son of Brimha. Narud desires to be instructed by his father; and for that purpose puts the following questions to him:

"*Narud.* O father! thou first of God, thou art said to have created the world, and thy son Narud, astonished at what he beholds, is desirous to be instructed how all these things were made.

"*Brimha.* Be not deceived, my son! do not imagine that

Shafter. that I was the creator of the world, independent of the Divine Mover, who is the great original essence and creator of all things. Look, therefore, only upon me as the instrument of the great *will*, and a part of his being, whom he called forth to execute his eternal designs.

" *Narud.* What shall we think of God?

" *Brimha.* Being immaterial, he is above all conception; being invisible, he can have no form; but, from what we behold in his works, we may conclude that he is eternal, omnipotent, knowing all things, and present everywhere.

" *Narud.* How did God create the world?

" *Brimha.* Affection dwelt with God from all eternity. It was of three different kinds; the creative, the preserving, and the destructive. This first is represented by Brimha, the second by Bishen, and the third by Shibah. You, O Narud! are taught to worship all the three in various shapes and likenesses, as the Creator, the Preserver, and the Destroyer. The affection of God then produced power, and power, at a proper conjunction of time and fate, embraced goodness, and produced matter. The three qualities then acting upon matter, produced the universe in the following manner: From the opposite actions of the creative and destructive quality in matter, self-motion first arose. Self-motion was of three kinds; the first inclining to plasticity, the second to discord, and the third to rest. The discordant actions then produced the Akash (a kind of celestial element), which invisible element possessed the quality of conveying sound; it produced air, a palpable element; fire, a visible element; water, a fluid element; and earth, a solid element.

" The Akash dispersed itself abroad. Air formed the atmosphere; fire, collecting itself, blazed forth in the host of heaven; water rose to the surface of the earth, being forced from beneath by the gravity of the latter element. Thus broke forth the world from the veil of darkness, in which it was formerly comprehended by God. Order rose over the universe. The seven heavens were formed, and the seven worlds were fixed in their places; there to remain till the great dissolution, when all things shall be absorbed into God.

" God seeing the earth in full bloom, and that vegetation was strong from its seeds, called forth for the first time intellect, which he endued with various organs and shapes, to form a diversity of animals upon the earth. He endued the animals with five senses; feeling, seeing, smelling, tasting, and hearing; but to man he gave reflection, to raise him above the beasts of the field.

" The creatures were created male and female, that they might propagate their species upon the earth. Every herb bore the seed of its kind, that the world might be clothed with verdure, and all animals provided with food.

" *Narud.* What dost thou mean, O father! by Intellect?

" *Brimha.* It is a portion of the *great soul* of the universe breathed into all creatures, to animate them for a certain time.

" *Narud.* What becomes of it after death?

" *Brimha.* It animates other bodies, or returns, like a drop, into that unbounded ocean from which it first arose.

" *Narud.* Shall not then the souls of good men receive rewards? nor the souls of the bad meet with punishment? Shafter, Shaw.

" *Brimha.* The souls of men are distinguished from those of other animals; for the first are endued with reason, and with a consciousness of right and wrong. If therefore man shall adhere to the first, as far as his powers shall extend, his soul, when disengaged from the body by death, shall be absorbed into the divine essence, and shall never more reanimate flesh: But the souls of those who do evil are not, at death, disengaged from all the elements. They are immediately clothed with a body of fire, air, and akash, in which they are for a time punished in hell. After the season of their grief is over, they reanimate other bodies; but till they shall arrive at a state of purity they can never be absorbed into God.

" *Narud.* What is the nature of that absorbed state which the souls of good men enjoy after death?

" *Brimha.* It is a participation of the divine nature, where all passions are utterly unknown, and where consciousness is lost in bliss.

" *Narud.* Thou sayest, O father, that unless the soul is perfectly pure it cannot be absorbed into God: now, as the actions of the generality of men are partly good and partly bad, whither are their spirits sent immediately after death?

" *Brimha.* They must atone for their crimes in hell, where they must remain for a space proportioned to the degree of their iniquities; then they rise to heaven to be rewarded for a time for their virtues; and from thence they will return to the world to reanimate other bodies.

" *Narud.* What is time?

" *Brimha.* Time existed from all eternity with God: but it can only be estimated since motion was produced, and only be conceived by the mind, from its own constant progress.

" *Narud.* How long shall this world remain?

" *Brimha.* Until the four jugs shall have revolved. Then Rudder (the same with *Shibah*, the destroying quality of God), with the ten spirits of dissolution, shall roll a comet under the moon, that shall involve all things in fire, and reduce the world into ashes. God shall then exist alone, for matter will be totally annihilated."

Those who desire more information on this subject may consult Dow's History of Indostan, and Holwell's Interesting Historical Events.

SHAW, Dr Thomas, known to the learned world by his travels to Barbary and the Levant, was born at Kendal in Westmoreland about the year 1692. He was appointed chaplain to the English consul at Algiers, in which station he continued for several years; and from thence took proper opportunities of travelling into different parts. He returned in 1733; was elected fellow of the Royal Society; and published the account of his travels at Oxford, folio, 1738. In 1740 he was nominated principal of St Edmond-hall, which he raised from a ruinous state by his munificence; and was regius professor of Greek at Oxford until his death, which happened in 1751. Dr Clayton, bishop of Clogher, having attacked these Travels in his Description of the East, Dr Shaw published a supplement by way of vindication,

dication, which is incorporated into the second edition of his Travels, prepared by himself, and published in 4to, 1757.

SHAWIA, a genus of plants, belonging to the class syngenesia, and order polygamia segregata, of which the characters are the following; the calyx is imbricated with five or six leaves, the three interior of which are larger; the corolla is five-cleft; there is one oblong seed. One species only has been discovered, which is a native of New Zealand.

SHAWLS, are woollen handkerchiefs, an ell wide, and near two long. The wool is so fine and silky, that the whole handkerchief may be contained in the two hands closed. It is the produce of a Tibet sheep; but some say that no wool is employed but that of lambs torn from the belly of their mother before the time of birth. The most beautiful shawls come from Cashmire: their price is from 150 livres (about six guineas) to 1200 livres (or 50l. sterling).

In the Transactions of the Society for Encouraging Arts, Manufactures, &c. for the year 1792, we are informed that a shawl counterpane, four yards square, manufactured by Mr P. J. Knights of Norwich, was presented to the society; and that, upon examination, it appeared to be of greater breadth than any goods of equal fineness and texture that had ever before been presented to the society, or to their knowledge woven in this country. The shawls of Mr Knights's manufacture, it is said, can scarcely be distinguished from Indian shawls, though they can be afforded at one-twentieth part of the price. When the shawl is 16 quarters square, Mr Knights says it may be retailed at 20l.; if it consisted of 12 quarters, and embroidered as the former, it will cost 15l.; if plain, with a fringe only, a shawl of 16 quarters square may be sold at 8l. 8s.; if 12 quarters and fringed, at 6l. 6s.

Mr Knights maintains, that his counterpane of four yards square is equal in beauty, and superior in strength, to the Indian counterpanes, which are sold at 200 guineas. The principal consumption of this cloth is in train-dresses for ladies; as likewise for long scarfs, in imitation of the real Indian scarfs, which are sold from 60l. to 80l.; whereas scarfs of this fabric are sold for as many shillings, and the ladies square shawls in proportion.

SHEADING, a riding, tything, or division, in the isle of Man; the whole island being divided into six sheadings; in every one of which is a coroner or chief constable, appointed by the delivery of a rod at the annual convention.

SHEARBILL, the *Rhynchops Nigra* of Linnæus, the *Black Skimmer* of Pennant and Latham, and *Cutwater* of Catesby. See ORNITHOLOGY *Index*.

SHEATHING, in the sea-language, is the casing that part of a ship which is to be under water with firboard of an inch thick; first laying hair and tar mixed together under the boards, and then nailing them on, in order to prevent worms from eating the ship's bottom.—Ships of war are now generally sheathed with copper: but copper sheathing is liable to be corroded by the action of salt water, and something is still wanting to effect this purpose. It is very probable that tar might answer very well.

In the Cornish mines, copper or brass pumps are often placed in the deepest parts, and are consequently exposed to the vitriolic or other mineral waters with which some of these mines abound, and which are known to have a much stronger effect on copper than sea water. These pumps are generally about six feet long, and are screwed together, and made tight by the interposition of a ring of lead, and the joinings are afterwards tarred. One of these pumps was so much corroded as to render it unfit for use; but the spots of tar, which by accident had dropped on it, preserved the parts they covered from the action of the water. These projected in some places more than a quarter of an inch; and the joints were so far defended by the thin coat of tar, that it was as perfect as when it came from the hands of the manufacturer. If tar thus effectually defends copper from these acrid waters, can there remain a doubt of its preserving it from the much milder waters of the sea?

SHEATS, in a ship, are ropes bent to the clews of the sails, serving in the lower sails to haul aft the clews of the sail; but in topsails they serve to haul home the clew of the sail close to the yard-arm.

SHEAVE, in *Mechanics*, a solid cylindrical wheel, fixed in a channel, and moveable about an axis, as being used to raise or increase the mechanical powers applied to remove any body.

SHEBBEARE, JOHN, a political writer, was born at Bideford in Devonshire, in the year 1709. He received the rudiments of his education at the free grammar school of Exeter. It has been often observed, that the future life of a man may be gathered from his puerile character; and accordingly Shebbeare, while a boy at school, gave the strongest indications of his future eminence in misanthropy and learning, by the extraordinary tenaciousness of his memory and the readiness of his wit, as well as the malignity of his disposition; being universally regarded as a young man of surprising genius, while at the same time he was despised for his malicious temper.

About the age of 16, Shebbeare was bound apprentice to an eminent surgeon in his native town, under whom he acquired a considerable share of medical knowledge. His talent for lampoon appeared at this early period, and he could not forbear from exercising it on his master; but the chief marks for the arrows of his wit were the gentlemen of the corporation, some of whom laughed at such trifles, while such as were irritable often commenced prosecutions against him, but without success. He was frequently summoned to appear at the sessions, for daring to speak and write disrespectfully of the magistrates; but the laugh was always on the side of Shebbeare.

When his time was out, he set up for himself, then discovering a taste for chemistry; soon after which he married an amiable young woman with no fortune, but of respectable connections. Failing in business at Bideford, he went to Bristol in 1736, entering into partnership with a chemist, and never afterwards visited his native town.

The attention of the public was, in the year 1739, attracted by an epitaph to the memory of Thomas Coster, Esq. M. P. for Bristol, in which he contrived to raise emotions of pity, grief, and indignation. In the following year he published a pamphlet on the Bristol waters, after which we know little or nothing respecting him for a number of years. He was at Paris in 1752, where he obtained, it is said, the degree of doctor in medicine,

a

Shebbeare.

a fact, however, which many are difpofed to queftion. About this time he began to emerge from obfcurity, and draw the attention of the public, by pamphlets written with fuch virulence and celerity as it would be difficult to equal in the moft intemperate times. In 1754 he commenced his career with a work denominated the *Marriage Act*, a political novel, in which he treated the legiflature with fuch freedom that he was apprehended, but foon after fet at liberty.

The moft celebrated performances, however, were a feries of letters to the People of England, written in a vigorous and energetic ftyle, well calculated to make an impreffion on common readers; and they were of courfe read with avidity, and diligently circulated. They galled the miniftry, who at firft were too eager to punifh the author. When the third letter was publifhed, warrants were iffued by Lord Holderneffe in March 1756, to take up both the publifher and the author; a profecution which appears to have been dropt. On the 12th of January 1758, the fame nobleman figned a general warrant for apprehending the author, printer, and publifhers of a wicked, audacious, and treafonable libel, entitled, "A fixth letter to the people of England, on the progrefs of national ruin, in which is fhewn that the prefent grandeur of France and calamities of this nation are owing to the influence of Hanover on the councils of England;" and then having found, to feize and apprehend, together with their books and papers.

Government having received information that a feventh letter was in the prefs, all the copies were feized and fuppreffed by virtue of another warrant, dated January 23. In Eafter term an information was filed againft him by the attorney-general, and on the 17th of June the information was tried, when Shebbeare was found guilty; and on the 28th of November he received fentence, by which he was fined 5l. ordered to ftand in the pillory December 5. at Charing Crofs, to be confined three years, and to give fecurity for his good behaviour for feven years, himfelf in 500l. and two others in 250l. each. During his confinement, he declared he never received as prefents more than 20 guineas from all the world.

He was detained in prifon during the whole time of the fentence, and with fome degree of rigour; for when his life was in danger from a bad ftate of health, and he applied to the court of king's-bench for permiffion to be carried into the rules a few hours in a day; though Lord Mansfield acceded to the petition, the prayer of it was denied and defeated by Judge Fofter. At the termination of the time of his fentence, a new reign commenced; and fhortly afterwards, during Mr Grenville's adminiftration, a penfion of 200l. a-year was granted him by the crown, through the influence of Sir John Philips; and he ever after became devoted to the fervice of government. He was of courfe abufed in almoft every periodical work, which he feems in general to have had the good fenfe to neglect. Dr Smollet introduced him, in no very refpectful light, under the name of Ferret, in Sir Launcelot Greaves; and Mr Hogarth made him one of the group in the third election print.

During the latter part of his life he feems to have written but little. He ftrenuoufly fupported the miniftry during the American war, having publifhed, in 1775, an anfwer to the printed fpeech of Edmund Burke, Efq. fpoken in the houfe of commons, April 19. 1774, wherein he inveftigates his knowledge of polity, legiflature, human kind, hiftory, commerce, and finance; his arguments are examined; the conduct of adminiftration is boldly defended, and his talents as an orator clearly expofed to view. An effay on the origin, progrefs, and eftablifhment of National Society; in which the principles of government, the definition of phyfical, moral, civil, and religious liberty contained in Dr Price's obfervations, &c. are examined and controverted; together with a juftification of the legiflature in reducing America to obedience by force.

Shebbeare, Sheep.

His publications of a fatirical, political, and medical nature, amount to 34, befides a novel called Filial Piety, in which hypocrify and bluftering courage are very properly chaftifed. He died on the 1ft of Auguft 1788, leaving behind him the character of a benevolent man among thofe who were beft acquainted with him; a character which, from the manner he fpeaks of his connections, he probably deferved.

SHEEP, in *Zoology*. See OVIS and WOOL. 1

Sheep ferve a wonderfull variety of purpofes.

Amongft the various animals with which Divine Providence has ftored the world for the ufe of man, none is to be found more innocent, more ufeful, or more valuable, than the fheep. The fheep fupplies us with food and clothing, and finds ample employment for our poor at all times and feafons of the year, whereby a variety of manufactures of woollen cloth is carried on without interruption to domeftic comfort and lofs to friendly fociety or injury to health, as is the cafe with many other occupations. Every lock of wool that grows on its back becomes the means of fupport to ftaplers, dyers, pickers, fcourers, fcriblers, carders, combers, fpinners, fpoolers, warpers, queelers, weavers, fullers, tuckers, burlers, fhearmen, preffers, clothiers, and packers, who, one after another, tumble and tofs, and twift, and bake, and boil, this raw material, till they have each extracted a livelihood out of it; and then comes the merchant, who, in his turn, fhips it (in its higheft ftate of improvement) to all quarters of the globe, from whence he brings back every kind of riches to his country, in return for this valuable commodity which the fheep affords.

Befides this, the ufeful animal, after being deprived of his coat, produces another againft the next year; and when we are hungry, and kill him for food, he gives us his fkin to employ the fell-mongers and parchment-makers, who fupply us with a durable material for fecuring our eftates, rights, and poffeffions; and if our enemies take the field againft us, fupplies us with a powerful inftrument for roufing our courage to repel their attacks. When the parchment-maker has taken as much of the fkin as he can ufe, the glue-maker comes after and picks up every morfel that is left, and therewith fupplies a material for the carpenter and cabinet-maker, which they cannot do without, and which is effentially neceffary before we can have elegant furniture in our houfes; tables, chairs, looking-glaffes, and a hundred other articles of convenience: and when the winter nights come on, while we are deprived of the cheering light of the fun, the fheep fupplies us with an artificial mode of light, whereby we preferve every pleafure of domeftic fociety, and with whofe affiftance we can continue our work, or write or read, and improve

our

Sheep. our minds, or enjoy the social mirth of our tables. Another part of the slaughtered animal supplies us with an ingredient necessary for making good common soap, a useful store for producing cleanliness in every family, rich or poor. Neither need the horns be thrown away; for they are converted by the button-makers and turners into a cheap kind of buttons, tips for bows, and many useful ornaments. From the very trotters an oil is extracted useful for many purposes, and they afford good food when baked in an oven.

Even the bones are useful also; for by a late invention of Dr Higgins, they are found, when reduced to ashes, to be an useful and essential ingredient in the composition of the finest artificial stone in ornamental work for chimney-pieces, cornices of rooms, houses, &c. which renders the composition more durable by effectually preventing its cracking (A).

If it is objected to the meek inoffensive creature, that he is expensive while living, in eating up our grass, &c. it may be answered that it is quite the contrary; for he can feed where every other animal has been before him and grazed all they could find; and that if he takes a little grass on our downs or in our fields, he amply repays us for every blade of grass in the richness of the manure which he leaves behind him. He protects the hands from the cold wintry blast, by providing them with the softest leather gloves. Every gentleman's library is also indebted to him for the neat binding of his books, for the sheath of his sword, and for cases for his instruments; in short, not to be tedious in mentioning the various uses of leather, there is hardly any furniture or utensil of life but the sheep contributes to render either more useful, convenient, or ornamental.

As the sheep is so valuable an animal, every piece of information concerning the proper method of managing it must be of importance. It will not therefore be useless or unentertaining to give some account of the manner of managing sheep in Spain, a country famous for producing the best wool in the world.

Account of the Spanish sheep

In Spain there are two kinds of sheep: the coarse-woolled sheep, which always remain in their native country, and are housed every night in winter; and the fine-woolled sheep, which are always in the open air, and travel every summer from the cool mountains of the northern parts of Spain, to feed in winter on the southern warm plains of Andalusia, Mancha, and Estremadura. Of these latter, it appears from accurate computations, that there are about five millions (B); and that the wool and flesh of a flock of 10,000 sheep produced yearly about 24 reals a-head, about the value of 12 English sixpences, one of which belongs to the owner, three to the king, and the other eight are allowed for the expences of pasture, tythes, shepherds, dogs, salt, shearing, &c. Ten thousand sheep form a flock, which is divided into ten tribes, under the management of one person, who has absolute dominion over fifty shepherds and fifty dogs.

3 Of Segovia,

M. Bourgoanne, a French gentleman, who resided many years in Spain, and directed his inquiries chiefly to the civil government, trade, and manufactures, of that country, gives the following account of the wandering sheep of Segovia. "It is (says he) in the neighbouring mountains that a part of the wandering sheep feed during the fine season. They leave them in the month of October, pass over those which separate the two Castiles, cross New Castile, and disperse themselves in the plains of Estramadura and Andalusia. For some years past those of the two Castiles, which are within reach of the Sierra-Morena, go thither to pass the winter; which, in that part of Spain, is more mild; the length of their day's journey is in proportion to the pasture they meet with. They travel in flocks from 1000 to 1200 in number, under the conduct of two shepherds; one of whom is called the *Mayoral*, the other the *Zagal*. When arrived at the place of their destination, they are distributed in the pastures previously assigned them. They return in the month of April; and whether it be habit or natural instinct that draws them towards the climate, which at this season becomes most proper for them, the inquietude which they manifest might, in case of need, serve as an almanac to their conductors."

Bourgoanne's Travels, vol. i. p. 53.

Mr Arthur Young, in that patriotic work which he conducted with great industry and judgement, the Annals of Agriculture, gives us a very accurate and interesting account of the Pyrenean or Catalonian sheep.

4 Of Catalonia. *Annals of Agriculture*, vol. vii. p. 195.

"On the northern ridge, bearing to the west, are the pastures of the Spanish flocks. This ridge is not, however, the whole; there are two other mountains, quite in a different situation, and the sheep travel from one to another as the pasturage is short or plentiful. I examined the soil of these mountain pastures, and found it in general stony; what in the west of England would be

(A) Any curious person would be much entertained to see the manufactory of bone-ash, now (about 1794) carried on by Mr Minish of White-chapel, New Road, wherein the bones of sheep and cows undergo many ingenious processes. 1. There is a mill to break them; 2. A cauldron to extract their oil, marrow, and fat; 3. A reverberatory to heat them red hot; 4. An oven for those bones to moulder to ashes; 5. A still to collect the fumes of the burnt bones into a brown fluid, from whence hartshorn is made; 6. Furnaces for making parts thereof into Glauber's salts; 7. A sand heat containing twelve jars, for collecting a crystallizing vapour into sal-ammoniac.

(B) In the 16th century the travelling sheep were estimated at seven millions: under Phillip III. the number was diminished to two millions and a half. Ustariz, who wrote at the beginning of the 18th century, made it amount to four millions. The general opinion is, that at present it does not exceed five millions. If to this number the eight millions of stationary sheep be added, it will make nearly thirteen millions of animals, all managed contrary to the true interests of Spain, for the advantage of a few individuals. For the proprietors of stationary flocks also have privileges which greatly resemble those of the members of the Mesta. According to Arriquebar, Spain contains eight millions of fine-woolled sheep, ten millions of coarse-woolled, and five hundred thousand bulls, oxen, and cows.

Sheep.

be called a *ſi ne braſh*, with ſome mixture of loam, and in a few places a little peaty. The plants are many of them untouched by the ſheep; many ferns, narciſſus, violets, &c. but burnet (*poterium ſanguiſorba*) and the narrow-leaved plantain (*plantago lanceolata*) were eaten, as may be ſuppoſed, cloſe. I looked for trefoils, but found ſcarcely any: it was very apparent that ſoil and peculiarity of herbage had little to do in rendering theſe heights proper for ſheep. In the northern parts of Europe, the tops of mountains half the height of theſe (for we were above ſnow in July) are bogs, all are ſo which I have ſeen in our iſlands, or at leaſt the proportion of dry land is very trifling to that which is extremely wet: Here they are in general very dry. Now a great range of dry land, let the plants be what they may, will in every country ſuit ſheep. The flock is brought every night to one ſpot, which is ſituated at the end of the valley on the river I have mentioned, and near the port or paſſage of Picada: it is a level ſpot ſheltered from all winds. The ſoil is eight or nine inches deep of old dung, not at all incloſed: from the freedom from wood all around, it ſeems to be choſen partly for ſafety againſt wolves and bears. Near it is a very large ſtone, or rather rock, fallen from the mountain. This the ſhepherds have taken for a ſhelter, and have built a hut againſt it; their beds are ſheep ſkins, and their door ſo ſmall that they crawl in. I ſaw no place for fire; but they have it, ſince they dreſs here the fleſh of their ſheep, and in the night ſometimes keep off the bears, by whirling fire-brands: four of them belonging to the flock mentioned above lie here. I viewed their flock very carefully, and by means of our guide and interpreter, made ſome inquiries of the ſhepherds, which they anſwered readily, and very civilly. A Spaniard at Venaſque, a city in the Pyrenees, gives 600 livres French (the livre is $10\frac{1}{2}$d. Engliſh) a-year for the paſturage of this flock of 2000 ſheep. In the winter he ſends them into the lower parts of Catalonia, a journey of 12 or 13 days, and when the ſnow is melted in the ſpring, they are conducted back again. They are the whole year kept in motion, and moving from ſpot to ſpot, which is owing to the great range they everywhere have of paſture. They are always in the open air, never houſed or under cover, and never taſte of any food but what they can find on the hills.

"Four ſhepherds, and from four to ſix large Spaniſh dogs, have the care of this flock: the latter are in France called of the *Pyrenees breed;* they are black and white, of the ſize of a large wolf, a large head and neck, armed with collars ſtuck with iron ſpikes. No wolf can ſtand againſt them; but bears are more potent adverſaries: if a bear can reach a tree, he is ſafe; he riſes on his hind legs, with his back to the tree, and ſets the dogs at defiance. In the night the ſhepherds rely entirely on their dogs; but on hearing them bark are ready with fire-arms, as the dogs rarely bark if a bear is not at hand. I was ſurpriſed to find that they are fed only with bread and milk. The head ſhepherd is paid 120 livres a-year wages and bread; the others [illegible] livres and bread. But they are allowed to keep goats, of which they have many, which they milk every day. Their food is milk and bread, except the fleſh of ſuch ſheep or [illegible] as accidents give them. The head ſhepherd keeps on the mountain top, or an elevated ſpot, from [illegible] he can the better ſee around while the flock traverſes the declivities. In doing this the ſheep are expoſed to great danger in places that are ſtony; for by walking among the rocks, and eſpecially the goats, they move the ſtones, which, rolling down the hills, acquire an accelerated force enough to knock a man down, and ſheep are often killed by them; yet we ſaw how alert they were to avoid ſuch ſtones, and cautiouſly on their guard againſt them. I examined the ſheep attentively. They are in general polled, but ſome have horns; which in the rams turn backwards behind the ears and project half a circle forward; the ewes horns turn alſo behind the ears, but do not project: the legs white or reddiſh; ſpeckled faces, ſome white, ſome reddiſh; they would weigh fat, I reckon, on an average, from 15 lb. to 18 lb. a quarter. Some tails ſhort, ſome left long. A few black ſheep among them: ſome with a very little tuft of wool on their foreheads. On the whole they reſemble thoſe on the South Downs; their legs are as ſhort as thoſe of that breed; a point which merits obſervation, as they travel ſo much and ſo well. Their ſhape is very good, round ribs and flat ſtraight backs; and would with us be reckoned handſome ſheep; all in good order and fleſh. In order to be ſtill better acquainted with them, I deſired one of the ſhepherds to catch a ram for me to feel, and examine the wool, which I found very thick and good of the carding ſort, as may be ſuppoſed. I took a ſpecimen of it, and alſo of a hoggit, or lamb of laſt year. In regard to the mellow ſoftneſs under the ſkin, which, in Mr Bakewell's opinion, is a ſtrong indication of a good breed, with a diſpoſition to fatten, he had it in a much ſuperior degree to many of our Engliſh breeds, to the full as much ſo as the South Downs, which are for that point the beſt ſhort-woolled ſheep which I know in England. The fleece was on his back, and weighed, as I gueſſed, about 8 lb. Engliſh; but the average, they ſay, of the flock is from four to five, as I calculated by reducing the Catalonian pound of 12 oz. to ours of 16, and is all ſold to the French at 30s. the lb. French. This ram had the wool of the back part of his neck tied cloſe, and the upper tuft tied a ſecond knot by way of ornament; nor do they ever ſhear this part of the fleece for that reaſon we ſaw ſeveral in the flock with this ſpecies of decoration. They ſaid that this ram would ſell in Catalonia for 20 livres. A circumſtance which cannot be too much commended, and deſerves univerſal imitation, is the extreme docility they accuſtom them to. When I deſired the ſhepherd to catch one of his rams, I ſuppoſed he would do it with his crook, or probably not be able to do it at all; but he walked into the flock, and ſingling out a ram and a goat, bid them follow him, which they did immediately; and he talked to them while they were obeying him, holding out his hand as if to give them ſomething. By this method he brought me the ram, which I caught, and held without difficulty."

The beſt ſort of ſheep for fine wool are thoſe bred in Herefordſhire, Devonſhire, and Worceſterſhire; but they are ſmall, and black faced, and bear but a ſmall quantity. Warwick, Leiceſterſhire, Buckingham, and Northamptonſhire, breed a large-boned ſheep, of the beſt ſhape and deepeſt wool we have. The marſhes of Lincolnſhire breed a very large kind of ſheep, but their wool is not good, unleſs the breed [illegible] by bringing in ſheep of other counties among them, which [illegible] of late [illegible] allowed them. It [illegible]

What ſheep [illegible] the beſt wool.

Sheep. this county, it is no uncommon thing to give fifty guineas for a ram, and a guinea for the admiffion of an ewe to one of thefe valuable males, or twenty guineas for the ufe of it for a certain number of ewes during one feafon. Suffolk alfo breeds a very valuable kind of fheep. The northern counties in general breed fheep with long but hairy wool: however, the wool which is taken from the neck and fhoulders of the Yorkfhire fheep is ufed for mixing with Spanifh wool in fome of their fineft cloths.

Wales bears a fmall hardy kind of fheep, which has the beft tafted flefh, but the worft wool of all. Neverthelefs it is of more extenfive ufe than the fineft Segovian fleeces; for the benefit of the flannel manufacture is univerfally known. The fheep of Ireland vary like thofe of Great Britain; thofe of the fouth and eaft being large and their flefh rank: thofe of the north and the mountainous parts fmall and their flefh fweet. The fleeces in the fame manner differ in degrees of value. Scotland breeds a fmall kind, and their fleeces are coarfe.

But the new Leicefterfhire breed is the moft fafhionable, and of courfe the moft profitable breed in the ifland. Jofeph Altom of Clifton, who raifed himfelf from a plough-boy, was the firft who diftinguifhed himfelf in the midland counties of England for a fuperior breed of fheep. How he improved his breed is not known; but it was cuftomary for eminent farmers in his time to go to Clifton in fummer to choofe and purchafe ram-lambs, for which they paid two or three guineas. This man was fucceeded by Mr Bakewell; and it may reafonably be fuppofed that the breed, by means of Altom's ftock, had paffed the firft ftage of improvement before Mr Bakewell's time. Still, however, it muft be acknowledged, that the Leicefterfhire breed of fheep owes its prefent high ftate of improvement to the ability and care of Mr Bakewell.

6 Account of Mr Bakewell's breed. *Marfhall's Midland Counties*, vol. i. p. 382.

"The manner in which Mr Bakewell raifed his fheep to the degree of celebrity in which they defervedly ftand, is, notwithftanding the recentnefs of the improvement, and its being done in the day of thoufands now living, a thing in difpute; even among men high in the profeffion, and living in the very diftrict in which the improvement has been carried on!

7 How it is fuppofed he improved it.

"Some are of opinion that he effected it by a crofs with the Wiltfhire breed; an improbable idea, as their form altogether contradicts it: others, that the Ryeland breed were ufed for this purpofe; and with fome fhow of probability. If any crofs whatever was ufed the Ryeland breed, whether we view the form, the fize, the wool, the flefh, or the fatting quality, is the moft probable inftrument of improvement.

"Thefe ideas, however, are regiftered merely as matters of opinion. It is more than probable that Mr Bakewell alone is in poffeffion of the feveral minutiæ of improvement; and the public can only hope that at a proper time the facts may be communicated for the direction of future improvers.

"Whenever this fhall take place, it will moft probably come out that no crofs with any alien breed whatever has been ufed; but that the improvement has been effected by felecting individuals from kindred breeds; from the feveral breeds or varieties of long-woolled fheep, with which Mr Bakewell was furrounded on almoft every fide, and by breeding, *inandin* (c), with this felection: folicitoufly feizing the fuperior accidental varieties produced; affociating thefe varieties; and ftill continuing to felect, with judgement, the fuperior individuals.

8 Defcription of his ewes and wedders.

"It now remains to give a defcription of the fuperior clafs of individuals of this breed, efpecially ewes and wedders, in full condition, but not immoderately fat. The rams will require to be diftinguifhed afterwards.

"The head is long, fmall, and hornlefs, with ears fomewhat long, and ftanding backward, and with the nofe fhooting forward. The neck thin, and clean toward the head; but taking a conical form; ftanding low, and enlarging every way at the bafe; the fore-end altogether fhort. The bofom broad, with the fhoulders, ribs, and chine extraordinary full. The loin broad, and the back level. The haunches comparatively full toward the hips, but light downward; being altogether fmall in proportion to the fore-parts. The legs, at prefent, of a moderate length; with the bone extremely fine. The bone throughout remarkably light. The carcafe, when fully fat, takes a remarkable form; much wider than it is deep, and almoft as broad as it is long. Full on the fhoulder, wideft on the ribs, narrowing with a regular curve towards the tail; approaching the form of the turtle nearer perhaps than any other animal. The pelt is thin, and the tail fmall. The wool is fhorter than long wools in general, but much longer than the middle wools; the ordinary length of ftaple five to feven inches, varying much in finenefs and weight."

9 Fatten remarkably well.

This breed furpaffes every other in beauty of form; they are full and weighty in the fore quarters; and are remarkable for fmallnefs of bone. Mr Marfhall, who has been of fo much benefit to agriculture and his country by his publications, informs us, in his Rural Economy of the Midland Counties, that he has feen a rib of a fheep of this breed contrafted with one of a Norfolk fheep: the difparity was ftriking; the latter nearly twice the fize; while the meat which covered the former was three times the thicknefs: confequently the proportion of meat to bone was in the one incomparably greater than in the other. Therefore, in this point of view, the improved breed has a decided preference: for furely while mankind continue to eat flefh and throw away bone, the former muft be, to the confumer at leaft, the more valuable.

The criterions of good and bad flefh while the animal is alive differ in different fpecies, and are not properly fettled in the fame fpecies. One fuperior breeder is of opinion, that if the flefh is not loofe, it is of courfe good; holding, that the flefh of fheep is never found in a ftate of hardnefs, like that of ill-flefhed cattle: while others make a fourfold diftinction of the flefh of fheep; as loofenefs, mellownefs, firmnefs, hardnefs: confidering the firft and the laft equally exceptionable, and the fecond and third equally defirable; a happy mixture of the two being deemed the point of perfection.

The

(c) *Inandin* is a term ufed in the midland counties of England to exprefs breeding from the fame family.

Sheep.

The flesh of sheep, when slaughtered, is well known to be of various qualities. Some is composed of large coarse grains, interspersed with wide empty pores like a sponge: others, of large grains, with wide pores filled with fat; others, of fine close grains, with smaller pores filled with fat: and a fourth, of close grains, without any intermixture of fatness.

The flesh of sheep, when dressed, is equally well known to possess a variety of qualities: some mutton is coarse, dry, and insipid; a dry sponge, affording little or no gravy of any colour. Another sort is somewhat firmer, imparting a light-coloured gravy only. A third plump, short, and palatable; affording a mixture of white and red gravy. A fourth likewise plump and well-flavoured, but discharging red gravy, and this in various quantities.

It is likewise observable, that some mutton, when dressed, appears covered with a thick, tough, parchment-like integument; others with a membrane comparatively fine and flexible. But these, and some of the other qualities of mutton, may not be wholly owing to breed, but in part to the age and the state of fatness at the time of slaughter. Examined in this light, whether we consider the degree of fatness, or their natural propensity to a state of fatness, even at an early age, the improved breed of Leicestershire sheep appears with many superior advantages.

The degree of fatness to which the individuals of this breed are capable of being raised, will perhaps appear incredible to those who have not had an opportunity of being convinced by their own observation. "I have seen wedders (says Mr Marshall) of only two shear (two or three years old) so loaded with fat as to be scarcely able to make a run; and whose fat lay so much without the bone, it seemed ready to be shaken from the ribs on the smallest agitation.

Midland Counties, vol. i. p. 398.

"It is common for the sheep of this breed to have such a projection of fat upon the ribs, immediately behind the shoulder, that it may be easily gathered up in the hand, as the flank of a fat bullock. Hence it has gained, in technical language, the name of the *fore-flank*; a point which a modern breeder never fails to touch in judging of the quality of this breed of sheep.

"What is, perhaps, still more extraordinary, it is not rare for the rams, at least of this breed, to be 'cracked on the back;' that is, to be cloven along the top of the chine, in the manner fat sheep generally are upon the rump. This mark is considered as an evidence of the best blood.

"Extraordinary, however, as are these appearances while the animals are living, the facts are still more striking after they are slaughtered. At Litchfield, in February 1785, I saw a fore quarter of mutton, fatted by Mr Princep of Croxall, and which measured upon the ribs four inches of fat. It must be acknowledged, however, that the Leicestershire breed do not produce so much wool as most other long-woolled sheep."

As the practice of letting rams by the season is now become profitable, it may be useful to mention the method of rearing them.

10 How the rams are reared.

"The principal ram-breeders save annually twenty, thirty, or perhaps forty ram lambs; castration being seldom applied, in the first instance, to the produce of a valuable ram, for in the choice of these lambs they are led more by blood or parentage, than by form; on which, at an early age, little dependence can be placed. Their treatment from the time they are weaned, in July or August, until the time of shearing, the first week in June, consists in giving them every indulgence of keep, in order to push them forward for the show; it being the common practice to let such as are fit to be let the first season, while they are yet yearlings—provincially 'sharhogs.'

"Their first pasture, after weaning, is pretty generally, I believe, clover that has been mown early, and has got a second time into head; the heads of clover being considered as a most forcing food of sheep. After this goes off, turnips, cabbages, colewort, with hay, and (report says) with corn. But the use of this the breeders severally deny, though collectively they may be liable to the charge.

"Be this as it may, something considerable depends on the *art of making up*, not lambs only, but rams of all ages. Fat, like charity, covers a multitude of faults; and besides, is the best evidence of their fatting quality which their owners can produce (*i. e.* their natural propensity to a state of fatness), while in the fatness of the sharhogs is seen their degree of inclination to fat at an early age.

"Fatting quality being the one thing needful in grazing stock, and being found, in some considerable degree at least, to be hereditary, the fattest rams are of course the best; though other attachments, well or ill placed, as to form or fashionable points, will perhaps have equal or greater weight in the minds of some men, even in this enlightened age. Such shearlings as will not make up sufficiently as to form and fatness, are either kept on to another year to give them a fair chance, or are castrated, or butchered while sharhogs."

11 What sums Mr Bakewell received for letting them.

From the first letting, about 40 years ago, to the year 1780, the prices kept gradually rising from fifteen shillings to a guinea, and from one to ten. In 1780 Mr Bakewell let several at ten guineas each; and, what is rather inexplicable, Mr Parkinson of Quarndon let one the same year for twenty-five guineas; a price which then astonished the whole country.

From that time to 1786 Mr Bakewell's stock rose rapidly from ten to a hundred guineas; and that year he let two thirds of one ram (reserving one third of the usual number of ewes to himself) to two principal breeders, for a hundred guineas each, the entire services of the ram being rated at three hundred guineas! Mr Bakewell making that year, by letting twenty rams only, more than a thousand pounds!

Since that time the prices have been still rising. Four hundred guineas have been repeatedly given. Mr Bakewell, this year (1789) makes, says Mr Marshall, twelve hundred guineas by three rams (brothers, we believe); two thousand of seven; and of his whole letting, full three thousand guineas!

Beside this extraordinary sum made by Mr Bakewell, there are six or seven other breeders who make from five hundred to a thousand guineas each. The whole amount of moneys produced that year in the midland counties, by letting rams of the modern breed for one season only, is estimated, by those who are adequate to the subject, at the almost incredible sum of ten thousand pounds.

Rams previous to the season are reduced from the cumbrous fat state in which they are shown. The usual time

Sheep.

time of fending them out is the middle of September. They are conveyed in carriages of two wheels with fprings, or hung in flings, 20 or 30 miles a-day, fometimes to the diftance of 200 or 300 miles. They are not turned loofe among the ewes, but kept apart in a fmall inclofure, where a couple of ewes only are admitted at once. When the feafon is over, every care is taken to make the rams look as fat and handfome as poffible.

12
The treatment of the rams and choice of the ewes.

In the choice of ewes the breeder is led by the fame criterions as in the choice of rams. Breed is the firft object of confideration. Excellency, in any fpecies or variety of live-ftock, cannot be attained with any degree of certainty, let the male be ever fo excellent, unlefs the females employed likewife inherit a large proportion of the genuine blood, be the fpecies or variety what it may. Hence no prudent man ventures to give the higher prices for the Difhley rams, unlefs his ewes are deeply tinctured with the Difhley blood. Next to breed is flefh, fat, form, and wool.

After the lambs are weaned, the ewes are kept in common feeding places, without any alteration of pafture, previous to their taking the ram. In winter they are kept on grafs, hay, turnips, and cabbages. As the heads of the modern breed are much finer than moft others, the ewes lamb with lefs difficulty.

The female lambs, on being weaned, are put to good keep, but have not fuch high indulgence fhown them as the males, the prevailing practice being to keep them from the ram the firft autumn.

At weaning time, or previoufly to the admiffion of the ram, the ewes are culled, to make room for the thaves or fhearlings, whofe fuperior blood and fafhion intitle them to a place in the breeding flock. In the work of culling, the ram-breeder and the mere grazier go by fomewhat different guides. The grazier's guide is principally age, feldom giving his ewes the ram after they are four fhear. The ram-breeder, on the contrary, goes chiefly by merit; an ewe that has brought him a good ram or two is continued in the flock fo long as fhe will breed. There are inftances of ewes having been prolific to the tenth or twelfth year; but in general the ewes of this breed go off at fix or feven fhear.

In the practice of fome of the principal ram-breeders, the culling ewes are never fuffered to go out of their hands until after they are flaughtered, the breeders not only fatting them, but having them butchered, on their premifes. There are others, however, who fell them; and fometimes at extraordinary prices. Three, four, and even fo high as ten guineas each, have been given for thefe outcafts.

There are in the flocks of feveral breeders ewes that would fetch at auction twenty guineas each. Mr Bakewell is in poffeffion of ewes which, if they were now put up to be fold to the beft bidder, would, it is eftimated, fetch no lefs than fifty each, and perhaps, through the prefent fpirit of contention, much higher prices.

13
Inftructions for purchafing fheep.

The following inftructions for purchafing fheep, we hope, will be acceptable to our country readers.—The farmer fhould always buy his fheep from a worfe land than his own, and they fhould be big-boned, and have a long greafy wool, curling clofe and well. Thefe fheep always breed the fineft wool, and are alfo the moft approved of by the butcher for fale in the market. For the choice of fheep to breed, the ram muft be young, and his fkin of the fame colour with his wool, for the lambs will be of the fame colour with his fkin. He fhould have a large long body; a broad forehead, round, and well-rifing; large eyes; and ftraight and fhort noftrils. The polled fheep, that is, thofe which have no horns, are found to be the beft breeders. The ewe fhould have a broad back; a large bending neck; fmall, but fhort, clean, and nimble legs; and a thick, deep wool covering her all over.

To know whether they be found or not, the farmer fhould examine the wool that none of it be wanting, and fee that the gums be red, the teeth white and even, and the brifket-fkin red, the wool firm, the breath fweet, and the feet not hot. Two years old is the beft time for beginning to breed; and their firft lambs fhould not be kept too long, to weaken them by fuckling, but be fold as foon as conveniently may be. They will breed advantageoufly till they are feven years old. The farmers have a method of knowing the age of a fheep, as a horfe's is known, by the mouth. When a fheep is one fhear, as they exprefs it, it has two broad teeth before; when it is two fhear, it will have four; when three, fix; and when four, eight. After this their mouths begin to break.

The difference of land makes a very great difference in the fheep. The fat paftures breed ftraight tall fheep, and the barren hills and downs breed fquare fhort ones; woods and mountains breed tall and flender fheep; but the beft of all are thofe bred upon new-ploughed land and dry grounds. On the contrary, all wet and moift lands are bad for fheep, efpecially fuch as are fubject to be overflowed, and to have fand and dirt left on them. The falt marfhes are, however, an exception to this general rule, for their faltnefs makes amends for their moifture; falt, by reafon of its drying quality, being of great advantage to fheep.

As to the time of putting the rams to the ewes, the farmer muft confider at what time of the fpring his grafs will be fit to maintain them and their lambs, and whether he has turnips to do it till the grafs comes; for very often both the ewes and lambs are deftroyed by the want of food; or if this does not happen, if the lambs are only ftinted in their growth by it, it is an accident that they never recover. The ewe goes 20 weeks with lamb, and according to this it is eafy to calculate the proper time. The beft time for them to yean is in April, unlefs the owner has very forward grafs or turnips, or the fheep are field fheep. Where you have not inclofures to keep them in, then it may be proper they fhould yean in January, that the lambs may be ftrong by May-day, and be able to follow the dam over the fallows and water-furrows; but then the lambs that come fo early muft have a great deal of care taken of them, and fo indeed fhould all other lambs at their firft falling, elfe while they are weak the crows and magpies will pick their eyes out.

14
When rams ought to be admitted to the ewes.

When the fheep are turned into fields of wheat or rye to feed, it muft not be too rank at firft, for if it be, it generally throws them into fcourings. Ewes that are big fhould be kept but bare, for it is very dangerous to them to be fat at the time of their bringing forth their young. They may be well fed, indeed, like cows, a fortnight beforehand, to put them in heart. Mortimer's Hufbandry, p. 243.

The

Sheep.

The feeding ſheep with turnips is one great advantage to the farmers. When they are made to eat turnips they ſoon fatten, but there is ſome difficulty in bringing this about. The old ones always refuſe them at firſt, and will ſometimes faſt three or four days, till almoſt famiſhed; but the young lambs fall to at once. The common way, in ſome places, of turning a flock of ſheep at large into a field of turnips, is very diſadvantageous, for they will thus deſtroy as many in a fortnight as would keep them a whole winter. There are three other ways of feeding them on this food, all of which have their ſeveral advantages.

15 The firſt way of feeding ſheep with turnips.

The firſt way is to divide the land by hurdles, and allow the ſheep to come upon ſuch a portion only at a time as they can eat in one day, and ſo advance the hurdles farther into the ground daily till all be eaten. This is infinitely better than the former random method; but they never eat them clean even this way, but leave the bottoms and outſides ſcooped in the ground: the people pull up theſe indeed with iron crooks, and lay them before the ſheep again, but they are commonly ſo fouled with the creature's dung and urine, and with the dirt from their feet, that they do not care for them; they eat but little of them, and what they do eat does not nouriſh them like the freſh roots.

16 The ſecond.

The ſecond way is by incloſing the ſheep in hurdles, as in the former; but in this they pull up all the turnips which they ſuppoſe the ſheep can eat in one day, and daily remove the hurdles over the ground whence they have pulled up the turnips: by this means there is no waſte, and leſs expence, for a perſon may in two hours pull up all thoſe turnips; the remaining ſhells of which would have employed three or four labourers a-day to get up with their crooks out of the ground trodden hard by the feet of the ſheep; and the worſt is, that as in the method of pulling up firſt, the turnips are eaten up clean, in this way, by the hook, they are waſted, the ſheep do not eat any great part of them, and when the ground comes to be tilled afterwards for a crop of corn, the fragments of the turnips are ſeen in ſuch quantities on the ſurface, that half the crop at leaſt ſeems to have been waſted.

17 The third, which is the beſt.

The third manner is to pull up the turnips, and remove them in a cart or waggon to ſome other place, ſpreading them on a freſh place every day; by this method the ſheep will eat them up clean, both root and leaves. The great advantage of this method is, when there is a piece of land not far off which wants dung more than that where the turnips grew, which perhaps is alſo too wet for the ſheep in winter, and then the turnips will, by the too great moiſture and dirt of the ſoil, ſometimes ſpoil the ſheep, and give them the rot. Yet ſuch ground will often bring forth more and larger turnips than dry land, and when they are carried off, and eaten by the ſheep on ploughed land, in dry weather, and on green ſward in wet weather, the ſheep will ſucceed much better; and the moiſt ſoil where the turnips grew not being trodden by the ſheep, will be much fitter for a crop of corn than if they had been fed with turnips on it. The expence of hurdles, and the trouble of moving them, are ſaved in this caſe, which will counterbalance at leaſt the expence of pulling the turnips and carrying them to the places where they are to be eaten. They muſt always be carried off for oxen.

18 Diſeaſes of ſheep.

The diſeaſes to which ſheep are ſubject are theſe, rot, red-water, foot-rot and hoving, ſcab, dunt, rickets, fly-ſtruck, flux, and burſting. Of each of theſe we ſhall give the beſt deſcription in our power, with the moſt approved remedies.

19 The rot.

The *rot*, which is a very pernicious diſeaſe, has of late engaged the attention of ſcientific farmers. But neither its nature nor its cauſe has yet been fully aſcertained. Some valuable and judicious obſervations have, however, been made upon it, which ought to be circulated, as they may perhaps, in many caſes, furniſh an antidote for this malignant diſtemper, or be the means of leading others to ſome more efficacious remedy. Some have ſuppoſed the rot owing to the quick growth of graſs or herbs that grow in wet places. Without premiſing, that all bounteous Providence has given to every animal its peculiar taſte, by which it diſtinguiſhes the food proper for its preſervation and ſupport, if not vitiated by fortuitous circumſtances, it ſeems very difficult to diſcover on philoſophical principles why the quick growth of graſs ſhould render it noxious, or why any herb ſhould at one ſeaſon produce fatal effects, by the admiſſion of pure water only into its component parts, which at other times is perfectly innocent, although brought to its utmoſt ſtrength and maturity by the genial influence of the ſun. Beſides, the conſtant practice of moſt farmers in the kingdom, who with the greateſt ſecurity feed their meadows in the ſpring, when the graſs ſhoots quick and is full of juices, militates directly againſt this opinion.

Mr Arthur Young aſcribes this diſeaſe to moiſture. In confirmation of this opinion, which has been generally adopted, we are informed, in the Bath Society papers*, by a correſpondent, that there was a paddock adjoining to his park which had for ſeveral years cauſed the rot in moſt of the ſheep which were put into it. In 1769 he drained it, and from that time his ſheep were free from this malady. But there are facts which render it doubtful that moiſture is the ſole cauſe. We are told, the dry limed land in Derbyſhire will produce the rot as well as water meadows and ſtagnant marſhes; and that in ſome wet grounds ſheep ſuſtain no injury for many weeks.

* Vol. I. art. xlvi.

20 Its cauſe.

Without attempting to enumerate other hypotheſes which the ingenious have formed on this ſubject, we ſhall purſue a different method in order to diſcover the cauſe. On diſſecting ſheep that die of this diſorder, a great number of inſects called *flukes* (ſee FASCIOLA) are found in the liver. That theſe flukes are the cauſe of the rot, therefore, is evident; but to explain how they come into the liver is not ſo eaſy. It is probable that they are ſwallowed by the ſheep along with their food while in the egg ſtate. The eggs depoſited in the tender germ are conveyed with the food into the ſtomach and inteſtines of the animals, whence they are received into the lacteal veſſels, carried off in the chyle, and paſs into the blood; nor do they meet with any obſtruction until they arrive at the capillary veſſels of the liver. Here, as the blood filtrates through the extreme branches, anſwering to thoſe of the *vena porta* in the human body, the ſecerning veſſels are too minute to admit the impregnated ova, which, adhering to the membrane, produce thoſe animalculæ that feed upon the liver and deſtroy the ſheep. They much reſemble the flat fiſh called plaice, are ſometimes as large as a ſilver two pence, and are found both in the liver and in

Sheep. the pipe (anſwering to that of the *vena cava*) which conveys the blood from the liver to the heart.

The common and moſt obvious objection to that opinion is, that this inſect is never found but in the liver, or in ſome parts of the viſcera, of ſheep that are diſeaſed more or leſs; and that they muſt therefore be bred there. But this objection will loſe its force, when we conſider that many inſects undergo ſeveral changes, and exiſt under forms extremely different from each other. Some of them may therefore appear and be well known under one ſhape, and not known to be the ſame under a ſecond or third. The fluke may be the laſt ſtate of ſome aquatic animal which we at preſent very well know under one or other of its previous forms.

If this be admitted, it is eaſy to conceive that ſheep may, on wet ground eſpecially, take multitudes of theſe ova or eggs in with their food; and that the ſtomach and viſcera of the ſheep being a proper nidus for them, they of courſe hatch, and appearing in their fluke or laſt ſtate, feed on the liver of the animal, and occaſion this diſorder.

It is a ſingular fact, "that no ewe ever has the rot while ſhe has a lamb by her ſide." The reaſon of this may be, that the impregnated ovum paſſes into the milk, and never arrives at the liver. The rot is fatal to ſheep, hares, and rabbits, and ſometimes to calves; but never infeſts animals of a larger ſize.

21 and moſt approved cures.

Miller ſays that parſley is a good remedy for the rot in ſheep. Perhaps a ſtrong decoction of this plant, or the oil extracted from its ſeeds, might be of ſervice. Salt is alſo a uſeful remedy. It ſeems to be an acknowledged fact, that ſalt-marſhes never produce the rot. Salt indeed is pernicious to moſt inſects. Common ſalt and water expel worms from the human body; and ſea-weed, if laid in a garden, will drive away inſects; but if the ſalt is ſeparated by ſteeping it in the pureſt ſpring-water for a few days, it abounds with animalculæ of various ſpecies.

Liſle, in his book of huſbandry, informs us of a farmer who cured his whole flock of the rot by giving each ſheep a handful of Spaniſh ſalt for five or ſix mornings ſucceſſively. The hint was probably taken from the Spaniards, who frequently give their ſheep ſalt to keep them healthy. On ſome farms perhaps the utmoſt caution cannot always prevent this diſorder. In wet and warm ſeaſons the prudent farmer will remove his ſheep from the lands liable to rot. Thoſe who have it not in their power to do this may give each ſheep a ſpoonful of common ſalt, with the ſame quantity of flour, in a quarter of a pint of water, once or twice a-week. At the commencement of the rot the ſame remedy given four or five mornings ſucceſſively will in all probability effect a cure. The addition of the flour and water, it is ſuppoſed, not only abates the pungency of the ſalt, but diſpoſes it to mix with the chyle in a more gentle and efficacious manner.

A farmer of a conſiderable lordſhip in Bohemia viſiting the hot-wells of Carlſbad, related how he preſerved his flocks of ſheep from the mortal diſtemper which raged in the wet year 1760, of which ſo many periſhed. His preſervative was very ſimple and very cheap: "He fed them every night, when turned under a ſhed, cover, or ſtables, with haſhed fodder ſtraw; and, by eating it greedily, they all eſcaped." Sheep.

22 Red water.

"*Red water* is a diſorder moſt prevalent on wet grounds. I have heard (ſays Mr Arthur Young) that it has ſometimes been cured by tapping, as for a dropſy. This operation is done on one ſide of the belly towards the flank, juſt below the wool.

23 Foot-rot.

"The *foot-rot* and *hoving*, which is very common on low fenny grounds, is cured by keeping the part clean, and lying at reſt in a dry paſture."

24 Scab.

The *ſcab* is a cutaneous diſeaſe owing to an impurity of the blood, and is moſt prevalent in wet lands or in rainy ſeaſons. It is cured by tobacco-water, brimſtone, and alum, boiled together, and then rubbed over the ſheep. If only partial, tar and greaſe may be ſufficient. But the ſimpleſt and moſt efficacious remedy for this diſeaſe was communicated to the Society for the Encouragement of Arts, &c. by Sir Joſeph Banks.

25 Remedy recommended by Sir Joſeph Banks.

"Take one pound of quickſilver, half a pound of Venice turpentine, half a pint of oil of turpentine, and four pounds of hogs lard (c). Let them be rubbed in a mortar till the quickſilver is thoroughly incorporated with the other ingredients; for the proper mode of doing which, it may be proper to take the advice, or even the aſſiſtance, of ſome apothecary or other perſon uſed to make ſuch mixtures.

"The method of uſing the ointment is this: Beginning at the head of the ſheep, and proceeding from between the ears along the back to the end of the tail, the wool is to be divided in a furrow till the ſkin can be touched; and as the furrow is made, the finger ſlightly dipped in the ointment is to be drawn along the bottom of it, where it will leave a blue ſtain on the ſkin and adjoining wool: from this furrow ſimilar ones muſt be drawn down the ſhoulders and thighs to the legs, as far as they are woolly; and if the animal is much infected, two more ſhould be drawn along each ſide parallel to that on the back, and one down each ſide between the fore and hind legs.

"Immediately after being dreſſed, it is uſual to turn the ſheep among other ſtock, without any fear of the infection being communicated; and there is ſcarcely an inſtance of a ſheep ſuffering any injury from the application. In a few days the blotches dry up, the itching ceaſes, and the animal is completely cured: it is generally, however, thought proper not to delay the operation beyond Michaelmas.

"The *hippoboſca ovina*, called in Lincolnſhire *ſheep fagg*, an animal well known to all ſhepherds, which lives among the wool, and is hurtful to the thriving of ſheep both by the pain its bite occaſions and the blood it ſucks, is deſtroyed by this application, and the wool is not at all injured. Our wool-buyers purchaſe the fleeces on which the ſtain of the ointment is viſible, rather in preference to others, from an opinion that the uſe of it

(c) By ſome unaccountable miſtake the laſt ingredient, the four pounds of hogs lard, is omitted in the receipt publiſhed in the Tranſactions of the Society; a circumſtance that might be productive of bad effects.—The leaf which contained the receipt has ſince been cancelled, and a new one printed.

Sheep.

it having preſerved the animal from being vexed either with the ſcab or faggs, the wool is leſs liable to the defects of joints or knots; a fault obſerved to proceed from every ſudden ſtop in the thriving of the animal, either from want of food or from diſeaſe.

"This mode of curing was brought into that part of Lincolnſhire where my property is ſituated about 12 years ago, by Mr Stephenſon of Mareha *, and is now ſo generally received, that the ſcab, which uſed to be the terror of the farmers, and which frequently deterred the more careful of them from taking the advantage of paſturing their ſheep in the fertile and extenſive commons with which that diſtrict abounds, is no longer regarded with any apprehenſion: by far the moſt of them have their flock anointed in autumn, when they return from the common, whether they ſhow any ſymptoms of ſcab or not; and having done ſo, conclude them ſafe for ſome time from either giving or receiving infection. There are people who employ themſelves in the buſineſs, and contract to anoint our large ſheep at five ſhillings a ſcore, inſuring for that price the ſucceſs of the operation; that is, agreeing, in caſe many of the ſheep break out afreſh, to repeat the operation gratis even ſome months afterwards."

26 The dunt.

The *dunt* is a diſtemper cauſed by a bladder of water gathering in the head. No cure for this has yet been diſcovered.

27 Rickets.

The *rickets* is a hereditary diſeaſe for which no antidote is known. The firſt ſymptom is a kind of lightheadedneſs, which makes the affected ſheep appear wilder than uſual when the ſhepherd or any perſon approaches him. He bounces up ſuddenly from his lare, and runs to a diſtance, as though he were purſued by dogs. In the ſecond ſtage the principal ſymptom is the ſheep's rubbing himſelf againſt trees, &c. with ſuch fury as to pull off his wool and tear away his fleſh. "The diſtreſſed animal has now a violent itching in his ſkin, the effect of a highly inflamed blood; but it does not appear that there is ever any cutaneous eruption or ſalutary critical diſcharge. In ſhort, from all circumſtances, the fever appears now to be at its height."—The laſt ſtage of this diſeaſe "ſeems only to be the progreſs of diſſolution, after an unfavourable criſis. The poor animal, as condemned by Nature, appears ſtupid, walks irregularly (whence probably the name *rickets*), generally lies, and eats little: theſe ſymptoms increaſe in degree till death, which follows a general conſumption, as appears upon diſſection of the carcaſe; the juices and even ſolids having ſuffered a general diſſolution.

In order to diſcover the ſeat and nature of this diſeaſe, ſheep that die of it ought to be diſſected. This is ſaid to have been done by one gentleman, Mr Beal; and he found in the brain or membranes adjoining a maggot about a quarter of an inch long, and of a browniſh colour. A few experiments might eaſily determine this fact.

28 Fly-ſtruck.

The *fly-ſtruck* is cured by clipping the wool off as far as infected, and rubbing the parts dry with lime or wood-aſhes; curriers oil will heal the wounds, and prevent their being ſtruck any more; or they may be cured with care, without clipping, with oil of turpentine, which will kill all the vermin where it goes; but the former is the ſureſt way.

29 Flux.

The *flux* is another diſeaſe to which ſheep are ſubject. The beſt remedy is ſaid to be, to houſe the ſheep immediately when this diſtemper appears, to keep them very warm, and feed them on dry hay, giving them frequent glitters of warm milk and water. The cauſe of that diſtemper is either their feeding on wet lands, or on graſs that is become moſſy by the lands having been fed many years without being ploughed. When the farmer perceives his ſheep-walks to become moſſy, or to produce bad graſs, he ſhould either plough or manure with hot lime, making kilns either very near or in the ſheep walks, becauſe the hotter the lime is put on, the ſweeter the graſs comes up, and that early in the year.

30 And burſting.

Burſting, or as it is called in ſome places the *blaſt*, attacks ſheep when driven into freſh graſs or young clover. They overeat themſelves, foam at the mouth, ſwell exceedingly, breathe very quick and ſhort, then jump up, and inſtantly fall down dead. In this caſe, the only chance of ſaving their life is by ſtabbing them in the maw with an inſtrument made for the purpoſe. The inſtrument is a hollow tube, with a pointed weapon paſſing through it. A hole is made with the pointed weapon; which is immediately withdrawn, and the hole is kept open by inſerting the tube till the wind is diſcharged.

31 Account of the noſe-worms which infeſt ſheep.

Sheep are infeſted with worms in their noſe called *œſtrus oves*, and produced from the egg of a large two-winged fly. The frontal ſinuſes above the noſe in ſheep and other animals are the places where theſe worms live and attain their full growth. Theſe ſinuſes are always full of a ſoft white matter, which furniſhes theſe worms with a proper nouriſhment, and are ſufficiently large for their habitation; and when they have here acquired their deſtined growth, in which they are fit to undergo their changes for the fly-ſtate, they leave their old habitation, and, falling to the earth, bury themſelves there; and when theſe are hatched into flies, the female, when ſhe has been impregnated by the male, knows that the noſe of a ſheep or other animal is the only place for her to depoſit her eggs, in order to their coming to maturity. Mr Valliſnieri, to whom the world owes ſo many diſcoveries in the inſect claſs, is the firſt who has given any true account of the origin of theſe worms. But though their true hiſtory had been till that time unknown, the creatures themſelves were very early diſcovered, and many ages ſince were eſteemed great medicines in epilepſies.

The fly produced from this worm has all the time of its life a very lazy diſpoſition, and does not like to make any uſe either of its legs or wings. Its head and corſelet together are about as long as its body, which is compoſed of five rings, ſtreaked on the back; a pale yellow and brown are there diſpoſed in irregular ſpots; the belly is of the ſame colours, but they are there more regularly diſpoſed, for the brown here makes three lines, one in the middle, and one on each ſide, and all the intermediate ſpaces are yellow. The wings are nearly of the ſame length with the body, and are a little inclined in their poſition, ſo as to lie upon the body: they do not, however, cover it; but a naked ſpace is left between them. The ailerous or petty wings which are found under each of the wings are of a whitiſh colour, and perfectly cover the balancers, ſo that they are not to be ſeen without lifting up theſe.

The fly will live two months after it is firſt produced, Sheep ‖ Sheers.

ced, but will take no nourishment of any kind; and possibly it may be of the same nature with the butterflies, which never take any food during the whole time of their living in that state. Reaumur, Hist. Inf. vol. iv. p. 552, &c.

32 Composition for marking sheep.

To find a proper composition for marking sheep is a matter of great importance, as great quantities of wool are every year rendered useless by the pitch and tar with which they are usually marked. The requisite qualities for such a composition are, that it be cheap, that the colour be strong and lasting, so as to bear the changes of weather, and not to injure the wool. Dr Lewis recommends for this purpose melted tallow, with so much charcoal in fine powder stirred into it as is sufficient to make it of a full black colour, and of a thick consistence. This mixture, being applied warm with a marking iron, on pieces of flannel, quickly fixed or hardened, bore moderate rubbing, resisted the sun and rain, and yet could be washed out freely with soap, or ley, or stale urine. In order to render it still more durable, and prevent its being rubbed off, with the tallow may be melted an eighth, sixth, or fourth, of its weight of tar, which will readily wash out along with it from the wool. Lewis's Com. Phil. Techn. p. 361.

SHEEP-Stealing. See THEFT.

SHEERING, in the sea-language. When a ship is not steered steadily, they say she sheers, or goes sheering; or when, at anchor, she goes in and out by means of the current of the tide, they also say she sheers.

SHEERNESS, a fort in Kent, seated on the point where the river Medway falls into the Thames. It was built by King Charles II. after the insult of the Dutch, who burnt the men of war at Chatham. The buildings belonging to it, in which the officers lodge, make a pretty little neat town; and there is also a yard and a dock, a chapel and a chaplain. Mr Lyons, who sailed with the honourable Captain Phipps in his voyage towards the pole, fixed the longitude of Sheerness to 0. 48′. E. its latitude 51° 25′.

SHEERS, a name given to an engine used to hoist or displace the lower masts of a ship. The sheers employed for this purpose in the royal navy are composed of several long masts, whose heels rest upon the side of the hulk, and having their heads declining outward from the perpendicular, so as to hang over the vessel whose masts are to be fixed or displaced. The tackles, which extend from the head of the mast to the sheer-heads, are intended to pull in the latter toward the mast-head, particularly when they are charged with the weight of a mast after it is raised out of any ship, which is performed by strong tackles depending from the sheer-heads. The effort of these tackles is produced by two capsterns, fixed on the deck for this purpose.

In merchant ships this machine is composed of two masts or props, erected in the same vessel wherein the mast is to be planted, or from whence it is to be removed. The lower ends of these props rest on the opposite sides of the deck, and their upper parts are fastened across, so as that a tackle which hangs from the intersection may be almost perpendicularly above the station of the mast to which the mechanical powers are applied. These sheers are secured by stays which extend forward and aft to the opposite extremities of the vessel.

Sheet ‖ Sheffield.

SHEERS, aboard a ship, an engine used to hoist or displace the lower masts of a ship.

SHEET-LEAD. See PLUMBERY.

SHEET, in sea-language, a rope fastened to one or both the lower corners of a sail, to extend and retain it in a particular station. When a ship sails with a lateral wind, the lower corner of the main and fore sail are fastened by a tack and a sheet; the former being to windward, and the latter to leeward; the tack, however, is entirely diffused with a stern wind, whereas the sail is never spread without the assistance of one or both of the sheets. The stay-sails and studding sails have only one tack and one sheet each: the stay-sail tacks are always fastened forward, and the sheet drawn aft; but the studding-sail tack draws the under clue of the sail to the extremity of the boom, whereas the sheet is employed to extend the inmost.

SHEFFIELD, a town in the west riding of Yorkshire, about 162 miles from London, is a large, thriving town on the borders of Derbyshire, with a population of 31,314 souls; has a fine stone bridge over the Don, and another over the Sheaf, and a church built in the reign of Henry I. It had a castle built in the reign of Henry III. in which, or else in the manor-house of the Park, Mary queen of Scots was prisoner 16 or 17 years; but after the death of Charles I. it was with several others, by order of parliament demolished. In 1673 an hospital was erected here, and endowed with 200l. a-year. There is a charity-school for 30 boys, and another for 30 girls. This town has been noted several hundred years for cutlers and smiths manufactures, which were encouraged and advanced by the neighbouring mines of iron, particularly for files, and knives or whittles; for the last of which especially it has been a staple for above 300 years; and it is reputed to excel Birmingham in these wares, as much as it is surpassed by it in locks, hinges, nails, and polished steel. The first mills in England for turning grindstones were also set up here. The houses look black from the continual smoke of the forges. Here are 600 master cutlers, incorporated by the style of the *Cutlers of Hallamshire* (of which this is reckoned the chief town), who employ no less than 40,000 persons in the iron manufactures; and each of the masters gives a particular stamp to his wares. There is a large market on Tuesday for many commodities, but especially for corn, which is bought up here for the whole west riding, Derbyshire, and Nottinghamshire. It has fairs on Tuesday after Trinity-Sunday, and November 28. In the new market-place, erected by the duke of Norfolk, the shambles are built upon a most excellent plan, and strongly inclosed. There are several other new good buildings, such as a large and elegant octagon chapel belonging to the hospital or alms-houses; likewise a good assembly-room and theatre. We must not omit the large steam-engine, lately finished, for the purpose of polishing and grinding the various sorts of hardware. The parish being very large, as well as populous, Mary I. incorporated 12 of the chief inhabitants, and their successors for ever, by the style of the *Twelve Capital Burgesses of Sheffield*, empowering them to elect and ordain three priests to assist the vicar, who were to be paid out of certain lands and rents which she gave out of the crown; and since this settlement two more chapels have been built in two hamlets of this parish,

rish, which are served by two of the assistants, while the third, in his turn, helps the vicar in his parish-church. James I. founded a free grammar school here, and appointed 13 school burgesses to manage the revenue, and appoint the master and usher. A new chapel was built lately by the contributions of the people of the town and of the neighbouring nobility and gentry. Water is conveyed by pipes into Sheffield, whose inhabitants pay but a moderate rent for it. In the neighbourhood there are some mines of alum. The remains of the Roman fortification between this town and Retheram, which is six miles lower down the river, are still visible; and here also is the famous trench of five miles long, by some called *Devil's* or *Dane's Bank*, and by others *Kemp Bank* and *Temple's Bank*. West Long. 1. 29. N. Lat. 13. 20.

SHEFFIELD, *John*, duke of Buckinghamshire, an eminent writer of the 17th and 18th century, of great personal bravery, and an able minister of state, was born about 1650. He lost his father at nine years of age; and his mother marrying Lord Offulston, the care of his education was left entirely to a governor, who did not greatly improve him in his studies. Finding that he was deficient in many parts of literature, he resolved to devote a certain number of hours every day to his studies; and thereby improved himself to the degree of learning he afterwards attained. Though possessed of a good estate, he did not abandon himself to pleasure and indolence, but entered a volunteer in the second Dutch war; and accordingly was in that famous naval engagement where the duke of York commanded as admiral: on which occasion his lordship behaved so gallantly, that he was appointed commander of the Royal Catharine. He afterward made a campaign in the French service under M. de Turenne. As Tangier was in danger of being taken by the Moors, he offered to head the forces which were sent to defend it; and accordingly was appointed to command them. He was then earl of Mulgrave, and one of the lords of the bed-chamber to King Charles II. The Moors retired on the approach of his majesty's forces; and the result of the expedition was the blowing up of Tangier. He continued in several great posts during the short reign of King James II. till that unfortunate prince was dethroned. Lord Mulgrave, though he paid his respects to King William before he was advanced to the throne, yet did not accept of any post in the government till some years after. In the sixth year of William and Mary he was created marquis of Normanby in the county of Lincoln. He was one of the most active and zealous opposers of the bill which took away Sir John Fenwick's life; and exerted the utmost vigour in carrying through the Treason Bill, and the bill for Triennial Parliaments. He enjoyed some considerable posts under King William, and enjoyed much of his favour and confidence. In 1702 he was sworn lord privy-seal; and in the same year was appointed one of the commissioners to treat of an union between England and Scotland. In 1703 he was created duke of Normanby, and soon after duke of Buckinghamshire. In 1711 he was made steward of her majesty's household, and president of the council. During Queen Anne's reign he was but once out of employment; and then he voluntarily resigned, being attached to what were called the *Tory principles*. Her majesty offered to make him lord chancellor; but he declined the office. He was instrumental in the change of the ministry in 1710. A circumstance that reflects the highest honour on him is, the vigour with which he acted in favour of the unhappy Catalans, who afterward were so inhumanly sacrificed. He was survived by only one legitimate son (who died at Rome in 1735); but left several natural children. He died in 1721. He was admired by the poets of his age; by Dryden, Prior, and Garth. His Essay on Poetry was applauded by Addison, and his Rehearsal is still read with pleasure. His writings were splendidly printed in 1723, in two volumes 4to; and have since been reprinted in 1729, in two volumes 8vo. The first contains his poems on various subjects; the second, his prose works; which consist of historical memoirs, speeches in parliament, characters, dialogues, critical observations, essays, and letters. It may be proper to observe, that the edition of 1729 is castrated; some particulars relating to the revolution in that of 1723 having given offence.

SHEFFIELDIA, a genus of plants belonging to the class of pentandria, and to the order of monogynia. The corolla is bell-shaped; the filaments are ten; of which every second is barren. The capsule consists of one cell, which has four valves. There is only one species, the *repens*, a native of New Zealand.

SHEIBON, a district in Africa, lying on the south-east of the kingdom of Dar-Fur, where much gold is found both in dust and in small pieces. The idolatrous natives and savages collect the dust in quills of the ostrich and vulture, and in that condition dispose of it to the merchants. On discovering a large piece of gold, they kill a sheep on it before it is removed. Their marriage is a simple agreement to cohabit. The slaves bought in great numbers from this quarter, are partly prisoners of war among themselves, and partly seduced by treachery, and sold. In times of scarcity, it is said, a father has been known to sell his children.

There are some Mahometans at Sheibon, who wear clothing, and live among the idolaters; but it is not said whether they are Arabs or not.

SHEIK, in the oriental customs, the person who has the care of the mosques in Egypt; his duty is the same as that of the imams at Constantinople. There are more or fewer of these to every mosque, according to its size or revenue. One of these is head over the rest, and answers to a parish-priest with us; and has under him, in large mosques, the readers, and people who cry out to go to prayers; but in small mosques the sheik is obliged to do all this himself. In such it is their business to open the mosque, to cry to prayers, and to begin their short devotions at the head of the congregation, who stand rank and file in great order, and make all their motions together. Every Friday the sheik makes an harangue to his congregation.

SHEIK-Bellet, the name of an officer in the Oriental nations. In Egypt the sheik-bellet is the head of a city, and is appointed by the pacha. The business of this officer is to take care that no innovations be made which may be prejudicial to the Porte, and that they send no orders which may hurt the liberties of the people. But all his authority depends on his credit and interest, not his office: for the government of Egypt is of such a kind, that often the people of the least power

by

by their posts have the greatest influence: and a caia of the janizaries or Arabs, and sometimes one of their meanest officers, an oda-basha, finds means, by his parts and abilities, to govern all things.

SHEILDS. See SHIELDS.

SHEKEL, the name of a weight and coin current among the ancient Jews. Dr Arbuthnot makes the weight of the shekel equal to 9 pennyweights $2\frac{4}{7}$ grains Troy weight; and the value equal to 2s. $3\frac{3}{8}$d. Sterling. The golden shekel was worth 1l. 16s. 6d.

SHELDRAKE. See ANAS, ORNITHOLOGY *Index*.

SHELF, among miners, the same with what they otherwise call *fast ground*, or *fast country*; being that part of the internal structure of the earth which they find lying even and in an orderly manner, and evidently retaining its primitive form and situation.

SHELL, in *Natural History*, a hard, and, as it were, stony covering, with which certain animals are defended, and thence called *shell fish*. For the classification and history, see CONCHOLOGY.

SHELLS, in *Gunnery*, are hollow iron balls to throw out of mortars or howitzers, with a fuse-hole of about an inch diameter, to load them with powder, and to receive the fuse. The bottom, or part opposite to the fuse, is made thicker than the rest, that the fuse may fall uppermost. But in small elevations this does not always happen, nor indeed is it necessary; for, let the shell fall as it will, the fuse sets fire to the powder within, which bursts the shell, and causes great devastation. The shells had much better be of an equal thickness; for then they burst into more pieces.

Message SHELLS, are nothing more than howitz-shells, in the inside of which a letter or other papers are put; the fuse hole is stopped up with wood or cork, and the shells are fired out of a royal or howitz, either into a garrison or camp. It is supposed, that the person to whom the letter is sent knows the time, and accordingly appoints a guard to look out for its arrival.

SHELL-Fish. These animals are in general oviparous, very few instances having been found of such as are viviparous. Among the oviparous kinds, anatomists have found that some species are of different sexes, in the different individuals of the same species; but others are hermaphrodites, every one being in itself both male and female. In both cases their increase is very numerous, and scarce inferior to that of plants, or of the most fruitful of the insect class. The eggs are very small, and are hung together in a sort of clusters by means of a glutinous humour, which is always placed about them, and is of the nature of the jelly of frog's spawn. By means of this, they are not only kept together in the parcel, but the whole cluster is fastened to the rocks, shells, or other solid substances; and thus they are preserved from being driven on shore by the waves, and left where they cannot succeed.

SHELL-Gold. See GOLD.

SHELTIE, a small but strong kind of horse, so called from Shetland, or Zetland, where they are produced.

SHELVES, in sea-language, a general name given to any dangerous shallows, sand banks, or rocks, lying immediately under the surface of the water, so as to intercept any ship in her passage, and endanger her destruction.

SHENAN. See *Dyeing of LEATHER*.

SHENSTONE, WILLIAM, an admired English poet, the eldest son of a plain country gentleman, who farmed his own estate in Shropshire, was born in November 1714. He learned to read of an old dame, whom his poem of the "School-mistress" has delivered to posterity; and soon received such delight from books, that he was always calling for new entertainment, and expected that, when any of the family went to market, a new book should be brought him, which, when it came, was in fondness carried to bed, and laid by him. It is said, that when his request had been neglected, his mother wrapped up a piece of wood of the same form, and pacified him for the night. As he grew older, he went for a while to the grammar-school in Hales Owen, and was placed afterwards with Mr Crumpton, an eminent school-master at Solihul, where he distinguished himself by the quickness of his progress. When he was young (June 1724), he was deprived of his father; and soon after (August 1726) of his grandfather; and was, with his brother, who died afterwards unmarried, left to the care of his grandmother, who managed the estate. From school he was sent, in 1732, to Pembroke college in Oxford, a society which for half a century has been eminent for English poetry and elegant literature. Here it appears that he found delight and advantage; for he continued his name there ten years, though he took no degree. After the first four years he put on the civilian's gown, but without showing any intention to engage in the profession. About the time when he went to Oxford, the death of his grandmother devolved his affairs to the care of the reverend Mr Dolman, of Brome, in Staffordshire, whose attention he always mentioned with gratitude. —At Oxford he applied to English poetry; and, in 1737, published a small Miscellany, without his name. He then for a time wandered about, to acquaint himself with life, and was sometimes at London, sometimes at Bath, or any place of public resort; but he did not forget his poetry. He published, in 1740, his "Judgement of Hercules," addressed to Mr Lyttleton, whose interest he supported with great warmth at an election; this was two years afterwards followed by the "School-mistress." Mr Dolman, to whose care he was indebted for his ease and leisure, died in 1745, and the care of his fortune now fell upon himself. He tried to escape it a while, and lived at his house with his tenants, who were distantly related; but, finding that imperfect possession inconvenient, he took the whole estate into his own hands, an event which rather improved its beauty than increased its produce. Now began his delight in rural pleasures, and his passion of rural elegance; but in time his expences occasioned clamours that overpowered the lamb's bleat and the linnet's song, and his groves were haunted by beings very different from fauns and fairies. He spent his estate in adorning it, and his death was probably hastened by his anxieties. He was a lamp that spent its oil in blazing. It is said, that if he had lived a little longer, he would have been assisted by a pension; such bounty could not have been more properly bestowed, but that it was ever asked is not certain; it is too certain that it never was enjoyed.—He died at the Leasowes, of a putrid fever, about five on Friday morning, Feb. 11. 1763; and was buried by the side of his brother, in the churchyard of Hales-Owen.

In his private opinions, our author adhered to no particular fect, and hated all religious difputes. Tendernefs, in every fenfe of the word, was his peculiar characteriftic; and his friends, domeftics, and poor neighbours, daily experienced the effects of his benevolence. This virtue he carried to an excefs that feemed to border upon weaknefs; yet if any of his friends treated him ungeneroufly, he was not eafily reconciled. On fuch occafions, however, he ufed to fay, "I never will be a revengeful enemy; but I cannot, it is not in my nature, to be half a friend." He was no economift; for the generofity of his temper prevented his paying a proper regard to the ufe of money: he exceeded therefore the bounds of his paternal fortune. But, if we confider the perfect paradife into which he had converted his eftate, the hofpitality with which he lived, his charities to the indigent, and all out of an eftate that did not exceed 300l. a-year, one fhould rather wonder that he left any thing behind him, than blame his want of economy: he yet left more than fufficient to pay all his debts, and by his will appropriated his whole eftate to that purpofe. Though he had a high opinion of many of the fair fex, he forbore to marry. A paffion he entertained in his youth was with difficulty furmounted. The lady was the fubject of that admirable paftoral, in four parts, which has been fo univerfally read and admired, and which, one would have thought, muft have foftened the proudeft and moft obdurate heart. His works have been publifhed by Mr Dodfley, in 3 vols 8vo. The firft volume contains his poetical works, which are particularly diftinguifhed by an amiable elegance and beautiful fimplicity; the fecond volume contains his profe works; the third his letters, &c. *Biog. Dict.*

SHEPPEY, an ifland at the mouth of the river Medway, about 20 miles in circumference. It is feparated from the main land by a narrow channel; and has a fertile foil, which feeds great flocks of fheep. The borough-town of Queenborough is feated thereon; befides which it has feveral villages.

SHERARDIA, a genus of plants belonging to the tetrandria clafs, and in the natural method ranking under the 47th order, *Stellatæ*. See BOTANY *Index*.

SHERBET, or SHERBIT, a compound drink, firft brought into England from Turkey and Perfia, confifting of water, lemon-juice, and fugar, in which are diffolved perfumed cakes made of excellent Damafcus fruit, containing an infufion of fome drops of rofe water. Another kind of it is made of violets, honey, juice of raifins, &c.

SHERIDAN, THOMAS, D. D. the intimate friend of Dean Swift, is faid by Shield, in Cibber's "Lives of the Poets," to have been born about 1684, in the county of Cavan, where, according to the fame authority, his parents lived in no very elevated ftate. They are defcribed as being unable to afford their fon the advantages of a liberal education; but he, being obferved to give early indications of genius, attracted the notice of a friend to his family, who fent him to the college of Dublin, and contributed towards his fupport while he remained there. He afterwards entered into orders, and fet up a fchool in Dublin, which long maintained a very high degree of reputation, as well for the attention beftowed on the morals of the fcholars as for their proficiency in literature. So great was the eftimation in which this feminary was held, that it is afferted to have produced in fome years the fum of 1000l. It does not appear that he had any confiderable preferment; but his intimacy with Swift, in 1725, procured for him a living in the fouth of Ireland worth about 150l. a-year, which he went to take poffeffion of, and, by an act of inadvertence, deftroyed all his future expectations of rifing in the church; for being at Corke on the 1ft of Auguft, the anniverfary of King George's birth-day, he preached a fermon, which had for its text, "Sufficient for the day is the evil thereof." On this being known, he was ftruck out of the lift of chaplains to the lord lieutenant, and forbidden the caftle.

This living Dr Sheridan afterwards changed for that of Dunboyne, which, by the knavery of the farmers, and power of the gentlemen in the neighbourhood, fell fo low as 80l. per annum. He gave it up for the free fchool of Cavan, where he might have lived well in fo cheap a country on 80l. a-year falary, befides his fcholars; but the air being, as he faid, too moift and unwholefome, and being difgufted with fome perfons who lived there, he fold the fchool for about 400l.; and having foon fpent the money, he fell into bad health, and died Sept. 10. 1738, in his 55th year.

Lord Corke has given the following character of him. "Dr Sheridan was a fchool-mafter, and in many inftances perfectly well adapted for that ftation. He was deeply verfed in the Greek and Roman languages, and in their cuftoms and antiquities. He had that kind of good nature which abfence of mind, indolence of body, and careleffnefs of fortune, produce; and although not over ftrict in his own conduct, yet he took care of the morality of his fcholars, whom he fent to the univerfity remarkably well founded in all kinds of claffical learning, and not ill inftructed in the focial duties of life. He was flovenly, indigent, and cheerful. He knew books much better than men; and he knew the value of money leaft of all. In this fituation, and with this difpofition, Swift faftened upon him as upon a prey with which he intended to regale himfelf whenever his appetite fhould prompt him." His Lordfhip then mentions the event of the unlucky fermon, and adds: "This ill-ftarred, good-natured, improvident man, returned to Dublin, unhinged from all favour at court, and even banifhed from the caftle. But ftill he remained a punfter, a quibbler, a fiddler, and a wit. Not a day paffed without a rebus, an anagram, or a madrigal. His pen and his fiddleftick were in continual motion; and yet to little or no purpofe, if we may give credit to the following verfes, which fhall ferve as the conclufion of his poetical character:

"With mufic and poetry equally blefs'd,
"A bard thus Apollo moft humbly addrefs'd;
"Great author of poetry, mufic, and light,
"Inftructed by thee, I both fiddle and write;
"Yet unheeded I fcrape, or I fcribble all day,
"My tunes are neglected, my verfe flung away.
"Thy fubftitute here, Vice-Apollo difdains
"To vouch for my numbers, or lift to my ftrains.
"Thy manual fign he refufes to put
"To the airs I produce from the pen or the gut:
"Be thou then propitious, great Phœbus, and grant
"Relief, or reward, to my merit or want.

Sheridan, Sheriff.

"Tho' the Dean and Delany tranſcendently ſhine,
"O! brighten one ſolo or ſonnet of mine:
"Make one work immortal, 'tis all I requeſt.
"Apollo look'd pleas'd, and reſolving to jeſt,
"Replied—Honeſt friend, I've conſider'd your caſe,
"Nor diſlike your unmeaning and innocent face.
"Your petition I grant, the boon is not great,
"Your works ſhall continue, and here's the receipt:
"On rondeaus hereafter your fiddle-ſtrings ſpend,
"Write verſes in circles, they never ſhall end."

"One of the volumes of Swift's miſcellanies conſiſts almoſt entirely of letters between him and the Dean. He publiſhed a proſe tranſlation of Perſius; to which he added the beſt notes of former editors, together with many judicious ones of his own. This work was printed at London, 1739, in 12mo. *Biog. Dict.*

SHERIDAN, *Mrs Frances*, wife to Thomas Sheridan, M. A. was born in Ireland about the year 1724, but deſcended from a good Engliſh family which had removed thither. Her maiden name was Chamberlaine, and ſhe was grand-daughter of Sir Oliver Chamberlaine. The firſt literary performance by which ſhe diſtinguiſhed herſelf was a little pamphlet at the time of a violent party-diſpute relative to the theatre, in which Mr Sheridan had newly embarked his fortune. So well-timed a work exciting the attention of Mr Sheridan, he by an accident diſcovered his fair patroneſs, to whom he was ſoon afterwards married. She was a perſon of the moſt amiable character in every relation of life, with the moſt engaging manners. After lingering ſome years in a very weak ſtate of health, ſhe died at Blois, in the ſouth of France, in the year 1767. Her "Sydney Biddulph" may be ranked with the firſt productions of that claſs in ours or in any other language. She alſo wrote a little romance in one volume called *Nourjahad*, in which there is a great deal of imagination productive of an admirable moral. And ſhe was the authoreſs of two comedies, "The Diſcovery" and "The Dupe."

Blackſt. Comment. vol. i. p. 339.

SHERIFF, an officer, in each county in England, nominated by the king, inveſted with a judicial and miniſterial power, and who takes place of every nobleman in the county during the time of his office.

The ſheriff is an officer of very great antiquity in this kingdom, his name being derived from two Saxon words, ſignifying the *reeve*, *bailiff*, or *officer* of the ſhire. He is called in Latin *vice-comes*, as being the deputy of the earl or *comes*, to whom the cuſtody of the ſhire is ſaid to have been committed at the firſt diviſion of this kingdom into counties. But the earls, in proceſs of time, by reaſon of their high employments and attendance on the king's perſon, not being able to tranſact the buſineſs of the county, were delivered of that burden; reſerving to themſelves the honour, but the labour was laid on the ſheriff. So that now the ſheriff does all the king's buſineſs in the county; and though he be ſtill called *vice-comes*, yet he is entirely independent of, and not ſubject to, the earl; the king, by his letters patent, committing *cuſtodiam comitatus* to the ſheriff, and to him alone.

Sheriffs were formerly choſen by the inhabitants of the ſeveral counties. In confirmation of which it was ordained, by ſtatute 28 Edw. I. c. 8. that the people ſhould have an election of ſheriffs in every ſhire where the ſhrievalty is not of inheritance. For anciently in ſome counties the ſheriffs were hereditary; as we apprehend they were in Scotland till the ſtatute 20 Geo. II. c. 43; and ſtill continue in the county of Weſtmoreland to this day; the city of London having alſo the inheritance of the ſhrievalty of Middleſex veſted in their body by charter. The reaſon of theſe popular elections is aſſigned in the ſame ſtatute, c. 13. "that the commons might chooſe ſuch as would not be a burden to them." And herein appears plainly a ſtrong trace of the democratical part of our conſtitution; in which form of government it is an indiſpenſable requiſite, that the people ſhould chooſe their own magiſtrates. This election was in all probability not abſolutely veſted in the commons, but required the royal approbation. For in the Gothic conſtitution, the judges of their county courts (which office is executed by the ſheriff) were elected by the people, but confirmed by the king: and the form of their election was thus managed; the people, or *incolæ territorii*, choſe twelve electors, and they nominated three perſons, *ex quibus rex unum confirmabat*. But, with us in England, theſe popular elections, growing tumultuous, were put an end to by the ſtatute 9. Edw. II. ſt. 2. which enacted, that the ſheriffs ſhould from thenceforth be aſſigned by the chancellor, treaſurer, and the judges; as being perſons in whom the ſame truſt might with confidence be repoſed. By ſtatutes 14 Edw. III. c. 7. 23 Hen. VI. c. 8. and 21 Hen. VIII. c. 20. the chancellor, treaſurer, preſident of the king's council, chief juſtices, and chief baron, are to make this election; and that on the morrow of All Souls, in the exchequer. And the king's letters patent, appointing the new ſheriffs, uſed commonly to bear date the ſixth day of November. The ſtatute of Cambridge, 12 Ric. II. c. 2. ordains, that the chancellor, treaſurer, keeper of the privy ſeal, ſteward of the king's houſe, the king's chamberlain, clerk of the rolls, the juſtices of the one bench and the other, barons of the exchequer, and all other that ſhall be called to ordain, name, or make juſtices of the peace, ſheriffs, and other officers of the king, ſhall be ſworn to act indifferently, and to name no man that ſueth to be put in office, but ſuch only as they ſhall judge to be the beſt and moſt ſufficient. And the cuſtom now is (and has been at leaſt ever ſince the time of Forteſcue, who was chief juſtice and chancellor to Henry the ſixth), that all the judges, together with the other great officers, meet in the exchequer chamber on the morrow of All Souls yearly, (which day is now altered to the morrow of St Martin, by the laſt act for abbreviating Michaelmas term), and then and there propoſe three perſons to the king, who afterwards appoints one of them to be ſheriff. This cuſtom of the twelve judges propoſing three perſons ſeems borrowed from the Gothic conſtitution before mentioned: with this difference, that among the Goths the 12 nominors were firſt elected by the people themſelves. And this uſage of ours, at its firſt introduction, there is reaſon to believe, was founded upon ſome ſtatute, though not now to be found among our printed laws; firſt, becauſe it is materially different from the direction of all the ſtatutes before-mentioned; which it is hard to conceive that the judges would have countenanced by their concurrence, or that Forteſcue would have inſerted in his book, unleſs by the authority of ſome ſtatute; and alſo, becauſe a ſtatute is expreſsly referred to in the record, which Sir Edward Coke tells

Sheriff. tells us he transcribed from the council book of 3d March, 34 Hen. VI. and which is in substance as follows. The king had of his own authority appointed a man sheriff of Lincolnshire, which office he refused to take upon him; whereupon the opinions of the judges were taken, what should be done in this behalf. And the two chief justices, Sir John Fortescue and Sir John Prisot, delivered the unanimous opinion of them all; "that the king did an error when he made a person sheriff that was not chosen and presented to him according to the statute; that the person refusing was liable to no fine for disobedience, as if he had been one of the three persons chosen according to the tenor of the statute; that they would advise the king to have recourse to the three persons that were chosen according to the statute, or that some other thrifty man be intreated to occupy the office for this year; and that, the next year, to eschew such inconveniences, the order of the statute in this behalf made be observed." But, notwithstanding this unanimous resolution of all the judges of England, thus entered in the council-book, and the statute 34 and 35 Hen. VIII. c. 26. § 61. which expressly recognizes this to be the law of the land, some of our writers have affirmed, that the king, by his prerogative, may name whom he pleases to be sheriff, whether chosen by the judges or not. This is grounded on a very particular case in the fifth year of Queen Elizabeth, when, by reason of the plague, there was no Michaelmas term kept at Westminster; so that the judges could not meet there *in crastino animarum* to nominate the sheriffs: whereupon the queen named them herself, without such previous assembly, appointing for the most part one of two remaining in the last year's list. And this case, thus circumstanced, is the only authority in our books for the making these extraordinary sheriffs. It is true, the reporter adds, that it was held that the queen by her prerogative might make a sheriff without the election of the judges, *non obstante aliquo statuto in contrarium;* but the doctrine of *non obstante*, which sets the prerogative above the laws, was effectually demolished by the bill of rights at the revolution, and abdicated Westminster-hall when King James abdicated the kingdom. However, it must be acknowledged, that the practice of occasionally naming what are called *pocket-sheriffs*, by the sole authority of the crown, hath uniformly continued to the reign of his present majesty; in which, it is believed, few (if any) instances have occurred.

Sheriffs, by virtue of several old statutes, are to continue in their office no longer than one year; and yet it hath been said that a sheriff may be appointed *durante bene placito*, or during the king's pleasure; and so is the form of the royal writ. Therefore, till a new sheriff be named, his office cannot be determined, unless by his own death, or the demise of the king; in which last case it was usual for the successor to send a new writ to the old sheriff; but now, by statute 1 Anne st. 1. c. 8 all officers appointed by the preceding king may hold their offices for six months after the king's demise, unless sooner displaced by the successor. We may farther observe, that by statute 1 Ric. II. c. 11. no man that has served the office of sheriff for one year can be compelled to serve the same again within three years after.

We shall find it is of the utmost importance to have the sheriff appointed according to law, when we consider his power and duty. These are either as a judge, as the keeper of the king's peace, as a ministerial officer of the superior courts of justice, or as the king's bailiff. Sheriff.

In his judicial capacity he is to hear and determine all causes of 40 shillings value and under, in his county-court: and he has also a judicial power in divers other civil cases. He is likewise to decide the elections of knights of the shire, (subject to the controul of the House of Commons), of coroners, and of verderors; to judge of the qualification of voters, and to return such as he shall determine to be duly elected.

As the keepers of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein, during his office. He may apprehend, and commit to prison, all persons who break the peace, or attempt to break it; and may bind any one in a recognizance to keep the king's peace. He may, and is bound, *ex officio*, to pursue and take all traitors, murderers, felons, and other misdoers, and commit them to gaol for safe custody. He is also to defend his county against any of the king's enemies when they come into the land; and for this purpose, as well as for keeping the peace and pursuing felons, he may command all the people of his county to attend him; which is called the *posse comitatus*, or power of the county; which summons, every person above 15 years old, and under the degree of a peer, is bound to attend upon warning, under pain of fine and imprisonment. But though the sheriff is thus the principal conservator of the peace in his county, yet, by the express directions of the great charter, he, together with the constable, coroner, and certain other officers of the king, are forbidden to hold any pleas of the crown, or, in other words, to try any criminal offence. For it would be highly unbecoming, that the executioners of justice should be also the judges; should impose, as well as levy, fines and amercements; should one day condemn a man to death, and personally execute him the next. Neither may he act as an ordinary justice of the peace during the time of his office; for this would be equally inconsistent, he being in many respects the servant of the justices.

In his ministerial capacity, the sheriff is bound to execute all process issuing from the king's courts of justice. In the commencement of civil causes, he is to serve the writ, to arrest, and to take bail; when the cause comes to trial, he must summon and return the jury; when it is determined, he must see the judgment of the court carried into execution. In criminal matters, he also arrests and imprisons, he returns the jury, he has the custody of the delinquent, and he executes the sentence of the court, though it extend to death itself.

As the king's bailiff, it is his business to preserve the rights of the king within his bailiwick; for so his county is frequently called in the writs: a word introduced by the princes of the Norman line; in imitation of the French, whose territory is divided into bailiwicks, as that of England into counties. He must seize to the king's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures; must seize and keep all waifs, wrecks, estrays, and the like, unless

Sheriff, Sherlock.

they be granted to some subject; and must also collect the king's rents within his bailiwick, if commanded by process from the exchequer.

To execute these various offices, the sheriff has under him many inferior officers; an under-sheriff, bailiffs, and gaolers, who must neither buy, sell, nor farm their offices, on forfeiture of 500l.

The under-sheriff usually performs all the duties of the office; a very few only excepted, where the personal presence of the high sheriff is necessary. But no under sheriff shall abide in his office above one year; and if he does, by statute 23 Hen. VI. c. 8. he forfeits 200l. a very large penalty in those early days. And no under-sheriff or sheriff's officer shall practise as an attorney during the time he continues in such office: for this would be a great inlet to partiality and oppression. But these salutary regulations are shamefully evaded, by practising in the names of other attorneys, and putting in sham deputies by way of nominal under-sheriffs: by reason of which, says Dalton, the under-sheriffs and bailiffs do grow so cunning in their several places, that they are able to deceive, and it may well be feared that many of them do deceive, both the king, the high sheriff, and the county.

SHERIFF, in Scotland. See LAW, Part iii. sect. 3.

SHERLOCK, WILLIAM, a learned English divine in the 17th century, was born in 1641, and educated at Eton school, where he distinguished himself by the vigour of his genius and his application to study. Thence he was removed to Cambridge, where he took his degrees. In 1669 he became rector of the parish of St George, Botolph-lane, in London; and in 1681 was collated to the prebend of Pancras, in the cathedral of St Paul's. He was likewise chosen master of the Temple, and had the rectory of Therfield in Hertfordshire. After the Revolution he was suspended from his preferment, for refusing the oaths to King William and Queen Mary; but at last he took them, and publicly justified what he had done. In 1691 he was installed dean of St Paul's. His Vindication of the Doctrine of the Trinity engaged him in a warm controversy with Dr South and others. Bishop Burnet tells us, he was "a clear, a polite, and a strong writer; but apt to assume too much to himself, and to treat his adversaries with contempt." He died in 1707. His works are very numerous; among these are, 1. A Discourse concerning the Knowledge of Jesus Christ, against Dr Owen. 2. Several pieces against the Papists, the Socinians, and Dissenters. 3. A practical Treatise on Death, which is much admired. 4. A practical Discourse on Providence. 5. A practical Discourse on the Future Judgment; and many other works.

SHERLOCK, *Dr Thomas*, bishop of London, was the son of the preceding Dr William Sherlock, and was born in 1678. He was educated in Catharine hall, Cambridge, where he took his degrees, and of which he became master: he was made master of the Temple very young, on the resignation of his father; and it is remarkable, that this mastership was held by father and son successively for more than 70 years. He was at the head of the opposition against Dr Hoadley bishop of Bangor; during which contest he published a great number of pieces. He attacked the famous Collins's "Grounds and Reasons of the Christian Religion," in a course of six sermons, preached at the Temple church, which he intitled "The Use and Intent of Prophecy in the several Ages of the World." In 1728, Dr Sherlock was promoted to the bishopric of Bangor; and was translated to Salisbury in 1734. In 1747 he refused the archbishopric of Canterbury, on account of his ill state of health; but recovering in a good degree, accepted the see of London the following year. On occasion of the earthquakes in 1750, he published an excellent Pastoral Letter to the clergy and inhabitants of London and Westminster: of which it is said there were printed in 4to, 5000; in 8vo, 20,000; and in 12mo, about 30,000; beside pirated editions, of which not less than 50,000 were supposed to have been sold. Under the weak state of body in which he lay for several years, he revised and published 4 vols of Sermons in 8vo, which are particularly admired for their ingenuity and elegance. He died in 1762, and by report worth 150,000l. "His learning," says Dr Nicholls, "was very extensive: God had given him a great and an understanding mind, a quick comprehension, and a solid judgment. These advantages of nature he improved by much industry and application. His skill in the civil and canon law was very considerable; to which he had added such a knowledge of the common law of England as few clergymen attain to. This it was that gave him that influence in all causes where the church was concerned; as knowing precisely what it had to claim from its constitutions and canons, and what from the common law of the land." Dr Nicholls then mentions his constant and exemplary piety, his warm and fervent zeal in preaching the duties and maintaining the doctrines of Christianity, and his large and diffusive munificence and charity; particularly by his having given large sums of money to the corporation of clergymen's sons, to several of the hospitals, and to the society for propagating the gospel in foreign parts: also his bequeathing to Catharine-hall in Cambridge, the place of his education, his valuable library of books, and his donations for the founding a librarian's place and a scholarship, to the amount of several thousand pounds.

Sherlock, Sherriffe.

SHERRIFFE of Mecca, the title of the descendants of Mahomet by Hassan Ibn Ali. These are divided into several branches, of which the family of Ali Bunemi, consisting at least of three hundred individuals, enjoy the sole right to the throne of Mecca. The Ali Bunemi are, again, subdivided into two subordinate branches, Darii Sajid, and Darii Barkad; of whom sometimes the one, sometimes the other, have given sovereigns to Mecca and Medina, when these were separate states.

Not only is the Turkish sultan indifferent about the order of succession in this family, but he seems even to foment the dissensions which arise among them, and favours the strongest, merely that he may weaken them all. As the order of succession is not determinately fixed, and the sherriffes may all aspire alike to the sovereign power, this uncertainty of right, aided by the intrigues of the Turkish officers, occasions frequent revolutions. The grand sherriffe is seldom able to maintain himself on the throne; and it still seldomer happens that his reign is not disturbed by the revolt of his nearest relations. There have been instances of a nephew succeeding his uncle, an uncle succeeding his nephew; and

and ſometimes of a perſon, from a remote branch, coming in the room of the reigning prince of the ancient houſe.

When Niebuhr was in Arabia, in 1763, the reigning Sherriffe Meſad had ſitten fourteen years on the throne, and, during all that period, had been continually at war with the neighbouring Arabs, and with his own neareſt relations ſometimes. A few years before, the pacha of Syria had depoſed him, and raiſed his younger brother to the ſovereign dignity in his ſtead. But after the departure of the caravan, Jafar, the new ſherriffe, not being able to maintain himſelf on the throne, was obliged to reſign the ſovereignty again to Meſad. Achmet, the ſecond brother of the ſherriffe, who was much beloved by the Arabs, threatened to attack Mecca while Niebuhr was at Jidda. Our traveller was ſoon after informed of the termination of the quarrel, and of Achmet's return to Mecca, where he continued to live peaceably in a private character.

Theſe examples ſhow that the Muſſulmans obſerve not the law which forbids them to bear arms againſt their holy places. An Egyptian bey even preſumed, a few years ſince, to plant ſome ſmall cannons within the compaſs of the Kaaba, upon a ſmall tower, from which he fired over that ſacred manſion, upon the palace of Sherriffe Meſad, with whom he was at variance.

The dominions of the ſherriffe, comprehend the cities of Mecca, Medina, Jambo, Taaif, Sadie, Ghunfude, Hali, and thirteen others leſs conſiderable, all ſituated in Hedjas. Near Taaif is the lofty mountain of Gazvan, which according to Arabian authors, is covered with ſnow in the midſt of ſummer. As theſe dominions are neither opulent nor extenſive, the revenue of their ſovereign cannot be conſiderable.

He finds a rich reſource, however, in the impoſts levied on pilgrims, and in the gratuities offered him by Muſſulman monarchs. Every pilgrim pays a tax of from ten to an hundred crowns, in proportion to his ability. The Great Mogul remits annually ſixty thouſand roupees to the ſherriffe, by an aſſignment upon the government of Surat. Indeed, ſince the Engliſh made themſelves maſters of this city, and the territory belonging to it, the nabob of Surat has no longer been able to pay the ſum. The ſherriffe once demanded it of the Engliſh, as the poſſeſſors of Surat; and, till they ſhould ſatisfy him, forbade their captains to leave the port of Jidda. But the Engliſh diſregarding this prohibition, the ſherriffe complained to the Ottoman Porte, and they communicated his complaints to the Engliſh ambaſſador. He at the ſame time opened a negociation with the nominal nabob, who reſides in Surat. But all theſe ſteps proved fruitleſs: and the ſovereign of Mecca ſeems not likely to be ever more benefited by the contribution from India.

The power of the ſherriffe extends not to ſpiritual matters; theſe are entirely managed by the heads of the clergy, of different ſects, who are reſident at Mecca. Rigid Muſſulmans, ſuch as the Turks, are not very favourable in their ſentiments of the ſherriffes, but ſuſpect their orthodoxy, and look upon them as ſecretly attached to the tolerant ſect of the Zeidi.

SHETLAND, the name of certain iſlands belonging to Scotland, and lying to the northward of Orkney. There are many convincing proofs that theſe iſlands were very early inhabited by the Picts, or rather by thoſe nations who were the original poſſeſſors of the Orkneys; and at the time of the total deſtruction of theſe nations, if any credit be due to tradition, their woods were entirely ruined (A). It is highly probable that the people in Shetland, as well as in the Orkneys, flouriſhed under their own princes dependent upon the crown of Norway; yet this ſeems to have been rather through what they acquired by fiſhing and commerce, than by the cultivation of their lands. It may alſo be reaſonably preſumed, that they grew thinner of inhabitants after they were annexed to the crown of Scotland; and it is likely that they revived again, chiefly by the very great and extenſive improvements which the Dutch made in the herring fiſhery upon their coaſts, and the trade that the crews of their buſſes, then very numerous, carried on with the inhabitants, neceſſarily reſulting from their want of proviſions and other conveniences.

There are many reaſons which may be aſſigned why theſe iſlands, though part of our dominions, have not hitherto been better known to us. They were commonly placed two degrees too far to the north in all the old maps, in order to make them agree with Ptolemy's deſcription of Thule, which he aſſerted to be in the latitude of 63 degrees; which we find urged by Camden as a reaſon why Thule muſt be one of the Shetland iſles, to which Speed alſo agrees, though from their being thus wrong placed he could not find room for them in his maps. Another, and that no light cauſe, was the many falſe, fabulous, and impertinent relations publiſhed concerning them (B), as if they were countries inhoſpitable and uninhabitable; and laſtly, the indolence, or rather indifference, of the natives, who, contenting themſelves with thoſe neceſſaries and conveniences procured by their intercourſe with other nations, and conceiving themſelves neglected by the mother country, have ſeldom troubled her with their applications.

There are few countries that have gone by more names than theſe iſlands; they were called in Iſlandic, *Hialtlandia*, from *hialt*, the "hilt of a ſword;" this might be poſſibly corrupted into *Hetland*, *Hitland*, or *Hethland*, though ſome tell us this ſignifies a "high land." They have been likewiſe, and are ſtill in ſome maps, called *Zetland* and *Zealand*, in reference, as has been ſuppoſed, to their ſituation. By the Danes, and by

(A) The tradition is, that this was done by the Scots when they deſtroyed the Picts; but is more probably referred to the Norwegians rooting out the original poſſeſſors of Shetland.

(B) They repreſented the climate as intenſely cold; the ſoil as compoſed of crags and quagmire, ſo barren as to be incapable of bearing corn; to ſupply which, the people, after drying fiſh-bones, powdered them, then kneaded and baked them for bread. The larger fiſh-bones were ſaid to be all the fuel they had. Yet, in ſo dreary a country, and in ſuch miſerable circumſtances, they were acknowledged to be very long-lived, cheerful, and contented.

Shetland. by the natives, they are ſtyled *Yealtaland:* and notwithſtanding the oddneſs of the orthography, this differs very little, if at all, from their manner of pronouncing Zetland, out of which pronunciation grew the modern names of *Shetland* and *Shotland*.

The iſlands of *Shetland*, as we commonly call them, are well ſituated for trade. The neareſt continent to them is Norway; the port of Bergen lying 44 leagues eaſt, whereas they lie 46 leagues north-north-eaſt from Buchanneſs; eaſt-north-eaſt from Sanda, one of the Orkneys, about 16 or 18 leagues; ſix or ſeven leagues north-eaſt from Fair Iſle; 58 leagues eaſt from the Ferroe iſles; and at nearly the ſame diſtance north-eaſt from Lewis. The ſouthern promontory of the Mainland, called *Sumburgh Head*, lies in 59 degrees and 59 minutes of north latitude; and the northern extremity of Unſt, the moſt remote of them all, in the latitude of 61 degrees 15 minutes. The meridian of London paſſes through this laſt iſland, which lies about 2 degrees 30 minutes weſt from Paris, and about 5 degrees 15 minutes eaſt from the meridian of Cape Lizard. According to Gifford's Hiſtorical Deſcription of Zetland, the inhabited iſlands are 33, of which the principal is ſtyled *Mainland*, and extends in length from north to ſouth about 60 miles, and is in ſome places 20 broad, though in others not more than two.

It is impoſſible to ſpeak with preciſion; but, according to the beſt computation which we have been able to form, the Shetland iſles contain near three times as much land as the Orkneys: and they are conſidered as not inferior to the provinces of Utrecht, Zealand, and all the reſt of the Dutch iſlands taken together; but of climate and ſoil they have not much to boaſt. The longeſt day in the iſland of Unſt is 19 hours 15 minutes, and of conſequence the ſhorteſt day 4 hours and 45 minutes. The ſpring is very late, the ſummer very ſhort; the autumn alſo is of no long duration, dark, foggy, and rainy; the winter ſets in about November, and laſts till April, and ſometimes till May. They have frequently in that ſeaſon ſtorms of thunder, much rain, but little froſt or ſnow. High winds are indeed very frequent and very troubleſome, yet they ſeldom produce any terrible effects. The aurora borealis is as common here as in any of the northern countries. In the winter ſeaſon the ſea ſwells and rages in ſuch a manner, that for five or ſix months their ports are inacceſſible, and of courſe the people during that ſpace have no correſpondence with the reſt of the world.

The ſoil in the interior part of the Mainland, for the moſt part, is mountainous, mooriſh, and boggy, yet not to ſuch a degree as to render the country utterly impaſſable; for many of the roads here, and in ſome of the northern iſles, are as good as any other natural roads, and the people travel them frequently on all occaſions. Near the coaſt there are ſometimes for miles together flat pleaſant ſpots, very fertile both in paſture and corn. The mountains produce large crops of very nutritive graſs in the ſummer; and they cut conſiderable quantities of hay, with which they feed their cattle in the winter. They might with a little attention bring more of their country into cultivation: but the people are ſo much addicted to their fiſhery, and feel ſo little neceſſity of having recourſe to this method for ſubſiſtence, that they are content, how ſtrange ſoever that may ſeem to us, to let four parts in five of their land remain in a ſtate of nature. Shetland.

They want not conſiderable quantities of marl in different iſlands, though they uſe but little; hitherto there has been no chalk found; limeſtone and freeſtone there are in the ſouthern parts of the Mainland in great quantities, and alſo in the neighbouring iſlands, particularly Fetlar; and conſiderable quantities of ſlate, very good in its kind. No mines have been hitherto wrought to any great extent; but there are in many places appearances of metallic ores, as thoſe of copper and iron; and it is ſaid, pieces of ſilver ore have been found. In ſome of the ſmaller iſles there are ſtrong appearances of iron; but, through the want of proper experiments being made, there is, in this reſpect at leaſt, hitherto nothing certain. Their meadows are incloſed with dikes, and produce very good graſs. The little corn they grow is chiefly barley, with ſome oats; though even in the northern extremity of Unſt the little land which they have is remarkable for its fertility. The hills abound with medicinal herbs; and their kitchen-gardens thrive as well, and produce as good greens and roots, as any in Britain. Of late years, and ſince this has been attended to, ſome gentlemen have had even greater ſucceſs than they expected in the cultivating of tulips, roſes, and many other flowers. They have no trees, and hardly any ſhrubs except juniper, yet they have a tradition that their country was formerly overgrown with woods; and it ſeems to be a confirmation of this, that the roots of timber-trees have been, and are ſtill, dug up at a great depth; and that in ſome, and thoſe too inacceſſible, places, the mountain-aſh is ſtill found growing wild. That this defect, viz. the want of wood at preſent, does not ariſe entirely from the ſoil or climate, appears from ſeveral late experiments; ſome gentlemen having raiſed aſh, maple, horſe-cheſnuts, &c. in their gardens. Though the inhabitants are without either wood or coals, they are very well ſupplied with fuel, having great plenty of heath and peat. The black cattle in this country are in general of a larger ſort than in Orkney, which is owing to their having more extenſive paſtures; a clear proof that ſtill farther improvements might be made in reſpect to ſize. Their horſes are ſmall, but ſtrong, ſtout, and well-ſhaped, live very hardy, and to a great age. They have likewiſe a breed of ſmall ſwine, the fleſh of which, when fat, is eſteemed very delicious. They have no goats, hares, or foxes; and in general no wild or venomous creatures of any kind except rats in ſome few iſlands. They have no moorfowl, which is the more remarkable, as there are everywhere immenſe quantities of heath; but there are many ſorts of wild and water-fowl, particularly the dunter-gooſe, clack-gooſe, ſolan-gooſe, ſwans, ducks, teal, whaps, ſoiſts, lyres, kittiwakes, maws, plovers, cormorants, &c. There is likewiſe the ember-gooſe, which is ſaid to hatch her egg under her wing. Eagles and hawks, as alſo ravens, crows, mews, &c. abound here.

All theſe iſlands are well watered; for there are everywhere excellent ſprings, ſome of them mineral and medicinal. They have indeed no rivers; but many pleaſant rills or rivulets, of different ſizes; in ſome of the largeſt they have admirable trouts, ſome of which are of 15 and even of 20 pounds weight. They have likewiſe

likewiſe many freſh-water lakes, well ſtored with trout and eels, and in moſt of them there are alſo large and fine flounders; in ſome very excellent cod. Theſe freſh-water lakes, if the country was better peopled, and the common people more at their eaſe, are certainly capable of great improvements. The ſea-coaſts of the Mainland of Shetland, in a ſtraight line, are 55 leagues; and therefore there cannot be a country conceived more proper for eſtabliſhing an extenſive fiſhery. What the inhabitants have been hitherto able to do, their natural advantages conſidered, does not deſerve that name, notwithſtanding they export large quantities of cod, tuſk, ling, and ſkate, inſomuch that the bounty allowed by acts of parliament amounts from 1400l. to 2000l. annually. They have, beſides, haddocks, whitings, turbot, and a variety of other fiſh. In many of the inlets there are prodigious quantities of excellent oyſters, lobſters, muſcles, cockles, and other ſhell-fiſh. As to amphibious creatures, they have multitudes of otters and ſeals; add to theſe, that amber, ambergris, and other ſpoils of the ocean, are ſometimes found upon the coaſts.

The inhabitants are a ſtout, well-made, comely people; the lower ſort of a ſwarthy complexion. The gentry are allowed, by all who have converſed with them, to be moſt of them polite, ſhrewd, ſenſible, lively, active, and intelligent perſons; and theſe, to the number of 100 families, have very handſome, ſtrong, well-built houſes, neatly furniſhed; their tables well ſerved; poliſhed in their manners, and exceedingly hoſpitable and civil to ſtrangers. Thoſe of an inferior rank are a hardy, robuſt, and laborious people, who, generally ſpeaking, get their bread by fiſhing in all weathers in their yawls, which are little bigger than Graveſend wherries; live hardily, and in the ſummer ſeaſon moſtly on fiſh; their drink, which, in reference to the Britiſh dominions, is peculiar to the country, is called *bland*, and is a ſort of butter-milk, long kept, and very ſour. Many live to great ages, though not ſo long as in former times. In reſpect, however, to the bulk of the inhabitants, from the poorneſs of living, from the nature of it, and from the drinking great quantities of corn-ſpirits of the very worſt ſort, multitudes are afflicted with an inveterate ſcurvy; from which thoſe in better circumſtances are entirely free, and enjoy as good health as in any other country in Europe. As they have no great turn to agriculture, and are perſuaded that their country is not fit for it, they do not (though probably they might) raiſe corn enough to ſupport them for more than two-thirds of the year. But they are much more ſucceſsful in their paſture-grounds, which are kept well incloſed, in good order, and, together with their commons, ſupply them plentifully with beef and mutton. They pay their rents generally in butter at Lammas, and in money at Martinmas. As to manufactures, they make a ſtrong coarſe cloth for their own uſe, as alſo linen. They make likewiſe of their own wool very fine ſtockings. They export, beſides the different kinds of fiſh already mentioned, ſome herrings, a conſiderable quantity of butter and train-oil, otter and ſeal ſkins, and no inconſiderable quantity of the fine ſtockings juſt mentioned. Their chief trade is to Leith, London, Hamburgh, Spain, and to the Straits. They import timbers, deals, and ſome of their beſt oats, from Norway; corn and flour from the Orkneys, and from North Britain; ſpirits and ſome other things from Hamburgh; cloths and better ſort of linen from Leith; grocery, houſehold furniture, and other neceſſaries, from London. The ſuperior-duties to the earl of Morton are generally let in farm; and are paid by the people in butter, oil, and money. The remains of the old Norwegian conſtitution are ſtill viſible in the diviſion of their lands; and they have ſome udalmen or freeholders amongſt them. But the Scots laws, cuſtoms, manners, dreſs, and language, prevail; and they have a ſheriff, and other magiſtrates for the adminiſtration of juſtice, as well as a cuſtomhouſe, with a proper number of officers. In reference to their eccleſiaſtical concerns, they have a preſbytery, 12 miniſters, and an itinerant for Foula, Fair Iſland, and the Skerries. Each of theſe miniſters has a ſtipend of between 40 and 50 pounds, beſides a houſe and a glebe free from taxes. The number of ſouls in theſe iſlands may be about 20,000.

SHEW-BREAD, the loaves of bread which the prieſt of the week put every Sabbath-day upon the golden-table in the ſanctuary, before the Lord, in the temple of the Jews. They were twelve in number, and were offered to God in the name of the twelve tribes of Iſrael. They were ſhaped like a brick, were ten palms long and five broad, weighing about eight pounds each. They were unleavened, and made of fine flour by the Levites. The prieſts ſet them on the table in two rows, ſix in a row, and put frankincenſe upon them to preſerve them from moulding. They were changed every Sabbath, and the old ones belonged to the prieſt upon duty. Of this bread none but the prieſts might eat, except in caſes of neceſſity. It was called the *bread of faces*, becauſe the table of the ſhew-bread, being almoſt over-againſt the ark of the covenant, the loaves might be ſaid to be ſet before the face of God. The original table was carried away to Babylon, but a new one was made for the ſecond temple. It was of wood overlaid with gold. This, with the candleſtick and ſome other ſpoils, was carried by Titus to Rome.

SHIELD, an ancient weapon of defence, in form of a light buckler, borne on the arm to fend off lances, darts, &c. The form of the ſhield is repreſented by the eſcutcheon in coats of arms. The ſhield was that part of the ancient armour on which the perſons of diſtinction in the field of battle always had their arms painted; and moſt of the words uſed at this time to expreſs the ſpace that holds the arms of families are derived from the Latin name for a ſhield, *ſcutum*. The French *eſcu* and *eſcuſſion*, and the Engliſh word *eſcutcheon*, or, as we commonly ſpeak it, *ſcutcheon*, are evidently from this origin; and the Italian *ſcudo* ſignifies both the ſhield of arms and that uſed in war. The Latin name *clypeus*, for the ſame thing, ſeems alſo to be derived from the Greek word γλυφειν, *to engrave*; and it had this name from the ſeveral figures engraved on it, as marks of diſtinction of the perſon who wore it.

The ſhield in war, among the Greeks and Romans, was not only uſeful in the defence of the body, but it was alſo a token, or badge of honour, to the wearer; and he who returned from battle without it was always treated with infamy afterwards. People have at all times thought this honourable piece of the armour the propereſt place to engrave, or figure on the ſigns of dignity of the poſſeſſor of it; and hence, when arms came to be painted for families in aftertimes, the heralds always

ways chose to represent them upon the figure of a shield, but with several exterior additions and ornaments; as the helmet, supporters, and the rest.

The form of the shield has not only been found different in various nations, but even the people of the same nation, at different times, have varied its form extremely; and among several people there have been shields of several forms and sizes in use, at the same period of time, and suited to different occasions. The most ancient and universal form of shields, in the earlier ages, seems to have been the triangular. This we see instances of in all the monuments and gems of antiquity: our own most early monuments show it to have been the most antique shape also with us, and the heralds have found it the most convenient for their purposes, when they had any odd number of figures to represent; as if three, then two in the broad bottom part, and one in the narrow upper end, it held them very well; or if five, they stood as conveniently, as three below, and two above. The other form of a shield, now universally used, is square, rounded and pointed at the bottom: this is taken from the figure of the Samnitic shield used by the Romans, and since copied very generally by the English, French, and Germans.

The Spaniards and Portuguese have the like general form of shields, but they are round at the bottom without the point; and the Germans, beside the Samnite-shield, have two others pretty much in use: these are, 1. The bulging shield, distinguished by its swelling or bulging out at the flanks; and, 2. The indented shield, or shield chancree, which has a number of notches and indentings all round its sides. The use of the ancient shield of this form was, that the notches served to rest the lance upon, that it might be firm while it gave the thrust; but this form being less proper for the receiving armorial figures, the two former have been much more used in the heraldry of that nation.

Beside this different form of the shields in heraldry, we find them also often distinguished by their different positions, some of them standing erect, and others slanting various ways, and in different degrees; this the heralds express by the word *pendant*, "hanging," they seeming to be hung up not by the centre, but by the right or left corner. The French call these *ecu pendant*, and the common antique triangular ones *ecu ancien*. The Italians call this *scuto pendente;* and the reason given for exhibiting the shield in these figures in heraldry is, that in the ancient tilts and tournaments, they who were to just at these military exercises, were obliged to hang up their shields with their armories, or coats of arms on them, out at the windows and balconies of the houses near the place; or upon trees, pavilions, or the barriers of the ground, if the exercise was to be performed in the field.

Those who were to fight on foot, according to Columbier, had their shields hung up by the right corner, and those who were to fight on horseback had theirs hung up by the left. This position of the shields in heraldry is called *couche* by some writers, though by the generality *pendant*.

It was very frequent in all parts of Europe, in arms given between the 11th and 14th centuries; but it is to be observed, that the hanging by the left corner, as it was the token of the owner's being to fight on horseback, so it was esteemed the most honourable and noble situation; and all the pendant shields of the sons of the royal family of Scotland and England, and of our nobility at that time, are thus hanging from the left corner. The hanging from this corner was a token of the owner's being of noble birth, and having fought in the tournaments before; but no sovereign ever had a shield pendant any way, but always erect, as they never formally entered the lists of the tournament.

The Italians generally have their shields of arms of an oval form; this seems to be done in imitation of those of the popes and other dignified clergy: but their herald Petro Sancto seems to regret the use of this figure of the shield, as an innovation brought in by the painters and engravers as most convenient for holding the figures, but derogatory to the honour of the possessor, as not representing either antiquity or honours won in war, but rather the honours of some citizen or person of learning. Some have carried it so far as to say, that those who either have no ancient title to nobility, or have sullied it by any unworthy action, cannot any longer wear their arms in shields properly figured, but were obliged to have them painted in an oval or round shield.

In Flanders, where this author lived, the round and oval shields are in the disrepute he speaks of; but in Italy, beside the popes and dignified prelates, many of the first families of the laity have them.

The secular princes, in many other countries, also retain this form of the shield, as the most ancient and truly expressive of the Roman clypeus.

SHIELD, in *Heraldry*, the escutcheon or field on which the bearings of coats of arms are placed. See HERALDRY.

SHIELDRAKE, or SHELDRAKE. See ANAS, ORNITHOLOGY *Index*.

SHIELDS, NORTH and SOUTH, two sea-port towns, at the mouth of the Tyne, the one in Northumberland, the other in the county of Durham. South Shields contained above 200 salt-pans, 50 years ago; but now there are not more than five or six; and the duty, which is now only 10,000l. per annum, amounted formerly to 80,000l. South Shields has a considerable trade, in which not less than 500 vessels from 100 to 500 tons burden are employed; and has nine dry docks for repairing, and 10 yards for building ships. This town has been much improved of late years. In the centre there is a large square, in which there is a handsome town-hall, with a colonnade under it for the weekly market, and from which streets branch out on all sides. North Shields contains also some fine streets and squares. The harbour is very commodious, and so spacious, that it is capable of receiving 2000 ships. It is defended by a fort, in which there is also a lighthouse, corresponding with another on the top of the bank, to direct vessels into the harbour. The population of North and South Shields is estimated at 25,000. W. Long. 1. 12. N. Lat. 55. 44.

SHIFTERS, on board a man of war, certain men who are employed by the cooks to shift and change the water in which the flesh or fish is put, and laid for some time, in order to fit it for the kettle.

SHIFTING A TACKLE, in sea-language, the act of removing the blocks of a tackle to a greater distance from each other, on the object to which they are applied, in order to give a greater scope or extent to their purchase. This operation is otherwise called *fleeting*. Shifting the helm denotes the alteration of its position, by

Shilling. by pushing it towards the opposite side of the ship. Shifting the voyal, signifies changing its position on the capstern, from the right to the left, and *vice versa*.

SHILLING, an English silver coin, equal to twelve pence, or the twentieth part of a pound.

Freherus derives the Saxon *scilling*, whence our shilling, from a corruption of *siliqua*; proving the derivation by several texts of law, and, among others, by the 26th law, *De annuis legatis*. Skinner deduces it from the Saxon *scild*, "shield," by reason of the escutcheon of arms thereon.

Bishop Hooper derives it from the Arabic *scheele*, signifying *a weight*; but others, with greater probability, deduce it from the Latin *sicilicus*, which signified in that language *a quarter of an ounce*, or the 48th part of a Roman pound. In confirmation of this etymology it is alleged, that the shilling kept its original signification, and bore the same proportion to the Saxon pound as sicilicus did to the Roman and the Greek, being exactly the 48th part of the Saxon pound; a discovery which we owe to Mr Lambarde *.

* *Explicatio Rerum et Verborum in Leg. Sax. voc. Libra.*

However, the Saxon laws reckon the pound in the round number at 50 shillings, but they really coined out of it only 48; the value of the shilling was fivepence; but it was reduced to fourpence above a century before the conquest; for several of the Saxon laws, made in Athelstan's reign, oblige us to take this estimate. Thus it continued to the Norman times, as one of the Conqueror's laws sufficiently ascertains; and it seems to have been the common coin by which the English payments were adjusted. After the conquest, the French *solidus* of twelvepence, which was in use among the Normans, was called by the English name of shilling; and the Saxon shilling of fourpence took a Norman name, and was called the *groat*, or great coin, because it was the largest English coin then known in England.

It has been the opinion of the bishops Fleetwood and Gibson, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and shillings, as well as by pence and farthings, had been in constant use even from the Saxon times, long before the Norman conquest, there never was such a coin in England as either a pound or a mark, nor any shilling, till the year 1504 or 1505, when a few silver shillings or twelvepences were coined, which have long since been solely confined to the cabinets of collectors.

Mr Clarke combats this opinion, alleging that some coins mentioned by Mr Folkes, under Edward I. were probably Saxon shillings new minted, and that Archbishop Aelfric expressly says †, that the Saxons had three names for their money, viz. mancuses, shillings, and pennies. He also urges the different value of the Saxon shilling at different times, and its uniform proportion to the pound, as an argument that their shilling was a coin; and the testimony of the Saxon gospels, in which the word we have translated *pieces of silver* is rendered *shillings*, which, he says, they would hardly have done, if there had been no such coin as a shilling then in use. Accordingly the Saxons expressed their shilling in Latin by *siclus* and *argenteus*. He farther adds, that the Saxon shilling was never expressed by *solidus* till after the Norman settlements in England; and howsoever it altered during the long period that elapsed from the conquest to the time of Henry VII. it was the most constant denomination of money in all payments, though it was then only a species of account, or the twentieth part of the pound sterling: and when it was again revived as a coin, it lessened gradually as the pound sterling lessened, from the 28th of Edward III. to the 43d of Elizabeth.

† *Gram. Saxon*, p. 52.

Shilling, Shilluk.

In the year 1560 there was a peculiar sort of shilling struck in Ireland, of the value of ninepence English, which passed in Ireland for twelvepence. The motto on the reverse was, *posui Deum adjutorem meum*. Eighty-two of these shillings, according to Malynes, went to the pound; they therefore weighed 20 grains, one-fourth each, which is somewhat heavier in proportion than the English shilling of that time, 62 whereof went to the pound, each weighing 92 grains seven-eighths; and the Irish shilling being valued at the Tower at ninepence English, that is, one-fourth part less than the English shilling, it should therefore proportionably weigh one-fourth part less, and its full weight be somewhat more than 62 grains; but some of them found at this time, though much worn, weighed 69 grains. In the year 1598, five different pieces of money of this kind were struck in England for the service of the kingdom of Ireland. These were shillings to be current in Ireland at twelvepence each; half shillings to be current at sixpence, and quarter shillings at threepence. Pennies and halfpennies were also struck of the same kind, and sent over for the payment of the army in Ireland. The money thus coined was of a very base mixture of copper and silver; and two years after there were more pieces of the same kinds struck for the same service, which were still worse; the former being three ounces of silver to nine ounces of copper; and these latter only two ounces eighteen pennyweights to nine ounces two pennyweights of the alloy.

The Dutch, Flemish, and Germans, have likewise their shilling, called *schelin*, *schilling*, *scalin*, &c. but these not being of the same weight or fineness with the English shilling, are not current at the same value. The English shilling is worth about 23 French sols; those of Holland and Germany about 11 sols and a half; those of Flanders about nine. The Dutch shillings are also called *sols de gros*, because equal to twelve gros. The Danes have copper shillings worth about one-fourth of a farthing sterling.

SHILLUK, a town in Africa on the banks of the true Nile. The houses are built of clay, and the clothing of the inhabitants consists of long grass, which they pass round the waist and between the thighs. They are all black, and both sexes shave their heads. These people have the dominion of the river, and exact toll of all passengers. The meaning of the word Shilluk seems to be unknown. When they transport Mahometans across the ferry, they sometimes shew the importance which their situation gives them. After the Mahometan has placed himself in the boat, they ask him, who is the master of that river? The other replies Ulloh or Rubbaric, God is the master of it. No, you must say that such a one (naming his chief) is the master of it, or you shall not pass. They are said to be hospitable to such as come among them in a peaceable manner, and as never betraying those to whom they have once afforded protection. The particulars of their worship have not been described. Shilluk, according to Mr Browne's map, is in 13° N. Lat. 3?° 26′ E. Long.

Shiloh.

SHILOH, is a term famous among interpreters and commentators upon Scripture. It is found (Gen. xlix. 10.) to denote the Messiah. The patriarch Jacob foretells his coming in these words; "The sceptre shall not depart from Judah, nor a lawgiver from between his feet, until Shiloh come; and unto him shall the gathering of the people be." The Hebrew text reads, יבא שלה עד כי *until Shiloh come*. All Christian commentators agree, that this word ought to be understood of the Messiah, or Jesus Christ; but all are not agreed about its literal and grammatical signification. St Jerome, who translates it by *Qui mittendus est*, manifestly reads *Shiloach* "sent," instead of *Shiloh*. The Septuagint have it Εως αν ελθη τα αποκειμενα αυτω; or, Εως αν ελθη ω αποκειται, (as if they had read שלו instead of שלה), i. e. "Until the coming of him to whom it is reserved;" or, "Till we see arive that which is reserved for him."

It must be owned, that the signification of the Hebrew word *Shiloh* is not well known. Some translate, "the sceptre shall not depart from Judah, till he comes to whom it belongs;" שלה or שלו instead of לו אשר. Others, "till the coming of the peace-maker;" or, "the pacific;" or, "of prosperity," שלה *prosperatus est*. *Shalah* signifies, "to be in peace, to be in prosperity;" others, "till the birth of him who shall be born of a woman that shall conceive without the knowledge of a man," שיל or שליא *secundina, fluxus* *; otherwise, "the sceptre shall not depart from Judah, till its end, its ruin; till the downfal of the kingdom of the Jews," שאל or שלה *it has ceased, it has finished* †. Some Rabbins have taken the name *Siloh* or *Shiloh*, as if it signified the city of this name in Palestine: "The sceptre shall not be taken away from Judah till it comes to Shiloh; till it shall be taken from him to be given to Saul at Shiloh." But in what part of Scripture is it said, that Saul was acknowledged as king or consecrated at Shiloh? If we would understand it of Jeroboam the son of Nebat, the matter is still as uncertain. The Scripture mentions no assembly at Shiloh that admitted him as king. A more modern author derives *Shiloh* from שלה. *fatigare*, which sometimes signifies *to be weary, to suffer*; "till his labours, his sufferings, his passion, shall happen."

* *Arab. Lud. de Dieu.*

† *Le Clerc in Genes.*

But not to amuse ourselves about seeking out the grammatical signification of Shiloh, it is sufficient for us to show, that the ancient Jews are in this matter agreed with the Christians: they acknowledge, that this word stands for the *Messiah the King*. It is thus that the paraphrasts Onkelos and Jonathan, that the ancient Hebrew commentaries upon Genesis, and that the Talmudists themselves, explain it. If Jesus Christ and his apostles did not make use of this passage to prove the coming of the Messiah, it was because then the completion of this prophecy was not sufficiently manifest. The sceptre still continued among the Jews; they had still kings of their own nation in the persons of the Herods; but soon after the sceptre was entirely taken away from them, and has never been restored to them since.

The Jews seek in vain to put forced meanings upon this prophecy of Jacob; saying, for example, that the sceptre intimates the dominion of strangers, to which they have been in subjection, or the hope of seeing one day the sceptre or supreme power settled again among themselves. It is easy to perceive, that all this is contrived to deliver themselves out of perplexity. In vain likewise they take refuge in certain princes of the captivity, whom they pretend to have subsisted beyond the Euphrates, exercising an authority over their nation little differing from absolute, and being of the race of David. This pretended succession of princes is perfectly chimerical; and though at certain times they could show a succession, it continued but a short time, and their authority was too obscure, and too much limited, to be the object of a prophecy so remarkable as this was.

Shiloh ‖ Ship.

SHINGLES, in building, small pieces of wood, or quartered oaken boards, sawn to a certain scantling, or, as is more usual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long.

Shingles are used instead of tiles or slates, especially for churches and steeples; however, this covering is dear; yet, where tiles are very scarce, and a light covering is required, it is preferable to thatch; and where they are made of good oak, cleft, and not sawed, and well seasoned in water and the sun, they make a sure, light, and durable covering.

The building is first to be covered all over with boards, and the shingles nailed upon them.

SHIP, a general name for all large vessels, particularly those equipped with three masts and a bowsprit; the masts being composed of a lowermast, topmast, and top-gallant-mast: each of these being provided with yards, sails, &c. Ships, in general, are either employed for war or merchandise.

SHIPS of War are vessels properly equipped with artillery, ammunition, and all the necessary martial weapons and instruments for attack or defence. They are distinguished from each other by their several ranks or classes, called *rates*, as follows: Ships of the first rate mount from 100 guns to 110 guns and upwards; second rate, from 90 to 98 guns; third rate, from 64 to 74 guns; fourth rate, from 50 to 60 guns; fifth rate, from 32 to 44 guns; and sixth rates, from 20 to 28 guns. See the article RATE. Vessels carrying less than 20 guns are denominated *sloops, cutters, fire-ships* and *bombs*. It has lately been proposed to reduce the number of these rates, which would be a saving to the nation, and also productive of several material advantages.

In Plate CCCCLXXX. is the representation of a first rate, with rigging, &c. the several parts of which are as follows:

Plate CCCCLXXX. Fig. 1.

Parts of the hull.—Fig. 1. A, The cathead; B, The fore-chain-wales, or chains; C, The main-chains; D, The mizen-chains; E, The entering port; F, The hawse-holes; G, The poop-lanterns; H, The chess-tree; I, The head; K, The stern.

1, The bowsprit. 2, Yard and sail. 3, Gammoning. 4, Manrop. 5, Bobstay. 6, Spritsail-sheets. 7, Pendants. 8, Braces and pendants. 9, Halliards. 10, Lifts. 11, Clue-lines. 12, Spritsail-horses. 13, Buntlines. 14, Standing lifts. 15, Bowsprit-shroud. 16, Jib-boom. 17, Jibstay and sail. 18, Halliards. 19, Sheets. 20, Horses. 21, Jib-guy. 12, Spritsail-topsail yard. 23, Horses. 24, Sheets. 25, Lifts. 26, Braces and pendants. 27, Cap of bowsprit. 28, Jack staff. 29, Truck. 30, Jack flag.—31, *Foremast*. 32, Runner and tackle. 33, Shrouds. 34, Laniards. 35, Stay and laniard. 36, Preventer-stay and laniard. 37, Woolding of the mast. 38, Foreyard and sail. 39, Horses.

Ship. Horſes. 40, Top. 41, Crowfoot. 42, Jeers. 43, Yard-tackles. 44, Lifts. 45, Braces and pendants. 46, Sheets. 47, Foretacks. 48, Bowlines and bridles. 49, Fore buntlines. 50, Fore leechlines. 51, Preventer-brace. 52, Futtock-ſhrouds.—53, *Foretop-maſt.* 54, Shrouds and laniards. 55, Foretop-ſail yard and ſail. 56, Stay and ſail. 57, Runner. 58, Backſtays. 59, Halliards. 60, Lifts. 61, Braces and pendants. 62, Horſes. 63, Clew-lines. 64, Bowlines and bridles. 65, Reef-tackles. 66, Sheets. 67, Buntlines. 68, Croſs trees. 69, Cap. 70, Foretop-gallant-maſt. 71, Shrouds. 72, Yard and ſail. 73, Backſtays. 74, Stay. 75, Lifts. 76, Clewlines. 77, Braces and pendants. 78, Bowlines and bridles. 79, Flag-ſtaff. 80, Truck. 81, Flag-ſtay-ſtaff. 82, Flag of the lord high admiral.—83, *Mainmaſt.* 84, Shrouds. 85, Laniards. 86, Runner and tackle. 87, Futtock-ſhrouds. 88, Top-lantern. 89, Crank of ditto. 90, Stay. 91. Preventer-ſtay. 92, Stay-tackles. 93, Woolding of the maſt. 94, Jeers. 95, Yard-tackles. 96, Lifts. 97, Braces and pendants. 98, Horſes. 99, Sheets. 100, Tacks. 101, Bowlines and bridles. 102, Crow-foot. 103, Cap. 104, Top. 105, Buntlines. 106, Leechlines. 107, Yard and ſail.—108, *Main-topmaſt.* 109, Shrouds and laniards. 110, Yard and ſail. 111, Futtock-ſhrouds. 112, Backſtays. 113, Stay. 114, Stayſail and halliards. 115, Tye. 116, Halliards. 117, Lifts. 118, Clewlines. 119, Braces and pendants. 120, Horſes. 121, Sheets. 122, Bowlines and bridles. 123, Buntlines. 124, Reef-tackles. 125, Croſs-trees. 126, Cap.—127, *Maintop gallantmaſt.* 128, Shrouds and laniards. 129, Yard and ſail. 130, Backſtays. 131, Stay. 132, Stayſail and halliards. 133, Lifts. 134, Braces and pendants. 135, Bowlines and bridles, 136, Clewlines. 137, Flagſtaff. 138, Truck. 139 Flagſtaff-ſtay. 140, Flag ſtandard.—141, *Mizenmaſt.* 142, Shrouds and laniards. 143, Cap. 144, Yard and ſail. 145, Block for ſignal halliards. 146, Sheet, 147, Pendant lines. 148, Peekbrails. 149. Stayſail. 150, Stay. 151, Derrick and ſpan. 152, Top. 153, Croſsjack yard. 154, Croſsjack lifts. 155, Croſsjack braces. 156, Croſsjack ſlings.—157, *Mizentop-maſt.* 158, Shrouds and laniards. 159. Yard and ſail. 160, Backſtays. 161, Stay. 162, Halliards. 163, Lifts. 164, Braces and pendants. 165, Bowlines and bridles. 166, Sheets. 167, Clewlines. 168, Stayſail. 169, Croſstrees. 170, Cap. 171, Flagſtaff. 172, Flagſtaff-ſtay. 173, Truck. 174, Flag, union. 175, Enſign-ſtaff. 176, Truck. 177, Enſign. 178, Stern ladder. 179, Bower cable.

Plate CCCCLXXXI. Fig. 2. Fig. 2. Plate CCCCLXXXI. is a vertical longitudinal ſection of a firſt rate ſhip of war, with references to the principal parts, which are as follows:

A, Is the head, containing,—1, The ſtem; 2, The knee of the head or cutwater; 3, The lower and upper cheek; 4, The trail-board; 5, The figure; 6, The gratings; 7, The brackets; 8, The falſe ſtem; 9. The breaſt hooks; 10, The hauſe holes; 11, The bulkhead forward; 12, The cathead; 13, The cathook; 14, Neceſſary ſeats; 15, The manger within board; 16, The bowſprit.

B, Upon the forecaſtle—17, The gratings; 18, The partners of the maſt; 19, The gunwale; 20, The belfry; 21, The funnel for ſmoke; 22, The gangway going off the forecaſtle; 23, The forecaſtle guns.

C, In the forecaſtle—24, The door of the bulkhead forward; 25, Officers cabins; 26, Staircaſe; 27, Foretop-ſail ſheet bits; 28, The beams; 29, The carlings.

D, The middle gun deck forward—30, The forejeer bits; 31, The oven and furnace of copper; 32, The captain's cook room; 33, The ladder or way to the forecaſtle.

E, The lower gun-deck forward—34, The knees fore and aft; 35, The ſpirketings, or the firſt ſtreak next to each deck, the next under the beams being called *clamps;* 36. The beams of the middle gun deck fore and aft; 37, The carlings of the middle gun-deck fore and aft; 38, The fore-bits; 39, The after or main bits; 40. The hatchway to the gunner's and boatſwain's ſtore-rooms; 41. The jeer capſtan.

F, The orlop—42, 43, 44, The gunner's, boatſwain's, and carpenter's ſtore-rooms; 45, The beams of the lower gun-deck; 46, 47, The pillars and the riders, fore and aft; 48, The bulkhead of the ſtore-rooms.

G, The hold—49, 50, 51, The foot-hook rider, the floor rider, and the ſtandard, fore and aft; 52, The pillars; 53, The ſtep of the foremaſt; 54, The kelſon, or falſe keel, and dead riſing; 55, The dead-wood.

H, At midſhips in the hold—56, The floor timbers; 57, The keel; 58, The well; 59, The chain-pump; 60, The ſtep of the mainmaſt; 61, 62, Beams and carlings of the orlop, fore and aft.

I, The orlop amidſhips—63, The cable tire; 64, The main hatchway.

K, The lower gun-deck amidſhips—65, The ladder leading up to the middle gun-deck; 66, The lower tire of ports.

L, The middle gun-deck amidſhip—67, The middle tire of ports; 68, The entering port; 69, The main jeer bits; 70, Twiſted pillars or ſtanchions; 71, The capſtan; 72, Gratings; 73, The ladder leading to the upper deck.

M, The upper gun-deck amidſhips—74, The maintopſail-ſheet bits; 75, The upper partners of the mainmaſt; 76, The gallows on which ſpare topmaſts &c. are laid; 77, The foreſheet blocks; 78, The rennets; 79, The gunwale; 80, The upper gratings; 81, The drift brackets; 82, The piſs dale; 83, The capſtan pall.

N, Abaft the mainmaſt—84, The gangway off the quarterdeck; 85, The bulkhead of the coach; 86, The ſtaircaſe down to the middle gun-deck; 87, The beams of the upper deck; 88, The gratings about the mainmaſt; 89, The coach or council-chamber; 90, The ſtaircaſe up to the quarterdeck.

O, The quarterdeck—91, The beams; 92, The carlings; 93, The partners of the mizenmaſt; 94, The gangway up to the poop; 95, The bulkhead of the cuddy.

P, The poop—96, The trumpeter's cabin; 97, The taffarel.

Q, The captain's cabin.

R, The cuddy, uſually divided for the maſter and ſecretary's officers.

S, The ſtate-room, out of which is made the bedchamber and other conveniences for the commander in chief; 98, The entrance into the gallery; 99, The bulkhead of the great cabin; 100, The ſtern lights and after galleries.

T, The ward-room, allotted for the lieutenants and marine

Ship. marine officers: 101, The lower gallery; 102, The ſteerage and bulkhead of the wardroom; 103, The whipſtaff, commanding the tiller; 104, The after ſtaircaſe leading down to the lower gun-deck.

V, Several officers cabins abaft the mainmaſt, where the ſoldiers generally keep guard.

W, The gun room—105, The tiller commanding the rudder; 106, The rudder; 107, The ſtern-poſt; 108, The tiller tranſom; 109, The ſeveral tranſoms, viz. 1, 2, 3, 4, 5; 110, The gun-room ports, or ſtern-chaſe; 111, The bread-room ſcuttle, out of the gun-room; 112, The main capſtan; 113, The pall of the capſtan; 114, The partner; 115, The bulkhead of the bread-room.

X, The bread-room.

Y, The ſteward's room, where all proviſions are weighed and ſerved out.

Z, The cockpit, where are ſubdiviſions for the purſer, the ſurgeon, and his mates.

AA, The platform or orlop, where proviſion is made for the wounded in the time of ſervice; 116, The hold abaft the main-maſt; 117, The ſtep of the mizen-maſt; 118, The kelſon, or falſe keel; 119, The dead wood, or riſing.

Ships of war are fitted out either at the expence of the ſtate or by individuals. Thoſe fitted out at the public expence are called *King's ſhips*, and are divided into *ſhips of the line*, *frigates*, *ſloops*, &c. For an account of each of theſe, ſee the reſpective articles. Ships of war fitted out by individuals are called *privateers*. See the article PRIVATEER.

Armed SHIP. See *ARMED-Ship*.

Bomb-SHIP. See *BOMB Veſſels*.

Double-SHIP. See *SHIP-Building*.

Fire-SHIP. See *FIRE-Ship*.

Hoſpital-SHIP, a veſſel fitted up to attend on a fleet of men of war, and receive their ſick or wounded; for which purpoſe her decks ſhould be high, and her ports ſufficiently large. Her cables ought alſo to run upon the upper deck, to the end that the beds or cradles may be more commodiouſly placed between decks, and admit a free paſſage of the air to diſperſe that which is offenſive or corrupted.

Merchant-SHIP, a veſſel employed in commerce to carry commodities of various ſorts from one port to another.

The largeſt merchant ſhips are thoſe employed by the different companies of merchants who trade to the Eaſt Indies. They are in general larger than our 40 gun ſhips; and are commonly mounted with 20 guns on their upper-deck, which are nine pounders; and ſix on their quarter-deck, which are ſix pounders.

Regiſter-SHIP. See *REGISTER-Ship*.

Store-SHIP, a veſſel employed to carry artillery or naval ſtores for the uſe of a fleet, fortreſs, or garriſon.

Tranſport-SHIP, is generally uſed to conduct troops from one place to another.

Beſides the different kinds of ſhips abovementioned, which are denominated from the purpoſe for which they are employed, veſſels have alſo, in general, been named according to the different manner of rigging them. It would be an endleſs, and at the ſame time an unneceſſary taſk, to enumerate all the different kinds of veſſels with reſpect to their rigging; and therefore a few only are here taken notice of. Fig. 3. is a *ſhip* which would be converted into a *bark* by ſtripping the mizen maſt of its yards and the ſails belonging to them. If each maſt, its correſponding topmaſt and topgallant-maſt, inſtead of being compoſed of ſeparate pieces of wood, were all of one continued piece, then this veſſel with very little alteration would be a *polacre*. Fig. 4. repreſents a *ſnow*; fig. 5. a *bilander*; fig. 6. a *brig*; fig. 7. a *ketch*; fig. 8. a *ſchooner*; fig. 9. a *ſloop*; fig. 10. a *zebec*; fig. 11. a *galliot*; fig. 12. a *dogger*; fig. 13. a *galley* under ſail; fig. 14. ditto rowing.

Plate CCCCLXXX. Fig. 3.

Plate CCCCLXXXII. Fig. 6.

Ships are alſo ſometimes named according to the different modes of their conſtruction. Thus we ſay, a *cat-built* ſhip, &c.

To SHIP, is either uſed actively, as to embark any perſon or put any thing aboard ſhip: or paſſively, to receive any thing into a ſhip; as, "we ſhipped a heavy ſea at three o'clock in the morning."

To SHIP, alſo implies to fix any thing in its place; as, to ſhip the oars, that is, to put them in their row-locks; to ſhip the ſwivel guns, is to fix them in their ſockets; to ſhip the handſpokes, &c.

Machine for drawing Bolts out of SHIPS, an inſtrument invented by Mr William Hill for this purpoſe. His account of which is as follows*.

"Firſt, The uſe of this machine is to draw the kelſon and dead wood bolts out, and to draw the knee of the head bolts.—Secondly, The heads of the kelſon bolts heretofore were all obliged to be driven through the kelſon, floor-timbers, and keel, to get them out; by this means the kelſon is often entirely deſtroyed, and the large hole the head makes materially wounds the floors; and frequently, when the bolt is much corroded, it ſcarfs, and the bolt comes out of the ſide of the keel.—Thirdly, The dead-wood bolts that are driven with two or three drifts, are ſeldom or never got out, by which means the dead-wood is condemned, when ſome of it is really ſerviceable.—Fourthly, In drawing the knee of the head-bolts, ſometimes the knee ſtarts off, and cannot be got to again, but ſurs up, and with this machine may be drawn in; for it has been proved to have more power in ſtarting a bolt than the maul."

* *Tranſactions of the Society for the Encouragement of Arts, &c.* vol. xi.

In fig. 1. "A, A, repreſent two ſtrong male ſcrews, working in female ſcrews near the extremities of the cheeks, againſt plates of iron E, E. C C is the bolt to be drawn; which, being held between the chaps of the machine at DD, is, by turning the ſcrews by the lever B, forced upwards out of the wood or plank of the ſhip. F, F, are two dogs, with hooks at their lower extremities; which, being driven into the plank, ſerve to ſupport the machine till the chaps have got faſt hold of the bolt. At the upper part of theſe dogs are rings paſſing through holes in a collar, moveable near the heads of the ſcrews. Fig. 2. is a view of the upper ſide of the cheeks when joined together; *a*, *a*, the holes in which the ſcrews work; *b*, the chaps by which the bolts are drawn. Fig. 3. The under ſide of the cheek: *a*, *a*, the holes in which the ſcrews work; *b*, the chaps by which the bolts are drawn, and where the teeth that gripe the bolt are more diſtinctly ſhown. Fig. 4. One of the cheeks ſeparated from the other, the letters referring as in fig. 2. and 3.

Plate CCCCLXXXIII. Fig. 1. Fig. 2. Fig. 3. Fig. 4.

This machine was tried in his majeſty's yard at Deptford, and was found of the greateſt utility.—"Firſt, it drew a bolt that was driven down ſo tight as only to go one

Ship.

one inch in ſixteen blows with a double headed maul, and was well clenched below: the bolt drew the ring a conſiderable way into the wood, and wire drew itſelf through, and left the ring behind. Secondly, it drew a bolt out of the Venus's dead wood that could not be got out by the maul. That part of it which went through the keel was bent cloſe up to the lower part of the dead-wood, and the machine drew the bolt ſtraight, and drew it out with eaſe. It alſo drew a kelſon bolt out of the Stanley Weſt Indiaman, in Meſſrs Well's yard, Deptford; which being a bolt of two drifts, could not be driven out.

Management of SHIPS at ſingle anchor, is the method of taking care of a ſhip while riding at ſingle anchor in a tide-way, by preventing her from fouling her anchor, &c. The following rules for this purpoſe, with which we have been favoured by Henry Taylor * of North Shields, will be found of the utmoſt conſequence.

* *Taylor's Inſtructions to Young Mariners*

Riding at Anchor in moderate Weather.

Riding in a tide-way, with a freſh-of-wind, the ſhip ſhould have what is called *a ſhort* or *windward ſervice*, ſay 45 or 50 fathoms of cable, and always ſheered to windward (A), not always with the helm hard down, but more or leſs ſo according to the ſtrength or weakneſs of the tide. It is a known fact, that many ſhips ſheer their anchors home, drive on board of other ſhips, and on the ſands near which they rode, before it has been diſcovered that the anchor had been moved from the place where it was let go.

1
When the ſhip will back.

When the wind is croſs, or nearly croſs, off ſhore, or in the oppoſite direction, ſhips will always back. This is done by the mizen-topſail, aſſiſted, if needful, by the mizen ſtayſail; ſuch as have no mizen-topſail commonly uſe the main-topſail, or if it blows freſh, a topgallant-ſail, or any ſuch ſail at the gaff.

In backing, a ſhip ſhould always wind with a taught cable, that it may be certain the anchor is drawn round. In caſe there is not a ſufficiency of wind for that purpoſe, the ſhip ſhould be hove apeak.

2
How the yards ought to be braced.

Riding with the wind afore the beam, the yards ſhould be braced forward; if abaft the beam, they are to be braced all aback.

3
Riding windward tide in danger of breaking her ſheer.

If the wind is ſo far aft that the ſhip will not back (which ſhould not be attempted if, when the tide eaſes, the ſhip forges ahead, and brings the buoy on the lee quarter), ſhe muſt be ſet ahead: if the wind is far aft, and blows freſh, the utmoſt care and attention is neceſſary, as ſhips riding in this ſituation often break their ſheer, and come to windward of their anchors again. It ſhould be obſerved, that when the ſhip lies in this ticklish ſituation, the after-yards muſt be braced forward, and the fore-yards the contrary way: ſhe will lay ſafe, as the buoy can be kept on the lee quarter, or ſuppoſe the helm is aport, as long as the buoy is on the larboard quarter. With the helm thus, and the wind right aft, or nearly ſo, the ſtarboard main and fore braces ſhould be hauled in. This ſuppoſes the main braces to lead forward.

4
Tending to leeward when the ſhip muſt be ſet ahead.

When the ſhip begins to tend to leeward, and the buoy comes on the weather-quarter, the firſt thing to be done is to brace about the fore-yard; and when the wind comes near the beam, ſet the fore-ſtayſail, and keep it ſtanding until it ſhakes; then brace all the yards ſharp forward, eſpecially if it is likely to blow ſtrong.

5
How to manage when the ſhip breaks her ſheer.

If laying in the aforeſaid poſition, and ſhe breaks her ſheer, brace about the main-yard immediately; if ſhe recovers and brings the buoy on the lee or larboard quarter, let the main-yard be again braced about; but if ſhe come to a ſheer the other way, by bringing the buoy on the other quarter, change the helm and brace the fore-yard to.

6
When a long ſervice is out, and the ſhip is likely to go to windward.

Riding leeward tide with more cable than the windward ſervice, and expecting the ſhip will go to windward of her anchor, begin as ſoon as the tide eaſes to ſhorten in the cable. This is often hard work; but it is neceſſary to be done, otherwiſe the anchor may be fouled by the great length of cable the ſhip has to draw round; but even if that could be done, the cable would be damaged againſt the bows or cut-water. It is to be obſerved, that when a ſhip rides windward tide the cable ſhould be cackled from the ſhort ſervice towards the anchor, as far as will prevent the bare part touching the ſhip.

When the ſhip tends to windward and muſt be ſet ahead, hoiſt the fore-ſtayſail as ſoon as it will ſtand, and when the buoy comes on the lee quarter, haul down the fore-ſtayſail, brace to the fore-yard, and put the helm a-lee; for till then the helm muſt be kept a-weather and the yards full.

7
How to manage in a ſtorm.

When the ſhip rides leeward tide, and the wind increaſes, care ſhould be taken to give her more cable in time, otherwiſe the anchor may ſtart, and probably it will be troubleſome to get her brought up again; and this care is the more neceſſary when the ſhip rides in the hauſe of another ſhip. Previous to giving a long ſervice it is uſual to take a weather-bit, that is, a turn of the cable over the windlaſs end, ſo that in veering away the ſhip will be under command. The ſervice ought

(A) It has been thought by ſome theoriſts, that ſhips ſhould be ſheered to leeward of their anchors; but experience and the common practice of the beſt informed ſeamen are againſt that opinion: for it is found, that when a ſhip rides leeward tide and ſheered to windward, with the wind two or three points upon the bow, and blowing hard in the interval between the ſqualls, the ſheer will draw her towards the wind's eye; ſo that when the next ſquall comes, before ſhe be preſſed aſtream of her anchor, it is probable there will be a lull again, and the ſpring which the cable got by the ſheer will greatly eaſe it during the ſquall.

Every ſeaman knows that no ſhip without a rudder, or the helm left looſe, will wear; they always in ſuch ſituations fly to: this proves that the wind preſſing upon the quarter and the helm alee, a ſhip will be leſs liable to break her ſheer than when the helm is a-weather. Beſides, if the helm is a-lee when ſhe breaks her ſheer, it will be a-weather when the wind comes on the other quarter, as it ought to be until ſhe either ſwing to leeward, or bring the buoy on the other quarter. Now if the ſhip breaks her ſheer with the helm a-weather, it throws her head to the wind ſo ſuddenly as ſcarce to give time to brace the yards about, and very probably ſhe will fall over her anchor before the fore-ſtayſail can be got up.

ought to be greafed, which will prevent its chafing in the haufe.

If the gale continues to increafe, the topmafts fhould be ftruck in time; but the fore-yard fhould feldom, if ever, be lowered down, that in cafe of parting the forefail may be ready to be fet. At fuch times there fhould be more on deck than the common anchor-watch, that no accident may happen from inattention or falling afleep.

In a tide-way a fecond anchor fhould never be let go but when abfolutely neceffary; for a fhip will fometimes ride eafier and fafer, efpecially if the fea runs high, with a very long fcope of cable and one anchor, than with lefs length and two cables; however, it is advifable, as a preventive, when fhips have not room to drive, and the night is dark, to let fall a fecond anchor under foot, with a range of cable along the deck. If this is not thought neceffary to be done, the deep-fea lead fhould be thrown overboard, and the line frequently handled by the watch, that they may be affured fhe rides faft.

8
Caution refpecting the anchor watch.

If at any time the anchor-watch, prefuming on their own knowledge, fhould wind the fhip, or fuffer her to break her fheer without calling the mate, he fhould immediately, or the very firft opportunity, oblige the crew to heave the anchor in fight; which will prevent the commiffion of the like fault again; for befides the fhare of trouble the watch will have, the reft of the crew will blame them for neglecting their duty.

9
The particular duty of the chief mate.

Prudent mates feldom lie a week in a road-ftead without heaving their anchor in fight; even though they have not the leaft fufpicion of its being foul. There are other reafons why the anchor fhould be looked at; fometimes the cable receives damage by fweering wrecks or anchors that have been loft, or from rocks or ftones; and it is often neceffary to trip the anchor, in order to take a clearer birth, which fhould be done as often as any fhip brings up too near.

Method for the fafe removal of fuch SHIPS as have been driven on fhore. For this purpofe empty cafks are ufually employed to float off the veffel, efpecially if fhe is fmall, and at the fame time near the port to which it is propofed to conduct her. In other cafes, the following method adopted by Mr Barnard * will anfwer.

* *Philofophical Tranfactions*, vol. xx. part 1.

"On January 1. 1779 (fays Mr Barnard), in a moft dreadful ftorm, the York Eaft Indiaman, of eight hundred tons, homeward bound, with a pepper cargo, parted her cables in Margate roads, and was driven on fhore, within one hundred feet of the head and thirty feet of the fide of Margate pier, then drawing twenty-two feet fix inches water, the flow of a good fpring tide being only fourteen feet at that place.

"On the third of the fame month I went down, as a fhip-builder, to affift, as much as lay in my power, my worthy friend Sir Richard Hotham, to whom the fhip belonged. I found her perfectly upright, and her fheer (or fide appearance) the fame as when firft built, but funk to the twelve feet water-mark fore and aft in a bed of chalk mixed with a ftiff blue clay, exactly the fhape of her body below that draft of water; and from the rudder being torn from her as fhe ftruck coming on fhore, and the violent agitation of the fea after her being there, her ftern was fo greatly injured as to admit free accefs thereto, which filled her for four days equal to the flow of the tide. Having fully informed myfelf of her fituation and the flow of fpring-tides, and being clearly of opinion fhe might be again got off, I recommended, as the firft neceffary ftep, the immediate difcharge of the cargo; and, in the progrefs of that bufinefs, I found the tide always flowed to the fame height on the fhip; and when the cargo was half difcharged, and I knew the remaining part fhould not make her draw more than eighteen feet water, and while I was obferving the water at twenty-two feet fix inches by the fhip's marks, fhe inftantly lifted to feventeen feet eight inches; the water and air being before excluded by her preffure on the clay, and the atmofphere acting upon her upper part equal to fix hundred tons, which is the weight of water difplaced at the difference of thefe two drafts of water.

"The moment the fhip lifted, I difcovered fhe had received more damage than was at firft apprehended, her leaks being fuch as filled her from four to eighteen feet water in an hour and a half. As nothing effectual was to be expected from pumping, feveral fcuttles or holes in the fhip's fide were made, and valves fixed thereto, to draw off the water at the loweft ebb of the tide, to facilitate the difcharge of the remaining part of the cargo; and, after many attempts, I fucceeded in an external application of fheep-fkins fewed on a fail and thruft under the bottom, to ftop the body of water from rufhing fo furioufly into the fhip. This bufinefs effected, moderate pumping enabled us to keep the fhip to about fix feet water at low water, and by a vigorous effort we could bring the fhip fo light as (when the cargo fhould be all difcharged) to be eafily removed into deeper water. But as the external application might be difturbed by fo doing, or totally removed by the agitation of the fhip, it was abfolutely neceffary to provide fome permanent fecurity for the lives of thofe who were to navigate her to the river Thames. I then recommended as the cheapeft, quickeft, and moft effectual plan, to lay a deck in the hold, as low as the water could be pumped to, framed fo folidly and fecurely, and caulked fo tight, as to fwim the fhip independent of her own leaky bottom.

"Beams of fir-timber twelve inches fquare were placed in the hold under every lower-deck beam in the fhip, as low as the water would permit; thefe were in two pieces, for the conveniency of getting them down, and alfo for the better fixing them of an exact length, and well bolted together when in their places. Over thefe were laid long Dantzic deals of two inches and a half thick, well nailed and caulked. Againft the fhip's fides, all fore and aft, was well nailed a piece of fir twelve inches broad and fix inches thick on the lower and three inches on the upper edge, to prevent the deck from rifing at the fide. Over the deck, at every beam, was laid a crofs piece of fir timber fix inches deep and twelve inches broad, reaching from the pillar of the hold to the fhip's fide, on which the fhores were to be placed to refift the preffure of the water beneath. On each of thefe, and againft the lower-deck beam, at equal diftances from the fide and middle of the fhip, was placed an upright fhore, fix inches by twelve, the lower end let two inches into the crofs piece. From the foot of this fhore to the fhip's fide, under the end of every lower deck beam, was placed a diagonal fhore fix inches by twelve, to eafe the fhip's deck of part of the ftrain by throwing it on the fide. An upright fhore of three inches by twelve was placed from the end of every crofs piece

Ship.

piece to the lower deck beams at the ſide, and one of three inches by twelve on the midſhip end of every croſs piece to the lower deck beam, and nailed to the pillars in the hold. Two firm tight bulkheads or partitions were made as near the extremes of the ſhip as poſſible. The ceiling or inſide plank of the ſhip was very ſecurely caulked up to the lower deck, and the whole formed a complete ſhip with a flat bottom within ſide, to ſwim the outſide ſhip one; and that bottom being depreſſed ſix feet below the external water, reſiſted the ſhip's weight above it equal to five hundred and eighty-one tons, and ſafely conveyed her to the dry-dock at Deptford."

S H I P - B U I L D I N G.

1 Definition. SHIP-BUILDING, or Naval Architecture, is the art of conſtructing a ſhip ſo as to anſwer a particular purpoſe either of war or merchandiſe.

2 Hiſtory. To whom the world is indebted for the invention of ſhips, is, like all other things of equal antiquity, uncertain.

A very ſmall portion of art or contrivance was ſeen in the firſt ſhips: they were neither ſtrong nor durable; but conſiſted only of a few planks laid together, without beauty or ornament, and juſt ſo compacted as to keep out the water. In ſome places they were only the bulks or ſtocks of trees hollowed, and then conſiſted only of one piece of timber. Nor was wood alone applied to this uſe; but any other buoyant materials, as the Egyptian reed papyrus; or leather, of which the primitive ſhps were frequently compoſed; the bottom and ſides being extended on a frame of thin battens or ſcantlings, of flexible wood, or begirt with wickers, ſuch as we have frequently beheld amongſt the American ſavages. In this manner they were often navigated upon the rivers of Ethiopia, Egypt, and Sabæan Arabia, even in latter times. But in the firſt of them, we find no mention of any thing but leather or hides ſewed together. In a veſſel of this kind, Dardanus ſecured his retreat to the country afterwards called *Troas*, when he was compelled by a terrible deluge to forſake his former habitation of Samothrace. According to Virgil, Charon's infernal boat was of the ſame compoſition.

But as the other arts extended their influence, naval architecture likewiſe began to emerge from the gloom of ignorance and barbariſm; and as the ſhips of thoſe ages were increaſed in bulk, and better proportioned for commerce, the appearance of the floating citadels of unuſual form, full of living men, flying with ſeemingly expanded wings over the ſurface of the untravelled ocean, ſtruck the ignorant people with terror and aſtoniſhment: and hence, as we are told by Ariſtophanes, aroſe the fable of Perſeus flying to the Gorgons, who was actually carried thither in a ſhip! Hence, in all probability, the famous ſtory of Triptolemus riding on a winged dragon is deduced, only becauſe he ſailed from Athens, in the time of great dearth, to a more plentiful country, to ſupply the neceſſities of his people. The fiction of the flying horſe Pegaſus may be joined with theſe, who, as ſeveral mythologiſts report, was nothing but a ſhip with ſails, and thence ſaid to be the offspring of Neptune the ſovereign of the ſea; nor does there appear any other foundation for the ſtories of griffins, or of ſhips transformed into birds and fiſhes, which we ſo often meet with in the ancient poets. So acceptable to the firſt ages of the world were inventions of this nature, that whoever made any improvements in navigation or naval architecture, building new ſhips better fitted for ſtrength or ſwiftneſs than thoſe uſed before, or rendered the old more commodious by additional contrivances, or diſcovered countries unknown to former travellers, were thought worthy of the greateſt honours, and often aſſociated into the number of their deified heroes. Hence we have in aſtronomy the ſigns of Aries and Taurus, which were no other than two ſhips: the former tranſported Phryxus from Greece to Colchos, and the latter Europa from Phœnicia to Crete. Argo, Pegaſus, and Perſeus, were likewiſe new ſhips of a different ſort from the former, which being greatly admired by the barbarous and uninſtructed people of thoſe times, were tranſlated amongſt the ſtars, in commemoration of their inventors, and metamorphoſed into conſtellations by the poets of their own and of ſucceeding ages.

The chief parts, of which ſhips anciently conſiſted, were three, viz. the belly, the prow, and the ſtern: theſe were again compoſed of other ſmaller parts, which ſhall be briefly deſcribed in their order. In the deſcription, we chiefly follow Scheffer, who has ſo copiouſly treated this ſubject, and with ſuch induſtry and learning collected whatever is neceſſary to illuſtrate it, that very little room is left for enlargement by thoſe who incline to purſue this inveſtigation.

1. In the belly, or middle part of the ſhip, there was *τροπις*, *carina*, or the "keel," which was compoſed of wood: it was placed at the bottom of the ſhip, being deſigned to cut and glide through the waves, and therefore was not broad, but narrow and ſharp; whence it may be perceived that not all ſhips, but only the *μακραι*, which ſhips of war were called, whoſe bellies were ſtraight, and of a ſmall circumference, were provided with keels, the reſt having uſually flat bottoms. Around the outſide of the keel were fixed pieces of wood, to prevent it from being damaged when the ſhip was firſt launched into the water, or afterwards ſtruck on any rocks; theſe were called *χελευσματα*, in Latin *cunei*.

Next to the keel was *φαλκις* the "pump-well, or well-room," within which was contained the *αντλιον*, or "pump," through which water was conveyed out of the ſhip.

After this, there was *δευτερα τροπις*, or the "ſecond keel," ſomewhat reſembling what is now called *kelſon*; it was placed beneath the pump, and called *λεωσιον*, *χαλκηνε*, *κλειτοποδιον*; by ſome it is falſely ſuppoſed to be the ſame with *φαλκις*.

Above the pump was an hollow place, called by Herodotus *κοιλη της νηος*, by Pollux *κυτος* and *γαστρα*, becauſe large and capacious, after the form of a belly; by the Latins *teſtudo*. This was formed by crooked ribs, with which it was ſurrounded, which were pieces of wood riſing from the keel upwards, and called by Heſychius

νομε,

νομεις, and by others εγκοιλια, the belly of the ship being contained within them: in Latin, *costæ;* and in English, *timbers.* Upon these were placed certain planks, which Aristophanes calls εντερονειας, or εντερονιδα.

The πλευραι, *latera*, or "sides" of the ship, encompassed all the former parts on both hands; these were composed of large rafters extended from prow to stern, and called ζωστηρες, and ζωμαματα, because by them the whole fabric was begirt or surrounded.

In both these sides the rowers had their places, called τοιχοι and εδωλια, in Latin *fori* and *transtra*, placed above one another; the lowest was called θαλαμος, and those that laboured therein θαλαμιοι; the middle, ζυγα, and the men ζυγιοι; the uppermost θρανοι, whence the rowers were termed θρανιται. In these apartments were spaces through which the rowers put their oars: these were sometimes one continued vacuity from one end to the other, called τραφηξ, but more usually distinct holes, each of which was designed for a single oar; these were styled τρηματα, τρυπηματα, as also οφθαλμοι, because not unlike the eyes of living creatures. All of them were by a more general name termed εγκωπα, from containing the oars; but εγκωπιν seems to have been another thing, signifying the spaces between the banks of oars on each side, where the passengers appear to have been placed. On the top of all there was a passage or place to walk, called παραδος, and παραθρανος, as joining to the θρανοι, or uppermost bank of oars.

2. Πρωρα, the "prow, or fore deck," whence it is sometimes called μετωπον, and commonly distinguished by other metaphorical titles taken from human faces. In some ships there is mention of two prows, as also two sterns; such as Danaus's ship adorned by Minerva when he fled from Egypt. It was usual to beautify the prow with gold and various sorts of paint and colours; in the primitive times red was most in use; whence Homer's ships were generally dignified with the titles of μιλτοπαρηοι, and φοινικοπαρηοι, or "red faced;" the blue, likewise, or sky-colour, was frequently made use of, as bearing a strict resemblance to the colour of the sea; whence we find ships called by Homer κυανοπρωροι, by Aristophanes κυανεμβολοι. Several other colours were also made use of; nor were they barely varnished over with them, but very often annealed by wax melted in the fire, so that neither the sun, winds, nor water, were able to deface them. The art of doing this was called from the wax κηρογραφια, from the fire εγκαυστικη, which is described by Vitruvius, and mentioned in Ovid.

———*Picta coloribus ustis*
Cœruleam matrem concava puppis habet.

The painted ship with melted wax anneal'd
Had Tethys for its deity———

In these colours the various forms of gods, animals, plants, &c. were usually drawn, which were likewise often added as ornaments to other parts of the ships, as plainly appears from the ancient monuments presented to the world by Baysius.

The sides of the prow were termed πτερα, or "wings," and παρια, according to Scheffer, or rather παρειαι; for since the prow is commonly compared to a human face, it will naturally follow that the sides should be called *cheeks.* These are now called *bows* by our mariners.

3. Πρυμνη, "the hind-deck or poop," sometimes called ουρα, the "tail," because the hindmost part of the ship; it was of a figure more inclining to round than the prow, the extremity of which was sharp, that it might cut the waters; it was also built higher than the prow, and was the place where the pilot sat to steer; the outer-bending part of it was called επισειων, answering to our term *quarter.*

They had various ornaments of sculpture on the prow; as helmets, animals, triumphal wreaths, &c.— The stern was more particularly adorned with wings, shields, &c. Sometimes a little mast was erected whereon to hang ribbands of divers colours, which served instead of a flag to distinguish the ship; and a weather-cock, to signify the part from whence the wind blew.

On the extremity of the prow was placed a round piece of wood, called the πτυχις, from its bending; and sometimes οφθαλμος, the "eye" of the ship, because fixed in the fore-deck; on this was inscribed the name of the ship, which was usually taken from the figure painted on the flag. Hence comes the frequent mention of ships called *Pegasi*, *Scyllæ*, *bulls*, *rams*, *tigers*, &c. which the poets took the liberty to represent as living creatures that transported their riders from one country to another.

The whole fabric being completed, it was fortified with pitch, and sometimes a mixture of rosin, to secure the wood from the waters; whence it comes that Homer's ships are everywhere mentioned with the epithet of μελαιναι, or "black." Pitch was first used by the inhabitants of Phæacia, since called Corsica; sometimes wax was employed for the same purpose; whence Ovid,

Cœrulea ceratas accipit unda rates.

The azure waves receive the waxed ships.

After all, the ship being bedecked with garlands and flowers, the mariners also adorned with crowns, she was launched into the sea with loud acclamations and other expressions of joy; and being purified by a priest with a lighted torch, an egg and brimstone, or after some other manner, was consecrated to the god whose image she bore.

The ships of war of the ancients were distinguished from other kinds of vessels by various turrets and accessions of building, some to defend their own soldiers, and others to annoy the enemy; and from one another, in latter ages, by several degrees or ranks of oars, the most usual number of which was four or five, which appear not to have been arranged, as some imagine, on the same level in different parts of the ship; nor yet, as others have supposed, directly above one another's heads; but their seats being placed one behind another, ascended gradually, like stairs. Ptolemy Philopater, urged by a vain-glorious desire of exceeding all the world besides in naval architecture, is said to have farther enlarged the number of banks to 40; and the ship being otherwise in equal proportion, this raised her to such an enormous bulk, that she appeared at a distance like a floating mountain or island; and, upon a nearer view, like a prodigious castle on the ocean. She was 280 cubits long, 38 broad, and 48 high (each cubit being 1 English foot $5\frac{1}{2}$ inches), and carried 400 rowers, 400 sailors, and 3000 soldiers. Another which the same

History. same prince made to sail on the Nile, we are told, was half a stadium long. Yet these were nothing in comparison of Hiero's ship, built under the direction of Archimedes; on the structure of which Moschion wrote a whole volume. There was wood enough employed in it to make 50 galleys; it had all the variety of apartments of a palace; such as banqueting-rooms, galleries, gardens, fish-ponds, stables, mills, baths, and a temple to Venus. The floors of the middle apartment were all inlaid, and represented in various colours the stories of Homer's Iliad. The ceilings, windows, and all other parts, were finished with wonderful art, and embellished with all kinds of ornaments. In the uppermost apartment there was a spacious gymnasium, or place for exercise, and water was conveyed to the garden by pipes, some of hardened clay, and others of lead. The floors of the temple of Venus were inlaid with agates and other precious stones; the inside lined with cypress wood; the windows adorned with ivory paintings and small statues. There was likewise a library. This vessel was adorned on all sides with fine paintings. It had 20 benches of oars, and was encompassed with an iron rampart, eight towers, with walls and bulwarks, furnished with machines of war, particularly one which threw a stone of 300 pounds, or a dart 12 cubits long, the space of half a mile, with many other particulars related by Athenæus. Caligula likewise built a vessel adorned with jewels in the poop, with sails of many colours, and furnished with large porticoes, bagnios, and banqueting-rooms, besides rows of vines, and fruit-trees of various kinds. But these, and all such monstrous fabrics, served only for show and ostentation, being rendered by their vast bulk unwieldy and unfit for service. Athenæus informs us, the common names they were known by, were *Cyclades*, or *Ætna*, i. e. "islands, or mountains," to which they seemed nearly equal in bigness; consisting, as some report, of as many materials as would have composed 50 triremes, or ships of three banks.

The vessels employed by the northern nations appear to have been still more imperfect than those of the Romans; for a law was enacted in the reign of the emperor Honorius, 24th September, A. D. 418, inflicting capital punishment on any who should instruct the barbarians in the art of ship-building; a proof at once of the great estimation in which this science was then held, and of the ignorance of the barbarians with regard to it.

The fleet of Richard I. of England, when he weighed anchor for the holy war from Messina, in Sicily, where he had passed the winter, A. D. 1190-1, is said to have consisted of 150 great ships and 53 galleys, besides barks, tartans, &c. What kinds of ships these were is not mentioned. To the crusades, however pernicious in other respects, this science seems to owe some improvements; and to this particular one we are indebted for Richard's marine code, commonly called the *Laws of Oleron*, from the name of a small island on the coast of France, where he composed them, and which most of the nations in Europe have made the basis of their maritime regulations. Those ships, if they merited the name of ships, were probably very small, as we find that so long after as the time of Edward I. anno 1304, 40 men were deemed sufficient to man the best and largest vessels in England; and that Edward the Third, anno 1335, ordained the mayor and sheriffs of London to "take up all ships in their port, and all other ports in the kingdom, of the burden of 40 tons and upwards, and to furnish the same with armed men and other necessaries of war, against the Scots his enemies, confederated with certain persons of foreign nations." Edward the Third's fleet before Calais, anno 1347, consisted of 738 English ships, carrying 14,956 mariners, being on an average but 20 men to each ship; 15 ships and 459 mariners, from Bayonne in Guienne, being 30 men to each ship; 7 ships and 184 men from Spain, which is 26 men to each ship; one from Ireland, carrying 25 men; 14 from Flanders, with 133 men, being scarcely 10 men to each ship: and one from Guelderland, with 24 mariners. Fifteen of these were called the king's own ships, manned with 419 mariners, being somewhat under 17 to each ship.

Ib. vol. iv. p. 664.

History.

Historians represent the vessels of Venice and Genoa as the largest and the best about this time, but they were soon exceeded in size by the Spanish vessels called *carricks*, some of which carried cannon; and these again were exceeded by the vessels built by the northern people, particularly those belonging to the Hanse-towns.—In the 14th century, the Hanseatics were the sovereigns of the northern seas, as well without as within the Baltic; and their ships were so large, that foreign princes often hired them in their wars. According to Hakluyt, an English ship from Newcastle, of 200 tons burden, was seized in the Baltic by those of Wismar and Rostock, anno 1394; and another English vessel of the same burden was violently seized in the port of Lisbon, anno 1412.

Fœdera, vol viii. p. 727.

Soon after ships of a much larger size were constructed. It is mentioned that a very large ship was built, anno 1449, by John Taverner of Hull; and in the year 1455, King Henry IV. at the request of Charles king of Sweden, granted a licence for a Swedish ship of the burden of a thousand tons or under, laden with merchandize, and having 120 persons on board, to come to the ports of England, there to dispose of their lading, and to relade back with English merchandize, paying the usual customs. The inscription on the tomb of William Canning, an eminent merchant, who had been five times mayor of Bristol, in Ratcliff-church at Bristol, anno 1474, mentions his having forfeited the king's peace, for which he was condemned to pay 300 merks; in lieu of which sum, King Edward IV. took of him 2470 tons of shipping, amongst which there was one ship of 900 tons burden, another of 500 tons, and one of 400 tons, the rest being smaller.

Ib. vol. xi. p. 258.

Ib. vol xi. p. 364.

In the year 1506, King James IV. of Scotland built the largest ship which had hitherto been seen, but which was lost in her way to France in the year 1512, owing probably to a defective construction, and the unskilfulness of the crew in managing so large a ship.—About this time a very large ship was likewise built in France. In the fleet fitted out by Henry VIII. anno 1512, there was one ship, the Regent, of 1000 tons burden, one of 500, and three of 400 each. A ship still larger than the Regent was built soon after, called *Henri Grace Dieu!* In the year 1522 the first voyage round the globe was finished.

The English naval historians think that ships carried cannon on their upper decks only, and had no gunports before the year 1545: and it is certain that many

of

History.

of the largeſt ſhips in former times were fitted out from harbours, where ſhips of a moderate ſize now would not have water enough to float them. In 1575 the whole of the royal navy did not exceed 24 ſhips, and the number of merchant-ſhips belonging to England amounted to no more than 135 veſſels above 100 tons, and 656 between 40 and 100 tons. At Queen Elizabeth's death, anno 1603, there were not above four merchant-ſhips in England of 400 tons burden each.—The largeſt of Queen Elizabeth's ſhips of war was 1000 tons burden, carrying but 340 men, and 40 guns, and the ſmalleſt 600 tons, carrying 150 men and 30 guns. Smaller veſſels were occaſionally hired by her from private owners.

Monſon's Naval Tracts, p. 294.

In the memorable ſea-fight of Lepanto between the Turks and Chriſtians, anno 1571, no veſſels were employed but galleys; and it would appear from the carcaſes of ſome of them, which are ſtill preſerved in the arſenal at Venice, that even theſe were not ſo large or ſo well conſtructed as thoſe of our times. The Invincible Armada, as Spaniſh vanity ſtyled it, once the terror and admiration of nations, in the pompous and exaggerated deſcriptions of which the Spaniſh authors of thoſe times dwelt with ſo much apparent pleaſure, conſiſted of 130 ſhips, near 100 of which were the ſtatelieſt that had yet been ſeen on the ocean. The largeſt of theſe, however, would be no more than a third rate veſſel in our navy, and they were ſo ill conſtructed, that they would neither move eaſily, ſail near the wind, nor be properly worked in tempeſtuous weather. The whole of the naval force collected by Queen Elizabeth to oppoſe this formidable fleet, including hired veſſels, tenders, ſtore-ſhips, &c. amounted to no more than 143.

Ship-building began now to make a conſiderable progreſs in Britain. Both war and trade required an increaſe of ſhipping; ſo that, in the year 1670, the annual charge of the navy was reported to be 500,000l.; and in 1678 the navy conſiſted of 83 ſhips, of which 58 were of the line. At this time the exports amounted to ten millions per annum; and the balance of trade was two millions. In 1689 there were 173 ſhips, great and ſmall, in the royal navy, and it has been conſtantly increaſing; ſo that in 1761 the ſhips in the navy amounted to 372, of which 129 were of the line; and in the beginning of the year 1795, the total amount was above 430.

3 Ships of the common form found defective,

As ſhips of the common conſtruction are found to be very defective in many particulars, various methods have therefore from time to time been propoſed to remove ſome of the bad qualities they poſſeſſed. As it would be an endleſs taſk to enumerate the different inventions for this purpoſe, a few of them only will now be mentioned.

4 and improvements propoſed.

5 Double ſhips introduced by Sir William Petty, *European Magazine* for August 1752.

In 1663 Sir William Petty conſtructed a double ſhip, or rather a ſingle ſhip with a double bottom, which was found to ſail conſiderably faſter than any of the ſhips with which it had an opportunity of being tried. Her firſt voyage was from Dublin to Holyhead; and in her return "ſhe turned into that narrow harbour againſt wind and tide, among rocks and ſhips, with ſuch dexterity as many ancient ſeamen confeſſed they had never ſeen the like." This veſſel with 70 more was loſt in a dreadful tempeſt.

6 and again propoſed by Mr Gordon, p. 54.

This ſubject was again revived by Mr Gordon, in his Principles of Naval Architecture, printed at Aberdeen anno 1784; where, having delivered his ſentiments on the conſtruction of large maſts, he ſays: "Theſe experiments likewiſe point out to us methods by which two veſſels may be laterally connected together, though at a conſiderable diſtance from each other, in a manner ſufficiently ſtrong, with very little increaſe of weight or expence of materials, and without expoſing much ſurface to the action or influence of the wind or the waves, or obſtructing their motion in any conſiderable degree, and conſequently without being much oppoſed by them on that account under any circumſtances; and if veſſels are judiciouſly conſtructed with a view to ſuch a junction, it would be no eaſy matter to enumerate all the advantages that may be obtained by this means." He then enumerates the advantages that double veſſels would have over thoſe of the common conſtruction. Soon after double ſhips were actually built by Mr Miller of Dalſwinton.

7 And lately conſtructed by Mr Miller.

Principles of Naval Architecture, p. 76.

8 Draught of water propoſed to be diminiſhed in order to obtain velocity, &c.

Another plan was propoſed by Mr Gordon to make a ſhip ſail faſt, draw little water, and to keep a good wind. For this purpoſe, "the bottom (he ſays) ſhould be formed quite flat, and the ſides made to riſe perpendicular from it, without any curvature; which would not only render her more ſteady, as being more oppoſed to the water in rolling, but likewiſe more convenient for ſtowage, &c. while the ſimplicity of the form would contribute greatly to the eaſe and expedition with which ſhe might be fabricated. Though diminiſhing the draught of water is, *cæteris paribus*, undoubtedly the moſt effectual method of augmenting the velocity with which veſſels go before the wind; yet, as it proportionally diminiſhes their hold of the water, it renders them extremely liable to be driven to leeward, and altogether incapable of keeping a good wind. This defect may, however, be remedied, in a ſimple and effectual manner, by proportionally augmenting the depth of keel, or, as ſo large a keel would be inconvenient on many accounts, proportionally increaſing their number; as, in place of adding a keel eight feet deep to a veſſel drawing ſix feet water, to affix to different parts of her flat bottom, which would be well adapted for receiving them, ſix different keels of two feet deep each at equal diſtances from each other, with proper intervals between; which will be found equally effectual for preventing theſe pernicious effects. Four ſuch, indeed, would have anſwered the purpoſe as well as the eight feet keel, were it not for the ſuperior preſſure or reſiſtance of the lower water (A).

9 Inconveniency of this plan.

10 Remedied by augmenting the depth of the keel,

11 or by increaſing the number of keels.

Thus

(A) This is frequently repeated on the authority of Mr Gordon and others. Theory ſays otherwiſe; and the experiments of Sir Iſaac Newton ſhow in the moſt unexceptionable manner, that the reſiſtance of a ball deſcending through the water is the ſame at all depths; nay, the heaping up of the water on the bow, occaſioning a hydroſtatical preſſure in addition to the real reſiſtance, will make the whole oppoſition to an equal ſurface, but of greater horizontal dimenſions, greater, becauſe it bears a greater proportion to the reſiſtance.

Thus then it appears, that a veſſel drawing eight feet water only, keels and all, may be made to keep as good a wind, or be as little liable to be driven to leeward, as the ſharpeſt built veſſel of the ſame length drawing 14, nay 20 or upwards, if a few more keels are added, at the ſame time that ſhe would be little more reſiſted in moving in the line of the keels than a veſſel drawing ſix feet water only. Theſe keels, beſides, would ſtrengthen the veſſel conſiderably, would render her more ſteady, and leſs liable to be overſet, and thereby enable her to carry more ſail; and Mr Gordon then enumerates the ſeveral advantages that a ſhip of this conſtruction will poſſeſs.

12 The plan farther improved by the adoption of ſliding keels.

This plan has been put into execution by Captain Schank, with this difference only, that inſtead of the keels being fixed as propoſed by Mr Gordon, Captain Schank conſtructed them ſo as to ſlide down to a certain depth below the bottom, or to be drawn up within the ſhip as occaſion might require.

Captain Schank having communicated his plans to the Navy Board, two veſſels were in conſequence ordered to be built of 13 tons each, and ſimilar in dimenſions, one on the old conſtruction, and the other flat-bottomed, with ſliding keels. In 1790 a comparative trial in preſence of the commiſſioners of the navy was made on the river Thames, each having the ſame quantity of ſail; and although the veſſel on the old conſtruction had leeboards, a greater quantity of ballaſt, and two Thames pilots aboard, yet Captain Schank's veſſel with three ſliding keels beat the other veſſel, to the aſtoniſhment of all preſent, one half of the whole diſtance ſailed; and no doubt ſhe would have beat her much more had ſhe been furniſhed with a Thames pilot.

13 The utility of ſliding keels proved by experiment.

This trial gave ſo much ſatisfaction, that a king's cutter of 120 tons was immediately ordered to be built on the ſame conſtruction, and Captain Schank was requeſted to ſuperintend its building. This veſſel was launched at Plymouth in 1791, and named the *Trial*. The length of this veſſel is 66 feet, breadth 21 feet, and depth of the hold ſeven feet: her bottom is quite flat, and draws only ſix feet water, with all her guns, ſtores, &c. whereas all other veſſels of her tonnage on the old conſtruction draw 14 feet; ſo that ſhe can go with ſafety into almoſt any harbour or creek. She has three ſliding keels incloſed in a caſe or well; they are each 14 feet in length; the fore and the after keels are three feet broad each, and the middle keel is ſix feet broad. The keels are moveable by means of a winch, and may be let down ſeven feet below the real keel; and they work equally well in a ſtorm as in ſtill water. Her hold is divided into ſeveral compartments, all water-tight, and ſo contrived, that ſhould even a plank or two ſtart at ſea in different parts of the veſſel, ſhe may be navigated with the greateſt ſecurity to any place. If ſhe ſhould be driven on ſhore in a gale of wind, ſhe will not ſoon become a wreck, as her keels will be driven up into their caſes, and the ſhip being flat-bottomed, will not be eaſily overſet; and being able to go into ſuch ſhallow water, the crew may all be eaſily ſaved. By means of her ſliding keel ſhe is kept ſteady in the greateſt gale; ſhe is quite eaſy in a great ſea, does not ſtrain in the leaſt, and never takes in water on her deck; and when at anchor, ſhe rides more upright and even than any other ſhip can do: ſhe ſails very faſt either before or upon a wind; no veſſel ſhe has ever been in company with, of equal ſize, has been able, upon many trials, to beat her in ſailing; and yet her ſails ſeem too ſmall.

14 And actually put in practice upon a larger ſcale.

It has alſo been propoſed to conſtruct veſſels of other materials than wood; and a veſſel was built whoſe bottom, inſtead of being plank, was copper.

Book I. *Containing the Method of Delineating the ſeveral Sections of a Ship.*

Chap. I. *Of the Properties of Ships.*

15 General principles of ſhip-building.

A ship ought to be conſtructed ſo as to anſwer the particular purpoſe for which ſhe is intended. It would be an eaſy matter to determine the form of a ſhip intended to ſail by means of oars; but, when ſails are uſed, a ſhip is then acted upon by two elements, the wind and water: and therefore it is much more difficult than is commonly imagined to aſcertain the form of a ſhip ſo as to anſwer in an unfavourable as well as a favourable wind; the ſhip at the ſame time having a cargo of a certain weight and magnitude.

16 Properties that a ſhip muſt poſſeſs to be a good ſailer.

Every ſhip ought to ſail well, but particularly when the wind is upon the beam; for this purpoſe a conſiderable length in proportion to the breadth is neceſſary, and the plane of reſiſtance ſhould be the leaſt poſſible. The main frame ſhould alſo be placed in a proper ſituation; but according to the experiments of Mr Chapman *, its plane is variable with the velocity of the ſhip: the mean place of the main frame has, however, been generally eſtimated to be about one-twelfth of the length of the keel before the middle. Without a ſufficient degree of ſtability a ſhip will not be able to carry a preſs of ſail: a great breadth in proportion to the length and low upper-works will augment the ſtability. The following particulars being attended to, the above property will be gained, and the ſhip will alſo ſteer well. The wing tranſom ſhould be carried pretty high; the faſhion-pieces well formed, and not full below the load water-line: the lower part of the ſtem to be a portion of a circle, and to have a conſiderable rake: the ſternpoſt to be nearly perpendicular to the keel; and all the upper works kept as low as poſſible.

* *Traité de la Conſtruction des Vaiſſeaux*, p. 40.

17 To make a ſhip keep a good wind,

Many ſhips from conſtruction are liable to make much leeway. This may in a great meaſure be avoided by giving the ſhip a long keel, little breadth, and a conſiderable depth in the hold: whence the bow will meet with little reſiſtance in compariſon to the ſide, and therefore the ſhip will not fall much to the leeward.

18 and to ſail ſmoothly without pitching hard.

Another very great retardation to the velocity of a ſhip is her pitching. The principal remedy for this is to increaſe the length of the keel and floor, to diminiſh the riſing afore and abaft, and to conſtruct the hull in ſuch a manner that the contents of the fore-body may be duly proportioned to the contents of the after-body.

19 Ships of war the lower deck muſt be ſufficiently high above the water.

In a ſhip of war the lower tier of guns ought to be of a ſufficient height above the water, otherwiſe it will be impoſſible to work the lee-guns when it blows hard. This property will be obtained by giving her a long floor-timber, little riſing, a full midſhip frame, light upper works, and the wing tranſom not too high: And in every ſhip the extreme breadth ought always to be higher afore and abaft than at midſhips.

Properties of Ships.

20 Properties of a merchant ſhip, A merchant ſhip, beſides being a faſt ſailer, ought to carry a conſiderable cargo in proportion to its length, to ſail with little ballaſt, and to be navigated with few hands.

21 to take in a great cargo, That a ſhip may take in a conſiderable cargo, it ſhould have a great breadth and depth in proportion to its length, a full bottom, and a long and flat floor. But a ſhip of this conſtruction will neither ſail faſt, nor carry much ſail.

22 and to have ſtability. If a ſhip be filled out much towards the line of floatation, together with low upper works, ſhe will require little ballaſt: and that ſhip which is ſtiff from conſtruction is much better adapted for ſailing faſt than one which, in order to carry the ſame quantity of canvas, is obliged to be loaded with a much greater weight: for the reſiſtance is as the quantity of water to be removed, or nearly as the area of a tranſverſe ſection of the immerſed part of the body at the midſhip frame; and a body that is broad and ſhallow is much ſtiffer than one of the ſame capacity that is narrow and deep.

Principles of Naval Architecture, p. 100.

23 Advantages of a ſhip of a ſmall draught of water, "The advantages (ſays Mr Gordon) are numerous, important, and obvious. For it is evident, that by enlarging, perhaps doubling, the breadth of veſſels, and forming their bottoms flat and well furniſhed with keels, they muſt, in the *firſt* place, become much ſteadier, roll little, if any, and be enabled to carry greatly more ſail, and that in a better direction, at the ſame time that they would be in no danger of being diſmaſted or overſet, unleſs the maſts were of a moſt extraordinary height indeed. *Secondly*, They would have little or no occaſion for ballaſt, and if any was uſed, could incur leſs danger from its ſhifting. *Thirdly*, That there would be much more room upon deck, as well as accommodation below; the breadth being ſo much increaſed without any diminution of the height above the load-water line. *Fourthly*, That they would deviate much leſs from the intended courſe, and penetrate the water much eaſier in the proper direction: for doubling the breadth, without any increaſe of weight, would diminiſh the depth or draught of water one half; and though the extent of the directly oppoſing ſurface would be the ſame as before, yet the veſſel in moving would meet with half the former reſiſtance only; for ſo great is the difference between the preſſure, force, or reaction, of the upper and the under water. *Fifthly*, That they would by this means be adapted for lying unſupported in docks and harbours when dry, be rendered capable of being navigated in ſhallow water, and of being benefited by all the advantages attending that very important circumſtance; and it is particularly to be obſerved, that making veſſels which may be navigated in ſhallow water, may, in many reſpects, juſtly be regarded as a matter of equal importance with increaſing the number of harbours, and improving them, as having identically the ſame effects with regard to navigation; at the ſame time, that the benefits which would reſult from ſuch circumſtances are obtained by this means without either expence, trouble, or inconvenience: beſides, it would not only enable veſſels to enter many rivers, bays, and creeks, formerly inacceſſible to ſhips of burden, but to proceed to ſuch places as are moſt landlocked, where they can lie or ride moſt ſecure, and with leaſt expence of men and ground tackle. As ſhips of war would carry their guns well by being ſo ſteady, there could be but little occaſion for a high topſide, or much height of hull above water; and as little or no ballaſt would be required, there would be no neceſſity, as in other veſſels, for increaſing their weight on that account, and thereby preſſing them deeper into the water. Theſe are very important circumſtances, and would contribute much to improve the ſailing of ſuch veſſels." From whence it appears, that there would be united, what has hitherto been deemed irreconcileable, the greateſt poſſible ſtability, which is nearly as the area of a tranverſe ſection of the immerſed part of the body at the midſhip frame: and a body that is broad and ſhallow is much ſtiffer than one of the ſame capacity that is narrow and deep. A ſhip of this conſtruction may take in a conſiderable cargo in proportion to her ſize; but if deeply loaded will not ſail faſt, for then the area of a ſection of the immerſed part at the midſhip frame will be very conſiderable; and as the ſails of ſuch a ſhip muſt neceſſarily be large, more hands will therefore be required.

The leſs the breadth of a ſhip, the fewer hands will be neceſſary to work her; as in that caſe the quantity of ſail will be leſs, and the anchors alſo of leſs weight. We ſhall gain much (ſays M. Bouguer) by making the extreme breadth no more than the fifth or ſixth part of the length, if, at the ſame time, we diminiſh the depth proportionally; and likewiſe this moſt ſurpriſing circumſtance, that by diminiſhing theſe two dimenſions, or by increaſing the length, a ſhip may be made to go ſometimes as faſt as the wind. 24 and to be navigated with few hands. *Traité du Navire.*

In order to obtain the preceding properties, very oppoſite rules muſt be followed; and hence it appears to be impoſſible to conſtruct a ſhip ſo as to be poſſeſſed of them all. The body, however, muſt be ſo formed, that as many of theſe properties may be retained as poſſible, always obſerving to give the preference to thoſe which are moſt required. If it is known what particular trade the ſhip is to be employed in, thoſe qualities are then principally to be adhered to which are moſt eſſentially neceſſary for that employment. 25 Impoſſible to unite all the qualities in the ſame ſhip.

It may eaſily be demonſtrated that ſmall ſhips will not have the ſame advantages as large ones of a ſimilar form, when employed in the ſame trade: for a large ſhip will not only ſail faſter than a ſmall one of a ſimilar form, but will alſo require fewer hands to work her. Hence, in order that a ſmall ſhip may poſſeſs the ſame advantages as a large one, the correſponding dimenſions will not be proportional to each other. The reader will ſee in Chapman's *Architectura Navalis Mercatoria* ample tables of the ſeveral dimenſions of ſhips, of different claſſes and ſizes, deduced from theory combined with experiment. Tables of the dimenſions of the principal ſhips of the Britiſh navy, and of other ſhips, are contained in the Ship-builder's Repoſitory, and in Murray's Treatiſe on Ship-building. 26 Small ſhips inferior to large ones in point of ſailing, &c.

Chap. II. *Of the different Plans of a Ship.*

When it is propoſed to build a ſhip, the proportional ſize of every part of her is to be laid down; from whence the form and dimenſions of the timbers, and of every particular piece of wood that enters into the conſtruction, is to be found. As a ſhip has length, breadth, and depth, three different plans at leaſt are neceſſary to exhibit

Different Plans of a Ship.

exhibit the form of the ſeveral parts of a ſhip: theſe are are uſually denominated the *ſheer plan*, the *half breadth* and *body plans*.

27 Sheer draught, or elevation.

The *ſheer plan* or *draught*, otherwiſe called the *plan of elevation*, is that ſection of the ſhip which is made by a vertical plane paſſing through the keel. Upon this plan are laid down the length of the keel; the height and rake of the ſtem and ſternpoſt; the ſituation and height of the midſhip and other frames; the place of the maſts and channels; the projection of the head and quarter gallery, and their appendages; and in a ſhip of war the poſition and dimenſions of the gun-ports. Several imaginary lines, namely, the upper and lower height of breadth lines, water lines, &c. are alſo drawn in this plane.

28 Half breadth plan or horizontal plane.

The *half breadth* or, *floor plan*, or, as it is frequently called the *horizontal* plane, contains the ſeveral half-breadths of every frame of timbers at different heights; ribbands, water lines, &c. are alſo deſcribed on this plane.

29 Body plan, or projection.

The *body* plan, or *plane of projection*, is a ſection of the ſhip at the midſhip frame or broadeſt place, perpendicular to the two former. The ſeveral breadths, and the particular form of every frame of timbers, are deſcribed on this plane. As the two ſides of a ſhip are ſimilar to each other, it is therefore unneceſſary to lay down both; hence the frames contained between the main frame and the ſtem are deſcribed on one ſide of the middle line, commonly on the right hand ſide, and the after frames are deſcribed on the other ſide of that line.

30 The various lines laid down on theſe plans.

Several lines are deſcribed on theſe planes, in order the more readily to aſſiſt in the formation of the timbers; the principal of which are the following:

The *top-timber line*, is a curve limiting the height of the ſhip at each timber.

The *top-timber half breadth line*, is a ſection of the ſhip at the height of the top-timber line, perpendicular to the plane of elevation.

The *height of breadth lines*, are two lines named the *upper* and *lower* heights of breadth. Theſe lines are deſcribed on the plane of elevation to determine the height of the broadeſt part of the ſhip at each timber; and being deſcribed in the body plan, limit the height and breadth of each frame at its broadeſt part.

Main half breadth, is a ſection of the ſhip at the broadeſt part, perpendicular to the ſheer plan, and repreſents the greateſt breadth at the outſide of every timber.

Water lines, are lines ſuppoſed to be deſcribed on the bottom of a ſhip when afloat by the ſurface of water; and the uppermoſt of theſe lines, or that deſcribed by the water on the ſhip's bottom when ſufficiently loaded, is called the *load water line*. According as the ſhip is lightened, ſhe will riſe higher out of the water; and hence new water lines will be formed. If ſhe be lightened in ſuch a manner that the keel may preſerve the ſame inclination to the ſurface of the water, theſe lines will be parallel to each other; and if they are parallel to the keel, they will be repreſented by ſtraight lines parallel to each other in the body plan; otherwiſe by curves. In the half breadth plan, theſe lines are curves limiting the half breadth of the ſhip at the height of the correſponding lines in the ſheer plan. In order to diſtinguiſh theſe lines, they are uſually drawn in green.

Ribband lines, are curves on a ſhip's bottom by the interſection of a plane inclined to the plane of elevation; and are denominated *diagonal* or *horizontal*, according as they are meaſured upon the diagonal, or in a direction perpendicular to the plane of elevation. Both theſe anſwer to the ſame curve on the ſhip's bottom, but give very different curves when deſcribed on the half breadth plan.

31 Frames, compoſed of a floor timber, futtocks, and top timber.

Frames, are circular pieces of timber bolted together, and raiſed upon the keel at certain diſtances, and to which the planks are faſtened. A frame is compoſed of one floor-timber, two or three futtocks, and a top-timber on each ſide: which being united together, form a circular incloſure, and that which incloſes the greateſt ſpace is called the *midſhip* or *main* frame. The arms of the floor-timber of this frame form a very obtuſe angle; but in the other frames this angle decreaſes with the diſtance of the frame from midſhips. Thoſe floor-timbers which form very acute angles are called *crutches*. The length of the midſhip floor-timber is in general about half the length of the main frame.

Sweeps of the ſeveral parts of a frame.

A frame of timbers is commonly formed by arches of circles called *ſweeps*. There are generally five ſweeps: 1ſt, The *floor ſweep*; which is limited by a line in the body plan perpendicular to the plane of elevation, a little above the keel; and the height of this line above the keel at the midſhip frame is called the *dead riſing*. The upper part of this arch forms the head of the floor timber. 2d, The *lower breadth ſweep*; the centre of which is in the line repreſenting the lower height of breadth. 3d, The *reconciling ſweep*. This ſweep joins the two former, without interſecting either; and makes a fair curve from the lower height of breadth to the riſing line. If a ſtraight line is drawn from the upper edge of the keel to touch the back of the floor ſweep, the form of the midſhip frame below the lower height of breadth will be obtained. 4th, The *upper breadth ſweep*; the centre of which is in the line repreſenting the upper height of breadth of the timber. This ſweep deſcribed upwards forms the lower part of the top timber. 5th, The *top timber ſweep* is that which forms the hollow of the top timber. This hollow is, however, very often formed by a mould, ſo placed as to touch the upper breadth ſweep, and paſs through the point limiting the half breadth of the top timber.

32 Names of frames.

The main frame, or as it is uſually called *dead-flat*, is denoted by the character ⊕. The timbers before dead-flat are marked A, B, C, &c. in order; and thoſe abaft dead-flat by the figures 1, 2, 3, &c. The timbers adjacent to dead-flat, and of the ſame dimenſions nearly, are diſtinguiſhed by the characters (A), (B), &c. and (1), (2), &c. That part of the ſhip abaft the main frame is called the *after body*; and that before it the *fore body*.

All timbers are perpendicular to the half breadth plan. Thoſe timbers whoſe planes are perpendicular to the ſheer plan, are called *ſquare timbers*; and thoſe whoſe planes are inclined to it are called *canted timbers*.

The *riſing line*, is a curve drawn in the ſheer plan, at the heights of the centres of the floor ſweeps in the body plan. As, however, this line, if drawn in this manner, would extend beyond the upper line of the figure, it is therefore uſually ſo drawn that its lower part may touch the upper edge of the keel. This is performed by taking the heights of each of the centres in the

Different Plans of a Ship.

the body plan, from the height of the centre of the sweep of dead-flat, and setting them off on the corresponding timbers in the sheer plan from the upper edge of the keel.

Half breadth of the rising, is a curve in the floor plan, which limits the distances of the centres of the floor sweeps from the middle line of the body plan.

The rising of the floor, is a curve drawn in the sheer plan, at the height of the ends of the floor timbers. It is limited at the main frame or dead flat by the dead rising, and in flat ships is nearly parallel to the keel for some timbers afore and abaft the midship frame; for which reason these timbers are called *flats*: but in sharp ships it rises gradually from the main frame, and ends on the stem and post.

Cutting-down line, is a curve drawn on the plane of elevation. It limits the depth of every floor timber at the middle line, and also the height of the upper part of the dead wood afore and abaft.

Timber and room, or *room and space*, is the distance between the moulding edges of two timbers, which must always contain the breadth of two timbers and an interval of about two or three inches between them. In forming the timbers, one mould serves for two, the foreside of the one being supposed to unite with the aftside of the other, and so make only one line, which is called the *joint of the timbers*.

34 Principal pieces that compose a ship. Plate cccclxxxiv. Fig. 1.

In order to illustrate the above, and to explain more particularly the principal pieces that compose a ship, it will be necessary to give a description of them. These pieces are for the most part represented according to the order of their disposition in fig. 1.

A, Represents the pieces of the keel to be securely bolted together and clinched.

B, the sternpost, which is tenanted into the keel, and connected to it by the knee G.

E, The back of the post, which is also tenanted into the keel, and securely bolted to the post; the intention of it is to give sufficient breadth to the port, which seldom can be got broad enough in one piece. C is the false post, which is fayed (B) to the fore part of the sternpost.

C, The stem, in two pieces, to be scarfed together. The stem is joined to the fore foot, which makes a part of both.

H, The apron, in two pieces, to be scarfed together, and fayed on the inside of the stem, to support the scarf thereof; and therefore the scarf of the apron must be at some distance from that of the stem.

I, The stemson, in two pieces, to support the scarf of the apron.

D, The beams which support the decks; and F the knees by which the beams are fastened to the sides of the ship.

K, The wing transom: it is fayed across the sternpost, and bolted to the head of it, and its extremities are fastened to the fashion pieces. L, Is the deck transom, parallel to the wing transom. M, N, Two of the lower transoms: these are fastened to the sternpost and fashion pieces in the same manner as the wing transom. Q, The knee which fastens the transom to the ship's side. And, O, The fashion piece, of which there is one on each side. The keel of the fashion piece is connected with the dead-wood, and the head is fastened to the wing transom.

Different Plans of a Ship.

R, S, Breast-hooks: these are fayed in the inside to the stem, and to the bow on each side of it, to which they are fastened with proper bolts. There are generally four or five in the hold, in the form of that marked R, and one in the form of that marked S, into which the lower deck planks are rabbeted: There is also one immediately under the hause holes, and another under the second deck.

T, The rudder, which is joined to the sternpost by the rudder irons, upon which it turns round in the googings, fastened to the sternpost for that purpose. There is a mortise cut in the head of the rudder, into which a long bar is fitted called the *tiller*, and by which the rudder is turned.

U, A floor timber: it is laid across the keel, to which it is fasten-d by a bolt through the middle. V, V, V, V, The lower, the second, third, and fourth futtocks. W, W, The top timbers. These represent the length and scarf of the several timbers in the midship frame.

X, The pieces which compose the kelson. They are scarfed together in the same manner as the keel, and placed over the middle of the floor timbers, being scored about an inch and a half down upon each side of them, as represented in the figure.

Y, The several pieces of the knee of the head; the lower part of which is saved to the stem, and its keel is scarfed to the head of the forefoot. It is fastened to the bow by two knees, called *cheeks*, in the form of that represented by Z; and to the stem, by a knee called a *standard*, in the form of that marked ⊕.

a, The cathead, of which there is one on each side of the bow, projecting so far as to keep the anchor clear of the ship when it is hove up.

b, The bits, to which the cable is fastened when the ship is at anchor.

d, The side counter-timbers, which terminate the ship abaft within the quarter gallery.

e, *e*, Two pieces of dead wood, one afore and the other abaft, fayed on the keel.

Fig. 2. is a perspective representation of a ship framed and ready for the planking; in which A, A is the keel; B, the sternpost; C, the stem; K, L, M, the transoms; F, F, F, F, F, F, the ribbands. Fig. 2.

CHAP. III. *Containing Preliminary Problems*, &c.

The general dimensions of a ship are the *length*, *breadth*, and *depth*.

35 Proportional dimensions of a ship 36 to be inferred from theory combined with practice;

To ascertain those dimensions that will best answer the intended purpose is, no doubt, a problem of considerable difficulty; and, from theory, it may be shown that there are no determinate proportions subsisting between the length, breadth, and depth, by which these dimensions may be settled; yet, by combining theory and practice, the proportional dimensions may be approximated to pretty nearly.

As

(B) To *fay*, is to join two pieces of timber close together.

Preliminary Problems. As ships are constructed for a variety of different purposes, their principal dimensions must therefore be altered accordingly, in order to adapt them as nearly as possible to the proposed intention; but since there is no fixed standard whereby to regulate these dimensions, the methods therefore introduced are numerous, and in a great measure depend upon custom and fancy.

37 and also from the circle. With regard, however, to the proportional dimensions, they perhaps may be inferred from the circle. Thus, if the extreme breadth be made equal to the diameter, the length at the load water line, or the distance between the rabbets of the stem and post at that place, may be made equal to the circumference of the same circle; and the depth of the hold equal to the radius, the upper works being continued upwards according to circumstances. A ship formed from these dimensions, with a bottom more or less full according as may be judged necessary, will no doubt answer the proposed intention. Nevertheless, one or other of these dimensions may be varied in order to gain some essential property, which the trade that the vessel is intended for may require.

* *Practical Seamanship*, page 25.

The following hints are given by Mr Hutchinson * towards fixing rules for the best construction of ships bottoms.

† See Book ii. chap. 2.

1. "I would recommend (says he), to prevent ships bottoms from hogging † upwards amidship, to have the fore and after part of their keels deep enough, that the upper part may be made to admit a rabbet for the garboard streak, that the main body and bearing part of the ships bottoms may be made to form an arch downwards in their length, suppose with the same sheer as their bends, at the rate of about 2 inches for every 30 feet of the extreme length of the keel towards the midship or main frame, which may be reckoned the crown of the arch; and the lower part of the keel to be made straight, but laid upon blocks so that it may form a regular convex curve downwards at the rate of an inch for every 30 feet of the extreme length of the keel, the lowest part exactly under the main frame; which curve, I reckon, is only a sufficient allowance for the keel to become straight below, after they are launched afloat, by the pressure of the water upward against their floors amidship, which causes their tendency to hog. And certainly a straight keel is a great advantage in sailing, as well as to support them when laid upon level ground or on straight blocks in a repairing dock, without taking damage.

2. "As square sterned ships, from experience, are found to answer all trades and purposes better than round or pink sterned ships, I would recommend the fore part of the sternpost, on account of drawing the water lines in the draught, only to have a few inches rake, that the after part may stand quite upright perpendicular to the keel: and for the rake of the stem I would propose the rabbet for the hudding ends for the entrance, and bows from the keel upwards, to form the same curve as the water line from the stem at the harpin towards the main breadth, and the bows at the harpin to be formed by a sweep of a circle of half the three-fourths of the main breadth; and the main transom to be three-fourths of the main-breadth; and the buttocks, at the load or sailing mark aft, to be formed, in the same manner as the bows at the harpin, with a sweep of a circle of half the three fourths of the main breadth, to extend just as far from the stem and stern post as to admit a regular convex curve to the main frame, and from these down to the keel to form regular convex water-lines, without any of those unnatural, hollow, concave ones, either in the entrance or run; which rules, in my opinion, will agree with the main body of the ship, whether she is designed to be built full for burden or sharp below for sailing. [illegible] Problems.

3. "This rule for raking the stem will admit all the water-lines in the ship's entrance to form convex curves all the way from the stem to the midship or main frame, which answers much better for sailing as well as making a ship more easy and lively in bad weather. And the bows should flange off, rounding in a circular form from the bends up to the gunwale, in order to meet the main breadth the sooner, with a sweep of half the main breadth at the gunwale amidships; which will not only prevent them greatly from being plunged under water in bad weather, but spread the standing fore-rigging the more, to support these material masts and sails forward to much greater advantage than in those over sharp bowed ships, as has been mentioned. And as the sailing trim of ships in general is more or less by the stern, this makes the water lines of the entrance in proportion the sharper to divide the particles of water the easier, so that the ship may press through it with the least resistance.

4. "The run ought to be formed shorter or longer, fuller or sharper, in proportion to the entrance and main body, as the ship is designed for burden or sailing fast. The convex curves of the water lines should lessen gradually from the load or sailing mark aft, as has been mentioned, downwards, till a fair straight taper is formed from the after part of the floor to the sternpost below, without any concavity in the water lines; which will not only add buoyancy and burden to the after body and run of the ship, but, in my opinion, will help both her sailing and steering motions; for the pressure of the water, as it closes and rises upon it to come to its level again, and fill up that hollow which is made by the fore and main body being pressed forward with sail, will impinge, and act with more power to help the ship forward in her progressive motion, than upon those unnatural concave runs, which have so much more flat dead wood, that must, in proportion, be a hinderance to the stern being turned so easily by the power of the helm to steer the ship to the greatest advantage."

Many and various are the methods which are employed to describe the several parts of a ship. In the following problems, however, those methods only are given which appear to be most easily applied to practice, and which, at the same time, will answer any proposed purpose.

Problem I. To describe in the plane of elevation the sheer or curvature of the top timbers.

Let QR (fig 3.) be the length of the ship between the wing transom and the rabbet of the stem. Then since it is generally agreed, especially by the French constructors, that the broadest part of the ship ought to be about one-twelfth of the length before the main frame or dead flat; therefore make R$\oplus$ equal to five-twelfths of QR, and $\oplus$ will be the station of the main frame; space the other frames on the keel, and from these points let perpendiculars be drawn to the keel. Let $\oplus$P be the height of the ship at the main frame, Plate cccclxxxv. Fig. 3. 38 The place of the main frame about one-twelfth before the [illegible] of the ship.

VF

Preliminary Problems.

VF the height at the aftermoſt frame, and RK the height at the ſtem. Through P draw EPL parallel to the keel; deſcribe the quadrants PGI, PMN, the radius being P⊕; make PH equal to EF, and PO equal KL, and draw the parallels GH, OM: Divide GH ſimilar to ⊕C, and OM ſimilar to ⊕R. Through theſe points of diviſion draw lines perpendicular to EL, and the ſeveral portions of theſe perpendiculars contained between EL and the arch will be the riſings of the top-timber line above EL. A curve drawn through theſe points will form the top-timber line.

39 Method of deſcribing the top-timber line.

This line is more eaſily drawn by means of a curved or bent ruler, ſo placed that it may touch the three points F, P, and K.

40 The ſtem, Fig 3.

PROB. II. To deſcribe the ſtem.

Let K (fig. 3.) be the upper part of the ſtem, through which draw KS parallel to the keel, and equal to twice KR: Through the termination of the wales on the ſtem draw TW parallel to QR. Then from the centre S, with the diſtance SK, deſcribe an arch: Take an extent equal to the neareſt diſtance between the parallels WT, QR; and find the point W, ſuch that one point of the compaſs being placed there, the other point will juſt touch the neareſt part of the above arch; and from this point as a centre deſcribe an arch until it meets the keel, and the ſtem will be formed.

41 and poſt. Fig. 3.

PROB. III. To deſcribe the ſternpoſt.

Set off QV (fig. 3.) for the rake of the poſt: draw VX perpendicular to the keel, and equal to the height of the wing tranſom, join QX, and it will repreſent the aft ſide of the poſt.

42 Main half breadth line. Fig. 4.

PROB. IV. To deſcribe the half breadth line.

Let MN (fig. 4.) be the given length: Make N⊕ equal to five-twelfths of MN; draw the line ⊕P perpendicular to MN, and equal to the propoſed extreme half breadth. Let ME be the round aft of the ſtern or wing tranſom; make EO perpendicular to MN, and equal to the given half breadth at the ſtern, which is generally between two-thirds and three-fourths of the main half breadth; and deſcribe the arch MO, the centre of which is in the middle line. Space the frames (A), A, B, &c. and (1), 1, 2, &c. From the centre ⊕, with the radius ⊕P, deſcribe the quadrant PRS; deſcribe alſo the quadrant PCT. Through the point O draw ORU parallel to MN; divide the ſtraight line RU ſimilar to M⊕; and through theſe points of diviſion draw lines perpendicular to MN, and meeting the arch. Transfer theſe lines to the correſpondent frames each to each, and a curve drawn through the extremities will repreſent that part of the ſide contained between the main frame and the ſtern. Again, through Q, the extremity of the foremoſt frame, draw QV parallel to MN. Or make PV a fourth or third part of PU, according as it is intended to make the ſhip more or leſs full towards the bow. Divide VC ſimilar to ⊕C; through theſe points draw lines perpendicular to MN, and terminating in the quadrantal arch: Transfer theſe lines to the correſponding timbers in the fore part, and a curve drawn through the extreme points will limit that part of the ſhip's ſide contained between P and Q. Continue the curve to the next timber at X. From Q draw QZ perpendicular to QX; make the angle ZNQ equal to ZQN, and the point Z will be the centre of the arch forming the bow. Remark, if it is propoſed that the breadth of the ſhip at the frames adjacent to the main frame ſhall be equal to the breadth at the main frame; in this caſe, the centres of the quadrantal arches will be at the points of interſection of theſe frames with the line MN; namely, at (A) and (1). Alſo, if the height of the ſhip at the frames (A) and (1) is to be the ſame as at dead flat, the quadrantal arches in fig. 3. are to be deſcribed from the points of interſection of theſe frames with the line EL.

These rules, it is evident, are variable at pleaſure; and any perſon acquainted with the firſt principles of mathematics may apply calculation to find the radii of the ſeveral ſweeps.

PROB. V. To deſcribe the main frame or dead flat. 43

This frame is that which contains the greateſt ſpace, and the particular form of each of the other frames depends very much on it. If the ſhip is intended to carry a great burden in proportion to her principal dimenſions, this frame is made very full; but if ſhe is intended to ſail faſt, it is uſually made ſharp. Hence ariſes diverſity of opinions reſpecting its form; each conſtructor uſing that which to him appears preferable. In order to ſave repetition, it is judged proper to explain certain operations which neceſſarily enter into all the different methods of conſtructing this frame.

Of the midſhip frame.

In the plane of the upper ſide of the keel produced, draw the line AB (fig. 5.) equal to the propoſed breadth of the ſhip; biſect AB in C, and draw AD, CE, and BF, perpendicular to AB. Then, ſince the two ſides of a ſhip are ſimilar, it is therefore thought ſufficient to deſcribe the half of each frame between the main frame and the ſtern on one ſide of the middle line CE, and the half of each of thoſe before the main frame on the other ſide of it. The firſt half is called the *after-body*, and the other the *fore-body*. The after-body is commonly deſcribed on the left ſide of the middle line; and the fore-body on the right ſide of it: hence the line AD is called the *ſide line* of the *after* body, and BF the ſide line of the *fore* body. Make AD and BF each equal to the height of the ſhip at the main frame. Make AG, BG, and AH, BH, equal to the lower and upper heights of breadth reſpectively, taken from the ſheer plan. Let II be the load water line, or line of floatation when the ſhip is loaded, and KK the height of the riſing line of the floor at this frame. Make CN, CO, each equal to half the length of the floor timber, and N, O, will be the heads of the floor timber, through which draw perpendiculars to AB. Make C*m*, E*m*, each equal to half the thickneſs of the ſternpoſt, and C*n*, E*n*, equal to half the thickneſs of the ſtem, and join *mm*, *nn*.

44 General precepts for deſcribing Fig. 5.

Method I. *Of deſcribing a main frame.*—From the centre *a* (fig. 5.), in the lower breadth line, deſcribe the lower breadth ſweep G*e*; make N*b* equal to the propoſed radius of the floor ſweep, and from the centre *b* deſcribe the floor ſweep N*f*. Let the radius of the reconciling ſweep be A*g*, equal to about the half of AC; then make A*h* equal to N*b*, and A*m* equal to G*a*. Now from the centre *a*, with an extent equal to *gm*, deſcribe an arch, and from the centre *b*, with the extent *gh*, deſcribe an arch interſecting the former in *c*, which will be the centre of the reconciling ſweep *ef*. Join N*m* by an inverted curve, the centre of which may be in the line *b*N produced downwards; or it may be joined

Preliminary Problems.

joined by two curves, or by a straight line if there is little rising; and hence the lower part of the main frame will be described.

In order to form the top timber, make F k equal to such part of the half breadth, agreeable to the proposed round of the side, as one-seventh; join H k, and make $k\,i$ equal to about two-thirds of H k: make the angle H i l equal to i H l; and from the centre l at the distance l H describe the arch H i; and from the centre o, the intersection of $l\,i$, and k F produced, describe the arch $i\,k$, and the top timber will be formed.

II. *To describe a main frame of an intermediate capacity, that is, neither too flat nor too sharp.*—Divide the line AX (fig. 6.), which limits the head of the floor timber, into three equal parts; and make $a\,b$ equal to one of them. Divide the line d B, the perpendicular distance between the load water line and the plane of the upper side of the keel, into seven equal parts; and set off one of these parts from d to c, and from c to m. Let GH be the lower deck, join G m, and produce it to q. Draw the straight line V a, bisect it in n, and from the points n, a, describe arches with the radius Gq intersecting each other in P, which will be the centre of the arch $n\,a$. The centre of the arch V n is found by describing arches downwards with the same radius.

Fig. 6.

With an extent equal to once and a half of B e, describe arches from the points b, e, intersecting each other in A, and from this point as a centre describe the arch $e\,b$; make $a\,l$ equal to $d\,m$, and join A m, A l. Then, in order to reconcile two arches so as to make a fair curve, the centres of these arches and of the points of contact must be in the same straight line. Hence the point k will be the centre of the arch $d\,m$, and o the centre of the arch $a\,l$. The arch $l\,m$ is described from the centre A.

To form the top timber, set back the tenth part of the half breadth from K to S upon the line of the second deck; then with an extent equal to two-thirds of the whole breadth describe an arch through the points S and H, the upper height of breadth. Again, make MI equal to the fifth part of the half breadth; describe an arch of a circle through the points S and T, taking the diagonal GB for the radius. As this arch is inverted in respect of the arch d S, the centre will be without the figure. Hence one-half of the main frame is formed, and the other half is described by similar operations.

Remark. This frame may be made more or less full by altering the several radii.

III. *To describe a main frame of a circular form.*—Let the several lines be drawn as before: Then make O a (fig. 7.) equal to the half breadth G a, and from the centre a, with the radius G a, describe the arch b G c O. Let d be the head of the floor-timber, and $d\,x$ the rising. Assume the point f in the arch, according to the proposed round of the second futtock, and describe the arch $d\,f$; the centre of which may be found as in the former method: from the centre a, with the distance $a\,d$, describe the arch $d\,c$ O; make $d\,c$ equal to one-third of d O, and the angle $d\,c\,h$ equal to $c\,d\,h$, and from the centre h describe the arch $d\,c$. The inverted arch c O may be described as before.

Plate cccclxxxvi. Fig. 7.

IV. *To describe a very full main frame.*—Let the vertical and horizontal lines be drawn as before: let b, fig. 8. be the floor-head, and $b\,x$ the rising. Divide G c into two equal parts in the point d, and upon $c\,d$ describe the square $d\,b\;a\,c$, in which inscribe the quadrant $d\,e\,a$. Divide the line $b\,d$ into any number of equal parts in the points O, N, M, L, and draw the lines L m, M e, N n, O b, perpendicular to $d\,b$. Divide the line G C, the depth of the hold, the rising being deducted, into the same number of equal parts in the points E, F, I, K, and make the lines E p, F q, I r, K s, in the frame, equal to the lines O b, N n, M e, L m, in the square, each to each respectively; and through the points G, p, q, r, s, b, describe a curve. The remaining part of the frame may be described by the preceding methods.

Fig. 8.

V. *To describe the main frame of a ship intended to be a fast sailer.*—The principal lines being drawn as before, let the length of the floor-timber be equal to half the breadth of the ship, and the rising one-fifth or one-sixth of the whole length of the floor-timber, which lay off from x to E, fig. 9. Through the point E draw the line T x perpendicular to GC, and d E perpendicular to AG. Join T d, which bisect in B, and draw BF perpendicular thereto, and meeting CG produced in F, from the centre F, at the distance FT, describe the semicircle T dD. Divide GT into any number of parts, VW, &c. and bisect the intervals DV, DW, &c. in the points X, Z, &c.; then, from the centre X, with the extent XV, describe the semicircle D b V, intersecting AG in b. Let VP be drawn perpendicular to GT, and b P perpendicular to AG, and the point of intersection P will be one point through which the curve is to pass. In like manner proceed for the others, and a curve drawn through all the points of intersection will be part of the curve of the main frame. The remaining part of the curve from E to Y will be composed of two arches, the one to reconcile with the former part of the curve at E, and the other to pass through the point Y, the centre of which may be found by any of the preceding methods. In order to find the centre of that which joins with the curve at E, make TR equal to the half of GD, and join ER, in which a proper centre for this arch may be easily found.

Fig. 9.

The portion G b E of the curve is a parabola, whose vertex is G and parameter GD.

For GD : G b : : G b : GV by construction.

Hence DG $\times$ GV $=$ Gb^2, which is the equation for a parabola.

VI. *To describe a main frame of a middling capacity.*—Let the length of the floor-timber be equal to one-half of the breadth of the ship. Make O d, fig. 10. equal to one-fourth of the length of the floor-timber, and draw the perpendicular $d\,c$ equal to the rising, and divide it into two equal parts in the point e. Describe an arch through e, and the extremity a of the floor-timber, the radius being equal to the half breadth, or more or less according to the proposed round of the floor-head. Then with the radius O l, half the length of the floor-timber, describe the arch e Y.

Fig. 10.

Draw $l\,m$ perpendicular to OA: bisect A n in p, and draw the perpendicular $p\,q$. From the middle of A p draw the perpendicular $r\,s$, and from the middle of A r draw the perpendicular $t\,u$. Make $n\,z$, $p\,g$, each equal to $l\,n$: make the distances $p\,y$, $r\,b$, each equal to $a\,g$: r F, t E, each equal to $a\,b$; and $t\,x$ equal to a E. Then a curve drawn through the points a, z, y, F, x, T, will form the under part of the midship frame.

We shall finish these methods of describing the main frame

Preliminary Problems.

frame of a fhip with the following remark from M. Vial du Clairbois *. "It feems (fays he) that they have affected to avoid ftraight lines in naval architecture; yet, geometrically fpeaking, it appears that a main frame formed of ftraight lines will have both the advantage and fimplicity over others." To illuftrate this, draw the ftraight line MN (fig. 9.) in fuch a manner that the mixtilineal fpace M a d may be equal to the mixtilineal fpace DNY. Hence the capacity of the main frame formed by the ftraight lines MN, NY will be equal to that of the frame formed by the curve M a DY; and the frame formed by the ftraight lines will for the moft part be always more fufceptible of receiving a bow that will eafily divide the fluid. It is alfo evident, that the cargo or ballaft, being lower in the frame formed of ftraight lines than in the other, it will therefore be more advantageoufly placed, and will enable the fhip to carry more fail (C); fo that having a bow equally well or better formed, fhe will fail fafter.

* Architecture Navale, p. 22.

Traité de Navire de Bouguer, p. 601.

PROB. VI. To defcribe a ftern having a fquare tuck.

Fig. 11.

Let AB (fig. 11.) be the middle line of the poft, and let CD be drawn parallel thereto at a diftance equal to half the thicknefs of the poft. Make CE equal to the height of the lower part of the fafhion-piece above the keel: make CT equal to the height of the extremity G of the tranfom above the plane of the keel produced, and CH equal to the height of the tranfom on the poft, HT being equal to above one-ninth or one-tenth of GT, and defcribe the arch GH, the centre of which will be in BA produced: make EK equal to five-twelfths of ET: through K draw KL perpendicular to CD, and equal to EK; and with an extent equal to EL defcribe the arch EL. Make GI equal to the half of ET, and from the centre I defcribe the arch GM, and draw the reconciling curve ML.—Let the curve of the fafhion-piece be produced upwards to the point reprefenting the upper height of breadth as at O. Make ON equal to the height of the top-timber, and BN equal to the half breadth at that place, and join ON. Through N and the upper part of the counter, let arches be defcribed parallel to GH. The tafferel, windows, and remaining part of the ftern, may be finifhed agreeable to the fancy of the artift.

Fig. 12.

In fig. 12. the projection of the ftern on the plane of elevation is laid down, the method of doing which is obvious from infpection.

Plate cccclxxxvii. Fig. 14.

If the tranfom is to round aft, then fince the fafhion-pieces are always fided ftraight, their planes will interfect the fheer and floor planes in a ftraight line. Let Gg (fig. 14.) be the interfection of the plane of the fafhion-piece with the floor plane. From the point g draw gW perpendicular to gM: make yk equal to the height of the tuck, and Wk being joined will be the interfection of the plane of the fafhion-piece with the fheer plane. Let the water lines in the fheer plane produced meet the line kW in the points a, s, h, and draw the perpendiculars aa, fs, hh. From the points a, s, h (fig. 14.) draw lines parallel to Gg to interfect each correfponding water line in the floor plane in the points 3, 2, 1. From the points G, 3, 2, 1, in the floor-plane draw lines perpendicular to gM, interfecting the water lines (fig. 13.) in the points G, 3, 2, 1; and through thefe points defcribe the curve G 3 2 1 k; and WG 3 2, 1 k will be the projection of the plane of the fafhion-piece on the fheer plane. Through the points G, 3, 2, 1 (fig. 13.) draw the lines GF, 3 A, 2 S, 1 H, perpendicular to Wk; and make the lines WF, aA, sS, hH, equal to the lines gG, a 3, s 2, h 1 (fig. 14.) refpectively, and WFASHk will be the true form of the plane of the aft fide of the fafhion-piece. When it is in its proper pofition, the line WF will be in the fame plane with the fheer line; the line aA in the fame plane with the water line a 3; the line sS in the fame plane with the water line s 2; and the line hH in the fame plane with the water line h 1. If lines be drawn from the feveral points of interfection of the water lines with the rabbet of the port (fig. 13.), perpendicular to gM, and curved lines being drawn from thefe points to G, 3, 2, 1 (fig. 14.) refpectively, will give the form and dimenfions of the tuck at the feveral water lines. Fig. 13. Fig. 14.

PROB. VII. To bevel the fafhion-piece of a fquare tuck by water-lines.

As the fafhion-piece both rakes and cants, the planes of the water-lines will therefore interfect it higher on the aft than on the fore-fide: but before the heights on the fore-fide can be found, the breadth of the timber muft be determined; which let be bn (fig. 15.). Then, as it cants, the breadth in the direction of the water-line will exceed the true breadth. In order to find the true breadth, form the aft-fide of the fafhion-piece as directed in the laft problem.

Let t 5 (fig. 13.) be the aft-fide of the rabbet on the outfide of the poft, WM the common fection of the plan of the fafhion-piece and the fheer-plan. Before this laft line can be determined, the feveral water-lines 1, 2, 3, 4, and 5, muft be drawn parallel to the keel, which may reprefent fo many tranfoms.—Let thefe water-lines be formed and ended at the aft-fide of the rabbet, as in fig. 14. where the rounds aft of the feveral tranfoms are defcribed, limiting the curves of the water-lines. Now the line WM muft rake fo as to leave room for half the thicknefs of the poft, at the tuck: in order to which, produce Wg to r; make rg half the thicknefs of the poft; through r draw a line parallel to gM to interfect gG in b: then with the radius rb, from x the point of the tuck as a centre, defcribe an arch, and draw the line WM juft to touch the back of that arch. Fig. 15.

The line WM being drawn, let any point k in it be affumed at pleafure: from k draw ky perpendicular to gM: through y draw yf (fig. 14.) parallel to gG, interfecting the line Mf drawn perpendicular to gM in the point f. From M draw Mi perpendicular to yf, and from y draw yn perpendicular to WM (fig. 13.). Make Mn (fig. 15.) equal to Mi (fig. 14.); then MI (fig. 15.) being equal to yk (fig. 13.), join n I, and the angle I nM will be the bevelling to the horizontal plane. Again, make Mz, Mf (fig. 15.) refpectively equal to yn (fig. 13.) and Mf (fig. 14.), and join zf; and

(C) It is not a general rule, that lowering the cargo of a fhip augments her ftability. This is demonftrated by the Chevalier de Borda, in a work publifhed by M. de Goimpy upon this fubject. See alfo *L'Architecture Navale par M. Vial du Clairbois*, p. 23.

Preliminary Problems.

and the angle M $z f$ will be the bevelling to the sheer-plane.

Fig. 15.

The bevelling being now found, draw the line $a b$ (fig. 15.) parallel to $z n$, $a z$ or $b n$ being the scantling of the timber. Then $n x$ will be the breadth of the timber on the horizontal plane, and $z e$ its breadth on the sheer-plane, and $a c$ what it is within a square.

Now as the lines g G, a 3, s 2, h 1, y i, represent the aft-side of the fashion-piece on the horizontal plane (fig. 14.), dotted lines may be drawn parallel to them to represent the fore-side, making $n x$ (fig. 15.) the perpendicular distance between the lines representing fore and aft sides of the fashion-piece. By these lines form the fore-side of the fashion-piece in the same manner as the aft-side was formed. The water-lines on the fore-side of the plane of the fashion-piece must, however, be first drawn in fig. 13. thus: Draw the lines $e b$, $c d$ parallel to WM, and whose perpendicular distances therefrom may be equal to $a c$ and $z e$ (fig. 15.) respectively. Draw a line parallel to a A through the point where the line $c d$ intersects the fifth water-line. Draw a line parallel to a A through the point where the fourth water-line intersects the line $c d$; in like manner proceed with the other water-lines. The fore-side of the fashion-piece is now to be described by means of these new water-lines, observing that the distances in the floor-plane must be set off from the line $e b$, and not from WM, as in the former case; and a curve described through the points 5, 3, 2, 1, where these distances reach to, will represent the fore-side of the fashion-piece.

The nearest distance between the points 5, 3, 2, 1 and the aft side of the fashion-piece is what the bevelling is beyond the square when both stock and tongue of the bevel are perpendicular to the timber. Make Mp

Fig. 16.

(fig. 16.) equal to the breadth of the timber, and M 5 equal to the perpendicular distance of the point 5 (fig. 13.) from the aft-side of the fashion-piece, and join 5 p. In like manner proceed with the others, and the bevellings at these parts will be obtained; but, in order to avoid confusion, the perpendiculars 4, 3, 2, (fig. 13.), instead of being laid off from M (fig. 16.), were set off from points as far below M as the other extremities of the lines drawn from these points are below the point p.

PROB. VIII. To describe the transoms of a round poop.

The transoms are fastened to the stern-post in the same manner that the floor-timbers are fastened to the keel, and have a rising called the *flight* similar to the rising of the floor-timbers. The upper transom is called the *wing* transom, the next the *deck* transom, and the others the *first*, *second*, and *third* transoms in order. The wing transom has a round aft and a round up: the round up of the deck transom is the same as that of the beams.

The fashion-piece of a square tuck must be first described, together with the three adjacent frames, by the method to be explained. The part of the stern above the wing transom is to be described in the same manner as before, and may therefore be omitted in this place. The part below the keel of the fashion-piece is also the

Plate cccclxxxviii Fig. 17.

same in both cases. Let fig. 17. represent the fashion-piece of a square tuck, and the three adjoining frames. Divide the interval AB into four equal parts in the points C, D, E, and draw the perpendiculars AF, CG, DH, EI, and BK: these will be portions of water-lines answering to the several transoms.

Fig. 18.

Let these water-lines be described on the floor-plan (fig. 18.), in which ABC represents the wing transom. Describe the arch bC to reconcile the curves A b and CE. Let LFG be the water-line answering to the lower part of the fashion-piece, the distance between the points L and A being equal to the excess of the projection of the point A beyond that of B (fig. 20.). Draw CK (fig. 18.) perpendicular to AM, and make the angle KCM equal to about 25 degrees, and CN will be the projection of the fashion-piece on the floor-plane. Make AB (fig. 19.) equal to AB

Fig. 19.

(fig. 17.). Divide it into four equal parts, and draw the perpendiculars AF, CH, DI, EK, and BG. Make AF equal to CM, and BG equal to MN, and draw the curve FHIKG, having a less curvature than the fashion-piece of the square tuck $s c p g n$. Make MO, MP, MQ, equal to CH, DI, and EK respectively. Divide AL (fig. 18.) into four equal parts, and to these points of division draw curves through the points O, P, Q, so as to partake partly of the curvature of A b CE and partly of that of LNF, but most of the curvature of that to which the proposed curve is nearest; and hence the form of the several transoms will be obtained.

In order to represent the curve of the fashion-piece on the plane of projection, make the lines AF, CG, DH, EI, and BK, (fig. 17.) respectively equal to the perpendicular distance of the points C, O, P, Q, and N. From the line AN (fig. 18.), and through the extremities of these lines, draw the curve FGHIK.

It remains to lay down the projection of the fashion-piece on the plane of elevation. In order to which, divide the line AB, fig. 20. (equal to AB, fig. 17.) into four equal parts, and through the points of division draw the perpendiculars AF, CG, DH, EI, and BK;

Fig. 20.

make AF (fig. 20.) equal to the perpendicular distance of the point C from the line BL (fig. 18.). In like manner make the lines CG, DH, EI, and BK (fig. 20.) respectively equal to the perpendicular distances of the points O, P, Q, and N, from the line BL (fig. 18.); and a curve drawn through these points will be the projection of the fashion-piece on the plane of elevation.

PROB. IX. To describe the intermediate frames in the after body.

For this purpose the midship and stern frames must be drawn in the plane of projection. As the main frame contains the greatest capacity, and the stern frame is that having the least, it hence follows that the form and dimensions of the intermediate frames will be between these; each frame, however, partaking most of the form of that to which it is nearest.

Fig. 21.

Let ACDE (fig. 21.) be the main frame on the plane of projection, and FGH the stern frame; and let there be any convenient number of intermediate frames, as *nine*. Draw the floor ribband CF, and the breadth ribband GD. Divide the curves CD, FG, each into the same number of equal parts, as three, in the points K, M; L, N; and draw the second and third ribbands KL, MN. In order to divide these ribbands so as to form fair curves in different sections, various methods have been proposed. One of the best of these, being that which is chiefly employed by the French construc-

 tors

Preliminary Problems.

tors is by means of an equilateral triangle, which is constructed as follows.

Fig. 22. Draw the line ME (fig. 22.), limited at M, but produced towards E: take M 1 equal to any convenient extent; make 1, 2 equal to thrice that extent, 2, 3 equal to five times, and 3, 4 equal to seven times the above extent; and continue this division to E, always increasing by two, until there be as many points as there are frames, including the main and stern frames. Upon ME describe the equilateral triangle MSE, and draw lines from the vertex S to each point of division; then the line SM will be that answering to the main frame, and SE that corresponding to the post; and the other lines will be those answering to the intermediate frames in order.

Fig. 23. Let fig. 23. be the projection of part of the stern on the plane of elevation, together with the eighth and ninth frames. From the points L, N, G, (fig. 21.) draw the lines LO, NP, GQ, perpendicular to the plane of the upper edge of the keel. Make AB (fig. 23.) equal to AF (fig. 21.), and draw the water line BCD. Draw the line BC (fig. 22.) so that it may be parallel to the base of the triangle, and equal to CD (fig. 23.), which produce indefinitely towards H. Make BD equal to BC (fig. 23.), and draw the dotted line SD (fig. 22.). The ribband FC (fig. 21.) is to be applied to the triangle, so that it may be parallel to the base, and contained between the line MS and the dotted line SD. Let *cf* represent this line; then transfer the several divisions from *cf* to the ribband CF (fig. 21.), and number them accordingly. Again, make EF (fig. 23.) equal to LO (fig. 21.), and draw the water line FGH; make BF (fig. 22.) equal to FG (fig. 23.), and draw the dotted line SF; apply the second ribband LK to the triangle, so that the extremity K may be on the line SM, and the other extremity L on the dotted line SF, and making with SM an angle of about 62½ degrees. Let *kl* be this line, and transfer the divisions from it to the ribband KL. In like manner make IK (fig. 23.) equal to NP (fig. 21.), and draw the water line KLM. Make BG (fig. 22.) equal to KL (fig. 23.), and draw the dotted line SG; then the ribband MN is to be applied to the triangle in such a manner that its extremities M and N may be upon the lines SM, SG respectively, and that it may make an angle of about 68 degrees with the line SM; and the divisions are to be transferred from it to the ribband MN. The same process is to be followed to divide the other ribbands, observing to apply the fourth ribband to the triangle, so that it may make an angle of 86 degrees with the line SM; the fifth ribband to make an angle of 65 degrees, and the sixth an angle of 60 degrees with the line SM.

The quantities of these angles are, however, far from being precisely fixed. Some constructors, in applying the ribbands to the triangle, make them all parallel to its base; and others vary the measures of these angles according to fancy. It may also be remarked, that a different method of dividing the base of the triangle is used by some. It is certainly proper to try different methods; and that is to be preferred which best answers the intended purpose.

Beside the frames already mentioned, there are other two laid down by some constructors in the several plans, called *balance frames*. The after balance frame is placed at one fourth of the length of the ship before the sternpost; and the other, commonly called the *loof frame*, at one fourth of the ship's length aft of a perpendicular to the keel from the rabbet of the stem. Let the dotted line at X, between the fifth and sixth frames, (fig. 23.) be the place of the after balance frame in the plane of elevation. Then, in order to lay down this frame in the plane of projection, its representation must be previously drawn in the triangle. To accomplish this, draw the line SV (fig. 22.) so that the interval 5V may have the same ratio to 5 6 (fig. 22.) that 5 X has to 5 6 (fig. 23.) (D). Then the several points in the ribbands in the plane of projection answering to this frame are to be found by means of the triangle in the same manner as before.

The loof frame is nearly of the same dimensions as the after balance frame, or rather of a little greater capacity, in order that the centre of gravity of that part of the ship may be nearly in the plane of the midship frame. Hence the loof frame may be easily drawn in the plane of projection, and hence also the other frames in the fore body may be readily described.

PROB. X. To describe the frames in the fore body.

Draw the middle line of the stem AB (fig. 24.); make AC, BD each equal to half the thickness of the stem, and draw the line CD; describe also one half of the main frame CEFGHI. Let *e* E, *f* F, *g* G, *h* H, be water lines at the heights of the ribbands on the main frame; also let *a* be the termination of the floor ribband, and *b* that of the breadth ribband on the stem. Divide the interval *a b* into three equal parts in the points *c*, *d*, and draw the ribbands *a* E, *c* F, *d* G, and *b* H. Make *ei*, *fk*, *gl*, *hm* (fig. 24.) equal to *ei*, *fk*, *gl*, *hm* (fig. 21.) respectively, and draw the curve C*iklm*, which will be the projection of the loof frame. Or since it is necessary that the capacity of the loof frame should be a little greater than that of the after balance frame, each of the above lines may be increased by a proportional part of itself, as one tenth or one twentieth, as may be judged proper. Fig. 24.

Construct the triangle (fig. 25.) in the same manner as fig. 22. only observing, that as there are fewer frames in the fore than in the after body, its base will therefore be divided into fewer parts. Let there be eight frames in the fore body, then there will be eight divisions in the base of the triangle beside the extremes. Fig. 25.

Let fig. 26. represent the stem and part of the forebody in the plane of elevation, and let O be the place of the loof frame. Divide the interval 4, 5 (fig. 25.) so that 4, 5 may be to 4 Z as 4, 5 to 4, o (fig. 26.), and draw the dotted line SZ, which will be the line denoting the loof frame in the triangle.

Draw the lines AB, CD, EF, GH (fig. 26.) parallel to the keel, and whose perpendicular distances therefrom may be equal to C *a*, C *c*, C *d*, C *b*, (fig. 24.) the intersections Fig. 26.

(D) It is evident, from the method used to divide the base of the triangle, that this proportion does not agree exactly with the construction: the difference, however, being small, is therefore neglected in practice.

Preliminary Problems.

interfections of thefe lines with the rabbet of the ftem, namely, the points I, K, L, M will be the points of termination of the feveral ribbands on the ftem in the plane of elevation. Divide S A (fig. 25.) fo that 8 B, 8 C, 8 D, and 8 E, may be refpectively equal to BI, DK, FL, and HM (fig. 26.), and draw the dotted lines SB, SC, SD, SE (fig. 25.). Apply the edge of a flip of card to the firft ribband (fig. 24.), and mark thereon the extremities of the ribband *a*, E, and alfo the point of interfection of the loof frame. Then apply this flip of card to the triangle in fuch a manner that the point *a* may be on the dotted line SB, the point E on the line SM, and the point anfwering to the loof frame on the dotted line SZ; and mark upon the card the feveral points of interfection of the lines S 1, S 2, &c. Now apply the card to the ribband *a* E (fig. 24.) as before, and transfer the feveral points of divifion from it to the ribband. In like manner proceed with the other ribbands; and lines drawn through the correfponding points in the ribbands will be the projection of the lower part of the frames in the fore body. The projections of the top-timbers of the feveral frames may be taken from the half breadth plan; and hence each top-timber may be eafily defcribed.

In large fhips, particularly in thofe of the French navy, a different method is employed to form the top-timbers in the fore body, which is as follows:

Plate ccccLxxxix. Fig. 27.

Let BI (fig. 27.) be one fourth of the breadth of the fhip, and draw IK parallel to AB. Take the height of the foremoft frame from the plane of elevation, and lay it off from A to B: from the point B draw BH perpendicular to AB, and equal to half the length of the wing tranfom. Let E be the place of the breadth ribband on the main frame, and F its place on the ftem at the height of the wing tranfom. With a radius equal to five fixths of half the greateft breadth of the fhip defcribe the quadrant EFG (fig. 28.): Make EH equal to FG (fig. 27.), the point F being at the height of the wing tranfom. Through H draw HO perpendicular to EH, and interfecting the circumference in O; then draw OL parallel to HE, and EL parallel to HO. Divide EL into as many equal parts as there are frames in the fore body, including the main frame, and from thefe points of divifion draw the perpendiculars 11, 22, &c. meeting the circumference as in the figure. Take the diftance 11, and lay it off from G (fig. 27.) towards F to the point 1; and from the fame point G lay off towards F the feveral perpendiculars contained between the ftraight line and the curve to the points 2, 3, &c. and through thefe points draw lines parallel to EG.

Fig. 28.

Fig. 29.

Take any line AB (fig. 29.) at pleafure: divide it equally in two in the point 8: divide 8 B in two parts in the point 7, and continue this method of divifion until there are as many points as there are frames in the fore body, including the main frame. Upon AB conftruct the equilateral triangle ACB, and draw the lines C 8, C 7, &c. Place a flip of card on the parallel *a* K 8 (fig. 27.), and mark thereon the points oppofite to *a*, K, and 8; and let them be denoted accordingly. Then apply this flip of card to the triangle, fo that the point *a*, which is that anfwering to the rabbet of the ftem, may be on the line AC; that the point anfwering to K may be on C 8, and the extremity 8 on the line CB; and mark on the card the points of interfection of the lines C 7, C 6, &c. and number them accordingly. Now apply this flip of card to the feventh parallel (fig. 23.), the point *a* being on the line CD, and mark on this parallel the point of interfection 7; flide the card down to the fixth parallel, to which transfer the point N° 6. In like manner proceed with the other parallels.

The point K, at the interfection of the line IK with the eighth parallel, is one point through which the eighth frame paffes. From this point upwards a curve is to be defcribed fo as to reconcile with the lower part of this frame already defcribed, and the upper part, forming an inverted arch, which is to terminate at H. This top-timber may be formed by two fweeps, whofe radii and centres are to be determined partly from circumftances and partly according to fancy. It however may be more readily formed by hand.

Let LM (fig. 27.) be the line of the fecond deck at the main frame, and let LN be the difference of the draught of water, if any. Make GN (fig. 28.) equal to LN: draw NM perpendicular to GN, meeting the circle in M; and through the points G and M draw the parallels GV and MV; divide GN as before, and from the feveral points of divifion draw perpendiculars terminating in the curve. Transfer thefe perpendiculars from L upwards (fig. 27.), and through the points thus found draw the lines 11, 22, &c. parallel to LM. Apply a flip of card to the eighth parallel, and mark upon it the point anfwering to the ftem, the eighth and main frames: carry this to the triangle, and place it fo that thefe points may be on the correfponding lines. Then the points of interfection of the lines C 7, C 6, &c. are to be marked on the card, which is now to be applied firft to the eighth parallel (fig. 27.), then to the feventh, &c. transferring the feveral points of divifion in order as before.

Draw the line HO (fig. 27.); mark its length on a flip of card, and apply it to the triangle, fo that it may be parallel to its bafe, and its extremities one on the eighth and the other on the main frame: mark on the card the points of interfection of the feveral intermediate lines as before; then apply the card to HO, and transfer the divifions.

There are now three points determined through which each top-timber muft pafs, namely, one in the breadth ribband, one in the fifth, and one in the upper ribband. Through thefe curves are to be defcribed, fo as to reconcile with the lower part of the frame, and partake partly of the curvature of the eighth frame, and partly of that of the main frame, but moft of that of the frame to which it is neareft: and hence the plane of projection is fo far finifhed, that it only remains to prove the feveral frames by water lines.

Another method of defcribing the frames in the body plan is by fweeps. In this method it is neceffary, in the firft place, to defcribe the height of the breadth lines, and the rifing of the floor, in the plane of elevation. The half breadth lines are next to be defcribed in the floor plan. The main frame is then to be defcribed by three or more fweeps, and giving it fuch a form as may be moft fuitable to the fervice the fhip is defigned for. The lower, upper, and top-timber heights of breadth, and the rifings of the floor, are to be fet upon the middle line in the body plan, and the feveral half breadths are then to be laid off on lines drawn through

thefe

Preliminary Problems.

these points perpendicular to the middle line. A mould may then be made for the main frame, and laid upon the feveral rifings, as in whole mouldings, explained in Chapter V. with this difference, that here an under breadth fweep is defcribed to pafs through the point which limits the half breadth of the timber, the centre of which will be in the breadth line of that timber. The proper centres for all the frames being found, and the arches defcribed, the bend mould muft be fo placed on the rifing line of the floor, that the back of it may touch the back of the under breadth fweep. But the general practice is, to defcribe all the floor fweeps with compaffes, as well as the under breadth fweeps, and to reconcile thefe two by a mould which is an arch of a circle, its radius being the fame with that of the reconciling fweep by which the midfhip frame was formed. It is ufual for all the floor fweeps to be of the fame radius; and in order to find their centres a line is formed on the floor plan for the half breadth of the floor. As this line cannot be defcribed on the furface of a fhip, it is therefore only an imaginary line. Inftead of it fome make ufe of a diagonal in the body plane to limit the half breadth of the floor upon every rifing line, and to erect perpendiculars at the feveral interfections, in the fame manner as for the midfhip frame.

After the fweeps are all defcribed, recourfe is had to moulds, or fome fuch contrivance, to form the hollow of the timbers, much in the fame manner as in whole moulding; and when all the timbers are formed, they muft be proved by ribband and water lines, and altered, if neceffary to make fair curves.

The preceding methods of defcribing the feveral planes or fections of a fhip being well underftood, it will be a very eafy matter to conftruct draughts for any propofed fhip: and as the above planes were defcribed feparately and independent of each other, it is therefore of little confequence which is firft defcribed. In the following application, however, the plane of elevation will be firft drawn, then part of the floor plan, and laftly the body plan: and in connecting thefe plans the moft rational and fimple methods will be employed.

CHAP. IV. *Application of the foregoing Rules to the Conftruction of Ships.*

SECT. I. *To conftruct a Ship intended to carry a confiderable Burden in Proportion to her general Dimenfions, and to draw little Water.*

DIMENSIONS.

Plate CCCCXC. Fig. 30.

Draw the line ab (fig. 30.) equal to 80 feet, from a convenient fcale: divide it into as many equal parts plus one as there are to be frames, which let be 16, and through each point of divifion draw perpendiculars. Make bc equal to 17 feet, the perpendicular height of the top of the ftem above the upper edge of the keel, and defcribe the ftem by Prob. II. Make ad equal to $10\frac{1}{2}$ feet, the height of the middle line of the wales at the ftern, and ae equal to the propofed rake of the poft, which may be about 2 feet: join de; and draw the line fg reprefenting the aft-fide of the poft. Defcribe the counter and ftern by Problem VI. and VII. Make $\oplus h$ equal to 14 feet, the top-timber height at the main frame, and ik equal to 18 feet, the height at the ftern; and through the three points c, h, k, defcribe the curve limiting the top-timbers by Problem I. Make bd equal to 10 feet, the height of the middle line of the wales at the ftem, and $\oplus$H equal to 6 feet 10 inches, the height at the main frame; and the curve dHd being defcribed will reprefent the middle line of the wales. At the diftance of $10\frac{1}{2}$ inches on each fide of this line draw two curves parallel thereto, and the wales will be completed in this plan. Make bl equal to $13\frac{1}{2}$ feet, the height of the breadth line at the ftem; am equal to $12\frac{1}{4}$ feet, the height at the ftern; and I$\oplus$ K$\oplus$ equal to 5 feet 10 inches and 7 feet 4 inches refpectively; and draw the upper breadth line lKm and lower breadth line lIm. From the line ab lay downwards the breadth of the keel, which may be about one foot, and draw the line Lt parallel to ab.

Let the line Lr, which is the lower edge of the keel, reprefent alfo the middle line of the floor plan. Produce all the perpendiculars reprefenting the frames: make $\oplus$ M (fig. 31.) equal to 11 feet, the main half breadth at midfhips; through m (fig. 30.) draw the line mN perpendicular to ab, and make pN equal to $7\frac{1}{2}$ feet, and draw the main half breadth line NMr by Problem IV. Defcribe alfo the top-timber half breadth line POr, $\oplus$O being equal to $10\frac{1}{2}$ feet, and form the projecting part of the ftem $qrst$. Fig. 31.

In order that the top-timber line may look fair on the bow, and to prevent the foremoft top-timbers from being too fhort, it is neceffary to lift or raife the fheer from the round of the bow to the ftem. For this purpofe the following method is ufually employed: Produce the circular fheer before the ftem in the plane of elevation at pleafure; then place a batton to the round of the bow in the half breadth plan, and mark on it the ftations of the fquare timbers and the fide of the ftem; apply the batton to the fheer plan, and place it to the fheer of the fhip, keeping the ftations of the timbers on the batton well with thofe on the fheer plan for feveral timbers before dead-flat, where they will not alter; then mark the other timbers and the ftem on the fheer line produced; through thefe points draw lines parallel to the keel, to interfect their correfponding timbers and the ftem in the fheer plan: then a curve defcribed thefe laft points will be the fheer of the fhip round the

Application of the foregoing Rules to the Construction of Ships.

the bow, lifted as required : and the heights of the timbers thus lengthened are to be transferred to the body plan as before.

Plate cccclxxxiv. Fig. 32.

Draw the line AB (fig. 32.) equal to 22 feet, the whole breadth; from the middle of which draw the perpendicular CD: make CE equal to half the thickness of the post, and CF equal to half that of the stem, and from the points A, E, F, B, draw lines parallel to CD. Make AG, BG each equal to 14 feet, the height at the main frame, and draw the line GG parallel to AB. Make GH, GH each equal to half a foot, the difference between the main and top timber half breadths. From A and B set up the heights of the lower and upper breadth lines to I and K, and draw the straight lines IK, IK. Let CL be the rising at the main frame, and ⊕, ⊕ the extremities of the floor timber. Hence, as there are now five points determined in each half of the main frame, it may be very easily described.

Make CM equal to L⊕, join M⊕, and draw the other ribbands NO, PQ. In order, however, to simplify this operation, the rectilineal distance ⊕I was trisected, and through the points of division the lines NO, PQ were drawn parallel to the floor ribband M⊕.

Take the distance *b c* (fig. 30.), and lay it off from F to (fig. 32.); also make F*b* (fig. 32.) equal to F*u* (fig. 30.); through *b* draw *b c* parallel to AB, and equal to FR (fig. 31.). In like manner take the heights of each top-timber from fig. 30. and lay them off from C towards D (fig. 32.); through these points draw lines parallel to AB, and make them equal each to each, to the corresponding half breadth lines taken from the floor-plan: Then through the several points *a*, *c*, &c. thus found, draw a line *a c*H, which will be the projection of the top-timber line of the fore body in the body plan. Proceed in the same manner to find the top-timber line in the after body.

Transfer the height of the main-breadth line on the stem *b l* (fig. 30.), from F to *d* (fig. 32.). Transfer also the heights of the lower and upper breadth lines at timber F (fig. 30.), namely, FW, FX, from F to *e* and *f* (fig. 32.); through which draw the parallels *e g*, *f h*; make them equal to FS (fig. 31.), and draw the straight line *g h*. In this manner proceed to lay down the portions of the extreme breadth at each frame, both in the fore and in the after body in the body plan, and draw the upper and lower breadth lines *d h* K, *d g* I in the fore body and K*i*, I*i* in the after body. Hence the portions of the several top-timbers contained between the top-timber and main breadth lines may be easily described. It was before remarked that their forms were partly arbitrary. The midship top-timber has generally a hollow, the form of which is left entirely to the artist, though in some ships, especially small ones, it has none. It is the common practice to make a mould for this hollow, either by a sweep or some other contrivance, which is produced considerably above the top-timber line, in a straight line or very near one. The midship top-timber is formed by this mould, which is so placed that it breaks in four with the back of the upper breadth sweep. The other top-timbers are formed by the same mould, observing to place it so that the straight part of it may be parallel to the straight part of the midship timber, and moved up or down, still keeping it in that direction till it just touches the back of the upper breadth sweep. Some constructors begin at the after timber, after the mould is made for the midship top-timber, because they think it easier to keep the straight part of the mould parallel to this than to the midship timber; and by this means the top side is kept from winding. Others, again, make a mark upon the mould where the breadth line of the midship timber crosses it, and with the same mould they form the after timber: this will occasion the mark that was made on the mould when at the main frame to fall below the breadth line of the after timber, and therefore another mark is made at the height of the breadth line at the after timber; the straight part of the mould is then laid obliquely across the breadth lines of the top-timbers in such a manner that it may intersect the breadth line of the midship timber at one of these marks and the breadth line of the after timber at the other mark; then the several intersections of the breadth lines of the timbers are marked upon the mould; which must now be so placed in forming each timber, that the proper mark may be applied to its proper breadth, and it must be turned about so as just to touch the upper breadth sweep. Any of these methods may make a fair side, and they may be easily proved by forming another intermediate half breadth line.

The remaining parts of the frames may be described by either of the methods laid down in Problems IX. and X. In order, however, to illustrate this still farther, it is thought proper to subjoin another method of forming the intermediate frames, the facility of which will recommend it.

Take FZ (fig. 30.), and lay it from F to *k* (fig. 32.); then describe the lower part of the foremost frame, making it more or less full according as proposed; and intersecting the ribbands in the points *l*, *m*, *n*. Describe also the aftermost frame *o*, *p*, *q*. Make $\alpha\beta$ (fig. 30.) equal to F*r* (fig. 32.), and produce it to *a* (fig. 31.); also draw $\gamma\delta$ and $\epsilon\zeta$ (fig. 30.) equal to E*r* and E*s* (fig. 32.) respectively; and produce them to *b* and *c*: Make F*e*, F*f*, FR (fig. 31.) equal to M*l*, N*m*, P*n* (fig. 32.) each to each. Let also ⊕*h*, ⊕*i*, ⊕*k*, and 9*l*, 9*m*, 9*n* (fig. 31.) be made equal to M⊕, NO, PQ, and M*o*, N*q*, P*p* (fig. 32.); then through these points trace the curves *a e n h l b*, *r f i m c*, and *r* R *k n p*, and they will be the projections of the ribbands in the floor plane. Now transfer the several intervals of the frames contained between the middle line and the ribbands (fig. 31.) to the corresponding ribbands in the body plan (fig. 32.). Hence there will be five points given in each frame, namely, one at the lower breadth line, one at each ribband, and one at the keel; and consequently these frames may be easily described. In order to exemplify this, let it be required to lay down the frame E in the plane of projection. Take the interval E*n* (fig. 31.), and lay it from M to *u* (fig. 32). Lay off also E*v*, E*e* (fig. 31.) from N to *v* and from P to *n* (fig. 32.); then through the points F, *u*, *v*, *n* and the lower breadth line describe a curve, and it will be the representation of the frame E in the body plan. In like manner the other frames may be described.

The ribbands may now be transferred from the body plan to the plane of elevation, by taking the several heights of the intersection of each ribband with the frames, and laying them off on the corresponding frames in the floor plan; and if the line drawn through these points

Application of the foregoing Rules to the Construction of Ships.

points make a fair curve, it is presumed that the curves of the frames are rightly laid down in the body plan. Only one of these ribbands, namely, the first, is laid down in fig. 30. These curves may also be farther proved, by drawing water lines in the plane of elevation, and in the body plan, at equal distances from the upper edge of the keel. Then the distances between the middle line of the body plan, and the several points of intersection of these lines with the frames, are to be laid off from the middle line in the floor plan upon the corresponding frames; and if the line drawn through these points form a fair curve, the frames are truly drawn in the body plan.

In figs. 30. and 32. there are drawn four water lines at any equal distances from the keel, and from each other. These lines are then transferred from fig. 32. to fig. 31.; and the lines passing through these points make fair curves.

The transoms are described by Problem VIII. it is therefore unnecessary to repeat the process. A rising line of the floor timbers is commonly drawn in the plane of elevation.

As this is intended only as an introductory example, several particulars have therefore been omitted; which, however, will be exemplified in the following section.

Sect. IV. *To describe the several Plans of a Ship of War proposed to carry* 80 *Guns upon two Decks.*

As it is proposed in this place to show the method of describing the plans of a ship of a very considerable size, it therefore seems proper to give the dimensions of every particular part necessary in the delineation of these plans. The several plans of this ship are contained in figs 33, and 34. But as it would very much confuse the figures to have a reference to every operation, and as the former example is deemed a sufficient illustration, the letters of reference are upon these accounts omitted in the figures.

Plate CCCCXCI. Figs. 33. & 34.

Principal Dimensions.

Ship Builder's Repository.

	F.	In.
Lengths.—Length on the gun or lower deck from the aft part of the rabbet of the stem to the aft part of the rabbet of the post	182	0
Length from the foremost perpendicular to dead flat	63	11¼
Length from the foremost perpendicular to timber Y	4	0
Length from after perpendicular to timber 37	3	4
Room and space of the timbers	2	8¼
Length of the quarter-deck from the aft part of the stern	95	0
Length of the forecastle from the fore part of the beak-head	49	0
Length of round-house deck from the aft part of the stern	51	8
Heights.—Height of the gun or lower deck from the upper edge of the keel to the under side of the plank at dead flat	24	0
Height of the gun or lower deck from the upper edge of the keel to the under side of the plank at foremost perpendicular	26	
Height of the gun or lower deck from the upper edge of the keel to the under side of the plank at after perpendicular	26	3
Height from the upper side of the gun-deck plank to the under side of the upper deck plank, all fore and aft	7	0
Height from the upper side of the upper deck plank to the under side of the greater deck plank — afore	6	10
— abaft	6	11
Height to the under side of forecastle plank, afore and abaft	6	6
Height from the upper side of the quarter deck plank to the under side of the round-house plank — afore	6	9
— abaft	6	10
Height of the lower edge of the main wales at foremost perpendicular	24	6
Height of the lower edge of the main wales at dead flat	20	0
Height of the lower edge of the main wales at after perpendicular	26	6
Height of the lower edge of the channel wales at foremost perpendicular	32	6
Height of the lower edge of the channel wales at dead flat	29	0
Height of the lower edge of the channel wales at after perpendicular	34	0
Height of the upper side of the wing transom	28	4
Height of the touch of the lower counter at the middle line	33	5
Height of the touch of the upper counter at the middle line	36	2
Height of the top-timber line at the after part of the stern timber	44	7
Breadths.—Main wales in breadth from lower to upper edge	4	6
Channel wales in breadth from lower to upper edge	3	0
Waist rail in breadth	0	7
Distance between the upper edge of the channel wales and the under edge of the waist rail	2	9
Sheer rail in breadth	0	6
Distance between the sheer rail and the rail above from timber 13 to the stern	2	5
Distance between the sheer rail and the rail above from timber 7 to timber 11	1	4
Distance between the sheer rail and the rail above from timber C to the forepart of beak-head	1	2
And the said rail to be in breadth	0	6
Plank sheer to be in thickness	0	2½
Centres of the masts.—From the foremost perpendicular to the centre of the mainmast on the gun-deck	103	2
From the foremost perpendicular to the centre of the foremast on the gun-deck	20	5
From the after perpendicular to the centre of the mizenmast on the gun-deck	28	6
Stem.—The centre of the sweep of the stem abaft timber P	0	4
Height of ditto from the upper edge of the keel	26	1
Stem moulded	1	3

I. *Of the Sheer Draught or Plane of Elevation.*

Fig. 33. Draw a ftraight line (fig. 33.) to reprefent the upper edge of the keel, erect a perpendicular on that end to the right, and from thence fet off 182 feet, the length on the gun-deck, and there erect another perpendicular; that to the right is called the *foremoft* perpendicular, and the other the *after* one: upon thefe two perpendiculars all the foremoft and aftermoft heights muft be fet off, which are expreffed in the dimenfions.

Then fet off the diftance of the main frame or dead flat from the foremoft perpendicular, and at that place erect a third perpendicular, which muft be diftinguifhed by the character ⊕. From dead flat the room and fpace of all the timbers muft be fet off; but it will only be neceffary to erect a perpendicular at every frame timber; which in the fore body are called *dead flat*, A, C, E, &c. and in the after body (2), 1, 3, 5, &c.: hence the diftance between the frame perpendiculars will be double the room and fpace expreffed in the dimenfions. Then fet off the heights of the gun-deck afore at midfhip or dead flat, and abaft from the upper fide of the keel; and a curve defcribed through thefe three points will be the upper fide of the gun-deck. Set off the thicknefs of the gun-deck plank below that; and another curve being drawn parallel to the former, the gun-deck will then be defcribed at the middle line of the fheer plan.

The centre of the ftem is then to be laid down by means of the table of dimenfions; from which centre, with an extent equal to the neareft diftance of the upper edge of the keel, defcribe a circle upwards: defcribe alfo another circle as much without the former as the ftem is moulded. Then fet off the height of the head of the ftem, with the diftance afore the perpendicular, and there make a point; and within that fet off the moulding of the ftem, and there make another point · from this laft mentioned point let a line pafs downwards, interfecting the perpendicular at the height of the gun-deck, and breaking in fair with the inner circle, and the after part of the ftern is drawn. Draw another line from the foremoft point downwards, parallel to the former, and breaking in fair with the outer circle; then the whole ftem will be formed, except the after or lower end, which cannot be determined till hereafter.

The ftern-poft muft be next formed. Set off on the upper edge of the keel a fpot for the aft part of the rabbet taken from the dimenfions, and from that forward fet off another point at the diftance of the thick-

nefs

nefs of the plank of the bottom, which is four inches and a half; and from this laft-mentioned point draw a line upwards interfecting the perpendiculars at the height of the lower deck; then fet up the perpendicular the height of the wing tranfom, and draw a level line, and where that line interfects, the line firft drawn will be the aft fide of the wing tranfom; on the upper part of the middle line fet off from that place the diftance of the aft fide of the ftern-poft; fet off alfo the diftance of the after part from the rabbet on the upper edge of the the keel, and a line drawn through thefe two points will be the aft fide of the poft. A line drawn parallel to the firft drawn line at the diftance of four inches and a half, the thicknefs of the plank on the bottom, will be the aft fide of the rabbet: and hence the ftern-poft is defcribed, except the head, which will be determined afterwards.

From the dimenfions take the feveral heights of the upper deck above the gun-deck, afore, at midfhip, and abaft, and fet them off accordingly; through thefe points defcribe a curve, which will be the under fide of the upper deck; defcribe alfo another curve parallel thereto, at the diftance of the thicknefs of the plank, and the upper deck will be then reprefented at the middle line of the fhip.

Set off the height of the lower counter, at the middle line, from the upper edge of the keel, and draw a horizontal line with a pencil; then on the pencil line fet off the diftance the touch of the lower counter is abaft the aft fide of the wing tranfom: from this point to that where the fore part of the rabbet of the ftern-poft interfects the line drawn for the upper part of the wing tranfom, draw a curve at pleafure, which curve will reprefent the lower counter at the middle line. The height of the upper counter is then to be fet off from the upper edge of the keel, and a horizontal line is to be drawn as before, fetting off the diftance the touch of the upper counter is abaft the aft fide of the wing tranfom; and a curve defcribed from thence to the touch of the lower counter will form the upper counter at the middle line.

Both counters being formed at the middle line, the upper part of the ftern timber above the counters is to be defcribed as follows: On the level line drawn for the upper fide of the wing tranfom fet off the diftance of the aft fide of the ftern timber at the middle line from the aft fide of the wing tranfom, at the height of the top-timber line, and erect a perpendicular: then upon this perpendicular, from the upper edge of the keel, fet off the height at the middle line of the top-timber line at the after fide of the ftern timber; through this point draw a ftraight line to the touch of the upper counter, and the upper part of the ftern timber will be defcribed.

As the ftern rounds two ways, both up and aft, the ftern timber at the fide will confequently alter from that at the middle line, and therefore remains to be reprefented. Take the round up of the upper counter from the dimenfions, and fet it below the touch at the middle, and with a pencil draw a level line; take alfo the round aft, and fet it forward from the touch on the touch line, and fquare it down to the pencil line laft drawn, and the point of interfection will be the touch of the upper counter at the fide. In the fame manner find the touch of the lower counter; and a curve, fimilar to that at the middle line, being defcribed from the one touch to the other, will form the upper counter at the fide.

Take the round up of the wing tranfom, and fet it off below the line before drawn for the height of the wing tranfom, and draw another horizontal line in pencil: then take the round aft of the wing tranfom, and fet it forward on the upper line from the point reprefenting the aft fide of the wing tranfom; fquare it down to the lower line, and the interfection will be the touch of the wing tranfom: then a curve, fimilar to that at the middle line, being drawn from the touch of the wing tranfom to the touch of the lower counter at the fide, will be the lower counter at the fide. Draw a line from the upper counter upwards, and the whole ftern timber at the fide will be reprefented. But as the ftraight line drawn for the upper part of the fide timber fhould not be parallel to that at the middle line, its rake is therefore to be determined as follows.

Draw a line at pleafure, on which fet off the breadth of the ftern at the upper counter; at the middle of this line fet off the round aft of the upper counter, then through this point and the extremities of the ftern defcribe a curve. Now take the breadth of the ftern at the top-timber line, and through the point where that breadth will interfect the curve for the round aft of the ftern draw a line parallel to that firft drawn, and the diftance from the line laft drawn to the curve at the middle of the line is the diftance that the fide timber muft be from the middle line at the height of the top-timber line.

The fheer is to be defcribed, which is done by fetting off the heights afore, at midfhips, and abaft; and a curve defcribed through thefe three points will be the fheer. But in order that the fheer may correfpond exactly with the dimenfions laid down, it will be neceffary to proceed as follows: The perpendicular reprefenting timber dead flat being already drawn, fet off from that the diftances of the other frame timbers, which is double the room and fpace, as the frames are only every other one; and erect perpendiculars, writing the name under each: then on each of thefe perpendiculars fet off the correfponding heights of the top-timber line taken from the table of dimenfions for conftructing the bodies; and through thefe points a curve being defcribed, will reprefent the fheer of the fhip or top-timber line agreeable to the dimenfions.

The quarter-deck and forecaftle are next to be defcribed, which may be done by taking their refpective heights and lengths from the dimenfions, and defcribing their curves. In the fame manner alfo, the round-houfe may be drawn. The decks being defcribed reprefenting their heights at the middle, it is then neceffary to reprefent them alfo at the fide. For this purpofe take the round of the decks from the dimenfions, and fet them off below the lower line drawn for the middle; and a curve defcribed both fore and aft, obferving to let it be rather quicker than the former, will be the reprefentation of the decks at the fide.

The ports come next under confideration. In the placing of them due attention muft be paid, fo as to preferve ftrength; or that they fhall be fo difpofed as not to weaken the fhip in the leaft, which is often done by cutting off principal timbers, placing them in too large openings, having too fhort timbers by the fide of them,

Application of the fore-going Rules to the Construction of Ships.

them, &c. The frames reprefented by the lines already drawn muft be firft confulted. Then with a pencil draw two curves, for the lower and upper parts of the lower deck pofts, parallel to the line reprefenting the lower deck; the diftances of thefe lines from the deck are to be taken from the dimenfions, obferving, however, to add to thefe heights the thicknefs of the deck, as the deck line at the fide reprefents the under part of the deck.

The foremoft port is then to be defcribed, obferving to place it as far aft as to give fufficient room for the manger: the moft convenient place will therefore be to put it between the frames R and T, and equally diftant from each. It will then be placed in the moft confpicuous point of ftrength, as it will have a long top-timber on the aft fide and a long fourth futtock on the fore fide of it. The fecond port may be placed in like manner between the next two frames, which will be be equally well fituated for ftrength as the former; and by proceeding in this manner, the ports on the gun deck may alfo be placed, taking care to have two frames between every two ports, all fore and aft.

The upper deck ports are then to be defcribed; and in order to difpofe of them in the ftrongeft fituation poffible, they muft be placed over the middle between the gun-deck ports, fo that every frame in the fhip will run up to the top of the fide, by their coming between a gun and upper deck port; and every port will be between the frames, which will in a great meafure contribute towards the ftrength of the fhip. With regard to the ports on the quarter deck, it is not of fuch material confequence if they cut the head of the frame, as in placing them the fituation of the dead eyes muft be confidered, placing a port where there is a vacancy between the dead eyes large enough to admit of one; obferving always to place them as nearly as poffible at equal diftances from each other; and where it happens that they do not fall in the wake of a frame, then that frame muft by all means be carried up to the top of the fide.

The neceffary length of the round houfe being determined in the dimenfions, it may be fet off; obferving, however, to let it be no longer than is juft fufficient for the neceffary accommodations, as the fhorter the round-houfe the works abaft may be kept lower, and a low fnug ftern is always accounted the handfomeft. Then fet off the round of the deck at the foremoft end, below the line drawn; the deck at the fide may be defcribed by another curve drawn quite aft. Now, from the point for the round of the deck to the ftern-timber, draw a curve parallel to the top-timber line, and that will be the extreme height of the top of the fide abaft, which height continues to range fair along to the foremoft end of the round-houfe, and at that place may have a fall about 14 inches, which may be turned off with a drift fcroll. At the fore part of the quarter-deck, the topfide may have a rife of 14 inches, which may alfo be turned off with a fcroll. But as the raifing of the topfide only 14 inches at that place will not be fufficient to unite with the heights abaft, it will therefore be neceffary to raife 14 inches more upon that, and break it off with a fcroll inverted on the firft fcroll, and continue thefe two lines, parallel to the top-timber line, to the diftance of about feven feet aft. At the foremoft end of the round-houfe there is a break of 14 inches already mentioned; and in order to make that part uniform with the breaks at the foremoft end of the quarter-deck, there muft be fet down 14 inches more below the former; and at thefe two heights continue two curves parallel to the top-timber line, from the aft part of the ftern to the ends of the two curves already drawn at the foremoft end of the quarter-deck. If they fhould happen not to break in fair with them, they muft be turned off with a round; but to make them appear more handfome, the lower line may be turned off with a fcroll. Thefe lines being drawn will reprefent the upper edges of the rails.

The height of the top fide at the fore part of the fhip muft next be confidered; which, in order to give proper height for the forecaftle, muft have a rife there of 14 inches, the break being at the after end of the forecaftle, and turned off as before. But as this part of the fhip is ftill confiderably lower than the after part, it will be neceffary to give another of eight inches upon the former, and turn it off with a fcroll inverted. Hence this part of the fhip will appear more uniform to the after part.

The finifhing parts, namely the wales, ftern, head, rails, &c. remain to be defcribed. The wales may be firft drawn; and as the ftrength of the fhip depends very much on the right placing of them, great care muft therefore be taken that they may be as little as poffible wounded by the lower deck ports, and fo placed that the lower deck bolts fhall bolt in them, and alfo that they come as near as poffible on the broadeft part of the fhip. In the firft place, therefore, the height of breadth lines muft be chofen for our guide. Thefe heights of breadth are to be taken from the dimenfions, and fet off on the refpective frames, and curves drawn through thefe points will be the upper and lower heights of breadth lines. The height of the wales may be now determined; which in general is in fuch a manner that the upper height of breadth line comes about fix inches below their upper edge, and the wales are then placed right upon the breadth lines. Take the heights and breadths of the wales afore, at midfhips, and abaft, from the table of dimenfions; draw curves through the points thus found, and the wales will be reprefented.

The channel wales are then to be defcribed. They are principally intended to ftrengthen the top fide, and muft be placed between the lower and upper deck ports; and the lower end of them at midfhips fhould be placed as low as poffible, in order to prevent them from being cut by the upper deck ports afore and abaft. Take their heights and breadths from the dimenfions; lay them off, and defcribe curves through the correfponding points, and the channel wales will be reprefented.

Lay off the dimenfions of the wafte rail found in the table; and through the points draw a line parallel to the top timber line all fore and aft. This rail terminates the lower part of the paint work on the top fide, as all the work above this rail is generally painted, and the work of the top fide below it payed with a varnifh, except the main wales, which are always payed with pitch.

Take the draught of water from the dimenfions, and draw the load water-line, which is always done in green. Divide the diftance between the load water-line and the upper edge of the keel into five equal parts, and through thefe points draw four more water-lines.

Set

Application of the foregoing Rules to the Construction of Ships.

Set off the centres of the masts on the gun-deck; their rake may likewise be taken from the dimensions. Set off also the centre of the bowsprit, letting it be four feet from the deck at the after part of the stem, which will give sufficient height for a light and airy figure.

Draw the knight-heads so as to be sufficiently high above the bowsprit to admit of a chock between them for the better security of the bowsprit. The timber heads may also be drawn above the forecastle, observing to place the most convenient for the timbers of the frame, being those which come over the upper deck ports, as they may be allowed long enough to form handsome heads. There should be one placed abaft the cat-head, to which the foremost block is to be bolted, and there may be two ports on the forecastle formed by them, and placed where it is most convenient to the dead eyes.

Describe the channels, taking their lengths and thicknesses from the dimensions, and place their upper edges well with the lower edge of the sheer rail. The dead eyes may then be drawn, observing to place them in such a manner that the chains may not interfere with the ports; and the preventer plates must all be placed on the channel wales, letting them be of such a length that the preventer bolt at each end may bolt on each edge of the channel wales. It must also be observed to give each of the chains and preventer plates a proper rake, that is, to let them lie in the direction of the shrouds, which may be done in the following manner: Produce the mast upwards, upon which set off the length of the mast to the lower part of the head; these straight lines drawn from that point through the centre of each dead eye will give the direction of the chains and preventer braces.

The fenders may be then drawn, observing to place them right abreast of the main hatchway, in order to prevent the ship's side from being hurt by whatever may be hoisted on board. The proper place for them will therefore be at timber 3; and the distance between them may be regulated by the distance between the ports. The chest-tree may also be drawn, which must be placed at a proper distance abaft the foremast, for the conveniency of hauling home the fore tack. It may therefore be drawn at the aft side of timber C from the top of the side down to the upper edge of the channel wales; and the fenders may reach from the top of the side down to the upper edge of the main wales. As the fenders and chest tree are on the outside of the planks, wales, &c. the lines representing the wales, &c. should not be drawn through them.

Draw the steps on the side, which must be at the fore part of the main drift or break, making them as long as the distance between the upper and lower deck ports will admit of. They may be about six inches asunder, and five inches deep, and continued from the top of the side down to the middle of the main wales.

In order to describe the head, the height of the beak-head must be first determined, which may be about two feet above the upper deck. At that place draw a horizontal line, upon which set off the length of the beak-head, which may be $7\frac{1}{2}$ feet abaft the fore part of the stem, and from thence square a line up to the forecastle deck; which line will represent the aft part of the beak head, and will likewise terminate the foremost end of the forecastle. The length of the head may now be determined, which by the proportions will be found to be 15 feet six inches from the fore part of the stem. Set it off from the fore part of the stem, and erect a perpendicular, which will be the utmost limits of the figure forward: then take the breadth of the figure from the proportions, which is four feet four inches, and set it off forward; and another perpendicular being drawn will show the utmost extent of the hair bracket forward, or aft part of the figure. Then draw the lower cheek, letting the upper edge be well with the upper edge of the main wales, and the after end ranging well with the beak head line; set off the depth of it on the stem; which is about 11 inches, and let a curved line pass from the after end through the point on the stem, and to break in fair with the perpendicular first drawn for the length of the head, the fore part of the curve will then represent the position of the figure.

The upper cheek may next be drawn; but, in order to know the exact place of it on the stem, the place of the main rail must first be set off on the stem, the upper edge of which may be kept on a level with the beak-head; then setting off the depth of it below that, the place for the upper cheek may be determined, letting it be exactly in the middle between that and the lower cheek: then, by drawing curves for the upper and lower edges of the cheek from the after end parallel to the lower cheek, to break in fair with the perpendicular, drawn for the back of the figure: then the upper cheek will be formed. The upper part may run in a serpentine as high as where the shoulder of the figure is supposed to come, at which place it may be turned off with a scroll. The distance from the scroll to the heel of the figure is called the hair bracket.

The head of the block may be formed by continuing the line at the breast round to the top of the hair-bracket, observing to keep the top of it about six inches clear of the under side of the bowsprit.

Having the distance set off on the stem for placing the main rail, it may next be described, keeping the bag of it as level as possible for the conveniency of the gratings, and letting the foremost end rise gradually according to the rise of the upper cheek and hair bracket, and may turn off on the round of the scroll before drawn for the hair-bracket. To form the after end, set off the size of the head of the rail abaft the beak-head line, and erect a perpendicular; then describe the arch of a circle from that perpendicular, to break in fair with the lower side of the rail in the middle, and also another from the beak-head perpendicular, to break in fair with the upper side of the rail at the middle, observing to continue the head of it sufficiently high to range with the timber heads above the forecastle.

The head timbers are next to be drawn, placing the stem timber its own thickness abaft the stem, and the foremost must be so placed that the fore side may be up and down with the heel of the block or figure, which has not yet been set off. Take therefore the distance from the breast to the heel on a square which is seven feet, and erect a perpendicular from the lower part of the lower cheek to the lower part of the upper cheek; which perpendicular will terminate the foremost end of the lower cheek and the heel of the figure, and will also terminate the lower end of the hair-bracket: then, by continuing the same perpendicular from the upper part of the

Application of the foregoing Rules to the Conſtruction of Ships.

the lower-deck to the under part of the main-rail, the fore ſide of the foremoſt head timber will be deſcribed; and by ſetting off its thickneſs aft, the other ſide may be drawn. The middle head timber may be ſpaced between the two former ones; and there may alſo be one timber placed abaft the ſtem, at a diſtance from the ſtem, equal to that between the others, and the lower end of it may ſtep on the upper edge of the lower rail.

To deſcribe the middle and lower rails, divide the diſtance between the lower part of the main rail and the upper part of the upper cheek equally at every head timber; and curves being deſcribed through theſe points will form the middle and lower rails. The after end of the lower rail muſt terminate at the after edge of the after head timber.

The cat-head ought to be repreſented in ſuch a manner as to come againſt the aft ſide of the head of the main rail, to rake forward four inches in a foot, and to ſteeve up $5\frac{1}{2}$ inches in a foot, and about one foot ſix inches ſquare. The lower part of it comes on the plank of the deck at the ſide, and the ſupporter under it muſt form a fair curve to break in with the after end of the middle rail.

The hawſe holes muſt come between the cheeks, which is the moſt convenient place for them; but their place fore and aft cannot be exactly determined until they are laid down in the half-breadth plan.

The knee of the head is to project from the breaſt of the figure about two inches; and particular care muſt be taken that in forming it downwards it be not too full, as it is then liable to rub the cable very much: it may therefore have no more ſubſtance under the lower cheek at the heel of the figure than is juſt ſufficient to admit of the bobſtay holes, and may be $3\frac{1}{2}$ feet diſtant from the ſtem at the load water-line, making it run in an agreeable ſerpentine line from the breaſt down to the third water line, where it may be $1\frac{1}{2}$ feet from the ſtem. By continuing the ſame line downwards, keeping it more diſtant from the ſtem as it comes down, the *gripe* will be formed. The lower part of it muſt break in fair with the under part of the falſe keel; and the breadth of the gripe at the broadeſt place will be found by the proportions to be $4\frac{1}{2}$ feet. As the aft part of the gripe is terminated by the fore foot, or foremoſt end of the keel, it will now be proper to finiſh that part as follows: From the line repreſenting the upper edge of the keel ſet down the depth of the keel, through which draw a line parallel to the former, and it will be the lower edge of the keel. From that point, where the aft ſide of the ſtem is diſtant from the upper edge of the keel by a quantity equal to the breadth of the keel at midſhips, erect a perpendicular, which will limit the foremoſt end of the keel; and the after or lower end of the ſtem may be repreſented by ſetting off the length of the ſcarf from the foremoſt end of the keel, which may be ſix feet. Set down from the line repreſenting the lower edge of the keel the thickneſs of the falſe keel, which is ſeven inches; and a line drawn through that point parallel to the lower edge of the keel will be the under edge of the falſe keel, the foremoſt end of which may be three inches afore the foremoſt end of the main keel.

The head being now finiſhed, proceed next to the ſtern, the ſide and middle timbers of which are already drawn. From the ſide timber ſet off forward 14 feet, the length of gallery, and draw a pencil line parallel to the ſide timber; draw alſo a line to interſect the touch of the upper counter at the ſide, producing it forwards parallel to the ſheer as far as the pencil line firſt drawn; and this line will repreſent the upper edge of the gallery rim. From which ſet down eight inches, the breadth of the gallery rail, and draw the lower edge of the rail. At the diſtance of eight inches from the fore ſide of the ſide timber draw a line parallel thereto; and from the point of interſection of this line with the upper edge of the gallery rim, draw a curve to the middle timber parallel to the touches of the upper counter, which line will repreſent the upper edge of the upper counter rail as it appears on the ſheer draught. The lower edge of this rail may be formed by ſetting off its depth from the upper edge. In the ſame manner the lower counter rail may be deſcribed: then take the diſtance between that and the upper counter rail, and ſet it off below the rim rail; and hence the rail that comes to the lower ſtool may be drawn, keeping it parallel to the rim rail. Underneath that, the lower finiſhing may be formed, making it as light and agreeable as poſſible.

Application of the foregoing Rules to the Conſtruction of Ships.

Set off from the middle timber on the end of the quarter-deck the projection of the balcony, which may be about two feet, and draw a line with a pencil parallel to the middle timber. On this line ſet off a point $1\frac{1}{2}$ inches below the under ſide of the quarter-deck, from which draw a curve to the ſide timber parallel to the upper counter rail, which curve will repreſent the lower ſide of the foot ſpace rail of the balcony as it appears in the ſheer draught.

Take the diſtance between the point of interſection of the upper edge of the upper counter with the middle line, and the point of interſection of the under ſide of the foot ſpace rail with the middle line, which ſet up on a perpendicular from the upper edge of the rim rail at the foremoſt end. Through this point draw a line parallel to the rim rail to interſect the lower part of the foot ſpace rail, and this line will repreſent the lower edge of the rail that comes to the middle ſtool, and will anſwer to the foot ſpace rail. Then between this line and the rim rail three lights or ſaſhes may be drawn, having a muntin or pillar between each light of about 14 inches broad, and the lower gallery will be finiſhed. Set off the depth of the middle ſtool rail above the line already drawn for the lower edge, and the upper edge may be drawn. Then ſet off the ſame depth above the curve drawn for the lower edge of the foot ſpace rail, and the upper edge of that rail may then be drawn.

The quarter-piece muſt be next deſcribed, the heel of which muſt ſtep on the after end of the middle ſtool. Draw a line with a pencil parallel to the middle timber, and at a diſtance therefrom, equal to the projection of the balcony. Upon this line ſet up from the roundhouſe deck the height of the upper part of the ſtern or taff rail, which may be four feet above the deck. At that height draw with a pencil a horizontal line, and from its interſection with the line firſt drawn deſcribe a curve to the middle ſtool rail, obſerving to make the lower part of this curve run nearly parallel to the ſide timber, and the lower part about three inches abaft the ſide timber; and this curve will repreſent the aft ſide of the quarter-piece at the outſide. There ſet off the thick-

Application of the fore-going Rules to the Construction of Ships.

nefs of the quarter-piece, which is one foot fix inches, afore the curve already drawn; and another curve being defcribed parallel to it from the lower part to the top of the fheer, and the quarter-piece at the outfide will be reprefented. On the horizontal line drawn for the upper part of the taff-rail fet off forward the thicknefs of the taff-rail, which is one foot; then draw a curve down to the head of the quarter-piece parallel to the firft, and that part of the taff-rail will be defcribed. Inftead of a fair curve, it is cuftomary to form the upper part of the taff-rail with one or two breaks, and their curves inverted. Either way may, however, be ufed according to fancy.

Set off the depth of the taff-rail, which may be about 3½ feet, on the line drawn for the projection; from the upper part, and from this point, defcribe a curve as low as the heel of the quarter-piece, and about five inches abaft it at that place; obferving to make it run nearly parallel to the after edge of the quarter-piece; and the after part of the quarter-piece, which comes neareft to the fide, will be reprefented.

Set up on the line drawn for the projection of the balcony the height of the upper part of the balcony or breaft rail, which is 3½ feet from the deck; fet off the thicknefs of the rail below that, and defcribe the balcony, keeping it parallel to the foot fpace rail, and terminating it at the line drawn for the after part of the quarter-piece neareft the fide; and the whole balcony will then be reprefented.

The upper gallery is then to be defcribed. In order to this, its length muft be determined, which may be 11 feet. Set off this diftance from the fide timber forward with the fheer; and at this point draw a line parallel to the fide timber, which line will reprefent the fore part of the gallery. Then take the diftance between the upper part of the foot fpace rail and the upper part of the breaft rail on a perpendicular, and fet it off on a perpendicular from the upper part of the middle ftool rail on the line drawn for the fore part of the gallery, from which to the fore part of the quarter-piece draw a ftraight line parallel to the rail below, which line will be the upper edge of the upper rim rail; and its thicknefs being fet off, the lower edge may alfo be drawn. From the upper edge of that rail fet up an extent equal to the diftance between the lower rim rail and middle ftool rail, and defcribe the upper ftool rail, the after end of which will be determined by the quarter-piece, and the fore end by the line for the length of the gallery. There may be three fafhes drawn between thefe two rails as before; and hence the upper gallery will be formed.

The upper finifhing fhould be next drawn, the length of which may be 1½ foot lefs than the upper gallery. Draw a line parallel to the rake of the ftern for the fore end of it, and let the upper part of the top fide be the upper part of the upper rail, from which fet down three inches for the thicknefs of the rail, and defcribe it. Defcribe alfo another rail of the fame length and thicknefs as the former, and eight inches below; from the end of which a ferpentine line may be drawn down to the upper ftool rail, and the upper finifhing will be completed.

The ftern being now finifhed, the rudder only remains to be drawn. The breadth of the rudder at the lower part is to be determined from the proportions, and fet off from the line reprefenting the aft part of the ftern-poft; which line alfo reprefents the fore part of the rudder. Then determine on the lower hance, letting it be no higher than is juft fufficient, which may be about one foot above the load water-line, and fet off its breadth at that place taken from the proportions. Then a line draw from thence to the breadth fet off at the lower part will be the aft fide of the rudder below the lower hance. There may alfo be another hance about the height of the lower deck. The ufe of thefe breaks or hances is to reduce the breadth as it rifes toward the head. The aft part may be drawn above the lower hance, the break at the lower hance being about ten inches, and the break at the upper hance fix inches.—The back may be then drawn. It is of elm, about four inches thick on the aft part. That thicknefs being fet off, and a line drawn from the lower hance to the lower end, will reprefent the back. The head of the rudder fhould be as high as to receive a tiller above the upper deck. Therefore fet off the fize of the head above the upper deck, and draw a line from thence to the break at the upper hance, and the aft part of the rudder will be reprefented all the way up. The bearding fhould be drawn, by fetting off the breadth of it at the keel from the fore fide of the rudder, which may be nine inches. Set off alfo the breadth at the head of the wing tranfom, which may be a foot. Then a line being drawn through thefe two points, from the lower part of the rudder to about a foot above the wing tranfom, and the bearding will be reprefented. As the bearding is a very nice point, and the working of the rudder depending very much upon it, it fhould always be very particularly confidered. It has been cuftomary to beard the rudder to a fharp edge at the middle line, by which the main piece is reduced more than neceffary. The rudder fhould, however, be bearded from the fide of the pintles, and the fore fide made to the form of the pintles.

The pintles and braces may next be drawn. In order to which determine the place of the upper one, which muft be fo difpofed that the ftraps fhall come round the head of the ftandard, which is againft the head of the ftern-poft on the gun-deck, and meet at the middle line. By this means there is double fecurity both to the brace and ftandard. To obtain thofe advantages, it muft therefore be placed about four inches above the wing tranfom: the fecond muft be placed juft below the gun-deck fo as to bolt in the middle of the deck tranfom, and the reft may be fpaced equally between the lower one, which may be about fix inches above the upper edge of the keel. The number of them is generally feven pair upon this clafs of fhips; but the number may be regulated by the diftance between the fecond and upper one, making the diftance between the reft nearly the fame. The length of all the braces will be found by fetting off the length of the lower one, which may be eight feet afore the back of the ftern-poft, and alfo the length of the third, which is four feet and a half afore the back of the ftern-poft; and a line drawn from the one extremity to the other will limit the intermediate ones, as will appear on the fheer draught. The braces will feem to diminifh in length very much as they go up; but when meafured or viewed on the fhape of the body, they will be nearly of an equal length. The length of the ftraps of the pintles which

Application of the foregoing Rules to the Construction of Ships.

come upon the rudder may all be within four inches of the aft side of the rudder; and the rudder being a flat surface, they will all appear of the proper lengths.

II. *Of the half-breadth and body plans.*—The half-breadth plan must be first drawn. Then produce the lower edge of the keel both ways, and let it also represent the middle line of the half-breadth plan. Produce all the frames downwards, and also the fore and after perpendiculars. Then from the place in the sheer-plan, where the height of breadth-lines intersect the stem, square down to the middle line the fore and aft part of the rabbet and the fore part of the stem. Take from the dimensions what the stem is sided at that place, and set off half of it from the middle line in the half-breadth plan, through which draw a line parallel to the middle line through the three lines squared down, and the half breadth of the stem will be represented in the half-breadth plan. Take the thickness of the plank of the bottom which is $4\frac{1}{2}$ inches, and describe the rabbet of the stem in the half-breadth plan.

From the points of intersection of the height of breadth lines with the counter timber at the side, and with the counter timber at the middle line, draw lines perpendicular to the middle line of the half-breadth plan, from which set off the half breadth of the counter on the line first drawn; and from this point to the intersection of the line last drawn, with the middle line draw a curve, and the half breadth of the counter will be represented at the height of breadth, which will be the broadest part of the stern.

Take the main half breadth of timber dead flat from the dimensions, and lay it off from the middle line on dead flat in the half-breadth plan. Take also from the dimensions the main half breadth of every timber, and set off each from the middle line on the corresponding timbers in the half-breadth plan. Then a curve drawn from the end of the line representing the half breadth of the counter through all the points, set off on the timbers, and terminating at the aft part of the stern, will be the main half-breadth line. Take from the dimensions the top-timber half breadth, and describe the top-timber half-breadth line in the half-breadth plan, in the same manner as the main half-breadth line.

Take from the dimensions the half breadth of the rising, and set it off from the middle line on the corresponding timbers in the half-breadth plan, observing, where the word *outside* is expressed in the tables, the half breadth for that timber must be set off above or on the outside of the middle line. Then a curve drawn through these points will be the half breadth of rising in the half-breadth plan.

Plate CCCCXCII. Fig. 35.

It will now be necessary to proceed to the body plan. Draw a horizontal line (fig. 35.), which is called the *base line*, from the right hand extremity of which erect a perpendicular. Then set off on the base line the main half breadth at dead flat, and erect another perpendicular, and from that set off the main half breadth again, and erect a third perpendicular. The first perpendicular, as already observed, is called the side line of the fore body; the second the middle line; and the third the side line of the after body.

Take from the dimensions the heights of the diagonals up the middle line, and set them from the base up the middle line in the body plan. Take also their distances from the middle line on the base, and set them off. Set off also their heights up the side lines, and draw the diagonals. Then take from the sheer plan the heights of the lower height of breadth line, and set them off upon the middle line in the body plan; through these points lines are to be drawn parallel to the base, and terminating at the side lines. In like manner proceed with the upper height of breadth line.

The rising is next to be set off on the body plan; it must, however, be first described in the sheer plan: Take, therefore, the heights from the dimensions, and set them off on the corresponding timbers in the sheer plan, and a curve described through these points will be the rising line in the sheer plan. Then take from the dimensions the rising heights of dead flat. Set it off in the body plan, and draw a horizontal line. Now take all the rising heights from the sheer plan, and set them off in the body plan from the line drawn for the rising height of dead flat, and draw horizontal lines through these points. Take from the half-breadth plan the half breadths of the rising, and set them off from the middle line in the body plan, and the centres of the floor sweeps of the corresponding timbers will be obtained.

From the half-breadth plan take the main half-breadth lines, and set them off from the middle line in the body plan on the corresponding lines before drawn for the lower height of breadth; and from the extremities of these lines set off towards the middle line the lengths of the lower breadth sweeps respectively.

Take from the dimensions the distance of each frame from the middle line on the diagonals, and set them off from the middle line on their respective diagonal lines. Now these distances being set off, and the lower breadth and floor sweeps described, the shape of the frames below the breadth line may easily be drawn as follows: Place one point of a compass in the distance set off for the length of the lower breadth sweep, and extend the other to the point which terminates the breadth, and describe an arch of a circle downwards, which will intersect the points set off on the upper diagonal lines, letting it pass as low as convenient. Then fix one point of the compasses in the centre of the floor sweep, and extend the other to the point set off on the fourth diagonal, which is the floor head; and describe a circle to intersect as many of the points set off on the diagonals as it will. Then draw a curve from the back of the lower breadth sweep, through the points on the diagonals, to the back of the floor sweep. Describe also another curve from the back of the floor sweep through the points on the lower diagonals, and terminating at the upper part of the rabbet of the keel, and that part of the frame below the breadth will be formed. In like manner describe the other frames.

Through the extremities of the frames at the lower height of breadth draw lines parallel to the middle line, and terminating at the upper height of breadth line, and from thence set off the upper breadth sweeps; now fix one point of the compass in the centres of the upper breadth sweeps successively, and the other point to the extremities of the frames, and describe circles upwards. Then from the sheer plan take off the heights of the top-timber lines, and set them off in the body plan, drawing horizontal lines; upon which set off the top-timber half breadths taken from the corresponding timbers

Application of the foregoing Rules to the Construction of Ships.

bers in the half-breadth plan; and by describing curves from the back of the upper breadth sweeps through the points set off on the seventh or upper diagonal; and intersecting the top-timber half-breadths, the timbers will then be formed from the keel to the top of the side. The upper end of the timbers may be determined by taking the several heights of the upper part of the top side above the top-timber line, and setting them off above the top-timber line on the corresponding timbers in the body plan. The lower parts of the timbers are ended at the rabbet of the keel as follows: With an extent of four inches and a half, the thickness of the bottom, and one leg of the compasses at the place where the line for the thickness of the keel intersects the base line; with the other leg describe an arch to intersect the keel line and the base. Then fix one point at the intersection of the arch and keel, and from the point of intersection of the keel and base describe another arch to intersect the former. Then from the intersection of these arches draw one straight line to the intersection of the keel and base, and another to the intersection of the lower arch and the keel, and the rabbet of the keel will be described at the main frame. All the timbers in the middle part of the ship which have no rising terminate at the intersection of the upper edge of the rabbet with the base line; but the lower part of the timbers, having a rising, end in the centre of the rabbet, that is, where the two circles intersect. Those timbers which are near the after end of the keel must be ended by setting off the half breadth of the keel at the port in the half-breadth plan, and describe the tapering of the keel. Then at the corresponding timbers take off the half breadth of the keel; set it off in the body plan, and describe the rabbet as before, letting every timber end where the two circles for its respective rabbet intersect.

To describe the side counter or stern timber, take the height of the wing transom, the lower counter, upper counter, and top-timber line at the side; from the sheer plan transfer them to the body plan, and through these points draw horizontal lines. Divide the distance between the wing transom and lower counter into three equal parts, and through the two points of division draw two horizontal lines. Draw also a horizontal line equidistant from the upper counter and the top-timber line in the sheer plan, and transfer them to the body plan.

Now, from the point of intersection of the aft side of the stern timber at the side, with the wing transom at the side in the sheer plan, draw a line perpendicular to the middle line in the half-breadth plan. Draw also perpendicular lines from the points where the upper and lower transoms touch the stern-post; from the points of intersection of the stern timber with the two horizontal lines drawn between, and from the intersection of the stern timber with the horizontal line drawn between the upper counter and top-timber line. Then curves must be formed in the half-breadth plan for the shape of the body at each of these heights. In order to which, begin with the horizontal or level line representing the height of the wing transom in the body plan. Lay a slip of paper to that line, and mark on it the middle line and the timbers 37, 35, 33, and 29; transfer the slip to the half-breadth plan, placing the point marked on it for the middle line exactly on the middle in the half-breadth plan, and set off the half breadths on the corresponding timbers 37, 35, 33, and 29, and describe a curve through these points, and to intersect the perpendicular drawn from the sheer plan. In like manner proceed with the horizontal lines at the heights of the counters, between the lower counter and wing transom, above the upper counter and top-timber line; and from the intersections of the curve drawn in the half-breadth plan, with the perpendicular lines drawn from the sheer plan, take the distances to the middle line, and set them off on the corresponding lines in the body plan; then a curve described through the several points thus set off will be the representative of the stern timber.

The round-up of the wing transom, upper and lower counter, may be taken from the sheer draught, and set off at the middle line above their respective level lines in the body plan, by which the round-up of each may be drawn. The round aft of the wing transom may also be taken from the sheer plan, and set off at the middle line, abaft the perpendicular for the wing transom in the half-breadth plan, whence the round aft of the wing transom may be described.

The after body being now finished, it remains to form the fore body; but as the operation is nearly the same in both, a repetition is therefore unnecessary, except in those parts which require a different process.

The foremost timbers end on the stem, and consequently the method of describing the ending of them differs from that used for the timbers used in the after body. Draw a line in the body plan parallel to the middle line, at a distance equal to the half of what the stem is sided. In the sheer plan take the height of the point of intersection of the lower part of the rabbet of the stem with the timber which is required to be ended, and set it off on the line before drawn in the body plan. Then take the extent between the points of intersection of the timber with the lower and upper parts of the rabbet, and with one leg of the compasses at the extremity of the distance laid off in the body plan describe a circle, and the timbers may then pass over the back of this circle. Now, by applying a small square to the timber, and letting the back of it intersect the point set off for the lower part of the rabbet, the lower part of the rabbet and the ending of the timbers will be described.

The foremost timbers differ also very much at the head from those in the after body: For since the ship carries her breadth so far forward at the top-timber line, it therefore occasions the two foremost frames to fall out at the head beyond the breadth, whence they are called *knuckle* timbers. They are thus described: The height of the top-timber line being set off in the body plan, set off on it the top half breadth taken from the half-breadth plan, and at that place draw a perpendicular; then from the sheer plan take the height of the top of the side, and set it off on the perpendicular in the body plan: Take also the breadth of the rail at the top-timber line in the sheer plan, and set it off below the top-timber line at the perpendicular line in the body plan, and the straight part of the knuckle timber to be drawn will be determined. Then from the last-mentioned point set off describe a curve through the points set off for the timber down to the upper breadth, and the whole knuckle timber will be formed. It will hence be feen that thofe timbers forward will fall out beyond the main breadth with a hollow, contrary to the reft of the top fide, which falls within the main breadth with a hollow.

The fore and after bodies being now formed, the water lines muft next be defcribed in the half-breadth plan, in order to prove the fairnefs of the bodies. In this draught the water lines are all reprefented parallel to the keel; their heights may, therefore, be taken from the fheer plan, and transferred to the body plan, drawing horizontal lines, and the water lines will be reprefented in the body plan. In fhips that draw more water abaft than afore, the water lines will not be parallel to the keel; in this cafe, the heights muft be taken at every timber in the fheer plan, and fet off on their correfponding timbers in the body plan; and curves being defcribed through the feveral points, will reprefent the water lines in the body plan.

Take the diftances from the middle line to the points where the water lines interfect the different timbers in the body plan, and fet them off on their correfponding timbers in the half-breadth plan. From the points where the water lines in the fheer plan interfect the aft part of the rabbet of the fternpoft draw perpendiculars to the middle line of the half-breadth plan, and upon thefe perpendiculars fet off from the middle line the half thicknefs of the fternpoft at its correfponding water line; which may be taken from the body plan, by fetting off the fize of the poft at the head and the keel, and drawing a line for the tapering of it; and where the line fo drawn interfects the water lines, that will be the half thicknefs required: then take an extent in the compaffes equal to the thicknefs of the plank, and fix one point where the half thicknefs of the poft interfects the perpendicular, and with the other defcribe a circle, from the back of which the water lines may pafs through their refpective points fet off, and end at the fore part of the half-breadth plan, proceeding in the fame manner as with the after part. A line drawn from the water line to the point fet off for the half thicknefs of the poft will reprefent the aft part of the rabbet of the poft; and in like manner the rabbet of the ftem may be reprefented. The water lines being all defcribed, it will be feen if the body is fair; and if the timbers require any alteration, it fhould be complied with.

The cant-timbers of the after body may next be defcribed in the half-breadth plan; in order to which the cant of the fafhion-piece muft firft be reprefented. Having therefore the round aft of the wing tranfom reprefented in the half-breadth plan, and alfo the fhape of a level line at the height of the wing tranfom; then fet off the breadth of the wing tranfom at the end, which is one foot four inches, and that will be the place where the head of the fafhion-piece will come: now to determine the cant of it, the fhape of the body muft be confidered; as it muft be canted in fuch a manner as to preferve as great a ftraightnefs as is poffible for the fhape of the timber, by which means the timber will be much ftronger than if it were crooked; the cant muft alfo be confidered, in order to let the timber have as little bevelling as poffible. Let, therefore, the heel of the timber be fet off on the middle line, two feet afore timber 35; and then drawing a line from thence to the point fet off on the level line for the wing tranfom, the cant of the fafhion-piece will be defcribed, and will be found fituated in the beft manner poffible to anfwer the before mentioned purpofes.

The cant of the fafhion-piece being reprefented, the cant of the other timbers may now be eafily determined. Let timber 29 be the foremoft cant timber in the after body, and with a pencil draw timber 28; then obferve how many frames there are between timber 28 and the fafhion-piece, which will be found to be nine, namely, 29, 30, 31, 32, 33, 34, 35, 36, and 37. Now divide the diftance between timber 28 and the fafhion-piece on the middle line into 10 equal parts: Divide alfo the correfponding portion of the main half-breadth lines into the fame number of equal parts; and ftraight lines joining the correfponding points at the middle line with thofe in the half-breadth line will reprefent the cant timbers in the after body.

The line drawn for the cant of the fafhion-piece reprefents the aft fide of it, which comes to the end of the tranfoms; but in order to help the converfion with regard to the lower tranfoms, there may be two more fafhion-pieces abaft the former; therefore the foremoft fafhion-piece, or that which is already defcribed in the half-breadth plan, may only take the ends of the three upper tranfoms, which are, the wing, filling, and deck: the middle fafhion-piece may take the four next, and the after fafhion-piece the lower ones: therefore fet off in the half-breadth plan the fiding of the middle and after fafhion-piece, which may be 13 inches each; then by drawing lines parallel to the foremoft fafhion-piece, at the aforefaid diftance from each other, the middle and after fafhion-piece will be reprefented in the half-breadth plan.

The fafhion-piece and tranfoms yet remain to be reprefented in the fheer plan; in order to which, let the number of tranfoms be determined, which, for fo large a buttock, may be feven below the deck tranfom: draw them with a pencil, beginning with the wing, the upper fide of which is reprefented by a level line at its height; fet off its fiding below that, and draw a level line for the lower edge. The filling tranfom follows; which is merely for the purpofe of filling the vacancy between the under edge of the wing and the upper part of the deck plank: it may therefore be reprefented by drawing two level lines for the upper and lower edge, leaving about two inches between the upper edge and lower edge of the wing tranfom, and four inches between the lower edge of the gun-deck plank; then the deck tranfom muft be governed by the gun-deck, letting the under fide of the gun-deck plank reprefent the upper fide of it, and fetting off its fiding below that; the under edge may alfo be drawn: the tranfoms below the deck may all be fided equally, which may be 11 inches; they muft alfo have a fufficient diftance between to admit the circulation of the air to preferve them, which may be about three inches.

The tranfoms being now drawn with a pencil, the fafhion-piece muft next be defcribed in the fheer plan, by which the length of the tranfoms as they appear in that plan will be determined. As the foremoft fafhion-piece reaches above the upper tranfom, it may therefore be firft defcribed: in order to which, draw a fufficient number of level lines in the fheer plan; or, as the water lines are level, draw therefore one line between the upper water line and the wing tranfom, and one above the

Application of the fore-going Rules to the Construction of Ships.

the wing tranfom at the intended height of the head of the fafhion-piece, which may be about five feet: then take the height of thefe two level lines, and transfer them to the body plan; and take off two or three timbers and run them in the half-breadth plan, in the fame manner as the water lines were done; then from the point where the line drawn for the cant of the fafhion-piece, in the half-breadth plan, interfects the level line drawn for the head of the fafhion-piece, draw up a perpendicular to the faid line in the fheer plan, making a point. Again, from the interfection of the cant line, with the level line for the wing tranfom in the half-breadth plan, draw a perpendicular to the wing tranfom in the fheer plan. Alfo draw perpendiculars from the points where the cant line in the half-breadth plan interfects the level line below the wing tranfom, and alfo the water lines to the correfponding lines in the fheer plan; then a curve defcribed through thefe points will be the reprefentation of the foremoft fafhion-piece in the fheer plan. In the fame manner the middle and after fafhion-pieces may be defcribed; obferving to let the middle one run up no higher than the under part of the deck tranfom, and the after to the under fide of the fourth tranfom under the deck. The tranfoms may now be drawn with ink, as their lengths are limited by the fafhion-pieces.

Neither the head nor the forefide of the fternpoft are yet defcribed; take, therefore, from the dimenfions, the breadth of the poft on the keel, and fet it off on the upper edge of the keel from the aft fide of poft. The head of the poft muft next be determined, which muft juft be high enough to admit of the helm-poft tranfom and the tiller coming between it and the upper deck beam; the height therefore that is neceffary will be one foot nine inches above the wing tranfom. Now draw a level line at that height, upon which fet off the breadth of the fternpoft at that place, taken from the dimenfions, and a line drawn from thence to the point fet off on the keel will be the forefide of the fternpoft; obferving, however, not to draw the line through the tranfoms, as it will only appear between them. The inner poft may be drawn, by fetting off its thicknefs forward from the fternpoft, and drawing a ftraight line as before, continuing it no higher than the under fide of the wing tranfom.

The cant timbers in the after body being defcribed, together with the parts dependent on them, thofe in the fore body may be next formed; in order to which, the foremoft and aftermoft cant timbers muft be firft determined, and alfo the cant of the foremoft ones. The foremoft cant timber will extend fo far forward as to be named *&*; the cant on the middle line may be one foot four inches afore fquare timber W, and on the main half breadth line one foot nine inches afore timber Y; in which fituation the line may be drawn for the cant; the aftermoft may be timber Q. The cant timbers may now be defcribed in the fame manner as thofe in the after body, namely, by fpacing them equally between the cant timber *&* and the fquare timber P, both on the main half-breadth, and middle lines, and drawing ftraight lines between the correfponding points, obferving to let them run out to the top-timber half-breadth line, where it comes without the main half-breadth line.

The hawfe pieces muft next be laid down in the half-breadth plan; the fides of which muft look fore and aft with the fhip upon account of the round of the bow. Take the fiding of the apron, which may be about four inches more than the ftem, and fet off half of it from the middle line, drawing a line from the main half-breadth to the foremoft cant timber, which will reprefent the foremoft edge of the knight-head; then from that fet off the fiding of the knight-head, which may be one foot four inches, and draw the aft fide of it. The hawfe pieces may then be drawn, which are four in number, by fetting off their fidings, namely, one foot fix inches parallel from the knight-head and from each other; and ftraight lines being drawn from the main half-breadth line to the foremoft cant timber will reprefent them.

The hawfe holes fhould be defcribed in fuch a manner as to wound the hawfe pieces as little as poffible; they may therefore be placed fo that the joint of the hawfe pieces fhall be in the centre of the holes, whence they will only cut half the hawfe pieces. Take the dimenfions of the hawfe holes, which is one foot fix inches, and fet off the foremoft one, or that next the middle line, on the joint between the firft and fecond hawfe piece; then fet off the other on the joint between the third and fourth hawfe piece; and fmall lines being drawn acrofs the main half-breadth at their refpective places will reprefent the hawfe holes in the half-breadth plan.

The hawfe holes fhould next be reprefented in the fheer plan. In this clafs of fhips they are always placed in the middle between the cheeks; therefore fet off their diameter, namely, one foot fix inches, between the cheeks, and draw lines parallel to the cheeks for their upper and lower part. Then to determine their fituation agreeable to the half-breadth plan, which is the fore and aft way, draw perpendiculars from their interfections with the main half-breadth line to the lines drawn between the cheeks, and their true fituations, the fore and aft way, will be obtained; and, by defcribing them round or circular, according to the points fet off, they will be reprefented as they appear in the fheer plan.

The apron may be drawn in the fheer plan, fetting off its bignefs from the ftem, and letting it come fo low that the fcarf may be about two feet higher than the foremoft end of the fore foot; by which it will give fhip to the fcarfs of the ftem. It may run up to the head of the ftem.

The cutting down fhould next be drawn. Take therefore from the tables of dimenfions the different heights there expreffed, and fet them off from the upper edge of the keel on the correfponding timbers in the fheer plan: then a curve defcribed through the points fet off, from the inner poft aft to the apron forward, will be the cutting down. Next fet off from the cutting down the thicknefs of the timber ftrake, which is eight inches and a half, and a curve defcribed parallel to the former will reprefent the timber ftrake, from which the depth of the hold is always meafured.

The kelfon is drawn, by taking its depth from the dimenfions, and fet it off above the cutting down line; and a curve defcribed parallel to the cutting down will reprefent the kelfon.

The cutting down line being defcribed, the knee of the dead wood abaft timber 27, being the after floor timber, may then be reprefented. Set off the fiding of the floor abaft it, and erect a perpendicular in the fheer plan, which will terminate the foremoft end of the

Application of the fore-going Rules to the Conſtruction of Ships.

the dead wood: then the fore and aft arm of the knee may be half the length of the whole dead wood, and the up and down arm may reach to the under part of the lower tranſom; and the whole knee may be placed in ſuch a manner that the upper piece of the dead wood ſhall bolt over it, and be of as much ſubſtance as the knee itſelf: therefore the knee muſt conſequently be placed its whole thickneſs below the cutting down line repreſenting the upper part of the dead wood.

The ſheer draught, the body, and half-breadth pl are now finiſhed, from whence the ſhip may be laid down in the mould loft, and alſo the whole frame erected. As, however, the uſe of the diagonal lines in the body plan has not been ſufficiently explained, it is therefore thought proper to ſubjoin the following illuſtration of them.

45 Nature and uſe of diagonal lines.

The diagonal lines in the body plan are mentioned in the tables of dimenſions merely for the purpoſe of forming the body therefrom; but after the body is formed, they are of very principal uſe, as at their ſtations the ribbands and harpins which keep the body of the ſhip together while in her frames are all deſcribed, and the heads of the different timbers in the frame likewiſe determined.

The lowermoſt diagonal, or N° 1. which is named the *lower ſirmark*, at which place the bevellings are taken for the hollow of the floors; its ſituation is generally in the middle between the keel and the floor ſirmark.

Second diagonal is placed in the midſhips, about 18 inches below the floor head, and is the ſtation where the floor ribband is placed in midſhips, and likewiſe the floor harpin forward; there is alſo a bevelling taken at this diagonal all the way fore and aft, from which it is termed the *floor ſirmark*.

Third diagonal, terminates the length of the floors, and is therefore called the *floor head*. There are likewiſe bevellings taken at this diagonal as far forward and aft as the floor extends. The placing of this diagonal is of the utmoſt conſequence to the ſtrength of the ſhip, it being ſo near to that part of the bulge which takes the ground, and of conſequence is always liable to the greateſt ſtrain: it ſhould therefore be placed as much above the bearing of the body in midſhips as could be conveniently allowed by converſion of the timber; but afore and abaft it is not of ſo much conſequence.

Fourth diagonal is placed in the middle between the floor head and the fifth diagonal, at which place a ribband and harpin are ſtationed for the ſecurity of the firſt or lower futtock, from whence it is named the *firſt futtock ſirmark*. There are alſo bevellings taken at this diagonal all afore and aft, which being part of the body where the timbers moſt vary, occaſions them to be the greateſt bevellings in the whole body.

Fifth diagonal terminates the heads of the firſt futtocks, and is therefore called the *firſt futtock head*. It ſhould be placed at a convenient diſtance above the floor head, in order to give a ſufficient ſcarf to the lower part of the ſecond futtocks. There are likewiſe bevellings for the timbers taken at this diagonal, all fore and aft.

Sixth diagonal ſhould be placed in the middle between the firſt futtock head and the ſeventh diagonal; at which place the ribband and harpin are ſtationed for the ſupport of the ſecond futtocks. Bevellings are taken at this diagonal all fore and aft. It is named the *ſecond futtock ſirmark*.

Application of the fore-going Rules to the Conſtruction of Ships.

Seventh diagonal terminates the ſecond futtock heads from the fore to the aftermoſt floors, and afore and abaft them it terminates the double futtock heads in the fore and aft cant bodies. It ſhould be placed in midſhips, as much above the firſt futtock head as the firſt futtock is above the floor head: by which it gives the ſame ſcarf to the lower part of the third futtock as the firſt futtock does to the ſecond. There are bevellings taken all fore and aft at this diagonal. It is named the *ſecond futtock head*.

Eighth diagonal is the ſtation for the ribband and harpin which ſupports the third futtocks, and is therefore placed between the ſecond futtock head and ninth diagonal. It is alſo a bevelling place, and is named the *third futtock ſirmark*.

Ninth and laſt diagonal is placed the ſame diſtance above the ſecond futtock head as that is above the firſt, and terminates all the heads of the third futtocks which are in the frames, as they come between the ports; but ſuch as are between the frames, and come under the lower deck ports, muſt run up to the under part of the ports, as no ſhort timbers ſhould by any means be admitted under the ports, which require the greateſt poſſible ſtrength. This diagonal is likewiſe a bevelling place for the heads of the third futtocks, and is therefore called the *third futtock head*.

The fourth futtock heads are terminated by the under part of the upper deck ports all fore and aft, and a ribband is placed fore and aft at the height of the upper breadth line, another between the lower and upper deck ports, and one at the top-timber line; which, with the ribbands and harpins before mentioned, keep the whole body of the ſhip together, and likewiſe in its proper form and ſhape.

It muſt be obſerved, that the diagonal lines laid down in the dimenſions will not correſpond to what has been ſaid above upon diagonals, as they were drawn diſcretionally upon the body for the purpoſe of giving the true dimenſions of it. Therefore, when the body is drawn in fair, the firſt diagonals (which ſhould only be in pencil) are to be rubbed out, and the proper diagonals drawn with red ink, ſtrictly adhering to what has been ſaid above.

Sect. III. *Of the Inboard Works of the Ship deſcribed in the preceding Section.*

Draughts of the outboard works being now conſtructed, in which every part is deſcribed that is neceſſary to enable the artiſt to put the ſhip in her frames, we muſt now proceed to form another draught of the cavity of the ſhip or inboard works, which muſt be ſo contrived that every thing within the ſhip may be arranged in the moſt commodious manner and to the beſt advantage.

It is uſual to draw the inboard works in the ſheer-draught; but as this generally occaſions much confuſion, it is therefore the beſt and eaſieſt method to appropriate a draught to this particular purpoſe. *Ship-Builder's Repoſitory.*

Take from the ſheer-draught the ſtem, ſtern-poſt, counter timbers, and keel, and deſcribe them on another paper; draw in alſo the cutting down, kelſon, apron, tranſoms, faſhion-pieces, and decks, and the upper line of the ſheer all fore and aft, alſo paſs the timbers and ports.

The

Application of the foregoing Rules to the Construction of Ships.

The beams come first under consideration, and should be so disposed as to come one under and one between each port, or as near as can be to answer other works of the ship; but where it happens that a beam cannot possibly be placed under the port, then a beam arm should be introduced to make good the deficiency. Every beam, and also the beam arms, should be kneed at each end with one lodging and one hanging knee; and in those parts of the ship which require the knees to be very acute, such as the after beams of the gun-deck, and in some ships, whose bodies are very sharp, the foremost beams of the gun-deck, there should be knees of iron. Care should be taken always to let the upper side of the knees be below the surface of the beams, in large ships one inch and a half, and in small ships an inch, by which means the air will have a free passage between the knees and under part of the deck.

In the conversion of the beams the side next the lodging knee should be left as broad at the end of the beam as can possibly be allowed by the timber, the beam retaining its proper scantling at the end of the lodging knee: by so doing the lodging knees will be more without a square, which consequently makes them the more easy to be provided.

In ships where the beams can be got in one piece, they should be so disposed as to have every other one with the butt end the same way; for this reason, that the butts will decay before the tops. In large ships the beams are made in two or three pieces, and are therefore allowed to be stronger than those that are in one piece. The beams in two pieces may have the scarf one-third of the length, and those in three pieces should have the middle piece half the length of the whole beam. The customary way of putting them together is to table them; and the length of the tablings should be one-half more than the depth of the beam. It is very common to divide the tablings in the middle of the beam, and that part which is taken out at the upper side to be left at the lower side, and then kersey or flannel is put into the scarf: but in this case the water is liable to lie in the scarf, and must be the means of rotting the beams. If, however, the beams were tabled together in dovetails, and taken through from side to side, putting tar only between them, which hardens the wood; then the water occasioned by the leaking of the decks would have a free passage, and the beam would dry again; and this method would not be found inferior in point of strength to the other. The length of the fore and aft arm of the lodging knee should extend to the side of the hanging knee next to it; but there is no necessity for that arm to be longer than the other. In fastening the knees, care would be taken to let one bolt pass exactly through the middle of the throat, one foot six inches from each end, and the rest divided equally between; observing always to have the holes bored square from the knee. The bolts for the thwartship arms of both hanging and lodging knees may go through the arms of each knee, and drive every one the other way.

In order to draw the beams in the draught, take the moulding of the lower deck beams, and set if off below the line representing the deck at the side, and draw a line in pencil parallel thereto, which will represent the under side of the beams. In like manner represent the under side of the beams for the upper deck, quarter deck, forecastle, and roundhouse. Then take the siding of the lower deck beams, and place one under and one between each port, all fore and aft, drawing them in pencil. Determine the dimensions of the well fore and aft, which is ten feet, and set it off abaft the beam under the eighth port, placing the beam under the ninth port at that distance: those two beams may then be drawn in ink, and will terminate the extent of the well the fore and aft way; and as a beam cannot go across the ship at that place upon account of its being the well and mast room, there must therefore be a beam arm between these two beams.

The main hatchway should then be determined, letting the beam that forms the fore part of the well form the aft part of it, and the beam under the next part may form the fore side of it, which beam may also be now drawn in ink: there should also be another beam arm introduced in the wake of the main hatchway.

The fore hatchway may be next determined; the fore side of which should range well up and down with the after end of the forecastle, and it may be fore and aft about four-sevenths of the main hatchway. At the foreside of the fore hatchway there must be a ladderway down to the orlop, which may be as much fore and aft as the beams will allow. The rest of the beams afore the fore hatchway may remain as first placed, there being nothing in the way to alter the ship. Then determine on the after hatchway, the foreside of which comes to the aft side of the mainmast room.

There should also be a hatchway, the foreside of which may be formed by the aft side of the beam under the twelfth port; which is for the conveniency of the spirit and fish rooms: and there should be a ladderway abaft it to lead down to the cockpit. There may be also another hatchway, the foreside of it to be formed by the aft side of the beam under the eleventh port. The size of the ladder and hatchways must be governed by the beams, as when there is a good shift of beams they should not be altered for ladder and hatchways, unless it is the three principal hatchways, which must always be of a proper size, according to the size of the ship.

The after capstan must be placed between the two hatchways last described, and the beams abaft may stand as they are already shifted, observing only the mizenmast. There should be a small scuttle placed afore the second beam from aft, for the convenience of the bread room: it must be on one side of the middle lines, as there is a carling at the middle under the four or five after beams to receive the pillars for the support thereof.

The bits may be placed, letting the foreside of the after ones come against the aft side of the beam abaft the third port, and the foreside of the foremost ones against the next beam but one forward: then at the foreside of each bit there should be drawn a small scuttle for the conveniency of handing up the powder from the magazine. The breast hook should also be drawn, which may be three feet the moulding away, and sided nine-tenths of the beams of the lower deck.

The gun-deck, beams, knees, &c. being described; in which, as well as all the decks having ports, the same precautions are to be used as in the gun-deck; and ob-

Application of the foregoing Rules to the Construction of Ships.

ferving to keep the beams upon one deck as nearly as poffible over the beams of the other, for the conveniency of pillaring, as they will then fupport each other.

The hatchways are to be placed exactly over thofe on the lower deck, each over each; and therefore, where there is a beam arm in the lower deck there muft alfo be one above it in the upper deck, and the fame in the middle deck in three-deck fhips. It commonly happens in fhips of the line that there cannot be a whole beam between the deck breaft hook and the beam that fupports the ftep of the bowfprit, becaufe the bowfprit paffes through that place: in this cafe, there muft be a beam arm placed, letting the end come equally between the beam and the breaft hook: but in fhips that the bowfprit will allow of a whole beam, then the ports and the reft of the beams muft be confulted in order to fpace it; and when it fo happens that the fore maft comes in the wake of a port, then a beam arm muft be neceffarily introduced.

Having placed the beams according to the difpofition of the other beams below, the ladderways fhould be contrived: there fhould be one next abaft the fore hatchway, which is a fingle ladderway, and one next afore the main hatch, which is a double ladderway; the ladders ftanding the fore and aft way. There fhould alfo be another next abaft the after hatch, and one over the cockpit correfponding with that on the lower deck.

The capftans are next to be confidered; the after one is already placed on the lower deck, the barrel of which muft pafs through the upper deck to receive the whelps and drumhead there, it being a double capftan. In fhips having three decks, the upper part of each capftan is in the middle deck; but in fhips with one deck there is only this one capftan, the upper part of which is placed on the quarter deck. The foremoft capftan fhould be placed in the moft convenient fpot, to admit of its being lowered down to the orlop out of the way of the long boat: it may therefore be placed between the main and fore hatchways; the beam under the fixth port of the lower deck may form the aft fide of its room, and the beams on each fide of it fhould be placed exactly over or under the beams on the other decks, and they fhould be at a diftance from each other fufficient to let the drumheads pafs between them. The centre of the capftan fhould then be placed in the middle between the beams which compofe its room; and the partners fhould be fitted in fuch a manner as to fhift occafionally when wanted, which is by letting them be in two pieces fitted together. The partners on the lower deck, wherein the capftan fteps, muft be fupported by a pillar on the orlop deck, the lower part of which may be fitted in an oak chock; fo that when the pillar is taken away, and the capftan lowered down, that chock ferves as a ftep for the capftan. Thofe two beams on the orlop, by having the pillar and chock upon them, have therefore the whole weight of the capftan preffing downwards: for the fupport of them, there fhould be a carling placed underneath the fore and aft way, with three pillars, one under each beam, and one between; all of them being ftept in the kelfon, by which the orlop deck will be well fupported in the wake of the capftan, and the other decks will feel no ftrain from it.

The fire hearth is next to be difpofed; which is placed differently according to the fize of the fhip. In three-deckers it is found moft convenient to place it on the middle deck; whence there is much more room under the forecaftle than there would have been had it been placed there. In all two-deck fhips it is placed under the forecaftle, becaufe on the deck underneath the bits are in the way. It is alfo under the forecaftle in one-deck fhips, though confined between the bits: in this cafe it fhould be kept as near as poffible to the after bits, that there may be more room between it and the foremoft bits to make a good galley.

The pofitions of the main-topfail-fheet bits are next to be determined; the foremoft of which muft be fo placed as to let its forefide come againft the aft fide of the beam abaft the main hatchway, and to pafs down to the lower deck, and there ftep in the beams: admitting it to be a ftraight piece, it would come at the aft fide of the lower deck beam the fame as it does at the upper deck beam, in confequence of thofe two beams ranging well up and down with each other: it muft therefore have a caft under the upper deck beam, by which the lower part may be brought forward fufficient to ftop in the lower deck beam. The aftermoft muft be placed againft the forefide of the beam abaft the maft, and ftep on the beam below; but there is no neceffity to provide a crooked piece as before, for the beam of the upper deck may be moved a little farther aft, till it admit of the bit ftopping on the lower deck beam, unlefs the beam comes under a port, as in that cafe it muft not by any means be moved. The crofs pieces to the bits fhould be on the forefide, and in height from the upper deck about one-third of the height between it and the quarter deck. With regard to the heads of the bits, the length of the fhip's wafte fhould be confidered; and if there is length enough from the forecaftle to the foremoft bits to admit of the fpare geer being ftowed thereon without reaching farther aft, the quarter deck may then run fo far forward that the head of the foremoft bits fhall tenon in the foremoft beam; this gives the mainmaft another deck, and admits of the quarter deck being all that the longer: but if there is not the room before mentioned, then the quarter deck muft run no further forward than the after bits, which will then tenon in the foremoft beam; and the foremoft bits muft have a crofs piece let on their heads, which is termed a *horfe*, and will be for the purpofe of receiving the ends of the fpare geer.

The length of the quarter deck being now determined, the beams are then to be placed. For this purpofe the feveral contrivances in the quarter deck muft be previoufly confulted. It is neceffary to obferve, that there are neither carlings nor lodges, the carlings of the hatches excepted, in the quarter deck, round-houfe, and forecaftle; as they would weaken inftead of ftrengthening the beams, which fhould be as fmall as the fize of the fhip will permit, in order that the upper works may be as light as poffible. Hence, as there are to be neither carlings nor lodges, the deck will require a greater number of beams, and a good round up, as on the contrary the deck will be apt to bend with its own weight. The moft approved rule is therefore to have double the number of beams in the quarter deck as there are in a fpace of the fame length in the upper deck.

Then proceed to fhift the beams to the beft advantage, Application of the foregoing Rules to the Construction of Ships

tage, consulting the hatchways, ladder-ways, masts, bits, wheel, &c. With respect to the ladder-ways on the quarter decks of all ships, there should be one near the fore part of the great cabin for the officers, and another near the foremost end of the quarter deck, consisting of double ladders for the conveyance of the men up from the other decks in cases of emergency; and likewise one on each side of the fore part of the quarter deck from the gangway: and in every ship of the line all the beams from the foremost ladder-way to the after one should be open with gratings, both for the admission of air, and for the greater expedition of conveying different articles in the time of action.

Two scuttles are to be disposed one on each side of the mainmast, if it happens to come through the quarter deck, for the top tackles to pass through, to hook to the eye bolts drove in the upper deck for that purpose.

The steering wheel should be placed under the forepart of the roundhouse, and the two beams of the quarter deck, which come under it, should be placed conformable to the two uprights, so that they may tenon in them. The quarter deck beams should be kneed at each end with one hanging and one lodging knee; which adds greatly to the strength of the side. The hanging knees which come in the great cabin may be of iron; their vertical arms to be two-thirds of the length of that of wood, and to reach the spirketing. It should be observed, that the beam abaft, which comes under the screen bulkhead, should round aft agreeable to the round of the bulkhead, for the support of the same.

The forecastle beams should be placed according as the works of the deck will admit. The hatchways are therefore to be considered first. There should be one for the funnel of the fire hearth to pass through, and one for the copper to admit of vent for the steam; and also one or two over the galley as the forecastle will admit of. The fore-topsail-sheet bits should be so disposed as to come one pair on the fore and one on the aft side of the mast, to let into the side of the forecastle beams, and step on the upper deck beams below: there should also be a ladder-way at the fore part of the forecastle for the conveniency of the fore part of the ship.

The beams may now be placed agreeable thereto, their number being four more than there are in a space in the upper deck equal in length to the forecastle; and where there happens to be a wide opening between the beams, as in the case of a hatchway, mast room, &c. then half a beam of fir may be introduced to make good the deficiency. The foremost beam should be of a breadth sufficient to take the aft side of the inboard arms of the catheads, as they are secured upon this beam by being bolted thereto. Every beam of the forecastle should be kneed at each end with one hanging and one lodging knee: the vertical arms of the hanging knees should reach the spirketing, and the knees well bolted and carefully clenched.

Proceed to the roundhouse; the same things being observed with respect to the beams as in the quarter deck: for as the roundhouse beams are sided very small, it hence follows that they must be near to each other. Let therefore the number of beams on the roundhouse be four more than in the same length of the quarter deck; every other beam being of fir for lightness, and every oak beam may be kneed at each end with one hanging and one lodging knee; the hanging knees abaft may be of iron, their vertical arms to be in length two thirds of those of wood. The roundhouse should always have a great round up, both for strength and conveniency. There must be on the roundhouse a small pair of knee-bits on each side of the mizenmast, turned round and scarfed over each other, and bolted through the mast carlings. There must also be a companion on the roundhouse placed over the middle of the coach, in order to give light thereto.

Application of the foregoing Rules to the Construction of Ships.

With regard to placing the roundhouse beams, the uprights of the steering wheel and the mizenmast are to be observed; as when the beams which interfere with those parts are properly spaced, the rest may be disposed of at discretion, or at an equal distance from each other, and letting the beam over the screen bulkhead have a proper round aft, agreeable to the quarter deck beam underneath.

The upper parts of the inboard works being now described, proceed next to the lower parts, or to those which come below the lower deck. Draw in the orlop, by taking the heights afore, at midships, and abaft, between that and the gun-deck, from the dimensions, and a curve described through these points will represent the upper part of the deck. Set off the thickness of the plank below, and the under side of the plank will be represented. As this deck does not run quite forward and aft as the other decks, the length of it must be therefore determined; for this purpose let the after beam be placed at a sufficient distance from aft to admit of the bread rooms being of a proper size for the ship, which will be under that beam of the gun-deck that comes at the second part from aft. The after beam being drawn in, proceed to space the other beams, placing them exactly under those of the gun-deck; and that which comes under the foremost beam of the gun-deck may terminate the fore part of the orlop. Draw the limber strake, by setting off its thickness above the cutting down line, and a line drawn parallel thereto will represent the limber strake. That part of the orlop which is over the after magazine, spirit room, and fish room, and also that which is over the fore magazine, is laid with thicker planks than the rest of the deck; which is for the better security of those places, the planks being laid over the beams; but in the midships, from the fore part of the spirit room to the aft part of the fore magazine, the beams are laid level with the surface of the deck, and the planks are rabbeted in from one beam to the other.

In order to represent the orlop as just described, the dimensions of the different apartments above mentioned must be determined: Let the aft side of the after beam be the aft side of the after magazine, and from thence draw the bulkhead down to the limber strake; and the foreside of the third beam may be the foreside of the after magazine, drawing that bulkhead likewise, which will also form the aft side of the fish room; the foreside of the fish room may be drawn from the aft side of the fifth beam, which will also represent the aft side of the spirit room; then the foreside of the spirit room may be drawn from the foreside of the sixth beam. Hence from the foreside of the sixth beam quite aft the deck will

Application of the foregoing Rules to the Construction of Ships.

will be represented by the two lines already drawn, and the upper side of the beams will be represented by the lower line.

Proceed next to the fore part of the orlop, letting the foreside of the after bits be the aft part of the foremost magazine, drawing the bulkhead thereof, which will come to the aft side of the sixth beam; therefore, from the sixth beam to the foremost end of the orlop, the plank and beams will be represented just in the same manner as before mentioned for the after part of the orlop: then the midship part of the deck will be represented by letting the upper line be the upper side of the plank, and likewise the upper side of the beams; and the lower line will represent the lower edge of the plank, only drawing it from beam to beam, and observing not to let it pass through them.

The hatchways, &c. may now be represented on the orlop, letting the main, fore, and after hatchway, be exactly under those of the gun-deck: there must be one over the fish room, and one over the spirit room. There must be two scuttles over the after magazine for the passage to the magazine and light room. There should also be one afore the fourth beam from forward for the passage to the fore magazine, and one abaft the second beam for the passage to the light room.

The bulkheads for the fore and after parts of the well may be drawn from the lower deck beams to the orlop, and from thence to the limber strake in the hold. The shot lockers may also be represented, having one afore and one abaft the well: there should also be one abaft the foremost magazine, the ends of which may be formed by the after bits. The steps of the masts may be drawn in by continuing their centres down to the limber strake; and likewise two crutches abaft the mizen step divided equally between that and the after part of the cutting down: the breast hooks may also be drawn letting them be five in number below the lower deck hook, and all equally divided between that and the fore step. Hence every part of the inboard is described as far as necessary.

Chap. V. *Of the Method of Whole-moulding.*

46 Method of whole-moulding. *Murray's Ship-Building.*

Having now finished the methods of laying down the several plans of a ship, any farther addition on this subject might appear unnecessary. We cannot, however, with propriety, omit to describe the method called *whole-moulding*, used by the ancients, and which still continues in use among those unacquainted with the more proper methods already explained. This method will be illustrated by laying down the several plans of a long-boat; the length of the keel being 29 feet, and breadth moulded nine feet.

47 Applied to a long boat. Plate CCCCXCIII Fig. 37.

Draw the straight line PO (fig. 37.) equal to 29 feet, the extreme length of the boat, and also to represent the upper edge of the keel. Let ⊕ be the station of the midship frame. From the points, P, ⊕, and O, draw the lines PT, ⊕M, and OS, perpendicular to PO. Make ⊕M, ⊕N, equal to the upper and lower heights of breadth respectively at the main frame, PT the height of breadth at the transom, and OS the height at the stem. Describe the curve TMS to represent the sheer or extreme height of the side, which in a ship would be called the *upper height of breadth line*, or upper edge of the wale. Through the point N draw a curve parallel to TMS, to represent the breadth of the upper strake of a boat, or lower edge of the wale if in a ship. The dotted line TNS may also be drawn to represent the lower height of breadth.

Method of Whole-moulding.

Set off the rake of the port from P to p, and draw the line $p\,t$ to represent the aft side of the port; then T t will represent the round-up of the transom. Set off the breadth of the port from p to r, and from T to s, and draw the line r s to represent the foreside of the port, which may either be a curve or a straight line at pleasure. Set up the height of the tuck from p to k. Let k X be the thickness of the transom, and draw the line ZX to represent the foreside of the transom.

There is given the point S, the height of the sheer on the foreside of the stem; now that side of the stem is to be formed either by sweeps or some other contrivance. Set off the breadth of the stem, and form the aft side of it.

Set up the dead-rising from ⊕ to d, and form the rising line r i s. Draw the line KL parallel to PO to represent the lower edge of the keel, and another to represent the thickness of the plank or the rabbet. The rabbet on the post and stem may also be represented; and the stations of the timbers assigned, as ⊕, (1), 1, 2, 3, 4, 5, 6, 7, 8, 9; and ⊕, (A), A, B, C, D, E, F, G, H; and the sheer plan will be completed.

The half-breadth plan is to be formed next; for this purpose the perpendiculars TP, 9, 8, &c. must be produced. Upon M⊕ produced set off the half breadth from the line KL to R (fig. 38.); set off also the half breadth at the transom from K to b, and describe the extreme half-breadth line b RX, making the forepart of the curve agreeable to the proposed round of the transom. Fig. 38.

We may next proceed to form the timbers in the body plan. Let AB (fig. 39.) be the breadth moulded at ⊕. Erect the perpendicular CD in the middle of the line AB; draw the line $m\,n$ distant therefrom the half thickness of the post, and $x\,y$ the half thickness of the stem. Then take off the several portions of the perpendiculars ⊕, 1, 2, &c. intercepted between the upper edge of the keel and the rising line in the sheer plan, and set them up from C upon the line CD; through these points draw lines parallel to AC; take off also the several lower heights of breadth at ⊕, 1, 2, &c. from the sheer plan; and set them up from C upon the middle line in the body plan; and draw lines parallel to AC through these points: Then take off the several half breadths corresponding to each from the floor plan; and set them off on their proper half-breadth lines from the middle line in the body plan. Fig. 39.

Construct the midship frame by Problem V. the form of which will in some measure determine the form of the rest. For if a mould be made on any side of the middle line to fit the curve part of it, and the rising line, or that marked *bend mould* (fig. 40.), and laid in such a manner that the lower part of it, which is straight, may be set upon the several rising lines, and the upper part just touch the point of the half breadth in the breadth line corresponding to that rising upon which the mould is placed, a curve may then be drawn by the mould to the rising line. In this manner we may proceed so far as the rising line is parallel to the lower height of the breadth line. Then a hollow mould must be made, the upper end of which is left straight, as that Fig. 40.

Method of Whole-moulding.

that marked *hollow mould* (fig. 40.). This is applied in such a manner, that some part of the hollow may touch the side of the keel, and the straight part touch the back of the curve before described by the bend mould; and, beginning abaft, the straight part will always come lower on every timber, till we come to the midship timber, when it comes to the side of the keel. Having thus formed the timbers, so far as the whole mouldings will serve, the timbers abaft them are next formed. Their half breadths are determined by the sheer and floor plans, which are the only fixed points through which the curves of these timbers must pass. Some form these after timbers before the whole is moulded, and then make the hollow mould, which will be straighter than the hollow of either of these timbers. It is indifferent which are first formed, or what methods are used; for after the timbers are all formed, though every timber may appear very fair when considered by itself, it is uncertain what the form of the side will be. In order to find which, we must form several ribband and water lines; and if these do not make fair curves, they must be rectified, and the timbers formed from these ribband and water lines. In using the hollow mould, when it is applied to the curve of each timber, if the straight part is produced to the middle line, we shall have as many points of intersection as there are timbers; and if the heights above the base be transferred to the corresponding timbers in the sheer plan, a curve passing through these points is what is called a *rising strait*. This may be formed by fixing a point for the aftermost timber that is whole moulded, and transferring that height to the sheer plan. The curve must pass through this point, and fall in with the rising line somewhere abaft dead flat; and if the several heights of this line be transferred from the sheer to the middle line in the body plan, these points will regulate what is called the *hauling down* of the hollow mould.

The timbers in the after body being all formed, those in the fore body are formed in the same manner, by transferring the several heights of the rising and breadth lines from the sheer to the body plans; the half breadths corresponding to each height must also be transferred from the floor to the body plan. The same hollow mould will serve both for the fore and after body; and the level lines, by which the water lines to prove the after body were formed, may be produced into the fore body, and by them the water lines to prove the fore body may be described.

Another method of proving the body is by ribband lines, which are formed by sections of planes inclined to the sheer plan, and intersecting the body plan diagonally, as before observed, of which there may be as many as may be judged necessary. As this has been already explained, we shall therefore lay down only one, represented in the body plan by the lines marked d i a. These are drawn in such a manner as to be perpendicular to as many timbers as conveniently may be. After they are drawn in the body plan, the several portions of the diagonal intercepted between the middle line and each timber must be transferred to the floor plan. Thus, fix one foot of the compasses in the point where the diagonal intersects the middle line in the body plan; extend the other foot to the point where the diagonal intersects the timber; for example, timber 9: Set off the same extent upon the perpendicular representing the plane of timber 9 from the point where it intersects the line KL on the floor plan: in like manner proceed with all the other timbers both in the fore and after body; and these shall have the points through which the curve must pass. If this should not prove a fair curve, it must be altered, observing to conform to the points as nearly as the nature of the curve will admit: so it may be carried within one point, and without another, according as we find the timbers will allow. For after all the ribband lines are formed, the timbers must, if needful, be altered by the ribband lines: this is only the reverse of forming the ribband lines; for taking the portions of the several perpendiculars intercepted between the line KL and the curve of the ribband line in the floor plan, and setting them off upon the diagonal from the point where it intersects the middle line, we shall have the points in the diagonal through which the curves of the timbers must pass. Thus the distance between the line KL and the ribband at timber 3 on the floor plan, when transferred to the body plan, will extend on the diagonal from the middle line to the point where the curve of timber 3 intersects that diagonal. The like may be said of all the other timbers; and if several ribband lines be formed, they may be so contrived that their diagonals in the body plan shall be at such distances, that a point for every timber being given in each diagonal, will be sufficient to determine the form of all the timbers.

In stationing the timbers upon the keel for a boat, there must be room for two futtocks in the space before or abaft ⊕; for which reason, the distance between these two timbers will be as much more than that between the other as the timber is broad. Here it is between ⊕ and (A); which contains the distances between ⊕ and (1), and the breadth of the timber besides.

The timbers being now formed, and proved by ribband and water lines, proceed then to form the transom, fashion-pieces, &c. by Problem VI.

This method of whole moulding will not answer for the long timbers afore and abaft. They are generally canted in the same manner as those for a ship. In order to render this method more complete, we shall here describe the manner of moulding the timbers after they are laid down in the mould loft, by a rising square, bend, and hollow mould.

It was shown before how to form the timbers by the bend and hollow moulds on the draught. The same method must be used in the loft; but the moulds must be made to their proper scantlings in real feet and inches. Now when they are set, as before directed, for moulding each timber, let the middle line in the body plan be drawn across the bend mould, and draw a line across the hollow mould at the point where it touches the upper edge of the keel; and let them be marked with the proper name of the timber, as in fig. 40. The graduations of the bend mould will therefore be exactly the same as the narrowing of the breadth. Thus, the distance between ⊕ and 7 on the bend mould is equal to the difference between the half breadth of timber 7 and that of ⊕. The height of the head of each timber is likewise marked on the bend mould, and also the floor and breadth firmarks. The floor firmark is in that point where a straight edged batten touches the back

back of the bend mould, the batten being ſo placed as to touch the lower edge of the keel at the ſame time. The ſeveral riſings of the floor and heights of the cutting down line are marked on the riſing ſquare, and the half breadth of the keel is ſet off from the ſide of it.

The moulds being thus prepared, we ſhall apply them to mould timber 7. The timber being firſt properly ſided to its breadth, lay the bend mould upon it, ſo as may beſt anſwer the round according to the grain of the wood; then lay the riſing ſquare to the bottom of the bend mould, ſo that the line drawn acroſs the bend mould at timber 7 may coincide with the line repreſenting the middle of the keel upon the riſing ſquare; and draw a line upon the timber by the ſide of the ſquare, or let the line be ſcored or cut by a tool made for that purpoſe, called a *raſeing knife* (E); this line ſo raſed will be the ſide of the keel. Then the ſquare muſt be moved till the ſide of it comes to 7 on the bend mould, and another line muſt be raiſed in by the ſide of it to repreſent the middle of the keel. The other ſide of the keel muſt likewiſe be raſed after the ſame manner, and the point 7 on the riſing ſquare be marked on each ſide of the keel, and a line raſed acroſs at theſe points to repreſent the upper edge of the keel. From this line the height of the cutting-down line at 7 muſt be ſet up, and then the riſing ſquare may be taken away, and the timber may be raiſed by the bend mould, both inſide and outſide, from the head to the floor firmark, or it may be carried lower if neceſſary. After the firmarks and head of the timbers are marked, the bend mould may likewiſe be taken away, and then the hollow mould applied to the back of the ſweep in ſuch a manner that the point 7 upon it may interſect the upper ſide of the keel, before ſet off by the riſing ſquare; and when in this poſition the timber may be raſed by it, which will complete the outſide of the timbers. The inſide of the timbers may likewiſe be formed by the hollow mould. The ſcantling at the keel is given by the cutting down before ſet off. The mould muſt be ſo placed as to touch the ſweep of the inſide of the timber formed before by the bend mould, and paſs through the cutting down point.

The uſe of the firmarks is to find the true places of the futtocks; for as they are cut off three or four inches ſhort of the keel, they muſt be ſo placed that the futtock and floor firmarks may be compared and coincide. Notwithſtanding which, if the timbers are not very carefully trimmed, the head of the futtock may be either within or without its proper half breadth; to prevent which a half breadth ſtaff is made uſe of.

The half breadth ſtaff may be one inch ſquare, and of any convenient length. Upon one ſide of it are ſet off from one end the ſeveral half-breadths of all the timbers in the after body, and theſe of the fore body upon the oppoſite ſide. On the other two ſides are ſet off the ſeveral heights of the ſheer, the after body on one ſide, and the fore body on its oppoſite. Two ſides of the ſtaff are marked *half breadths*, and the other two ſides *heights of the ſheer*.

The ſtaff being thus prepared, and the floor timbers faſtened on the keel, and levelled acroſs, the futtocks muſt next be faſtened to the floor timbers; but they muſt be ſet firſt to their proper half breadth and height. The half breadth ſtaff, with the aſſiſtance of the ram-line *, ſerves to ſet them to the half breadth; for as the keel of a boat is generally perpendicular to the horizon, therefore the line at which the plummet is ſuſpended, and which is moveable on the ram line, will be perpendicular to the keel. Whence we may by it ſet the timbers perpendicular to the keel, and then ſet them to their proper half breadths by the ſtaff: and when the two firmarks coincide, the futtock will be at its proper height, and may be nailed to the floor timbers, and alſo to the breadth ribband, which may be ſet to the height of the ſheer by a level laid acroſs, taking the height of the ſheer by the ſtaff from the upper ſide of the keel; by which means we ſhall diſcover if the ribband is exactly the height of the ſheer; and if not, the true height may be ſet off by a pair of compaſſes from the level, and marked on the timbers.

* See next chapter.

CHAP. VI. *Of the Practice of Ship-building.*

THE elevation, projection, and half breadth plans, of a propoſed ſhip being laid down on paper, we muſt next proceed to lay down theſe ſeveral plans on the mould loft of the real dimenſions of the ſhip propoſed to be built, and from which moulds for each ſeparate part are to be made. The method of laying down theſe plans, from what has been already ſaid, will, it is preſumed, be no very difficult taſk to accompliſh, as it is no more than enlarging the dimenſions of the original draughts; and with reſpect to the moulds, they are very eaſily formed agreeable to the figure of the ſeveral parts of the ſhip laid down in the mould loft.

Blocks of wood are now to be prepared upon which the keel is to be laid. Theſe blocks are to be placed at nearly equal diſtances, as of five or ſix feet, and in ſuch a manner that their upper ſurfaces may be exactly in the ſame plane, and their middle in the ſame ſtraight line. This laſt is eaſily done by means of a line ſtretched a little more than the propoſed length of the keel; and the upper planes of theſe blocks may be verified by a long and ſtraight rule; and the utmoſt care and precaution muſt be taken to have theſe blocks properly bedded. Each block may be about ſix or eight inches longer than the keel is in thickneſs; their breadth from 12 to 14 inches, and their depth from a foot to a foot and half.

The dimenſions of the keel are to be taken from the mould loft, and the keel is to be prepared accordingly. As, however, it is ſeldom poſſible to procure a piece of wood of ſufficient length for a keel, eſpecially if for a large ſhip, it is, therefore, for the moſt part neceſſary to compoſe it of ſeveral pieces, and theſe pieces are to be ſcarfed together, and ſecurely bolted, ſo as to make one entire piece. It muſt, however, be obſerved, that the pieces which compoſe the keel ought to be of ſuch lengths, that a ſcarf may not be oppoſite to the ſtep of any of the maſts. Rabbets are to be formed on each ſide of the keel to receive the edge of the planks next to

(E) The term *raſeing* is uſed when any line is drawn by ſuch an inſtrument inſtead of a pencil.

Practice of Ship-building.

to it, or garboard ſtrake, and the keel is to be laid on the blocks (F).

The ſtem, and the poſt, and the ſeveral tranſoms belonging to it, are to be prepared from the moulds, and rabbeted in like manner as the keel, to receive the ends of the plank. The tranſoms are to be bolted to the poſt at their middle, each at its reſpective height, taken from the elevation in the mould loft, and the extremities of the tranſoms are to be firmly connected with the faſhion-pieces. Both ſtem and poſt are then to be erected, each at its reſpective extremity of the keel. The tenons at the heel of each being let into mortiſes prepared to receive them, and being ſet to their proper rakes or angles with the keel, are to be ſupported by props or ſhores. Pieces of wood called *dead wood* are to be laid upon and fixed to the upper ſide of the keel towards the fore and aft parts of it; the deepneſs of the dead wood increaſing with its diſtance from the middle, agreeable to the propoſed form of the cutting-down line.

A line is to be ſtretched from the middle of the head of the ſtem to that of the poſt, called the *ram line*, upon which is a moveable line with a plummet affixed to it. The midſhip and other frames are to be erected upon the keel at their proper ſtations. The extremities of each frame are ſet at equal diſtances from the vertical longitudinal ſection of the ſhip, by moving the frame in its own plane until the plumb-line coincides with a mark at the middle between the arms of each frame; and although the keel is inclined to the horizon, yet the frames may alſo be ſet perpendicular to the keel by means of the plumb-line. The ſhores which are ſupporting the frames are now to be ſecurely fixed, that the poſition of the frames may not be altered. The ribbands are now to be nailed to the frames at their proper places, the more effectually to ſecure them; and the intermediate vacancies between the frames filled up with filling timbers. For a perſpective view of a ſhip framed, ſee fig. 2.

Plate cccclxxxiv. Fig. 2.

The frames being now ſtationed, proceed next to fix on the planks, of which the wales are the principal, being much thicker and ſtronger than the reſt. The harpins, which may be conſidered as a continuation of the wales at their fore ends, are fixed acroſs the hawſe pieces, and ſurround the fore part of the ſhip. The planks that incloſe the ſhip's ſides are then brought about the timbers; and the clamps, which are of equal thickneſs with the wales, fixed oppoſite to the wales within the ſhip. Theſe are uſed to ſupport the ends of the beams, and accordingly ſtretch from one end of the ſhip to the other. The thick ſtuff or ſtrong planks of the bottom within board are then placed oppoſite to the ſeveral ſcarfs of the timbers, to reinforce them throughout the ſhip's length. The planks employed to line the ſhip, called the *ceiling* or *foot-waling*, is next fixed in the intervals between the thick ſtuff of the hold. The beams are afterwards laid acroſs the ſhip to ſupport the decks, and are connected to the ſide by lodging and hanging knees: the former of which are exhibited at F, Plate CLXIX. See alſo the article DECK; and the hanging-knees, together with the breadth, thickneſs, and poſition of the keel, floor timbers, futtocks, top-timbers, wales, clamps, thick ſtuff, planks within and without, beams, decks, &c.

The croſs-pillars being next erected, the *carlings* and *ledges*, repreſented in Plate CLXIX. are diſpoſed between the beams to ſtrengthen the deck. The *water-ways* are then laid on the ends of the beams throughout the ſhip's length, and the ſpirketing fixed cloſe above them.—The upper deck is then planked, and the *ſtring* placed under the *gunnel*, or *plankſheer*, in the waiſt.

Then proceed next to plank the quarter-deck and forecaſtle, and to fix the *partners* of the maſts and capſterns with the *coamings* of the hatches. The *breaſt-hooks* are then bolted acroſs the ſtem and bow within-board, the ſtep of the foremaſt placed on the kelſon, and the *riders* fayed to the inſide of the timbers, to reinforce the ſides in different parts of the ſhip's length. The *pointers*, if any, are afterwards fixed acroſs the hold diagonally to ſupport the beams; and the crotches ſtationed in the after hold to unite the half timbers. The *ſteps* of the mainmaſt and capſterns are next placed; the planks of the lower deck and orlop laid; the *navel-hoods* fayed to the hawſe holes; and the *knees of the head*, or cut-water, connected to the ſtem. The figure of the head is then erected, and the *trail-board* and cheeks fixed on the ſide of the knee.

The *taffarel* and *quarter-pieces*, which terminate the ſhip abaft, the former above and the latter on each ſide, are then diſpoſed, and the ſtern and quarter galleries framed and ſupported by their brackets. The *pumps*, with their well, are next fixed in the hold; the *limber boards* laid on each ſide of the kelſon, and the *garboard ſtrake* fixed on the ſhip's bottom next to the keel without.

The hull being thus fabricated, proceed to ſeparate the apartments by bulkheads or partitions, to frame the port-lids, to fix the catheads and cheſs-trees; to form the hatchways and ſcuttles, and fit them with proper covers or gratings. Next fix the ladders at the different hatchways, and build the manger on the lower deck, to carry off the water that runs in at the hawſe-holes when the ſhip rides at anchor in a ſea. The bread-room and magazines are then lined; and the gunnel, rails, and gangways fixed on the upper part of the ſhip. The cleats, kevels, and ranges, by which the ropes are faſtened, are afterwards bolted or nailed to the ſides in different places.

The rudder, being fitted with its irons, is next hung to the ſtern-poſt, and the tiller or bar, by which it is managed, let into a mortiſe at its upper end. The *ſcuppers*, or leaden tubes, that carry the water off from the decks, are then placed in holes cut through the ſhip's ſides; and the *ſtandards* bolted to the beams and ſides above the decks to which they belong. The poop lanthorns are laſt fixed upon their cranes over the ſtern, and the *bilge-ways* or *cradles* placed under the bottom to conduct the ſhip ſteadily into the water whilſt launching.

As

(F) In ſhips of war, which are a long while in building, it has been found that the keel is often apt to rot before they are finiſhed. Upon this account, therefore, ſome builders have begun with the floor timbers, and added the keel afterwards.

Improvements in the Masts and Rudder.

As the various pieces which have been mentioned above are explained at large in their proper places, it is therefore superfluous to enter into a more particular description of them here.

CHAP. VII. *Of Improvements in the Masts and Rudder.*

48 Improvements in masts.

AN account of a method for restoring masts of ships when wounded, or otherwise injured, in an easy, cheap, and expeditious manner, by Captain Edward Pakenham of the royal navy, has been published in the tenth volume of the Transactions of the Society for the Encouragement of Arts, &c. Captain Pakenham introduces his invention with the following observations:

49 Of wounded masts, by Captain Pakenham. Page 209.

"Among the various accidents which ships are liable to at sea, none call more for the attention and exertion of the officer than the speedy refitting of the masts; and having observed, in the course of last war, the very great destruction made among the lower masts of our ship's from the enemy's mode of fighting, as well as the very great expence and delay in refitting a fleet after an action, particularly across the Atlantic—a very simple expedient has suggested itself to me as a resource in part; which appears so very speedy and secure, that the capacity of the meanest sailor will at once conceive it. I therefore think it my duty to state my ideas of the advantages likely to result from it; and I shall feel myself exceedingly happy should they in anywise contribute to remedy the evil.

"My plan, therefore, is, to have the heels of all lower masts so formed as to become the heads: but it is not the intention of the above plan to have the smallest alteration made in the heels of the present lower masts; for as all line-of-battle ships masts are nine inches in diameter larger at the heel than at the head, it will follow, that by letting in the tressel-trees to their proper depth, the mast will form its own cheeks or hounds; and I flatter myself the following advantages will result from the above alteration.

First, I must beg to observe, that all line-of-battle ships bury one third of their lower masts, particularly three-deckers; it therefore follows, that if the wounds are in the upper third, by turning the mast so as to make the heel the head, it will be as good as new; for, in eight actions I was present in last war, I made the following observations:

"That in the said actions fifty-eight lower masts were wounded, and obliged to be shifted, thirty-two of which had their wounds in the upper third, and of course the ships detained until new masts were made. And when it is considered that a lower mast for a 90 or 74 stands government in a sum not less, I am informed, than 2000l. or 2300l. the advantages across the Atlantic resulting from the aforesaid plan will be particularly obvious; not to mention the probability of there being no fit spars in the country, which was the case in the instances of the Isis and Princess Royal; and as I was one of the lieutenants of the Isis at that time, I am more particular in the circumstance of that ship. The Isis had both her lower masts wounded above the cathar pins in her action with the Cæsar, a French 74; and as there were no spars at New York, the Isis was detained five weeks at that place.—Now, if her masts had been fitted on the plan I have proposed, I am confident she would have been ready for sea in 48 hours; and as a further proof, I beg leave to add, that the whole fleet, on the glorious 12th of April, had not the least accident of any consequence except what befel their lower masts, which detained them between eight and ten weeks at Jamaica.

Improvements in the Masts and Rudder.

"The delay of a ship while a new mast is making, and probably the fleet being detained for want of that ship, which frequently occurred in the course of last war, the taking of shipwrights from other work, with a variety of inconveniences not necessary to mention here, must be obvious to every officer that has made the smallest observations on sea-actions.

"You will further observe, that this substitute is formed on the most simple principle, fitted to the meanest capacity, and calculated to benefit all ships, from a first-rate down to the smallest merchantman, in cases of an accident by shot, a spring, a rottenness, particularly as these accidents generally happen in the upper third of the mast and above the cheeks.

"It might probably be objected, that a difficulty and some danger might arise from the wounded part of the mast being below; but this will at once be obviated, when it is remembered, that as the wounded part is below the wedges, it may with ease be both fished, cased, and secured, to any size or degree you please, with the addition of its being wedged on each deck."

Fig. 41. represents a mast of a first-rate in its proper state, the figures representing its thickness at the different divisions. Plate CCXCIII, Fig. 41.

Fig. 42. the same mast inverted, the heel forming the head, and the tressel-trees let into their proper depth, the additional thickness of the mast forming its own cheeks. Fig. 42.

Fig. 43. the proposed mast, the figures representing the thickness of the mast in the proposed alterations; *a*, the heel made square; *b*, the letting in of the tressel-trees; *c*, the third proportion of thickness continued up to where the fourth is in the present mast, or at least some little distance above the lower part of the cheeks, which is always looked upon as the weakest part of the mast; and by its being so proportioned, the mast, when turned, will be nearly as strong in the partners as before. Fig. 43.

As the expence of a mast is much greater than is generally imagined, it is therefore thought proper to subjoin the following statement of the several articles used in making a 74 gun ship's mainmast.

Papers on Naval Architecture. Part 2.

Mr Gordon's plan of building maſts.

In order to leſſen the enormous expence of maſts, a propoſal was made ſome years ago to conſtruct them hollow; and the author having premiſed ſeveral experiments which he had made, proceeds as follows:

"Galileo taught us, that the reſiſtance or ſtrength of a hollow cylinder is to that of a full cylinder, containing the ſame quantity of matter, as the total diameter of the hollow one is to the diameter of the full one; and theſe experiments ſhow us, that the ſtrength or reſiſtance of two or more pieces of wood, faſtened together at each end, and connected by a pillar, pillars, or framing, increaſes, at leaſt to a certain degree, *cæteris paribus*, as the diſtance between them and number of pillars, provided the force is applied in the line or direction of the pillars.

"It is ſurpriſing that this diſcovery of Galileo has not been made ſubſervient to more uſeful purpoſes. It is particularly applicable to the conſtruction of maſts, as not requiring that the hollow cylinder ſhould be made of one ſolid piece of wood (G).

"However, the foregoing experiments teach us, that the ſame advantages may be obtained by other forms beſides that of a cylinder; and that perhaps not only in a ſuperior degree, but likewiſe with greater facility of execution; as by adopting a ſquare figure, but more particularly by conſtructing them of ſeparate pieces of wood, placed at proper diſtances from each other, in the following or any other manner that may be found moſt convenient. Fig. 44, 45, and 46. exhibit each the tranſverſe ſection of a maſt, in which the ſmall circles repreſent the trees or upright pieces of wood, and the lines the beams or framing of wood, which are employed at proper places and at proper diſtances from each other, for connecting them together. Perhaps ſolid frames of wood, placed at proper diſtances from each other, and filling up the whole dotted ſpace, would anſwer better; in which event, the maſt could be ſtrongly hooped with iron at thoſe places, and the upright trees formed ſquare, or of any other convenient form.

Fig. 44.
Fig. 45.
Fig. 46.

"It will be evident to thoſe acquainted with this ſubject, that ſuch maſts would be greatly ſtronger than common ones containing the ſame quantity of materials. It is likewiſe evident that they would be leſs apt to ſpring, as being ſupported on a more extended baſe, and affording many conveniences for being better ſecured; and that they might be conſtructed of ſuch wood as at preſent would be deemed altogether improper for maſts: a circumſtance of importance to Britain at all times, but more particularly now, when there is ſuch difficulty in procuring wood proper for the kind of maſts in common uſe."

51
An improvement of the rudder.

An improvement in the rudder has lately taken place in ſeveral ſhips, particularly in ſome of thoſe in the ſervice of the Eaſt India Company. It will, however, be neceſſary previouſly to deſcribe the uſual form of the rudder, in order to ſhow the advantages it poſſeſſes when conſtructed agreeable to the improved method.

Papers on Naval Architecture, Part 1.
Fig. 47.

N° 1. (fig. 47.) repreſents the rudder according to the common method of conſtruction; in which AB is the axis of rotation. It is hence evident that a ſpace conſiderably greater than the tranſverſe ſection of the rudder at the counter muſt be left in the counter for the rudder to revolve in. Thus, let CAB (N° 2.) be the ſection of the rudder at the counter; then there muſt be a ſpace ſimilar to CDE in the counter, in order that the rudder may be moveable as required. Hence, to prevent the water from waſhing up the rudder caſe, a rudder coat, that is, a piece of tarred canvas, is nailed in ſuch a manner to the rudder and counter as to cover the intermediate ſpace: but the canvas being continually waſhed by the ſea, ſoon becomes brittle, and unable to yield to the various turns of the rudder without breaking; in which caſe the ſhip is of courſe left pervious to the waves, even of three or four feet high; in fact, there are few men bred to the ſea who have not been witneſſes to the bad effects of ſuch a ſpace being left ſo ill guarded againſt the ſtroke of the waves; and many ſhips have, with great probability, been ſuppoſed to founder at ſea from the quantity of water ſhipped between the rudder and counter.

Fig. 48.

It was to remedy this defect that the alteration above alluded to took place; which conſiſts in making the upper part AFG (fig. 48. N° 1.) of the rudder ABD cylindrical, and giving that part at the ſame time a caſt forward, ſo that the axis of rotation may by that means be the line AD, paſſing as uſual from E to D, through the centres of the braces which attach the rudder to the ſtern-poſt, and from E to A through the axis of the cylinder AFG, in order that the tranſverſe ſection KH (N° 2.) at the counter may be a circle revolving upon its centre; in which caſe the ſpace of half an inch is more than ſufficient between the rudder and the counter, and conſequently the neceſſity of a rudder coat entirely done away. But as it was foreſeen, that if the rudder

(G) The ſtrength of theſe cylinders would be ſtill further augmented by having ſolid pieces of wood placed within them at proper diſtances, and ſecurely faſtened to them, in the ſame manner, and on the ſame principles, that nature has furniſhed reeds with joints; and for anſwering, in ſome reſpects, the ſame purpoſe as the pillars in the experiments alluded to.

Load-water Line and Ship's Capacity.

rudder by an accident was unſhipped, this alteration might endanger the tearing away of the counter, the hole is made much larger than the tranſverſe ſection of the cylindric part of the rudder, and the ſpace between filled up with pieces of wood ſo fitted to the counter as to be capable of withſtanding the ſhock of the ſea, but to be eaſily carried away with the rudder, leaving the counter, under ſuch circumſtances, in as ſafe a ſtate as it would be agreeable in the preſent form of making rudders in the navy.

CHAP. VIII. *Upon the Poſition of the Load-water Line, and the Capacity of a Ship.*

See Hydrodynamics. THE weight of the quantity of water diſplaced by the bottom of a ſhip is equal to the weight of the ſhip with its rigging, proviſions, and every thing on board. If, therefore, the exact weight of the ſhip when ready for ſea be calculated, and alſo the number of cubic feet in the ſhip's bottom below the load-water line, and hence the weight of the water ſhe diſplaces; it will be known if the load-water line is properly placed in the draught.

Ship Builder's Repoſitory. The poſition of the ſhip in the draught may be either on an even keel, or to draw moſt water abaft; but an even keel is judged to be the beſt poſition in point of velocity, when the ſhip is conſtructed ſuitable thereto, that is, when her natural poſition is ſuch. For when a ſhip is conſtructed to ſwim by the ſtern, and when brought down to her load-water made to ſwim on an even keel (as is the caſe with moſt ſhips that are thus built), her velocity is by that means greatly retarded, and alſo her ſtrength greatly diminiſhed: for the fore-part being brought down lower than it ſhould be, and the middle of the ſhip maintaining its proper depth in the water, the after part is by that means lifted, and the ſhip is then upon an even keel: but in conſequence of her being out of her natural poſition, the after part is always preſſing downwards with a conſiderable ſtrain, which will continue till the ſhip's ſheer is entirely broken, and in time would fall into its natural poſition again: for which reaſon we ſee ſo many ſhips with broken backs, that is, with their ſheers altered in ſuch a manner that the ſheer rounds up, and the higheſt part is in the midſhips.

Such are the diſadvantages ariſing from not paying a due attention to thoſe points in the conſtruction of a draught; therefore, when the load-water line is found to be ſo ſituated at a proper height on the draught, according to the weight given for ſuch a ſhip, and alſo drawn parallel to the keel, as ſuppoſing that to be the beſt ſailing trim, the next thing is to examine whether the body is conſtructed ſuitable thereto, in order to avoid the above-mentioned ill conſequences.

In the firſt place, therefore, we muſt divide the ſhip equally in two lengthwiſe between the fore and after perpendiculars; and the exact number of cubic feet in the whole bottom beneath the load-water line being known, we muſt find whether the number of cubic feet in each part ſo divided is the ſame; and if they are found to be equal, the body of the ſhip may then be ſaid to be conſtructed in all reſpects ſuitable to her ſwimming on an even keel, let the ſhape of the body be whatever it will; and which will be found to be her natural poſition at the load-water line. But if either of the parts ſhould contain a greater number of cubic feet than the other, that part which contains the greateſt will ſwim the moſt out of the water, and conſequently the other will ſwim deepeſt, ſuppoſing the ſhip in her natural poſition for that conſtruction. In order, therefore, to render the ſhip ſuitably conſtructed to the load-water line in the draught, which is parallel to the keel, the number of cubic feet in the leſs part muſt be ſubtracted from the number contained in the greater part, and that part of the body is to be filled out till it has increaſed half the difference of their quantities, and the other part is to be drawn in as much: hence the two parts will be equal, that is, each will contain the ſame number of cubic feet, and the ſhip's body will be conſtructed in a manner ſuitable to her ſwimming on an even keel.

If it is propoſed that the ſhip laid down on the draught ſhall not ſwim on an even keel, but draw more water abaft than afore, then the fore and after parts of the ſhip's body below the load-water line are to be compared; and if theſe parts are unequal, that part which is leaſt is to be filled out by half the difference, and the other part drawn in as much as before.

It will be neceſſary, in the firſt place, to calculate the weight of a ſhip ready equipped for ſea, from the knowledge of the weight of every ſeparate thing in her and belonging to her, as the exact weight of all the timber, iron, lead, maſts, ſails, rigging, and in ſhort all the materials, men, proviſions, and every thing elſe on board of her, from which we ſhall be able afterwards to judge of the truth of the calculation, and whether the load-water line in the draught be placed agreeable thereto. This is indeed a very laborious taſk, upon account of the ſeveral pieces of timber, &c. being of ſo many different figures, and the ſpecific gravity of ſome of the timber entering the conſtruction not being preciſely determined.

In order to aſcertain the weight of the hull, the timber is the firſt thing which comes under conſideration: the number of cubic feet of timber contained in the whole fabric muſt be found; which we ſhall be able to do by help of the draught and the principal dimenſions and ſcantlings; obſerving to diſtinguiſh the different kinds of timber from each other, as they differ conſiderably in weight; then the number of cubic feet contained in the different ſorts of timber being reduced into pounds, and added, will be the weight of the timber. In like manner proceed to find the weight of the iron, lead, paint, &c. and the true weight of the whole will be found.

In reducing quantity to weight, it may be obſerved that a cubic foot of oak is equal to 66 pounds, and the ſpecific gravity of the other materials is as follows: *See Hydrodynamics.*

Weight of the men and ballast	1795361	801	1121
Sum - -	8182463	3652	1983

Agreeable to the above estimate, we find that the eighty gun ship, with every thing on board and fit for sea, when brought down to the load-water line, weighs 8,182,463 pounds, or nearly 3653 tons. It may now be known if the load-water line in the draught be properly placed, by reducing the immersed part of the body into cubic feet. For if the eighty gun ship, when brought down to the load-water line, weighs 3653 tons, the quantity of water displaced must also be 3653 tons: now a cubic foot of salt water being supposed to weigh 74 pounds, if therefore 8182463 be divided by 74, the quotient is 110573, the number of cubical feet which she must displace agreeable to her weight.

It is now necessary to find the number of cubic feet contained in the ship's bottom below the load-water line by calculation. If the bottom was a regular solid, this might be very easily done; but as it is otherwise, we must be satisfied with the following method by approximation, first given by M. Bouguer.

Take the lengths of every other of the lines that represent the frames in the horizontal plane upon the upper water line; then find the sum of these together, with half the foremost and aftermost frames. Now multiply that sum by the distance between the frames, and the product is the area of the water line contained between the foremost and aftermost frames: then find the area of that part abaft the after frame, which forms a trapezium, and also the post and rudder; find also the area of that part afore the foremost frame, and also of the stem and gripe; then these areas being added to that first found, and the sum doubled, will be the area of the surface of the whole water line. The reason of this rule will be obvious to those acquainted with the first principles of mathematics.

53 Method of calculating the contents of a ship.

The areas of the other water line may be found in the same manner: then the sum of all these areas, except that of the uppermost and lowermost, of which only one half of each must be taken, being multiplied by the distance between the water lines (these lines in the plane of elevation being equidistant from each other), and the product will be the solid content of the space contained between the lower and load-water lines.

Add

Load water Line and Ship's Capacity.

Add the area of the lower water line to the area of the upper side of the keel; multiply half that sum by the distance between them, the product will be the solid content of that part between the lower water line and upper edge of the keel, supposing them parallel to each other. But if the lower water line is not parallel to the keel, the above half sum is to be multiplied by the distance between them at the middle of the ship.

The solid contents of the keel must be next found, by multiplying its length by its depth, and that product by the breadth. Then the sum of these solid contents will be the number of cubic feet contained in the immersed part of the ship's bottom, or that part below the load water line.

Determination of the number of Cubic Feet contained in the Bottom of the Eighty Gun Ship. See Plates CCCCXC. and CCCCXCI.

54 Applied to the eighty-gun ship.

The fore body is divided into five, and the after body into ten, equal parts in the horizontal plane; besides the parts contained between the foremost timber and the stem, and the aftermost timber and the post. The plane of elevation is also divided into five equal parts by water lines drawn parallel to the keel. These water lines are also described upon the horizontal plane.

It is to be observed that there must be five inches added to each line that represents a frame in the horizontal plane for the thickness of the plank, that being nearly a mean between the thickness of the plank next the water and that on the lower part of the bottom.

Weight of the whole ship with every thing on board	8182463.8lbs.	

Tonnage of a Ship

As the weight of the ship, with every thing on board, found by this calculation, is equal to that found by estimate; it hence appears that the water line is properly placed in the draught. It now only remains to find whether the body is constructed suitably thereto, that is, whether the ship will be in her natural position when brought down to that line. For this purpose a perpendicular must be erected 27 feet ¼ inch. abaft dead flat, which will be the middle between the two perpendiculars and the place where the centre of gravity should fall, that the ship may swim on an even keel. The solidity of that part of the bottom contained between the said perpendicular and dead flat is then to be calculated, which will be found to be 25846 feet 7 inches.

Solidity of the bottom afore dead flat	36523 f.	4 in.
——— between the middle and dead flat	25846	7
Solid content of the fore part of the bottom	62369	11
Solidity of the bottom abaft dead flat	74050	6
——— between the middle and dead flat	25846	7
Solid content of the aft. part of the bot.	48203	11
——— fore part of the bottom	62369	11
Difference	14166	
Half	7083	

Hence the after part of the ship's bottom is too lean by 7083 cubic feet, and the fore part as much too full. The after part must therefore be filled out until it has received an addition of 7083 feet, and the fore part must be drawn in till it has lost the same quantity, and the bottom will then be constructed suitable to the ship's swimming on an even keel.

Chap. IX. *Of the Tonnage of a Ship.*

55 Proper method of calculating the tonnage of a ship.

This is a question of equal importance and difficulty. By the tonnage of a ship is meant the weight of every thing that can with safety and expediency be taken on board that ship for the purpose of conveyance; it is also called the *ship's burthen*; and it is totally different from the weight of the whole as she floats in the water. It is perhaps best expressed by calling it the *weight of the cargo*. It is of importance, because it is by this that the merchant or freighter judges of the fitness of

Tonnage of a Ship.

of the ship for his purpose. By this government judge of the ships requisite for transport service, and by this are all revenue charges on the ship computed. It is no less difficult to answer this question by any general rule which shall be very exact, because it depends not only on the cubical dimensions of the ship's bottom, but also on the scantling of her whole frame, and in short on the weight of every thing which properly makes part of a ship ready to receive on board her cargo. The weight of timber is variable; the scantling of the frame is no less so. We must therefore be contented with an average value which is not very remote from the truth; and this average is to be obtained, not by any mathematical discussion, but by observation of the burthen or cargo actually received, in a great variety of cases. But some sort of rule of calculation must be made out. This is and must be done by persons not mathematicians. We may therefore expect to find it incapable of being reduced to any principle, and that every builder will have a different rule. Accordingly the rules given for this purpose are in general very whimsical, measures being used and combined in a way that seems quite unconnected with stereometry or the measurement of solids. The rules for calculation are even affected by the interests of the two parties oppositely concerned in the result. The calculation for the tonnage by which the customs are to be exacted by government are quite different from the rule by which the tonnage of a transport hired by government is computed; and the same ship hired as a transport will be computed near one half bigger than when paying importation duties.

Yet the whole of this might be made a very simple business and very exact. When the ship is launched, let her light water line be marked, and this with the cubical contents of the immersed part be noted down, and be ingrossed in the deed by which the property of the ship is conveyed from hand to hand. The weight of her masts, sails, rigging, and sea-stores, is most easily obtained; and every builder can compute the cubical contents of the body when immersed to the load water line. The difference of these is unquestionably the burthen of the ship.

It is evident from what has been already said in the last chapter, that if the number of cubic feet of water which the ship displaces when light, or, which is the same, the number of cubic feet below the light water line, found by the preceding method of calculation, be subtracted from the number of cubic feet contained in the bottom below the load water line, and the remainder reduced to tons by multiplying by 74, the number of pounds in a cubic foot of sea water, and divided by 2240, the number of pounds in a ton, the quotient will be the tonnage.

But as this method is very troublesome, the following rule for this purpose is that which is used in the king's and merchants service.

56
Common rule.

Let fall a perpendicular from the foreside of the stem at the height of the hawse holes (H), and another perpendicular from the back of the main post at the height of the wing transom. From the length between these two perpendiculars deduct three-fifths of the extreme breadth (I), and also as many times 2½ inches as there are feet in the height of the wing transom above the upper edge of the keel; the remainder is the length of the keel for tonnage. Now multiply this length by the extreme breadth, and the product by half the extreme breadth, and this last product divided by 94 is the tonnage required.

Or, multiply the length of the keel for tonnage by the square of the extreme breadth, and the product divided by 188 will give the tonnage.

Calculation of the Tonnage of an Eighty Gun Ship.

57
Calculation of the tonnage of the eighty gun ship.

I. According to the true method.

Difference - -			95	72

58
The common rule gives the tonnage of ships of war greater, and of merchant ships less, than the truth.

Hence an eighty gun ship will not carry the tonnage she is rated at by about 95 tons. As the body of this ship is fuller than in ships of war in general, there is therefore a nearer agreement between the tonnages found by the two different methods. It may be observed that ships of war carry less tonnage than they are rated at by the common rule, and that most merchants ships carry

(H) In the merchant service this perpendicular is let fall from the fore side of the stem at the height of the wing transom, by reason of the hawse-holes being generally so very high in merchant ships, and their stems also having a great rake forward.

(I) The breadth understood in this place is the breadth from outside to outside of the plank.

Tonnage of a Ship.

a great deal more. In confirmation of this, it is thought proper to subjoin the dimensions of several ships, with the tonnage calculated therefrom.

Difference	148	2133

The impropriety of the common rule is hence manifest, as there can be no dependence on it for ascertaining the tonnage of vessels.

We shall now subjoin the following experimental method of finding the tonnage of a ship.

59 Experimental method of determining the tonnage of vessels.

Construct a model agreeable to the draught of the proposed ship, to a scale of about one fourth of an inch to a foot, and let the light and load water lines be marked on it. Then put the model in water, and load it until the surface of the water is exactly at the light water line; and let it be suspended until the water drains off, and then weighed. Now since the weights of similar bodies are in the triplicate ratio of their homologous dimensions, the weight of the ship when light is, therefore, equal to the product of the cube of the number of times the ship exceeds the model by the weight of the model, which is to be reduced to tons. Hence, if the model is constructed to a quarter of an inch scale, and its weight expressed in ounces; then to the constant logarithm 0,4893556, add the logarithm of the weight of the model in ounces, and the sum will be the logarithm of the weight of the ship in tons.

Again, the model is to be loaded until the surface of the water coincides with the load water line. Now the model being weighed, the weight of the ship is to be found by the preceding rule: then the difference between the weights of the ship when light and loaded is the tonnage required.

It

Tonnage of a Ship.

It will alſo be worth while to add the following exact rule of Mr Parkins, who was many years foreman of the ſhipwrights in Chatham dockyard.

1. *For Men of War.*

Take the length of the gun-deck from the rabbet of the ſtem to the rabbet of the ſtern-poſt. $\frac{23}{24}$ of this is to be aſſumed as the *length for tonnage*, = L.

Take the extreme breadth from outſide to outſide of the plank; add this to the length, and take $\frac{1}{21}$ of the ſum; call this the *depth for tonnage*, = D.

Set up this height from the limber ſtrake, and at that height take a breadth alſo from outſide to outſide of plank in the timber when the extreme breadth is found, and another breadth in the middle between that and the limber ſtrake; add together the extreme breadth and theſe two breadths, and take $\frac{1}{3}$ of the ſum for the breadth for tonnage, = D.

Multiply L, D, and B together, and divide by 49. The quotient is the burthen in tons.

The following proof may be given of the accuracy of this rule. Column 1. is the tonnage or burthen by the king's meaſurement; col. 2. is the tonnage by this rule; and, col. 3. is the weight actually received on board theſe ſhips at Blackſtakes:

Victory	100 guns.	2162	1839	1840
London	90	1845	1575	1677
Arrogant	74	1614	1308	1314
Diadem	64	1369	1141	965
Adamant	50	1044	870	886
Dolphin	44	879	737	758
Ampbion	32	667	554	549
Daphne	20	429	329	374

2. *For Ships of Burthen.*

Take the length of the lower deck from the rabbet of the ſtem to the rabbet of the ſtern-poſt; then $\frac{11}{12}$ of this is the length for tonnage, = L.

Add the length of the lower deck to the extreme breadth from outſide to outſide of plank; and take $\frac{1}{35}$ of the ſum for the depth for tonnage, = D.

Set up that depth from the limber ſtrake, and at this height take a breadth from outſide to outſide. Take another at $\frac{2}{3}$ of this height, and another at $\frac{1}{3}$ of the height. Add the extreme breadth and theſe three breadths, and take the 4th of the ſum for the breadth for tonnage, = B.

Multiply L, D, and B, and divide by $36\frac{2}{3}$. The quotient is the burthen in tons.

This rule reſts on the authority of many ſuch trials, as the following:

CHAP. X. *Of the Scale of Solidity.*

By this ſcale the quantity of water diſplaced by the bottom of the ſhip, for which it is conſtructed, anſwering to a given draught of water, is eaſily obtained; and alſo the additional weight neceſſary to bring her down to the load water line.

Scale of Solidity.

In order to conſtruct this ſcale for a given ſhip, it is neceſſary to calculate the quantity of water diſplaced by the keel, and by that part of the bottom below each water line in the draught. Since the areas of the ſeveral water lines are already computed for the eighty gun ſhip laid down in Plates CCCCXC. and CCCCXCI. the contents of theſe parts may hence be eaſily found for that ſhip, and are as follow.

Draught of water.			*Water diſplaced in*	
			Cubic feet.	*tons. lbs.*
Keel and falſe keel	2 f.	3 in.	660.9	21 1855
Diſt. bet. keel and 5th w. line	4	1	$8583.1\frac{1}{4}$	283 1233
Sum	6	4	$9243.10\frac{3}{4}$	305 848
Diſt. 5th and 4th w. line	4	1	$18657.8\frac{11}{48}$	616 828
Sum	10	5	$27901.7\frac{47}{48}$	921 1676
Diſt. 4th and 3d w. line	4	1	$23574.6\frac{17}{48}$	778 1795
Sum	14	6	$51476.2\frac{1}{4}$	1700 1231
Diſt. 3d and 2d w. line	4	1	$27812.1\frac{1}{24}$	918 1775
Sum	18	7	$79288.3\frac{21}{24}$	2619 766
Diſt. 2d and 1ſt w. line	4	1	$31285.7\frac{19}{24}$	1033 1218
Sum	22	8	$110573.11\frac{1}{4}$	3652 1984

Conſtruct any convenient ſcale of equal parts to repreſent tons, as ſcale N° 1. and another to repreſent feet, as N° 2.

Draw the line AB (fig. 36.) limited at A, but produced indefinitely towards B. Make AC equal to the depth of the keel, 2 feet 3 inches from ſcale N° 2. and through C draw a line parallel to AB, which will repreſent the upper edge of the keel; upon which ſet off C*c* equal to 21 tons 1855 lbs. taken from ſcale N° 1. Again, make AD equal to the diſtance between the lower edge of the keel and the fifth water line, namely, 6 feet 4 inches, and a line drawn through D parallel to AB will be the repreſentation of the lower water line; and make D*b* equal to 305 tons 848 lbs. the correſponding tonnage. In like manner draw the other water lines, and lay off the correſponding tonnages accordingly: then through the points A, *c*, *b*, *e*, *f*, *g*, *h*, draw the curve A*cbefgh*. Through *h* draw *h*B perpendicular to AB, and it will be the greateſt limit of the quantity of water expreſſed in tons diſplaced by the bottom of the ſhip, or that when ſhe is brought down to the load water line. And ſince the ſhip diſplaces 1788 tons at her light water mark, take therefore that quantity from the ſcale N° 1. which being laid upon AB from A to K, and KL drawn perpendicular to AB, will be the repreſentation of the light water

Plate CCCCXCII. 60

Conſtruction of the ſcale of ſolidity for the ſhip of eighty guns.

Scale of Solidity. water line for tonnage. Hence the scale will be completed.

61
Use of the above scale. Let it now be required to find the number of cubic feet displaced when the draught of water is 17 feet, and the number of additional tons necessary to bring her down to the load water mark.

Take the given draught of water 17 feet from the scale N° 2, which laid from it will reach to I; through which draw the line IMN parallel to AB, and intersecting the curve in AC; then the distance IM applied to the scale N° 1, will measure about 2248 tons, the displacement answerable to that draught of water; and MN applied to the same scale will measure about 1405 tons, the additional weight necessary to bring her down to the load water mark. Also the nearest distance between M and the line KL will measure about 460 tons, the weight already on board.

It will conduce very much to facilitate this operation to divide KB into a scale of tons taken from the scale N° 1, beginning at B, and also *h* L, beginning at *h*. Then when the draught of water is taken from the scale N° 2, and laid from it to I, as in the former example, and IMN drawn parallel to AB, and intersecting the curve in M. Now through M draw a line perpendicular to AB, and it will meet KB in a point representing the number of tons aboard, and also *h* L in a point denoting the additional weight necessary to load her.

Again, if the weight on board be given, the corresponding draught of water is obtained as follows.

Find the given number of tons in the scale KB, through which draw a line perpendicular to AB; then through the point of intersection of this line with the curve draw another line parallel to AB. Now the distance between A and the point where the parallel intersected AH being applied to the scale N° 2, will give the draught of water required.

Any other case to which this scale may be applied will be obvious.

BOOK II. *Containing the Properties of Ships*, &c.

CHAP. I. *Of the Equilibrium of Ships.*

SINCE the pressure of fluids is equal in every direction, the bottom of a ship is therefore acted upon by the fluid in which it is immersed; which pressure, for any given portion of surface, is equal to the product of that portion by the depth and density of the fluid: or it is equal to the weight of a column of the fluid whose base is the given surface, and the altitude equal to the distance between the surface of the fluid and the centre of gravity of the surface pressed. Hence a floating body is in equilibrio between two forces, namely, its gravity and the vertical pressure of the fluid; the horizontal pressure being destroyed.

Plate CCCCLIV. Let ABC (fig. 49.) be any body immersed in a fluid whose line of floatation is GH: hence the pressure of the fluid is exerted on every portion of the surface of the immersed part AFCH. Let EF, CD be any two small portions contained between the lines ED, FC, parallel to each other, and to the line of floatation GH: then the pressure exerted upon EF is expressed by $EF \times IK$, IK being the depth of EF or CD; the density of the fluid being supposed equal to 1. In like manner the pressure upon CD is equal to $CD \times IK$. Now since the pressure is in a direction perpendicular to the surface, draw therefore the line EL perpendicular to EF, and DM perpendicular to DC, and make each equal to the depth IK, below the surface. Now the effort or pressure of the fluid upon EF will be expressed by $EF \times EL$, and that upon CD by $CD \times DM$. Complete the parallelograms ON, QS, and the pressure in the direction EL is resolved into EN, EO, the first in a horizontal, and the second in a vertical direction. In like manner, the pressure in the direction DM is resolved into the pressures DS, DQ. Hence the joint effect of the pressures in the horizontal and vertical directions, namely, $EF \times EN$, and $EF \times EO$, will be equal to $EF \times EL$: For the same reason, $CD \times DP + CD \times DQ = CD \times DM$. But the parts of the pressures in a horizontal direction $EF \times EN$, and $CD \times DP$, are equal. For, because of the similar triangles ENL, ERF, and DPM, DSC, we have $\frac{EL}{EN} = \frac{EF}{FR}$ and $\frac{DM}{DP} = \frac{DC}{CS}$: Hence $DM \times CS = DP \times DC$, and $EL \times FR = EN \times EF$. Now since $EL = DM$, and $FR = CS$, therefore $EL \times FR = DM \times CS = DP \times DC = EN \times EF$. Hence since $EF \times EN = DP \times CD$, the effects of the pressures in a horizontal direction are therefore equal and contrary, and consequently destroy each other. Equilibrium of Ships.

The pressure in a vertical direction is represented by $EO \times EF$, $DQ \times DC$, &c. which, because of the similar triangles EOL, ERF, and DLM, DSC, become $EL \times ER$, $DM \times DS$, &c. or $IK \times ER$, $IK \times DS$, &c. By applying the same reasoning to every other portion of the surface of the immersed part of the body, it is hence evident that the sum of the vertical pressures is equal to the sum of the corresponding displaced columns of the fluid. 62

The weight of a ship equal to that of the quantity of water displaced. Hence a floating body is pressed upwards by a force equal to the weight of the quantity of water displaced; and since there is an equilibrium between this force and the weight of the body, therefore the weight of a floating body is equal to the weight of the displaced fluid (K). Hence also the centre of gravity of the body and the centre of gravity of the displaced fluid are in the same vertical, otherwise the body would not be at rest.

63
And the centre of gravity of both are in the same vertical.

CHAP. II. *Upon the Efforts of the Water to bend a Vessel.*

Théorie complette, &c. par Euler, translated by Watson. WHEN it is said that the pressure of the water upon the immersed part of a vessel counterbalances its weight, it is supposed that the different parts of the vessel are so closely connected together, that the forces which act upon its surface are not capable of producing any change. For we may easily conceive, if the connection of the parts were not sufficiently strong, the vessel would run the risk either of being broken in pieces, or of suffering some alteration in its figure.

The vessel is in a situation similar to that of a rod AB

(K) Upon this principle the weight and tonnage of the 80 gun ship laid down were calculated.

Efforts of the Water to bend a Vessel.

AB (fig. 50.), which being acted upon by the forces $A a$, $C c$, $D d$, $B b$, may be maintained in equilibrio, provided it has a sufficient degree of stiffness: but as soon as it begins to give way, it is evident it must bend in a convex manner, since its middle would obey the forces $C c$ and $D d$, while its extremities would be actually drawn downwards by the forces $A a$ and $B b$.

The vessel is generally found in such a situation; and since similar efforts continually act whilst the vessel is immersed in the water, it happens but too often that the keel experiences the bad effect of a strain. It is therefore very important to inquire into the true cause of this accident.

For this purpose, let us conceive the vessel to be divided into two parts by a transverse section through the vertical axis of the vessel, in which both the centre

Plate CCCCXCV. Fig. 51.

of gravity G (fig. 51.) of the whole vessel and that of the immersed part are situated: so that one of them will represent the head part, and the other that of the stern, each of which will be considered separately. Let g be the centre of gravity of the entire weight of the first, and o that of the immersed part corresponding. In like manner, let γ be the centre of gravity of the whole after part, and ω that of its immediate portion.

Now it is plain, that the head will be acted upon by the two forces $g\,m$ and $o\,n$, of which the first will press it down, and the latter push it up. In the same manner, the stern will be pressed down by the force $\gamma\mu$, and pushed by the force $\omega\nu$. But these four forces will maintain themselves in equilibrium, as well as the total

64 The cause of a ship's hogging,

forces reunited in the points G and O, which are equivalent to them; but whilst neither the forces before nor those behind fall in the same direction, the vessel will evidently sustain efforts tending to bend the keel

65 and sagging.

upwards, if the two points $o\,\omega$ are nearer the middle than the two other forces $g\,m$ and $\gamma\mu$. A contrary effect would happen if the points o and ω were more distant from the middle than the points g and γ.

But the first of these two causes usually takes place almost in all vessels, since they have a greater breadth towards the middle, and become more and more narrow towards the extremities; whilst the weight of the vessel is in proportion much more considerable towards the extremities than at the middle. From whence we see, that the greater this difference becomes, the more also will the vessel be subject to the forces which tend to bend its keel upwards. It is therefore from thence that we must judge how much strength it is necessary to give to this part of the vessel, in order to avoid such a consequence.

If other circumstances would permit either to load the vessel more in the middle, or to give to the part immersed a greater capacity towards the head and stern, such an effect would no longer be apprehended. But the destination of most vessels is entirely opposite to such an arrangement: by which means we are obliged to strengthen the keel as much as may be necessary, in order to avoid such a disaster.

We shall conclude this chapter with the following practical observations on the hogging and sagging of ships by Mr Hutchinson of Liverpool:

Practical Seamanship, p. 13.

"When ships with long floors happen to be laid a-dry upon mud or sand, which makes a solid resistance against the long straight floors amidships, in comparison with the two sharp ends, the entrance and run meet with little support, but are pressed down lower than the flat of the floor, and in proportion hogs the ship amidships; which is too well known from experience to occasion many total losses, or do so much damage by hogging them, as to require a vast deal of trouble and expence to save and repair them, so as to get the hog taken out and brought to their proper sheer again: and to do this the more effectually, the owners have often been induced to go to the expence of lengthening them; and by the common method, in proportion as they add to the burden of these ships, by lengthening their too long straight floors in their main bodies amidships, so much do they add to their general weakness to bear hardships either on the ground or afloat; for the scantling of their old timber and plank is not proportionable to bear the additional burden that is added to them.

"But defects of this kind are best proved from real and incontestable facts in common practice. At the very time I was writing upon this subject, I was called upon for my advice by the commander of one of those strong, long, straight floored ships, who was in much trouble and distraction of mind for the damage his ship had taken by the pilot laying her on a hard, gentle sloping sand, at the outside of our docks at Liverpool, where it is common for ships that will take the ground to lie for a tide, when it proves too late to get into our wet docks. After recommending a proper ship carpenter, I went to the ship, which lay with only a small keel, yet was greatly hogged, and the butts of her upper works strained greatly on the lee side; and the seams of her bottom, at the lower futtock heads, vastly opened on the weather side: all which strained parts were agreed upon not to be caulked, but filled with tallow, putty, or clay, &c. with raw bullocks hides, or canvas nailed with battons on her bottom, which prevented her sinking with the flow of the tide, without hindering the pressure of water from righting and closing the seams again as she floated, so as to enable them to keep her free with pumping. This vessel, like many other instances of ships of this construction that I have known, was saved and repaired at a very great expence in our dry repairing docks. And that their bottoms not only hog upwards, but sag (or curve) downwards, to dangerous and fatal degrees, according to the strain or pressure that prevails upon them, will be proved from the following facts:

"It has been long known from experience, that when ships load deep with very heavy cargoes or materials that are stowed too low, it makes them so very laboursome at sea, when the waves run high, as to roll away their masts; and after that misfortune causes them to labour and roll the more, so as to endanger their working and straining themselves to pieces: to prevent which, it has been long a common practice to leave a great part of their fore and after holds empty, and to stow them as high as possible in the main body at midships, which causes the bottoms of these long straight-floored ships to sag downwards, in proportion as the weight of the cargo stowed there exceeds the pressure of the water upwards, so much as to make them dangerously and fatally leaky.

"I have known many instances of those strong ships of 500 or 600 tons burdens built with long straight floors, on the east coast of England, for the coal and timber trade, come loaded with timber from the Baltic

Efforts of the Water to bend a Vessel.

to Liverpool, where they commonly load deep with rock salt, which is too heavy to fill their holds, so that for the above reasons they stowed it high amidships, and left large empty spaces in their fore and after holds, which caused their long straight floors to sag downwards, so much as to make their hold staunchions amidships, at the main hatchway, settle from the beams three or four inches, and their mainmasts settle so much as to oblige them to set up the main rigging when rolling hard at sea, to prevent the masts being rolled away; and they were rendered so leaky as to be obliged to return to Liverpool to get their leaks stopped at great expence. And in order to save the time and expence in discharging them, endeavours were made to find out and stop their leaks, by laying them ashore dry on a level sand; but without effect: for though their bottoms were thus sagged down by their cargoes when afloat, yet when they came a-dry upon the sand, some of their bottoms hogged upwards so much as to raise their mainmasts and pumps so high as to tear their coats from their decks; so that they have been obliged to discharge their cargoes, and give them a repair in the repairing dock, and in some to double their bottoms, to enable them to carry their cargoes with safety, stowed in this manner. From this cause I have known one of these strong ships to founder.

" Among the many instances of ships that have been distressed by carrying cargoes of lead, one sailed from hence bound to Marseilles, which was soon obliged to put back again in great distress, having had four feet water in the hold, by the commander's account, owing to the ship's bottom sagging down to such a degree as made the hold staunchions settle six inches from the lower deck beams amidships; yet it is common with these long straight floored ships, when these heavy cargoes are discharged that make their bottoms sag down, then to hog upwards: so that when they are put into a dry repairing dock, with empty holds, upon straight blocks, they commonly either split the blocks close fore and aft, or damage their keels there, by the whole weight of the ship lying upon them, when none lies upon the blocks under the flat of their floors amidships, that being hogged upwards; which was the case of this ship's bottom; though sagged downwards six inches by her cargo, it was now found hogged so much that her keel did not touch the blocks amidships, which occasioned so much damage to the after part of the keel, as to oblige them to repair it; which is commonly the case with these ships, and therefore deserving particular notice."

In order to prevent these defects in ships, " they should all be built with their floors or bottoms lengthwise, to form an arch with the projecting part downwards, which will naturally not only contribute greatly to prevent their taking damage by their bottoms hogging and straining upwards, either aground or afloat, as has been mentioned, but will, among other advantages, be a help to their sailing, steering, staying, and waring."

Chap. III. *Of the Stability of Ships.*

When a vessel receives an impulse or pressure in a horizontal direction, so as to be inclined in a small degree, the vessel will then either regain its former position as the pressure is taken off, and is in this case said to be possessed of stability; or it will continue in its inclined state; or, lastly, the inclination will increase until the vessel is overturned. With regard to the first case, it is evident that a sufficient degree of stability is necessary in order to sustain the efforts of the wind; but neither of the other two cases must be permitted to have place in vessels.

Stability of Ships.

Let CED (fig. 52.) be the section of a ship passing through its centre of gravity, and perpendicular to the sheer and floor plans; which let be in equilibrium in a fluid; AB being the water line, G the centre of gravity of the whole body, and g that of the immersed part AEB. Let the body receive now a very small inclination, so that $a\,E\,b$ becomes the immersed part, and γ its centre of gravity. From γ draw γ M perpendicular to $a\,b$, and meeting g G, produced, if necessary, in M. If, then, the point M thus found is higher than G the centre of gravity of the whole body, the body will, in this case, return to its former position, the pressure being taken off. If the point M coincides with G, the vessel will remain in its inclined state; but if M be below G, the inclination of the vessel will continually increase until it is entirely overset. Fig. 52.

The point of intersection M is called the *metacenter*, and is the limit of the altitude of the centre of gravity of the whole vessel. Whence it is evident, from what has already been said, that the stability of the vessel increases with the altitude of the metacenter above the centre of gravity: But when the metacenter coincides with the centre of gravity, the vessel has no tendency whatever to move out of the situation into which it may be put. Thus, if the vessel be inclined either to the right or left side, it will remain in that position until a new force is impressed upon it: in this case, therefore, the vessel would not be able to carry sail, and is hence unfit for the purposes of navigation. If the metacenter is below the common centre of gravity, the vessel will instantly overset.

As the determination of the metacenter is of the utmost importance in the construction of ships, it is therefore thought necessary to illustrate this subject more particularly.

Let AEB (fig. 52.) be a section of a ship perpendicular to the keel, and also to the plane of elevation, and passing through the centre of gravity of the ship, and also through the centre of gravity of the immersed part, which let be g.

Now let the ship be supposed to receive a very small inclination, so that the line of floatation is a, b, and γ the centre of gravity of the immersed part a E b. From γ draw γ M perpendicular to $a\,b$, and intersecting GM in M, the metacenter, as before. Hence the pressure of the water will be in the direction γ M.

In order to determine the point M, the metacenter, the position of γ with respect to the lines AB and g G, must be previously ascertained. For this purpose, let the ship be supposed to be divided into a great number of sections by planes perpendicular to the keel, and parallel to each other, and to that formerly drawn, these planes being supposed equidistant. Let AEB (fig. 53.) be one of these sections, g the centre of gravity of the immersed part before inclination, and γ the centre of gravity of the immersed part when the ship is in its inclined state; the distance $g\,\gamma$ between the two centres of Fig. 53.

Stability of Ships.

of gravity in each ſection is to be found. Let AB be the line of floatation of the ſhip when in an upright ſtate, and $a\,b$ the water line when inclined. Then, becauſe the weight of the ſhip remains the ſame, the quantity of water diſplaced will alſo be the ſame in both caſes, and therefore $AEB = a\,E\,b$, each ſuſtaining the ſame part of the whole weight of the ſhip. From each of theſe take the part AEb, which is common to both, and the remainders $AO\,a$, $BO\,b$ will be equal; and which, becauſe the inclination is ſuppoſed very ſmall, may be conſidered as rectilineal triangles, and the point O the middle of AB.

Now, let H, I, K, be the centres of gravity of the ſpaces $AO\,a$, $AE\,b$, and $BO\,b$, reſpectively. From theſe points draw the lines $H\,h$, $I\,i$, and $K\,k$, perpendicular to AB, and let IL be drawn perpendicular to EO. Now to aſcertain the diſtance γq of the centre of gravity γ of the part $a\,E\,b$ from the line AB, the momentum of $a\,E\,b$ with reſpect to this line muſt be put equal to the difference of the momentums of the parts $AE\,b$, $AO\,a$, which are upon different ſides of AB *. Hence $a\,E\,b \times \gamma q$, or $AEB \times \gamma q = AE\,b \times I\,i - AO\,a \times H\,h$. But ſince g is the common centre of gravity of the two parts $AE\,b$, $BO\,b$, we have therefore $AEB \times g\,O = AE\,b \times I\,i + BO\,b \times K\,k$. Hence by expunging the term $AE\,b \times I\,i$ from each of theſe equations, and comparing them, we obtain $AEB \times \gamma q = AEB \times g\,O - BO\,b \times K\,k - AO\,a \times H\,h$.

* Bezout's Mechanique, art. 203.

Now, ſince the triangles $AO\,a$, $BO\,b$, are ſuppoſed infinitely ſmall, their momentums or products, by the infinitely little lines $H\,h$, $K\,k$, will alſo be infinitely ſmall with reſpect to $AEB \times g\,O$; which therefore being rejected, the former equation becomes $AEB \times \gamma q = AEB \times g\,O$, and hence $\gamma q = g\,O$. Whence the centres of gravity γ, g, being at equal diſtances below AB, the infinitely little line γg is therefore perpendicular to EO. For the ſame reaſon $g\gamma$, fig. 52. may be conſidered as an arch of a circle whoſe centre is M.

To determine the value of $g\gamma$, the momentum of $a\,E\,b$ with reſpect to EO muſt be taken, for the ſame reaſon as before, and put equal to the momentums of the two parts $AO\,a$, $AE\,b$; and we ſhall then have $a\,E\,b \times g\gamma$, or $AEB \times g\gamma = AEB \times IL + AO\,a \times O\,h$. But ſince g is the common centre of gravity of the two ſpaces $AE\,b$, $BO\,b$, we ſhall have $AE\,b \times IL - BO\,b \times O\,k = 0$, or $AE\,b \times IL = BO\,b \times O\,k$. Hence $AEB \times g\gamma = BO\,b \times O\,k + AO\,a \times O\,h = 2\,BO\,b \times O\,k$; becauſe the two triangles $AO\,a$, $BO\,b$ are equal, and that the diſtances $O\,k$, $O\,h$, are alſo evidently equal.

Let x be the thickneſs of the ſection repreſented by ABC. Then the momentum of this ſection will be $2\,BO\,b \times x \times O\,k$, which equation will alſo ſerve for each particular ſection.

Now let $\int$ repreſent the ſum of the momentums of all the ſections. Hence $\int AEB \times x \times g\gamma = \int 2 \cdot BO\,b \times x \times O\,k$. Now the firſt member being the ſum of the momentums of each ſection, in proportion to a plane paſſing through the keel, ought therefore to be equal to the ſum of all the ſections, or to the volume of the immerſed part of the bottom multiplied by the diſtance $g\gamma$. Hence V repreſenting the volume, we ſhall have $V \times g\gamma = \int 2\,BO\,b \times x\,O\,k$.

In order to determine the value of the ſecond member of this equation, it may be remarked, that when the ſhip is inclined, the original plane of floatation CBPQ (fig. 54.) becomes $C\,b\,p\,Q$. Now the triangles $NI\,n$, $BO\,b$, being the ſame as thoſe in figures 52. and 53.; and as each of theſe triangles has one angle equal, they may, upon account of their infinite ſmallneſs, be conſidered as ſimilar; and hence $BO\,b : NI\,n :: \overline{OB}|^2 : \overline{IN}|^2$; whence $BO\,b = \frac{\overline{OB}|^2}{\overline{IN}|^2} \times NI\,n$. Moreover, we have (fig. 53.) $O\,k = \frac{2}{3}\,OB$, for the points K and k may be conſidered as equidiſtant from the point O: whence $BO\,b \times O\,k = \frac{\frac{2}{3}\overline{OB}|^3}{\overline{IN}|^2} \times NI\,n$.

Stability of Ships. Fig. 54.

Hence $V \times g\gamma = \int \frac{\frac{4}{3}\overline{OB}|^3}{\overline{IN}|^2} \times x \times NI\,n$. From this equation the value of $g\gamma$ is obtained.

To find the altitude $g\,M$ (fig. 55.) of the metacenter above the centre of gravity of the immerſed part of the bottom, let the arc NS be deſcribed from the centre I with the radius IN; then $NI\,n = \frac{IN \times NS}{2}$. Now ſince the two ſtraight lines γM, $g\,M$ are perpendicular to $a\,n$ and AN reſpectively, the angles M and $NI\,n$ are therefore equal: and the infinitely little portion $g\gamma$, which is perpendicular to $g\,M$, may be conſidered as an arch deſcribed from the centre M. Hence the two ſectors NIS, $g\,M\,\gamma$ are ſimilar; and therefore $g\,M : g\gamma :: IN : NS$. Hence $NS = \frac{IN \times g\gamma}{g\,M}$; and conſequently $NI\,n = \frac{\overline{IN}|^2 \times g\gamma}{2\,g\,M}$. Now this being ſubſtituted in the former equation, and reduced, we have $V \times g\gamma = \int \frac{\frac{2}{3}\overline{OB}|^3 \times x \times g\gamma}{g\,M}$. But ſince $g\,M$ and $g\gamma$ are the ſame, whatever ſection may be under conſideration, the equation may therefore be expreſſed thus, $V \times g\gamma = \frac{\frac{2}{3} g\gamma}{g\,M} \cdot \int \overline{OB}|^3 \times x$. Hence $g\,M = \frac{\frac{2}{3}\int \overline{OB}|^3 \times x}{V}$. Let $y = OB$, and the equation becomes $g\,M = \frac{\frac{2}{3}\int y^3 x}{V}$.

Fig. 55.

Whence to have the altitude of the metacenter above the centre of gravity of the immerſed part of the bottom, the length of the ſection at the water-line muſt be divided by lines perpendicular to the middle line of this ſection into a great number of equal parts, ſo that the portion of the curve contained between any two adjacent perpendiculars may be conſidered as a ſtraight line. Then the ſum of the cubes of the half perpendiculars or ordinates is to be multiplied by the diſtance between the perpendiculars, and two-thirds of the product is to be divided by the volume of the immerſed part of the bottom of the ſhip.

It is hence evident, that while the ſector at the water line is the ſame, and the volume of the immerſed part of the bottom remains alſo the ſame, the altitude of the metacenter will remain the ſame, whatever may be the figure of the bottom.

Chap. IV. *Of the Centre of Gravity of the immerſed Part of the Bottom of a Ship.*

The centre of gravity * of a ſhip, ſuppoſed homogeneous, and in an upright poſition in the water, is in a vertical

* See Mechanics.

Centre of Gravity.

vertical ſection paſſing through the keel, and dividing the ſhip into two equal and ſimilar parts, at a certain diſtance from the ſtern, and altitude above the heel.

In order to determine the centre of gravity of the immerſed part of a ſhip's bottom, we muſt begin with determining the centre of gravity of a ſection of the ſhip parallel to the keel, as ANDFPB (fig. 56.), bounded by the parallel lines AB, DF, and by the equal and ſimilar curves AND, BPF.

Fig. 56.

66 Diſtance of the centre of gravity from the ſtem or ſtern.

If the equation of this curve were known, its centre of gravity would be eaſily found: but as this is not the caſe, let therefore the line CE be drawn through the middle C, E, of the lines AB, DF, and let this line CE be divided into ſo great a number of equal parts by the perpendiculars TH, KM, &c. that the arches of the curves contained between the extremities of any two adjacent perpendiculars may be conſidered as ſtraight lines. The momentums of the trapeziums DTHF, TKMH, &c. relative to the point E, are then to be found, and the ſum of theſe momentums is to be divided by the ſum of the trapeziums, that is, by the ſurface ANDFPB.

The diſtance of the centre of gravity of the trapezium THFD from the point E is $= \frac{\frac{1}{3}\text{IE} \times (\text{DF}+2\text{TH})}{\text{DF}+\text{TH}}$ *.

For the ſame reaſon, and becauſe of the equality of the lines IE, IL, the diſtance of the centre of gravity of the trapezium TKMH from the ſame point E will be $\frac{\frac{1}{3}\text{IE}\times(\text{TH}+2\text{KM})}{\text{TH}+\text{KM}}+\text{IE}$, or $=\frac{\frac{1}{3}\text{IE}\times(4\text{TH}+5\text{KM})}{\text{TH}+\text{KM}}$.

In like manner, the diſtance of the centre of gravity of the trapezium NKMP from the point E will be $\frac{\frac{1}{3}\text{IE}\times(\text{KM}+2\text{NP})}{\text{KM}+\text{NP}}+2\,\text{IE}$, or $\frac{\frac{1}{3}\text{IE}\times(7\,\text{KM}+8\text{NP})}{\text{KM}+\text{NP}}$, &c.

Now, if each diſtance be multiplied by the ſurface of the correſponding trapezium, that is, by the product of half the ſum of the two oppoſite ſides of the trapezium into the common altitude IE, we ſhall have the momentums of theſe trapeziums, namely, $\frac{1}{6}\,\overline{\text{IE}}|^2\times(\text{DF}+2\text{TH})$, $\frac{1}{6}\overline{\text{IE}}|^2\times(4\,\text{TH}+5\,\text{KM})$ $\frac{1}{6}\,\overline{\text{IE}}|^2\times(7\,\text{KM}+8\,\text{NP})$, &c. Hence the ſum of theſe momentums will be $\frac{1}{6}$ $\overline{\text{IE}}|^2\times(\text{DF}+6\,\text{TH}+12\,\text{KM}+18\,\text{NP}+24\,\text{QS}+14\,\text{AB})$. Whence it may be remarked, that if the line CE be divided into a great number of equal parts, the factor or coefficient of the laſt term, which is here 14, will be $= 2+3\,(n-2)$ or $3\,n-4$, n being the number of perpendiculars. Thus the general expreſſion of the ſum of the momentums is reduced to $\overline{\text{IE}}|^2\times(\frac{1}{6}\,\text{DF}+\text{TH}+2\,\text{KM}+3\,\text{NP}+4\,\text{QS}+$, &c. — $+\frac{3\,n-4}{6}\times\text{AB}$.

The area of the figure ANDFPB is equal to IE $\times(\frac{1}{2}\,\text{DF}+\text{TH}+\text{KM}+\text{NP}+$, &c..... $+\frac{1}{2}\,\text{AB})$; hence the diſtance EG of the centre of gravity G from one of the extreme ordinates DF is equal to

67 Rule for the diſtance of the centre of gravity from one of the extreme ordinates.

$$\frac{\text{IE}\times(\frac{1}{6}\text{DF}+\text{TH}+2\,\text{KM}+3\,\text{NP}+,\&\text{c.}\ \frac{3\,n-4}{6}\times\text{AB})}{\frac{1}{2}\,\text{DF}+\text{TH}+\text{KM}+\text{NP}+,\ \&\text{c.}+\frac{1}{2}\,\text{AB}}$$

Whence the following rule to find the diſtance of the centre of gravity G from one of the extreme ordinates DF. To the ſixth of the firſt ordinate add the ſixth of the laſt ordinate multiplied by three times the number of ordinates minus four; then the ſecond ordinate, twice the third, three times the fourth, &c. the ſum will be a firſt term. Then to half the ſum of the extreme ordinates add all the intermediate ones, and the ſum will be a ſecond term. Now the firſt term divided by the ſecond, and the quotient multiplied by the interval between two adjacent perpendiculars, will be the diſtance ſought.

Thus, let there be ſeven perpendiculars, whoſe values are 18, 23, 28, 30, 30, 21, 0, feet reſpectively, and the common interval between the perpendiculars 20 feet. Now the ſixth of the firſt term 18 is 3; and as the laſt term is 0, therefore to 3 add 23, twice 28 or 56, thrice 30 or 90, four times 30 or 120, five times 21 or 105; and the ſum is 397. Then to the half of 18+0, or 9, add the intermediate ordinates, and the ſum will be 141. Now $\frac{397\times20}{141}$, or $\frac{7940}{141}$, $=59$ feet four inches nearly, the diſtance of the centre of gravity from the firſt ordinate.

Now, when the centre of gravity of any ſection is determined, it is eaſy from thence to find the centre of gravity of the ſolid, and conſequently that of the bottom of a ſhip.

68 Height of the centre of gravity above the keel.

The next ſtep is to find the height of the centre of gravity of the bottom above the keel. For this purpoſe the bottom muſt be imagined to be divided into ſections by planes parallel to the keel or water-line, (figs. 57, 58.). Then the ſolidity of each portion contained between two parallel planes will be equal to half the ſum of the two oppoſed ſurfaces multiplied by the diſtance between them; and its centre of gravity will be at the ſame altitude as that of the trapezium *a b c d*, (fig. 58.), which is in the vertical ſection paſſing through the keel. It is hence obvious, that the ſame rule as before is to be applied to find the altitude of the centre of gravity, with this difference only, that the word perpendicular or ordinate is to be changed into ſection. Hence the rule is, to the ſixth part of the loweſt ſection add the product of the ſixth part of the uppermoſt ſection by three times the number of ſections minus four; the ſecond ſection in aſcending twice the third, three times the fourth, &c. the ſum will be a firſt term. To half the ſum of upper and lower ſections add the intermediate ones, the ſum will be a ſecond term. Divide the firſt term by the ſecond, and the quotient multiplied by the diſtance between the ſections will give the altitude of the centre of gravity above the keel.

Fig. 57, 58.

With regard to the centre of gravity of a ſhip, whether it is conſidered as loaded or light, the operation becomes more difficult. The momentum of every different part of the ſhip and cargo muſt be found ſeparately with reſpect to a horizontal and alſo a vertical plane. Now the ſums of theſe two momentums being divided by the weight of the ſhip, will give the altitude of the centre of gravity, and its diſtance from the vertical plane; and as this centre is in a vertical plane paſſing through the axis of the keel, its place is therefore determined. In the calculation of the momentums, it muſt be obſerved to multiply the weight, and not the magnitude of each piece, by the diſtance of its centre of gravity.

A more eaſy method of finding the centre of gravity of

* Bezout's *Mechanique*, art. 279.

Centre of Gravity.

69 A mechanical method for ascertaining the centre of gravity of a ship.

of a ship is by a mechanical operation, as follows: Construct a block of as light wood as possible, exactly similar to the parts of the proposed draught or ship, by a scale of about one-fourth of an inch to a foot. The block is then to be suspended by a silk-thread or very fine line, placed in different situations until it is found to be in a state of equilibrium, and the centre of gravity will be pointed out. The block may be proved by fastening the line which suspends it to any point in the line joining the middles of the stem and post, and weights are to be suspended from the extremities of this middle line at the stem and post. If, then, the block be properly constructed, a plane passing through the line of suspension, and the other two lines, will also pass through the keel, stem, and post. Now, the block being suspended in this manner from any point in the middle line, a line is to be drawn on the block parallel to the line of suspension, so that the plane passing through these two lines may be perpendicular to the vertical plane of the ship in the direction of the keel. The line by which the block is suspended is then to be removed to some other convenient point in the middle line; and another line is to be drawn on the block parallel to the line suspending it, as before. Then the point of intersection of this line with the former will give the position of the centre of gravity on the block, which may now be laid down in the draught.

Chap. V. *Application of the preceding Rules to the Determination of the Centre of Gravity and the Height of the Metacenter above the Centre of Gravity of a Ship of 74 Guns.*

In fig. 59. are laid down the several sections in a horizontal direction, by planes parallel to the keel, and at equal distances from each other, each distance being 10 feet 0 inches 4 parts. Fig. 59.

I. *Determination of the Centre of Gravity of the upper Horizontal Section.*

To find the distance of the centre of gravity of the plane 8 *g o* G from the first ordinate 8 *g*.

Ordinates.			Double Ord.			1st Factors	1st Products.			2d Factors.	2d Products,

$$\text{Now } \frac{3897\ \ 3\ \ 1}{554\ \ 4\ \ 3}\times 10\ \ 0\ \ 4=\frac{3897\cdot25}{554\cdot25}\times10.03=70.5.$$

	Feet.
Hence the distance of the centre of gravity of double the plane 8 *g o* G from the first ordinate, 8 *g*, is	70.5
Distance of this ordinate from the aft side of stern-post,	13.5
Distance of the centre of gravity from the aft side of post,	84.0
Distance of the centre of gravity of double the trapezium AR *g* 8 from its ordinate AR,	8.42
Distance of this ordinate from the aft side of the stern-post,	0.58
Distance of the centre of gravity of this plane from the aft-side of the stern-post	9.0
Distance of the centre of gravity of double the trapezium G *o* γ γ from its ordinate G *o*,	5.44
Distance of this ordinate from the aft-side of the post,	153.78
Distance of the centre of gravity of this trapezium from the aft side of the post,	159.22
Distance of the centre of gravity of the section of the stern-post from the aft part of the post,	0.29
Distance of the centre of gravity of the section of the stern from the aft side of the post,	169.76

The

Centre of Gravity.

The areas of these several planes, calculated by the common method, will be as follow:

5558.90 for that of the plane, and its momentum 5558.9×84 =	466947.6000
199.13 for that of double the trapezium ARg8, and its momentum 199.13×9 =	1792.1700
214.59 for that of double the trapezium G$o\gamma\gamma$, and its momentum 214.59×159.22 =	34167.0236
0.77 for that of the section of the stern-post, and its momentum 0.77×0.29 =	0.2233
0.77 for that of the section of the stem, and its momentum 0.77×169.76 =	130.7152
5974.16 Sum - , - - -	503037.7321

Now $\frac{503037.7321}{5974.16} = 84.2$, the distance of the centre of gravity of the whole section from the aft side of the stern-post.

II. *Determination of the Centre of Gravity of the second Horizontal Section.*

To find the distance of the centre of gravity of double the plane $8fn$G from its first ordinate $8f$.

Ordinates. Feet. In. Pts.	Double Ord. Feet In. Pts.	1. Factors.	1. Products. Feet In. Pts.	2. Fact.	2. Products. Feet In. Pts.
11 2 3	22 4 6	$0\frac{1}{3}$	3 8 9	$0\frac{1}{2}$	11 2 3
15 3 0	30 6 0	1	30 6 0	1	30 6 0

21 0 3	42 0 6	6	252 3 0	1	42 0 6
21 2 0	42 4 0	7	296 4 0	1	42 4 0
21 0 6	42 1 0	8	336 8 0	1	42 1 0
20 10 9	41 9 6	9	376 1 6	1	41 9 6
20 6 6	41 1 0	10	410 10 0	1	41 1 0
19 10 0	39 8 0	11	436 4 0	1	39 8 0
18 6 0	37 0 0	12	444 0 0	1	37 0 0
15 9 6	31 7 0	13	410 7 0	1	31 7 0
11 2 9	22 5 6	$\left((3 \times 15)-4\right) \times \frac{1}{3}$	153 5 6	$0\frac{1}{2}$	11 2 9
273 2 3	546 4 6		3698 5 3		523 11 6

Hence the distance of the centre of gravity of double the plane $8fn$G from its first ordinate $8n$ is

$\frac{3698 \quad 5 \quad 3}{523 \quad 11 \quad 6} \times 10.0.4 = \frac{3698.43}{523.95} \times 10.03 =$ - - -	70.79
Distance of this ordinate from the aft side of the stern-post - -	13.5
Distance of the centre of gravity of the above plane from the aft side of post - -	84.29
Distance of the centre of gravity of double the trapezium ARf8 from its ordinate AR -	8.38
Distance of this ordinate from aft side of stern-post - - -	0.57
Distance of the centre of gravity of the trapezium from the aft side of the post - -	8.95
Distance of the centre of gravity of the trapezium before the ordinate Gn from that ordinate	5.74
Distance of that ordinate from the aft side of the post - - -	153.78
Distance of the centre of gravity of the trapezium from the aft side of the post - -	159.52
Distance of the centre of gravity of the section of the stern-post from the aft side of the post -	0.29
Distance of the centre of gravity of the section of the stem from the aft side of the post -	169.76

The

Centre of Gravity.

The areas of these several planes being calculated, will be as follow:

5255.22 for that of the plane $8fnG$, and its momentum $5255.22 \times 84.29 =$ -	442962.4938
153.11 for that of double the trapezium $ARf8$, and its momentum $153.11 \times 8.95 =$	1370.3345
182.40 the area of the trapezium before, and its momentum $182.40 \times 159.52 =$ -	29096.4480
0.77 the area of the section of the sternpost, and its momentum $0.77 \times 0.29 =$ -	0.2233
0.77 the area of the section of the stem, and its momentum $0.77 \times 169.76 =$ -	130.7152
5592.27 Sum - - - -	473560.2148

Now $\frac{473560.2148}{5952.27} = 84.68$, the distance of the centre of gravity of the whole section from the aft-side of the stern-post.

III. *Determination of the Centre of Gravity of the third Horizontal Section.*

Distance of the centre of gravity of double the plane $8emG$ from its first ordinate $8e$.

Ordinates.			Double Ord.			1st Factors.	1st Products.			2d Fact.	2d Products.		
Feet.	In.	Pts.	Feet.	In.	Pts.		Feet.	In.	Pts.		Feet.	In.	Pts.

242	5	3	484	10	6		3347	0	6		469	10	6

Hence the distance of the centre of gravity of double the plane $8emG$ from its first ordinate $8e$ is $=$

$\frac{3347 \quad 0 \quad 6}{469 \quad 10 \quad 6} \times 10 \quad 0 \quad 4 = \frac{3347.04}{469.87} \times 10.03 =$ - - -	71.44
Distance of this ordinate from the aft side of the post - - -	13.5
Hence the distance of the centre of gravity of this plane from the aft side of the post is -	84.94
Distance of the centre of gravity of double the trapezium $ARe8$, from its ordinate AR -	8.03
Distance of this ordinate from the aft side of the post - - - -	0.58
Distance of the centre of gravity of this trapezium from the aft side of the post -	8.61
Distance of the centre of gravity of the foremost trapezium from its ordinate Gm -	5.19
Distance of this ordinate from the aft side of the post - - -	153.78
Distance of the centre of gravity of this trapezium from the aft side of the post -	158.97
Distance of the centre of gravity of the section of the post from the aft side of the post -	0.29
Distance of the centre of gravity of the section of the stem from the aft side of the post -	169.76

The

Centre of Gravity.

The areas of these several planes will be found to be as follows:

4712.7961	for that of double the plane $8\,e\,m\,G$, and its momentum $4712.7961 \times 84.94 =$	400304.9007
93.84	the area of double the trapezium $AR\,3\,e\,88$, and its momentum $93.84 \times 8.61 =$	807.9624
131.1	for the area of foremost trapezium, and its momentum $131.1 \times 158.97 =$	20840.967
0.77	the area of the section of the post, and its momentum $0.77 \times 0.29 =$ -	0.2233
0.77	the area of the section of the stem, and its momentum $0.77 \times 169.76 =$ -	130.7152
4939.2761	Sum - - - - - -	422084.7706

Now $\frac{422084.7706}{4939.2761} = 85.45$, the distance of the centre of gravity of the whole section from the aft side of the post.

IV. *Determination of the Centre of Gravity of the Fourth Horizontal Section.*

Distance of the centre of gravity of double the plane $8\,d\,l\,G$ from its first ordinate $8\,d$.

Ordinates. Feet. In. Pts.	Double Ord. Feet. In. Pts.	1. Factors.	1. Products. Feet. In. Pts.	2. Fact.	2. Products. Feet. In. Pts.
3 3 6	6 7 0	$0\frac{1}{6}$	1 1 2	$0\frac{1}{2}$	3 3 6
7 9 0	15 6 0	1	15 6 0	1	15 6 0
11 11 0	23 10 0	2	47 8 0	1	23 10 0

13 6 0	27 0 0	12	324 0 0	1	27 0 0
9 7 6	19 3 0	13	250 3 0	1	19 3 0
5 4 9	10 9 6	$\left((3 \times 15) - 4\right) \times \frac{1}{6}$	73 8 11	$0\frac{1}{2}$	5 4 9
205 7 6	411 3 0		2883 11 0		402 6 9

Hence the distance of the centre of gravity of double the plane $8\,d\,l\,G$ from its first ordinate $8\,d$, is $= \frac{2883\ 11\ 0}{402\ 6\ 9} \times 10\ 0\ 4 = \frac{2883.916}{402.56} \times 10.03 =$ - - - 71.85

Distance of this ordinate from the aft side of the post - - -	13.5
Distance of the centre of gravity of the plane from the aft side of the post - -	85.35
Distance of the centre of gravity of double the trapezium $AR\,d\,8$ from its ordinate AR -	7.89
Distance of this ordinate from the aft side of the post - - -	0.58
Distance of the centre of gravity of the trapezium from the aft side of the post - -	8.47
Distance of the centre of gravity of the foremost trapezium from its ordinate $G\,l$ - -	4.83
Distance of this ordinate from aft side of the post - -	153.78
Distance of the centre of gravity of the trapezium from the aft side of the post - -	158.61
Distance of the centre of gravity of the section of the post from its aft side - -	0.29
Distance of the centre of gravity of the section of the stem from the aft side of the post - -	169.76

The

Centre of Gravity.

The areas of these several planes being calculated, will be as follow:

4037.6768	for that of double the plane $8\,d\,l\,G$, and its momentum $4037.6768 \times 85.35 =$	344615.7149
51.12	the area of double the trapezium $AR\,d\,8$, and its momentum $51.12 \times 8.47 =$ -	432.9804
79.16	the area of the foremost trapezium, and its momentum $79.16 \times 158.61 =$ -	12555.5676
0.77	the area of the section of the post, and its momentum $0.77 \times 0.29 =$ - -	0.2233
0.77	the area of the section of the stem, and its momentum $0.77 \times 169.76 =$ - -	130.7152
4169.4968	Sum - - - - -	357735.2074

Then $\frac{357735.2074}{4169.4968} = 85.80$, the distance of the fourth horizontal section from the aft side of the stem-post.

V. *Determination of the Centre of Gravity of the fifth Horizontal Section.*

Distance of the centre of gravity of double the plane $8\,c\,k\,G$ from its first ordinate $8\,c$.

Ordinates. Feet.	In.	L.	Double Ord. Feet.	In.	L.	1. Factors.	1. Products. Feet.	In.	L.	2. Fact.	2. Products. Feet.	In.	L.
1	9	0	3	6	0	$0\frac{1}{6}$	0	7	0	$0\frac{1}{2}$	1	9	0
4	6	0	9	0	0	1	9	0	0	1	9	0	0
8	3	0	16	6	0	2	33	0	0	1	16	6	0
11	8	3	23	4	6	3	70	1	6	1	23	4	6
13	10	3	27	8	6	4	110	10	0	1	27	8	6
15	3	0	30	6	0	5	152	6	0	1	30	6	0
16	0	3	32	0	6	6	192	3	0	1	32	0	6
16	5	0	32	10	0	7	229	10	0	1	32	10	0
16	3	0	32	6	0	8	260	0	0	1	32	6	0
15	9	0	31	6	0	9	283	6	0	1	31	6	0

9	8	9	19	5	6	12	233	6	0	1	19	5	6
6	1	6	12	3	0	13	159	3	0	1	12	3	0
3	3	0	6	6	0	$\left((3 \times 15) - 4\right) \times \frac{1}{6}$	44	5	0	$0\frac{1}{2}$	3	3	0
166	6	3	333	0	7		2358	3	0		328	0	6

Hence the distance of the centre of gravity of double the plane $8\,c\,k\,G$ from its first ordinate is $\frac{2358\ \ 3\ \ 0}{328\ \ 0\ \ 6}$

$\times 10\ \ 0\ \ 4 = \frac{2358.25}{328.04} \times 10.03 =$ - - - - - - 72.10

Distance of this ordinate from the aft side of the post - - - -	13.50
Distance of the centre of gravity of the plane from the aft side of the post - - -	85.60
Distance of the centre of gravity of double the trapezium $AR\,c\,8$ from its ordinate AR - -	7.42
Distance of this ordinate from the aft side of post - - - - -	0.58
Distance of centre of gravity of trapezium from aft side of the post - - -	8.00
Distance of the centre of gravity of the foremost trapezium from its ordinate $G\,k$ - -	4.22
Distance of this ordinate from the aft side of post - - - - -	153.78
Distance of the centre of gravity of the foremost trapezium from the aft side of the post -	158.00
Distance of the centre of gravity of the section of the post from the aft side of post - -	0.29
Distance of the centre of gravity of the section of the stem from the aft side of post - -	169.76

The

Centre of Gravity.

The areas of these several planes being calculated, will be as follow.

3290.2412	for the area of double the plane $8\,c\,k\,G$, and its momentum $3290.2412 \times 85.6 =$	281644.6467
31.21	the area of double the trapezium $AR\,c\,8$, and its momentum $31.21 \times 8 =$	249.68
42.43	the area of the foremost trapezium, and its momentum $42.43 \times 158 =$	6703.94
0.77	the area of the section of the post, and its momentum $0.77 \times 0.29 =$	0.2233
0.77	the area of the section of the stem, and its momentum $0.77 \times 169.76 =$	130.7152
3365.4212	Sum	288729.2052

Now $\frac{288729.2052}{3365.4212} = 85.79$, the distance of the centre of gravity of the whole section from the aft side of the stern.

VI. *Determination of the Centre of Gravity of the sixth Horizontal Section.*

Distance of the centre of gravity of double the plane $8\ b\ i\ G$ from its first ordinate $8\ b$.

Ordinates. Feet.	In.	L.	Double Ord. Feet.	In.	L.	1. Factors.	1. Products. Feet	In.	L.	2. Fact.	2. Products. Feet.	In.	L.
1	0	0	2	0	0	$0\frac{1}{6}$	0	4	0	$0\frac{1}{2}$	1	0	0
2	5	0	4	10	0	1	4	10	0	1	4	10	0

117	4	3	234	8	6		1639	9	3		232	1	9

Hence the distance of the centre of gravity of double the plane $8\ b\ v\ G$ from its first ordinate $8\ b$ is

$\frac{1639\ \ 9\ \ 3}{232\ \ 1\ \ 3} \times 10\ \ 0\ \ 4 = \frac{1639.77}{232.14} \times 10.03 =$	70.84
Distance of this ordinate from aft side of post	13.50
Hence the distance of the centre of gravity of the plane from the aft side of the post is	84.34
Distance of the centre of gravity of the trapezium $AR\ b\ 8$ from its ordinate AR	6.88
Distance of this ordinate from the aft side of the post	0.58
Distance of the centre of gravity of the trapezium from the aft side of the post	7.46
Distance of the centre of gravity of the foremost trapezium from the ordinate $G\ i$	2.92
Distance of this ordinate from the aft side of post	153.78
Distance of the centre of gravity of this trapezium from the aft side of the post	156.70
Distance of the centre of gravity of the section of the post from its aft side	0.29
Distance of the centre of gravity of the section of the stem from the aft side of the post	169.76

The areas of these planes will be found to be as follow:

2328.3642	for that of double the plane $8\ b\ i\ G$, and its momentum $2328.3642 + 84.34 =$	196374.2366
21.52	for the area of double the trapezium $AR\ b\ 8$, and its momentum $21.52 \times 7.46 =$	160.5392
15.04	the area of the foremost trapezium, and its momentum $15.04 \times 156.7 =$	2356.7680
0.77	the area of the section of the post, and its momentum $0.77 \times 0.29 =$	0.2233
0.77	the area of the section of the stem, and its momentum $0.77 \times 169.76 =$	130.7152
2366.4642	Sum	199022.4823

Now

Centre of Gravity.

Now $\frac{199022.4823}{2366.4642} = 84.1$, the distance of the centre of gravity of the whole from the aft side of the post.

VII. *Determination of the Centre of Gravity of the seventh Horizontal Section.*

Distance of the centre of gravity of double the plane 8 *a h* G from its first ordinate 8 *a*.

Ordinates. Feet. In. Lin.	Double Ord. Feet. In. L.	1. Factors.	1. Products. Feet. In. Lin.	2. Fact.	2 Products. Feet. In. Lin.
0 8 0	1 4 0	$0\frac{1}{6}$	0 2 8	$0\frac{1}{2}$	0 8 0
1 1 6	2 3 0	1	2 3 0	1	2 3 0
1 7 6	3 3 0	2	6 6 0	1	3 3 0
1 10 9	3 9 6	3	11 4 6	1	3 9 6
2 1 3	4 2 6	4	16 10 0	1	4 2 6

1 10 9	2 9 6	6	22 9 0	1	3 9 6
1 8 0	3 4 0	7	23 4 0	1	3 4 0
1 1 0	2 2 0	8	17 4 0	1	2 2 0
0 9 0	1 6 0	9	13 6 0	1	1 6 0
0 8 0	1 4 0	10	13 4 0	1	1 4 0
0 8 0	1 4 0	11	14 8 0	1	1 4 0
0 8 0	1 4 0	12	16 0 0	1	1 4 0
0 8 0	1 4 0	13	17 4 0	1	1 4 0
0 8 0	1 4 0	$((3\times15)-4)\times\frac{1}{6}$	9 1 4	$0\frac{1}{2}$	0 8 0
18 2 9	36 5 6		205 4 6		35 1 6

Hence the distance of the centre of gravity of double this plane from its first ordinate is $\frac{205\ 4\ 6}{35\ 1\ 6}\times 10\ 0\ 4$

$=\frac{205.37}{35.12}\times 10.83 =$ - - - .	58.65
The distance of this ordinate from aft side of post = - - - - -	13.50
Hence the distance of the centre of gravity of this plane from the aft side of the post is	72.15
Distance of the centre of gravity of double the rectangle AR *a* 8 from its ordinate AR	6.45
Distance of this ordinate from the aft side of the post - - - - -	0.58
Distance of the centre of gravity of this rectangle from the aft side of the post	7.03
Distance of the centre of gravity of the foremost rectangle from its ordinate 7′ 7 *e* 7′	1.25
Distance of this ordinate from the aft side of the post - - - -	153.78
Distance of the centre of gravity of this rectangle from the aft side of the post	155.03
Distance of the centre of gravity of the section of the post from its aft side	0.29
Distance of the centre of gravity of the section of the stem from the aft side of the post - - - - -	169.76

Now, the areas of these several plans being calculated will be as follows.

352.2536, the area of double the plan 8*ah*G, and its momentum $352.2536\times72.15=$	25415 9 2
17.1570, the area of double the rectangle AR *a* 8, and its momentum $17.1570\times7.03=$	120.6137
3.3250, the area of the foremost rectangle, and its momentum $3.3250\times155.03=$	515.4747
0.77, the area of the section of the post, and its momentum $0.77\times0.29=$	0.2233
077, the area of the section of the stem and its momentum $0.77\times166.76=$	130.7152
374.2756 Sum	26182.1242

Then $\frac{26182.1242}{374.2756} = 69.95$, the distance of the centre of gravity of the whole section from the aft side of the post.

VIII. *Determination of the Centre of Gravity of the eighth Plane.*

This plane is equal in length to the seventh horizontal plane, and its breadth is equal to that of the keel. The distance between the seventh and eighth planes is three feet, but which is here taken equal to 2 feet 11½ inches.

Distance

Centre of Gravity.

Diſtance between the aft ſide of the poſt and the firſt ordinate - - -	13.5
Fourteen intervals between the fifteen ordinates, each interval being 10.03 feet	140.42
Diſtance of the laſt ordinate from the fore foot	2.2
Hence the length of the eighth plane is	156.12
Which multiplied by the breadth	1.33
The product is the area of this plane	208.
The diſtance of its centre of gravity from the aft ſide of the poſt, being equal to half its length, is - - -	78.06

The centres of gravity of theſe eight planes being found, the diſtance of the centre of gravity of the bottom of the ſhip from the aft ſide of the poſt, and alſo its altitude, may from thence be eaſily determined.

From the principles already explained, the diſtance of the centre of gravity of the bottom from the aft ſide of the poſt, is equal to the ſum of the momentums of an infinite number of horizontal planes, divided by the ſum of theſe planes, or, which is the ſame, by the ſolidity of the bottom. As, however, we have no more than eight planes, we muſt therefore conceive their momentums as the ordinates of a curve, whoſe diſtances may be the ſame as that of the horizontal planes. Now the ſum of theſe ordinates minus half the ſum of the extreme ordinates being multiplied by their diſtance, gives the ſurface of the curve; of which any ordinate whatever repreſents the momentum of the horizontal plane at the ſame altitude as theſe ordinates; and the whole ſurface will repreſent the ſum of the momentums of all the horizontal planes.

Hor. Planes.	Fact.	Products.	Momentums.	Fact.	Products.
5974.16	0½	2987.08	503037.73	0½	251518.86
5592.27	1	5592.27	473560.21	1	473560.21
4939.27	1	4939.27	422084.77	1	422084 77
4169.50	1	4169.50	357735.21	1	357735.21
3365.42	1	3365 42	288729.20	1	288729.20
2366.46	1	2366.46	199022.48	1	199022.48
374.27	1	374.27	21682.12	1	21682.12
208.00	0½	104.00	16236.48	0½	8118.24
		23898.27			2022451.09

Now $\frac{2022451.09}{23898.27}=84.63$, the diſtance of the centre of gravity of the bottom of the ſhip from the aft ſide of the poſt.

The height of the centre of gravity of the bottom above the lower edge of the keel may be determined by the ſame principles. Thus,

To one-ſixth of the lowermoſt horizontal ſection add the product of one-ſixth of the uppermoſt ſection by three times the number of ſections minus four the ſecond ſection in aſcending, twice the third, three times the fourth, &c.; and to half the ſum of the extreme planes add all the intermediate ones. Now the firſt of theſe ſums, multiplied by the diſtance between the planes or ſections, and divided by the ſecond ſum, gives the altitude of the centre of gravity of the bottom of the ſhip above the lower edge of the keel as required.

Hor. Planes.	1ſt Fact.	1ſt Products.	2d Fact.	2d Products.
208.00	0⅙	34.67	0½	104.00
374.27	1	374.27	1	374.27
2366.46	2	4732 92	1	2366.46
3365.42	3	10096.26	1	3365.42
4169.50	4	16678.00	1	4169.50
4939.27	5	24696.35	1	4939.27
5592.27	6	33553.62	1	5592.27
5974.16	$\left((3\times 8)-4\right)\times\frac{1}{6}$	19913.87	0½	2987 08
		110079.96		23898.27

Now $\frac{110079.96}{23898.27}\times 2.95=13.588$, the height of the centre of gravity of the bottom of the ſhip above the lower edge of the keel.

We have now found the diſtance of the centre of gravity of the bottom of the ſhip from the aft ſide of the poſt, and its altitude above the lower edge of the keel. Hence the ſhip being ſuppoſed in an upright poſition, this centre of gravity will neceſſarily be in the vertical longitudinal ſection which divides the ſhip into two equal and ſimilar parts; the poſition of this centre is therefore determined.

70 Determination of the height of the metacenter above the centre of gravity.

It now remains to find the height of the metacenter above the centre of gravity; the expreſſion for this altitude, as found in Chap. III. is $\frac{\frac{2}{3}\int y^3 x}{V}$; which we ſhall now apply to determine the metacenter of the ſhip of 74 guns, whoſe centre of gravity we have already found.

Ord. of the Plane of Floatation.				*Cub. of Ordinates.*

291	1	3	291.1	115719.442

Ordinate at 10.03 feet abaft the ordinate $8g$, $=4$, of which the cube is 64, and $64\times\frac{1}{2}$ - -	32.
Ordinate at 10.03 feet afore the ordinate $G\,o=6$, cube of which is 216 and $216\times\frac{1}{2}$ - -	108.
Sum - - -	115859.442
Diſtance between the ordinates -	10.03
Product - -	1162070.20326

Product

Centre of Gravity.

Product			1162070.20326
Half the cube of the aftermost ordinate	32.		
Half the cube of the thickness of the stem	0.14		
Sum	32.14		
Distance between the ordinates	3.0		
Product			96.42
Half the cube of the foremost ordinate	108.		
Half the cube of the thickness of the stem	.14		
Sum	108.14		
Distance between the ordinates	5.5		
Product			594.77
$\int y^3 x$			1162761.39326
$2\int y^3 x$			2325522.78652
$\frac{2}{3}\int y^3 x$			775174.26217

The solidity of the bottom is $2527\frac{1}{4}$ tons $=70018.67$ cubic feet: hence $\frac{\frac{2}{3}\int y^3 x}{V}=\frac{77517.26}{70018.67}=11.07$ feet, the altitude of the metacenter above the centre of gravity of the bottom of the ship.

APPENDIX.

When a ship is built, she must be fitted with masts, yards, sails, ropes, and blocks, or, in other words, she must be *rigged* before she can go to sea. To complete this article, it may therefore be thought necessary to treat of the art of rigging vessels; but we have elsewhere (see *Mast-Rigging*, Rope-Making, and Sail) shown how the several parts of a ship's rigging are made; and the art of putting them properly together, so as to make the ship best answer the purpose for which she is intended, depends upon a just knowledge of the impulse and resistance of fluids, and of the theory and practice of seamanship. (See *Resistance of Fluids* and Seamanship). Nothing, therefore, of the subject is left to us here, except we were to state in few words the progressive method of rigging ships; but there is no one undeviating mode which is pursued, as the nature of the operation is such that all the parts of it may be advancing at the same time. We shall therefore take our leave of *ships* and *ship-building* with a few general observations on *sail-making*, and refer our readers for farther information to the very elegant work on *the Elements and Practice of Rigging and Seamanship* in two volumes quarto.

Sails are made of canvas, of different textures, and are extended on or between the masts, to receive the wind that forces the vessel through the water. They are quadrilateral or triangular, as has been elsewhere described, and are cut out of the canvas cloth by cloth. The width is governed by the length of the yard, gaff, boom, or stay; the depth by the height of the mast. In the valuable work to which we have just referred, the following directions are given for cutting sails. "The width and depth being given, find the number of cloths the width requires, allowing for seams, tabling on the leeches, and slack cloth; and, in the depth, allow for tabling on the head and foot. For sails cut square on the head and foot, with gores only on the leeches, as some topsails, &c. the cloths on the head, between the leeches, are cut square to the depth; and the gores on the leeches are found by dividing the depth of the sail by the number of cloths gored, which gives the length of each gore. The gore is set down from a square with the opposite selvage; and the canvas being cut diagonally, the longest gored side of one cloth makes the shortest side of the next; consequently, the first gore being known, the rest are cut by it. In the leeches of topsails cut hollow, the upper gores are longer than the lower ones; and in sails cut with a roach leech, the lower gores are longer than the upper ones. This must be regulated by judgment, and care taken that the whole of the gores do not exceed the depth of the leech. Or, by drawing on paper the gored side of the sail, and delineating the breadth of every cloth by a convenient scale of equal parts of an inch to a foot, the length of every gore may be found with precision. Sails, gored with a sweep on the head or the foot, or on both, have the depth of their gores marked on the selvage, from the square of the given depth on each cloth, and are cut as above; the longest selvage of one serving to measure the shortest selvage of the next, beginning with the first gored cloth next the middle in some sails, and the first cloth next to the mast leech in others. For those gores that are irregular no strict rule can be given; they can only be determined by the judgement of the sail-maker, or by a drawing.

Appendix.

"In the royal navy, mizen topsails are cut with three quarters of a yard hollow in the foot; but, in the merchant service, top and topgallant sails are cut with more or less hollow in the foot. Flying jibs are cut with a roach curve on the stay, and a three-inch gore in each cloth, shortening from the tack to the clue. Lower studding-sails are cut with square leeches, and topmast and topgallant-mast studding sails with goring leeches.

Elements and Practice of Rigging and Seamanship, vol. i. p. 91.

"The length of reef and middle bands is governed by the width of the sail at their respective places; the leech-linings, buntline-cloths, top-linings, mast-cloths, and corner-pieces, are cut agreeably to the depth of the sail; each cloth and every article should be properly marked with charcoal, to prevent confusion or mistake. Sails that have bonnets are cut out the whole depth of the sail and bonnet included, allowing enough for the tablings on the foot of the sail and head and foot of the bonnet. The bonnet is cut off after the sail is sewed together. If a drabler is required, it is allowed for in the cutting out the same as the bonnet.

When the cloth is thus properly cut, the different pieces are to be joined together in the form of a sail; and for doing this properly we have the following directions in the work already quoted. "Sails have a double flat seam, and should be sewed with the best English made twine of three threads, spun 360 fathoms to the pound, and have from one hundred and eight to one hundred and sixteen stitches in every yard in length. The twine for large sails, in the royal navy, is waxed

Appendix. by hand, with genuine bees wax, mixed with one fixth part of clear turpentine; and, for fmall fails, in a mixture made with bees wax, 4 lb. hogs lard 5 lb. and clear turpentine 1 lb. In the merchant fervice, the twine is dipped in tar (L), foftened with a proper proportion of oil.

" It is the erroneous practice of fome failmakers not to few the feams any farther than where the edge is creafed down for the tabling; but all fails fhould be fewed quite home to the end, and, when finifhed, fhould be well rubbed down with a rubber. In the merchant fervice feams are fometimes made broader at the foot than at the head, being ftronger. Broad feams are not allowed to be made on courfes, in the royal navy, but goring leeches are adopted in lieu of them. Boom-mainfails and the fails of floops generally have the feams broader at the foot than at the head. The feams of courfes and topfails are ftuck or ftitched up, in the middle of the feams, along the whole length, with double feaming twine; and have from 68 to 72 ftitches in a yard. In the merchant fervice it is common to ftick the feams with two rows of ftitches, when the fail is half worn, as they will then laft till the fail is worn out.

" The breadth of the feams of courfes, topfails, and other fails, in the royal navy, to be as follow, viz. courfes and topfails, for 50 gun fhips and upwards, one inch and a half, and for 44 gun fhips and under, one inch and a quarter, at head and foot; all other fails, one inch at head and foot.

" The tablings of all fails are to be of a proportionable breadth to the fize of the fail, and fewed at the edge, with 68 to 72 ftitches in a yard. Thofe for the heads of main and fore courfes to be four to fix inches wide; for fprit courfes and mizens, drivers, and other boom fails, 3 to 4 inches wide; for topfails, 3 inches to 4 inches and a half; topgallant and fprit topfails, 3 inches; royal fails, 2 inches and a half; jib and other flayfails, 3 inches to 4 inches and a half, on the ftay or hoift; and for ftudding fails, 3 inches to 4 inches on the head. Tablings on the foot and leeches of main and fore courfes to be 3 inches to 5 inches broad; fprit courfe and topfails, 3 inches; topgallant and fprit topfails, 2 inches and a half; royals, 2 inches; fore leeches of mizen, driver, and other boomfails, 3 inches and a half to 4 inches; after leech, 3 inches; and on the foot 2 or 3 inches. Tablings on the after leech of jibs and other ftayfails to be from 2 to 3 inches broad; and, on the foot, 2 to 2 inches and a half: on ftudding fail leeches one inch and a half to two inches and a half; and on the foot, from one to two inches.

" Main and fore courfes are lined on the leeches, from clue to earing, with one cloth feamed on and ftuck or ftitched in the middle, and have a middle band half way between the lower reef band and the foot, alfo four buntline cloths, at equal diftances between the leeches, the upper ends of which are carried under the middle band, that the lower fide of the band may be tabled upon or fewed over the end of the buntline pieces. They have likewife two reef bands; each in breadth one third of the breadth of the canvas; the upper one is one fixth of the depth of the fail from the head, and the lower band is at the fame diftance from the upper one; the ends go four inches under the leech linings, which are feamed over the reef bands. All linings are feamed on, and are ftuck with 68 to 72 ftitches in a yard. Appendix.

" Main, fore, and mizen, topfails have leech linings, maft and top linings, buntline cloths, middle bands and reef bands. The leech linings are made of one breadth of cloth, fo cut and fewed as to be half a cloth broad at the head, and a cloth and a half broad at the foot; the piece cut out being half the breadth of the cloth at one end, and tapering to a point at the other. The middle bands are put on half way between the lower reef and foot, the buntline cloths join the top-linings, and the buntline cloths and top-linings are carried up to the lower fide of the middle band, which is tabled on them. The maft lining is of two cloths, and extends from the foot of the fail to the lower reef, to receive the beat or chafe of the maft. The middle band is made of one breadth of canvas, of the fame number as the top lining. It is firft folded and rubbed down, to make a creafe at one third of the breadth; then tabled on the felvage, and ftuck along the creafe; then turned down, and tabled and ftuck through both the double and fingle parts, with 68 to 72 ftitches in a yard. It is the opinion of many, that middle bands fhould not be put on until the fail is half worn.

" Main and fore topfails have three and fometimes four reef bands from leech to leech, over the leech linings; the upper one is one eighth of the depth of the fail from the head, and they are the fame diftance afunder in the royal navy, but more in the merchant fervice. The reef bands are each of half a breadth of canvas put on double; the firft fide is ftuck twice, and the laft turned over, fo that the reef holes may be worked upon the double part of the band, which is alfo ftuck with 68 to 72 ftitches in a yard.

" The top-lining of topfails is of canvas, N° 6 or 7. The other linings of this, and all the linings of other fails, fhould be of the fame quality as the fails to which they belong.

" Top-linings and maft cloths are put on the aft fide, and all other linings on the fore fide, of fails. Mizens are lined with one breadth of cloth from the clue five yards up the leech, and have a reef band fewed on, in the fame manner as on other fails, at one fifth the depth of the fail from the foot; they have alfo a nock-piece and a peek-piece, one cut out of the other, fo that each contains one yard. Mizen topfails of 50 gun fhips and upwards have three reefs, the upper one is one eighth of the depth of the fail from the head, and the reefs are at the fame diftance afunder. Mizen topfails of fhips of 44 guns and under have two reefs one feventh part of the depth of the fail afunder, the upper one being at the fame diftance from the head. Main and main top-ftudding fails have each one reef, at one eighth of the depth of the fail from the head. Reef bands fhould not be put on until the fail is fewed up, a contrary practice being very erroneous. Lower ftay-fails,

(L) The dipping of the twine in tar, we are perfuaded, is a very bad practice, for the reafon affigned in ROPE-MAKING. See that article, N° 32.

E. Mitchell sculp.

Appendix. sails, fore top and main top staysails, and flying jibs, have clue-pieces two yards long. Square tack staysails, have half a breadth of cloth at the fore part, with a clue-piece containing two yards, and a peck-piece, containing one yard.

"Sails have two holes in each cloth, at the heads and reefs of courses, topsails, and other square sails; one hole in every yard in the stay of flying jibs, and one in every three quarters of a yard in the stays of square tack and other staysails. These are made by an instrument called a *pegging awl*, or a stabber, and are fenced round by stitching the edge to a small grommet, made with log or other line; when finished, they should be well stretched or rounded up by a pricker or a marline spike. Reef and head holes of large sails have grommets of twelve-thread line, worked round with 18 to 21 stitches; smaller sails have grommets of nine-thread line, with 16 to 18 stitches, or as many as shall cover the line, and smaller holes in proportion. The holes for marling the clues of sails and the top brims of topsails have grommets of log-line, and should have from 9 to 11 stitches; twelve holes are worked in each cloth. Main courses have marling holes from the clue to the lower bow line cringle up the leech, and from the clue to the first buntline cringle on the foot. Fore courses have marling holes one eighth of the depth of the sail up the leech, and from the clue to the first buntline cringle at the foot. Main and fore topsails have marling holes three feet each way from the clue and at the top-brims. Spritsails, mizen topsails, lower staysails, main and fore top staysails, and jibs, have marling holes two feet each way from the clues. All other sails are sewed home to the clues. Marling holes of courses are at three fourths of the depth of the tablings at the clues from the rope, and those of topsails are at half the depth of the tablings at the clues and top brim from the rope."

The rope, which is sewed on the edges of sails to prevent their rending, and which is called *bolt-rope*, should be well made of fine yarn, spun from the best Riga rhine hemp well topt, and sewed on with good English made twine of three threads, spun 200 fathom to the pound; the twine in the royal navy is dipped in a composition made with bees-wax, 4 lbs. hogs lard 5 lbs. and clear turpentine one pound; and in the merchant service, in tar softened with oil. They should be stoved in a stove by the heat of a flue, and not in a baker's oven or a stove tub; and tarred in the best Stockholm tar. The flexibility of them should be always considered, in taking in the slack, which must rest on the judgment of the sailmaker. Appendix.

"Bolt ropes of courses, topsails, and all other sails, should be neatly sewed on through every buntline of the rope; and, to avoid stretching, the rope must be kept tightly twisted while sewing on, and care taken that neither too much nor too little slack is taken in; they are to be cross stitched at the leeches every twelve inches in length; at every seam, and in the middle of every cloth at the foot, with three cross-stitches: four cross-stitches should be taken at all beginnings and fastenings off; the first stitch given twice, and the last three times. Small sails have two cross stitches at every seam, and three at every fastening off.

"On main and fore courses two inches slack cloth should be allowed in the head and foot, and one inch and a half in the leeches, in every yard in length. Topsails are allowed 3 inches slack in every cloth in the foot, one inch and a half in every yard in the leech, and two inches in every cloth left open in the top brim. Mizen courses have two inches slack in every yard in the foremost leech, but none in the after leech or foot. Spritsail courses have no slack cloth. Jibs have four inches slack in every yard in the stay, one inch in every cloth in the foot, and none in the leech. Staysails have three inches slack in every yard in the stay, one inch in every cloth in the foot, but none in the leech. Topgallant sails have two inches slack in every cloth in the foot, and one inch in every yard in the leech. Studding sails have an inch and a half slack in every yard in goring leeches, but no slack in square leeches, and one inch in every cloth in the head and foot."

These directions for sailmaking, we trust may be useful. They are indeed very general, but the sailmaker will find every instruction that he can want in the *Elements of Rigging and Seamanship*, a work which we therefore recommend to his attention.

Ship. *SHIP's Form Gauge*, an instrument recommended by Mr Hutchinson as fit to ascertain any alteration in the bottom of a ship, by its hogging or sagging; and also to regulate the stowage of a ship.

"All ships (says he) of any consequence are built with staunchions fixed from the kelson to the middle of all the lower-deck beams fore and aft, in order to support them in their exact, regular height, as well as the whole frame of the ship in the regular form in which she was built upon the stocks; yet notwithstanding these staunchions, it is proved from experience that our ships bottoms, hitherto, by the pressure of water, and improper stowage, have generally been hogged upwards, or sagged downwards, and most about the midship frame or main body of the ship, which is commonly about the fore part of the main hatchway; which naturally makes it the best place at which to fix the ship's form gauge, where either the hogging or sagging of her bottom may be observed and seen soonest and best, to regulate the stowage of heavy materials to the greatest advantage, so as to keep her bottom nearly in the same form in which she was built. Ship.

"The gauge I recommend is nothing more than a narrow plate of iron divided into inches and quarters like the slide of a carpenter's rule. Let this be fixed to the after side of the staunchion now mentioned, with its upper end projecting two or three inches above the staunchion; a groove being cut out for it in the after side of the lower-deck beam, and a mark being made (when the ship is on the stocks) at the part of the beam which corresponds to the 0 on the gauge. When the ship alters in her shape, the gauge will slide up and down

Ship.

down in this groove, and the quantity of hogging or fagging will be pointed out on the gauge by the mark on the beam. The ftowage may then be fo managed as to bring this mark to coincide again with the o, or to approach it as near as we fee neceffary."

SHIP-Money, was an impofition charged upon the ports, towns, cities, boroughs, and counties of this realm, in the reign of King Charles I. by writs, commonly called *fhip-writs*, under the great feal of England, in the years 1635 and 1636, for the providing and furnifhing of certain fhips for the king's fervice, &c. which was declared to be contrary to the laws and ftatutes of this realm, the *petition of right* and liberty of the fubject, by ftat. 17 Car. I. c. 14. See *Blackftone's Commentaries*, vol. iv. p. 30.

SHIP-Shape, according to the fafhion of a fhip, or in the manner of an expert failor; as, The maft is not rigged fhip-fhape; Trim your fails fhip-fhape.

Stowing and Trimming of SHIPS, the method of difpofing of the cargo in a proper and judicious manner in the hold of a fhip.

A fhip's failing, fteering, ftaying, and wearing, and being lively and comparatively eafy at fea in a ftorm, depends greatly on the cargo, ballaft, or other materials, being properly ftowed, according to their weight and bulk, and the proportional dimenfions of the built of the fhip, which may be made too crank or too ftiff to pafs on the ocean with fafety. Thefe things render this branch of knowledge of fuch confequence, that rules for it ought to be endeavoured after, if but to prevent, as much as poffible, the danger of a fhip overfetting at fea, or being fo labourfome as to roll away her mafts, &c. by being improperly ftowed, which is often the cafe.

When a fhip is new, it is prudent to confult the builder, who may be fuppofed beft acquainted with a fhip of his own planning, and moft likely to judge what her properties will be, to advife how the cargo or materials, according to the nature of them, ought to be difpofed of to advantage, fo as to put her in the beft failing trim; and at every favourable opportunity afterwards it will be proper to endeavour to find out her beft trim by experiment.

Ships muft differ in their form and proportional dimenfions; and to make them anfwer their different purpofes, they will require different management in the ftowage, which ought not to be left to mere chance, or done at random, as goods or materials happen to come to hand, which is too often the caufe that fuch improper ftowage makes fhips unfit for fea: therefore the ftowage fhould be confidered, planned, and contrived, according to the built and properties of the fhip, which if they are not known fhould be inquired after. If fhe is narrow and high-built in proportion, fo that fhe will not fhift herfelf without a great weight in the hold, it is a certain fign fuch a fhip will require a great part of heavy goods, ballaft, or materials, laid low in the hold, to make her ftiff enough to bear fufficient fail without being in danger of overfetting. But if a fhip be built broad and low in proportion, fo that fhe is ftiff and will fupport herfelf without any weight in the hold, fuch a fhip will require heavy goods, ballaft, or materials, ftowed higher up, to prevent her from being too ftiff and labourfome at fea, fo as to endanger her mafts being roiled away, and the hull worked loofe and made leaky.

Ship.

In order to help a fhip's failing, that fhe fhould be lively and eafy in her pitching and afcending motions, it fhould be contrived by the ftowage, that the principal and weightieft part of the cargo or materials fhould lie as near the main body of the fhip, and as far from the extreme ends, fore and aft, as things will admit of. For it fhould be confidered, that the roomy part of our fhips lengthwife forms a fweep or curve near four times as long as they are broad; therefore thofe roomy parts at and above the water's edge, which are made by a full harping and a broad tranfom to fupport the fhip fteady and keep her from plunging into the fea, and alfo by the entrance and run of the fhip having little or no bearing body under for the preffure of the water to fupport them, of courfe fhould not be ftowed with heavy goods or materials, but all the neceffary vacancies, broken ftowage, or light goods, fhould be at thefe extreme ends fore and aft; and in proportion as they are kept lighter by the ftowage, the fhip will be more lively to fall and rife eafy in great feas; and this will contribute greatly to her working and failing, and to prevent her from ftraining and hogging; for which reafon it is a wrong practice to leave fuch a large vacancy in the main hatchway, as is ufual, to coil and work the cables, which ought to be in the fore or after hatchway, that the principal weight may be more eafily ftowed in the main body of the fhip, above the flatteft and loweft floorings, where the preffure of the water acts the more to fupport it.

Improved Capftan of SHIPS.—A capftan has been contrived by Mr Bofwell, which works without requiring the meffenger or cable coiled around it, to be ever furged; an operation which is neceffary with common capftans, and is always attended with delay, and frequently with danger. This capftan has been approved by fome gentlemen connected with the Britifh navy. A model of this machine was prefented to the Society for the Encouragement of Arts, and Mr Bofwell received the gold medal of the fociety for his invention *.

* *Tranf.* for 1807. *Phil. Mag.* xxxi. 267.

For the information of thofe unacquainted with maritime affairs, Mr Bofwell gives an account of the manner in which cables are hauled on board of large fhips. For the purpofe of fhewing the advantage of his improved capftan, cables, he obferves, above a certain diameter are too inflexible to admit of being coiled round a capftan; in fhips where cables of fuch large dimenfions are neceffary, a fmaller cable is employed for this purpofe, which is called the *meffenger*, the two ends of which are made faft together fo as to form an endlefs rope, which, as the capftan is turned about, rolls round it in unceafing fucceffion, paffing on its courfe to the head of the fhip, and again returning to the capftan. To this returning part of the meffenger, the great cable is made faft by a number of fmall ropes called nippers, placed at regular intervals; thefe nippers are applied, as the cable enters the hawfe hole, and are again removed as it approaches the capftan, after which it is lowered into the cable tier.

The meffenger, or any other rope coiled round the capftan, muft defcend a fpace at every revolution equal to the diameter of the rope or cable ufed; this circum-ftance ſtance brings the coils in a few turns to the bottom of the capſtan, when it can no longer be turned round, till the coils are looſened and raiſed up to its other extremity, after which the motion proceeds as before. This operation of ſhifting the place of the coils of the meſſenger on the capſtan is called *ſurging the meſſenger*. It always cauſes conſiderable delay; and when the meſſenger chances to ſlip in changing its poſition, which ſometimes happens, no ſmall danger is incurred by thoſe who are employed about the capſtan.
